8. Bryan's first quote is from William L. Bryan, Jr., "The Northern Rocky Mountain Environmental Advocate," September 1, 1972, 3, in author's possession. His second quote and Gordon's warning come from William L. Bryan, Jr., "Report on the August 1972 Activities of William L. Bryan, Jr., Northern Rocky Mountain Environmental Advocate," August 1972, 4, in author's possession.

9. Interview with William L. Bryan, Jr., August 15, 2008, Bozeman, MT, in author's possession; William L. Bryan, Jr., "September Report on the Activities of William L. Bryan, Jr., Northern Rocky Mountain Environmental Advocate," September 1972, 1, in author's possession.

10. Interview with Marie Brady Sanchez, August 24, 2009, Lame Deer, MT, in author's possession; National Park Service, "Sand Creek Massacre Project, Volume 1: Site Location Study," 2000, 268–69, home.nps.gov/sand/parkmgmt/upload/site-location-study_volume-1-2.pdf (accessed December 30, 2014). Allotment came late to the Northern Cheyenne Reservation, and as a result the tribe retained a sizeable portion of their reservation in communal ownership. The 1926 Northern Cheyenne Allotment Act authorized allotment, but tribal rolls were not completed and the reservation was not fully surveyed until the early 1930s. At that time, there were only 1,457 qualified allottees, meaning 234,732.56 acres were apportioned to these individuals in lots of 160 acres or less, leaving 209,791.90 acres in tribal ownership. The 1934 Indian Reorganization Act ended the practice of allotment, and subsequent opening of "surplus" land to white settlers, before this additional land could be distributed. Over time, the tribal government reacquired 46,781 allotted acres, giving the tribe 62 percent ownership by the 1970s. Of the remaining 38 percent, much of it had not been granted to the allottees in outright fee, thus the BIA retained trust oversight over this allotted land. See Testimony of Bert W. Kronmiller, Tribal Attorney, "To Grant Minerals, Including Oil, Gas, and Other Natural Deposits, on Certain Lands in the Northern Cheyenne Indian Reservation, Montana, to Certain Indians," Hearings Before the House Subcommittee on Indian Affairs, Committee on Interior and Insular Affairs, March 28, 1968, 11–12, folder "Northern Cheyenne 14," box 257, no. 1 (reel 167), Native America: A Primary Record, series 2: Assn. on American Indian Affairs Archives, General and Tribal Files, 1851–1983, microfilm collection published by Primary Source Media, filmed from the holdings of the Seeley G. Mudd Library, Princeton University (hereafter Assn. on American Indian Affairs Archives); Petition of Writ of Certiorari at 8, n. 5, *Northern Cheyenne v. Hollowbreast,* 425 U.S. 649 (1976) (No. 75–145).

11. Interview with Marie Brady Sanchez, August 24, 2009, Lame Deer, MT, in author's possession.

12. For a concise discussion of federal funding increases for Indian programs during the 1960s, including Indian higher education, and its contribution to increased Indian activism, see Joane Nagel, *American Indian Ethnic Renewal: Red Power and the Resurgence of Identity and Culture* (New York: Oxford University Press, 1996), 122–30. Nagel also provides an apt description of AIM's strategic shift, ibid., 166–68. Marie Sanchez's meeting with Russell Means is detailed in Michael Parfit, *Last Stand at Rosebud Creek: Coal, Power, and People* (New York: E. P. Dutton, 1980), 85–86.

13. Bryan, "September Report on the Activities of William L. Bryan, Jr.," 2.

14. Parfit, *Last Stand at Rosebud Creek,* chapters 20–21 and 23–24.

15. Josephy, "Agony of the Northern Plains"; David Earley, "Group Forms to Battle Strip Mining," *Billings Gazette,* April 27, 1972. Charter's quote is found at Calvin Kentfield, "New Showdown in the West," *New York Times,* January 28, 1973.

16. Earley, "Group Forms to Battle Strip Mining"; see also Northern Plains Resource Council website, "History," http://www.northernplains.org/about/history. McRae's quote is at Parfit, *Last Stand at Rosebud Creek,* 96.

17. Denise Curran, "Voice of Land Speaks Up," *Billings Gazette,* November 16, 1972.

18. Northern Plains Resource Council, "Newsletter," Billings, MT, June–July 1972, in author's possession; Northern Plains Resource Council, "Newsletter," Billings, MT, October–November 1972, in author's possession; Curran, "Voice of Land Speaks Up"; Parfit, *Last Stand at Rosebud Creek,* 91; Bryan, "September Report on the Activities of William L. Bryan, Jr."; Glenn Fowler, "Harry M. Caudill, 68, Who Told of Appalachian Poverty," December 1, 1990, *New York Times.*

19. Northern Plains Resource Council, "Newsletter," Billings, MT, October–November 1972; Northern Plains Resource Council, "Newsletter," Billings, MT, December–January 1972, 1973; interview with William L. Bryan, Jr., June 13, 2011, Bozeman, MT, in author's possession; and William L. Bryan, Jr., "October Activities of William L. Bryan, Jr.," October 1972, in author's possession.

20. Mining firms with prospecting crews active on the Northern Cheyenne Reservation in fall 1972 included Peabody, Consolidation, Chevron, and AMAX, as well as local speculators Bruce Ennis and Norsworthy & Reger, Inc. As to damages caused by some of these companies, see Ziontz et al., "Northern Cheyenne Petition," A-131 to A-134 and A-143. For the actual formation of the NCLA, see Bryan, "October Activities of William L. Bryan, Jr.," 3.

21. Bill Bryan notes how the AIM caravan's arrival disrupted the first attempt to organize the NCLA. Bryan, Jr., "October Activities of William L. Bryan, Jr.," 2. Organized by several Indian activist groups but led by AIM, the Trail of Broken Treaties was part of AIM's transition away from focusing on the civil rights of urban Indians and toward a broader message of enforcing tribal treaty rights. Ward Churchill and James Vander Wall, *Agents of Repression: The FBI's Secret Wars against the Black Panther Party and the American Indian Movement* (Boston: South End Press, 1990), 121–22. For more on the Trail of Broken Treaties and AIM's leadership, see Vine Deloria, *Behind the Trail of Broken Treaties: An Indian Declaration of Independence* (New York: Dell Publishing, 1974); Paul Chaat Smith and Robert Allen Warrior, *Like a Hurricane: The Indian Movement from Alcatraz to Wounded Knee* (New York: New Press, 1996), part 2; and Charles F. Wilkinson, *Blood Struggle: The Rise of Modern Indian Nations* (New York: Island Press, 2005), 139–43. For a history of the Red Power Movement that began before AIM's ascendance, see Bradley Shreve, *Red Power Rising: The National Indian Youth Council and the Origins of Native Activism* (Norman: University of Oklahoma Press, 2011).

22. Rising Sun's first quote and Bixby's response are found at Nagel, *American Indian Ethnic Renewal,* 169. For a discussion of generational differences between American Indians' reactions to the Trail of Broken Treaties, see ibid., at 136–37. Rising Sun's second quote is ibid., 41–42. For the Northern Cheyenne's condemnation of the BIA takeover, see Allen Rowland, "Northern Cheyenne Resolution No. 64 (73)," November 14, 1972, John Melcher Papers, series 1, box 115, folder 5, Mansfield Library, University of Montana. Two years after this condemnation, dozens of AIM members returned to the Northern Cheyenne Reservation after the organization's armed standoff with federal agents at Wounded Knee, South Dakota. AIM members declared that their mission was only to establish a legal aid center and

perhaps organize a Lame Deer chapter, but once again Cheyenne residents harassed the activists. This time, federal agents had to be called in to protect the peace. Jim Crane, "AIM to Aid in Opposing Coal Development," November 24, 1974 *Missoulian* (Missoula, MT); "AIM Organizing at Lame Deer," August 15, 1974, *Missoulian;* and "Most AIM Backers Leave Lame Deer," August 25, 1974, *Missoulian*. Interestingly, the visiting AIM activists camped at the home of Marie and Chuck Sanchez, who participated in the protest at Wounded Knee and then hosted Russell Means, Leonard Peltier, and about thirty other AIM members after the event. Marie Sanchez dismissed the publicity this second visit generated, explaining, "They [local reporters] just wanted to sell papers." In her recollection, AIM's presence on the reservation was a non-event and its contribution to the anti-coal cause minimal. Interview with Marie Brady Sanchez, August 24, 2009, Lame Deer, MT, in author's possession.

23. Results from the Northern Cheyenne Research Project and the tribal members' quotes are found at Jean Nordstrom et al., *The Northern Cheyenne Tribe and Energy Development in Southeastern Montana* (Lame Deer, MT: Northern Cheyenne Research Project, 1977), 174–75.

24. Ibid. Woodenlegs's statement is at "Proceedings of the Native American, Environmentalist, and Agriculturalist Workshop" (Northern Rockies Action Group, December 10, 1975), 14, in author's possession.

25. Tribal quotes regarding disruptions to the community are found at Nordstrom et al., *Northern Cheyenne Tribe and Energy Development,* 166, 164, and 161, respectively. For comparison sake, only 9 percent listed environmental impacts as coal mining's worst possible effect; another 7 percent feared most the loss of land and water that could be used for other industrial development. Rising Sun's and Sootkis's quotes come from George Wilson, "Indian Coal Fight Tests U.S. Policies," *Washington Post,* June 11, 1973.

26. For years, George Bird Grinnell's tome provided the primary account of the Northern Cheyenne's flight from Indian Territory back to Montana. *The Fighting Cheyennes* (New York: Scribner's, 1915), 383–411. Recently, James Leiker and Ramon Powers have supplied a much-needed update to this dramatic tale that includes recollections of the event and its contested meaning along the Great Plains. This work is especially instructive for understanding how the Northern Cheyenne's collective memory of this nineteenth-century ordeal serves to unite the tribe. *The Northern Cheyenne Exodus in History and Memory* (Norman: University of Oklahoma Press, 2011), esp. 183–195. Several other books relay the events as remembered by the participants. Edger Beecher Bronson, *Reminiscences of a Ranchman* (New York: McClure, 1908) 139–97; E. A. Brininstool, *Dull Knife: A Cheyenne Napoleon* (Hollywood: E. A. Brininstool, 1935); Thomas Marquis, trans., *Wooden Leg: A Warrior Who Fought Custer* (Lincoln: University of Nebraska Press, 1957), 321; and John Stands in Timber and Margot Liberty, *Cheyenne Memories,* (New Haven: Yale University Press, 1998), 232–37. Other secondary works dedicate substantial focus to the flight, including Stan Hoig, *Perilous Pursuit: The U.S. Cavalry and the Northern Cheyenne* (Boulder: University Press of Colorado, 2002); John H. Monnet, *Tell Them We Are Going Home: The Odyssey of the Northern Cheyennes* (Norman: University of Oklahoma Press, 2001); Orlan J. Svingen, *The*

Northern Cheyenne Indian Reservation, 1877–1900 (Niwot: University Press of Colorado, 1993), 19–24; Tom Weist, *A History of the Cheyenne People* (Billings, MT: Montana Council for Indian Education, 1977), 80–87; and Verne Dusenberry, "The Northern Cheyenne: All They Have Asked Is to Live in Montana," *Montana: The Magazine of Western History* 5 (Winter 1955): 28–30. For an alternative account arguing the Northern Cheyenne were awarded a reservation due to the tribe's selective adoption of settled agriculture, see James Allison, "Beyond the Violence: Indian Agriculture, White Removal, and the Unlikely Construction of the Northern Cheyenne Reservation, 1876–1900," *Great Plains Quarterly* 32, no. 2 (Spring 2012): 91–111.

27. Bill Parker's quote is found in "Proceedings of the Native American, Environmentalist, and Agriculturalist Workshop," 9–10. The tribe's comments opposing the Colstrip Power Plant are at Tom Scheuneman, "Statement of the Northern Cheyenne Tribe before the State of Montana Department of Natural Resources and Conservation," December 30, 1974, 3–4, Montana Energy Division Records, 1972–1990, record series 328, box 15, DNRC Public Hearings on Colstrip 3 and 4, Montana Historical Society, Digital Library and Archives (emphasis removed). Tribal comments related to air shed redesignation are at the Northern Cheyenne Research Project, "The Northern Cheyenne Air Quality Redesignation Request and Report," December 11, 1976, 3–10, in author's possession. Text on the tribe's official stationery is noted at Ambler, *Breaking the Iron Bonds,* 8. And finally, the last quote from the young tribal member comes from Nordstrom et al., *Northern Cheyenne Tribe and Energy Development in Southeastern Montana,* 174.

28. The text from Bill Bryan's pamphlet is found at Michael Wenninger, "$1 Billion Coal Plant Discussed," *Billings Gazette,* November 29, 1972; and William L. Bryan, Jr., "Northern Rocky Mountain Environmental Advocate, November Activities of William L. Bryan, Jr.," November 1972, 2, in author's possession. Bill Bryan provided the "Coal: Black Death" poster, and it is in the author's possession.

29. Unfortunately, Toole cites no sources for this meeting between Dahle and Crossland, and subsequent accounts simply cite Toole. Thus it is difficult to verify the meeting took place or assess its impact on tribal leaders. Toole, *Rape of the Great Plains,* 53–55; and Ambler, *Breaking the Iron Bonds,* 65. For the subsequent NCLA meetings and Rowland's and Spang's support, see Wenninger, "$1 Billion Coal Plant Discussed"; Michael Wenninger, "Cheyennes Eye Coal Proposal," *Billings Gazette,* November 30, 1972; Michael Wenninger, "Indians Mull Coal Referendum," *Billings Gazette,* December 1, 1972; and Bryan, "November Activities of William L. Bryan, Jr."

30. Attendees at this December 7 meeting are detailed in William L. Bryan, Jr., "Northern Rocky Mountain Environmental Advocate, December Activities of William L. Bryan, Jr.," December 1972, in author's possession; and Betty Clark to William Byler, December 1972, folder "Northern Cheyenne 16," box 257, no. 1 (reel 167), Native America: A Primary Record, series 2: Assn. on American Indian Affairs Archives, General and Tribal Files, 1851–1983. For NARF's founding and experience defending southwestern Indians, see Native American Rights Fund, *Announcements* 1, no. 1 (June 1972), 3–4 and 13. Brecher's personal involvement

with NARF is detailed in Michael Wenninger, "Northern Cheyenne to Fight Coal Complex," *Billings Gazette,* January 27, 1973.

31. Wenninger, "Northern Cheyenne to Fight Coal Complex."

32. For the suspension of drilling activities, see Ziontz et al., "Northern Cheyenne Petition," A-177. Rowland's and Dahle's quotes come from Wilson, "Indian Coal Fight Tests U.S. Policies." Gardner's quote is at Ben Franklin, "Indian Tribe in Montana Weighs Major Offer to Strip Mine Coal as Profitable but Perilous," *New York Times,* February 5, 1973.

33. As to Joseph Brecher's alienating style, see interview with William L. Bryan, Jr., June 13, 2011, Bozeman, MT, in author's possession. For tribal council efforts to draft tax and reclamation codes, see Franklin, "Indian Tribe in Montana Weighs Major Offer to Strip Mine Coal as Profitable but Perilous." The resolution canceling all existing coal deals is at Allen Rowland, "Resolution No. 132 (73): A Resolution of the Northern Cheyenne Tribal Council Relating to the Cancellation and Termination of All Existing Coal Permits and Leases on the Northern Cheyenne Reservation," March 5, 1973, Eloise Whitebear Pease Collection, 10:31, Little Bighorn College Archives, Crow Agency, MT.

34. To be clear, the Northern Cheyenne's initial grounds for terminating its leases rested on the BIA violating 25 C.F.R.§ 177.4, but once the tribe hired the Seattle law firm of Ziontz, Pirtle, Moresset, and Ernstoff, it greatly expanded its legal arguments. Filed on January 7, 1974, the official petition listed thirty-six violations of the law, each of which the tribe argued provided grounds to void the coal contracts. Steven Chestnutt, "Coal Development on the Northern Cheyenne Reservation," in Commission on Civil Rights, *Energy Resource Development: Implications for Women and Minorities in the Intermountain West* (Washington, DC: Government Printing Office, 1979), 165–71. Rowland's comparison of the Northern Cheyenne's situation to the Navajo and Hopi tribes is found in Allen Rowland to James Canan, March 9, 1973, 3, Lee Metcalf Papers, General Correspondence, Collection No. 172, box 219, folder 219–3, Montana Historical Society, Digital Library and Archives. Dahle's quote is in Nancy Cardwell, "Cheyenne's Last Stand?: Indians Fight New Battle in Montana, To Limit Coal Mining on Reservation," *Wall Street Journal,* September 10, 1975.

35. 25 C.F.R. § 177.4(a)(1) (1970); National Environmental Policy Act, Public Law 91–190, § 102, 83 Stat. 853, 854 (1970) (codified at 42 U.S.C. § 4332 (2006)). In 1972, the comptroller general failed to find documentation of the required "technical examinations" for any Indian mineral leases previously approved by the BIA. United States General Accounting Office, *Administration of Regulations for Surface Exploration, Mining, and Reclamation of Public and Indian Coal Lands* (Washington, DC: Government Printing Office, 1972), 13. In response, the BIA took the position that staff need not physically perform the technical examination as long as this requirement could be fulfilled by the "data available in the offices of the USGS and BIA plus the familiarity of the field offices employees with the land." John Crow to BIA Area Directors, November 17, 1972, Lee Metcalf Papers, General Correspondence, Collection No. 172, box 219, Montana Historical Society, Digital Library and Archives. Only after offering this post hoc rationale did the

Billings area office direct the Northern Cheyenne and Crow reservation superintendents to document how they fulfilled the technical examination requirements for leases and permits already issued. Maurice Babby to Superintendents, Crow and Northern Cheyenne Agencies, December 12, 1972, Lee Metcalf Papers, General Correspondence, Collection No. 172, box 219, folder 219–3, Montana Historical Society, Digital Library and Archives. K. Ross Toole argues this was "a blatant attempt, *ex post facto,* to doctor the files." Toole, *Rape of the Great Plains,* 59. For the Department of the Interior's position that NEPA did not apply to agency actions for Indian assets, see United States General Accounting Office, *Administration of Regulations for Surface Exploration, Mining, and Reclamation of Public and Indian Coal Lands;* and Harrison Loesch to John Dingell, November 12, 1971, folder "Natural Resources," box 147, no. 4 (reel 71), Native America: A Primary Record, series 2: Assn. on American Indian Affairs Archives, General and Tribal Files, 1851–1983. In 1975, the Ninth Circuit Court of Appeals rejected this argument, making clear NEPA applied to federal actions managing Indian resources. Further, although no federal court has determined whether compliance with the "technical examination" of 25 C.F.R. part 177 satisfies NEPA's procedural requirements for an environmental review of any major federal action, the Ninth Circuit held that BIA's compliance with NEPA's requirements renders the requirements of part 177 moot. *Davis v. Morton,* 469 F.2d 593 (10th Cir. 1972). Ambler's quote comes from Ambler, *Breaking the Iron Bonds,* 69.

36. Richard Nixon, "Special Message to Congress on Indian Affairs," July 8, 1970, The American Presidency Project, ed. Gerhard Peters and John T. Woolley, http://www.presidency.ucsb.edu/ws/index.php?pid=2573. For Nixon's message as just a continuation of the previous administrations' Indian policy, see Thomas Clarkin, *Federal Indian Policy in the Kennedy and Johnson Administrations, 1961–1969* (Albuquerque: University of New Mexico Press, 2001); and George Pierre Castile, *To Show Heart: Native American Self-Determination and Federal Indian Policy, 1960–1975* (Tucson: University of Arizona Press, 1998), chapters 1–3. In fact, Lyndon Johnson provided his own message to Congress two years earlier, which contained some of the same policy language: "I propose a new goal for our Indian programs: A goal that ends the old debate about 'termination' of Indian programs and stresses self-determination; a goal that erases old attitudes of paternalism and promotes partnership self-help." Lyndon B. Johnson, "Special Message to the Congress on the Problems of the American Indian: 'The Forgotten American,'" March 6, 1968, The American Presidency Project, ed. Gerhard Peters and John T. Woolley, http://www.presidency.ucsb.edu/ws/index.php?pid=28709#axzz1ckaZdTec.

37. Rogers Morton, "Decision on Northern Cheyenne Petition," June 4, 1974, Eloise Whitebear Pease Collection, 10:31, Little Bighorn College Archives, Crow Agency, MT. Morton actually denied most of the Northern Cheyenne's claims but did find that the BIA violated acreage limitations placed on the size of mineral leases and that the agency had not yet conducted the proper environmental analyses required by NEPA. On the original question of whether the BIA conducted the proper technical examination, Morton punted, requesting more information on agency actions to fulfill this requirement. The point, however, was moot since Morton already demanded a NEPA-style environmental analysis before mining could

commence. Rowland is quoted in John J. Fialka, "The Indians, the Royalties, and the BIA," *Civil Rights Digest* (Winter 1978): 29.

38. Ambler, *Breaking the Iron Bonds,* 69. For Northern Cheyenne meeting with Montana's congressional delegation, see Roger, "Memo on the Meeting on Northern Cheyenne Coal Lease," August 1, 1973, Lee Metcalf Papers, General Correspondence, Collection No. 172, box 218, folder 218–4, Montana Historical Society, Digital Library and Archives; Dorothy Tenenbaum, "Memo to File," September 7, 1973, Lee Metcalf Papers, General Correspondence, Collection No. 172, box 218, folder 218–4, Montana Historical Society, Digital Library and Archives; and Mike Mansfield and Lee Metcalf to Roy E. Huffman, September 12, 1973, Lee Metcalf Papers, General Correspondence, Collection No. 172, box 218, folder 218–4, Montana Historical Society, Digital Library and Archives. For tribal efforts to develop a mining enterprise business plan, see Alonzo Spang to Allen Rowland, August 28, 1973, 8NN-75-92-206, box 14, folder "Comprehensive Plan for the Northern Cheyenne Res.," National Archives, Denver; and Northern Cheyenne Tribal Council, "A Proposal to Develop a Preliminary Business Plan for the Development of Coal Reserves and Related Industry on Tribally Owned and Controlled Lands on the Northern Cheyenne Reservation," February 1974, Bradley H. Patterson Files, box 4, Northern Cheyenne-Coal, Gerald R. Ford Library, Ann Arbor, MI. The tribal council's tour of Peabody facilities is detailed in Fialka, "Indians, the Royalties, and the BIA," 22.

39. Northern Cheyenne Tribal Council, "A Proposal to Develop a Preliminary Business Plan for the Development of Coal Reserves and Related Industry on Tribally Owned and Controlled Lands on the Northern Cheyenne Reservation," 2.

CHAPTER 5. DETERMINING THE SELF

Epigraph. Washington Irving, *The Adventures of Captain Bonneville* (New York: John B. Alden, 1886), 138–39.

1. H. J. Armstrong to Commissioner of Indian Affairs, March 24, 1882, 6491, Letters Received—Office of Indian Affairs, RG 75, National Archives (quoted in Frederick Hoxie, *Parading through History: The Making of the Crow Nation in America, 1805–1935* [New York: Cambridge University Press, 1995], 21).

2. The quotes come from Hoxie, *Parading through History,* 29. Hoxie's coverage of the Sword Bearer incident is found ibid., 154–64. Other accounts of this incident are summarized in Colin Calloway, "Sword Bearer and the 'Crow Outbreak' of 1887," *Montana: The Magazine of Western History* 36, no. 4 (Autumn 1986): 38–51.

3. Patrick Stands Over Bull, "Statement from the Crow Tribal Chairman, Patrick Stands," August 29, 1975, 1, Joseph Medicine Crow Collection, 24:12, Little Bighorn College Archives, Crow Agency, MT (hereafter LBC Archives).

4. Ibid., 6.

5. Crow Coal, Inc.'s proposal is at Joseph Rawlins to Crow Industrial Development Commission, May 10, 1966, Eloise Whitebear Pease Collection, 16:54, LBC Archives. For background on the company and its formation, see "Articles of Incorporation of Crow Coal, Inc.," January 7, 1966, Eloise Whitebear Pease

Collection, 16:54, LBC Archives; Joseph Rawlins to Eloise Pease, October 6, 1966, Eloise Whitebear Pease Collection, 16:54, LBC Archives; and A. F. Czarnowsky, Deputy Regional Mining Supervisor, to Superintendent, Northern Cheyenne Reservation, February 4, 1965, 8NN-075-91-008, box 8, folder "Coal Leasing and Permit (Sene and Scott)," National Archives, Denver.

6. The federal government's 1910 assessment of Crow Reservation land and resources is found in House Committee on Indian Affairs, *Sale of Certain Land, etc. within the Diminished Crow Reservation, Mont.,* 61st Cong., 2d sess., 1910, H. Rep. 1495, 2. Yellowtail is quoted in Megan Benson, "The Fight for Crow Water: Part 1, The Early Reservation Years through the New Deal," *Montana: The Magazine of Western History* 57, no. 4 (Winter 2007): 36. The Crow Allotment Act is at Act of June 4, 1920, Public Law 66-239, 41 Stat. 751 (1920).

7. For oil and gas activity on the Crow Reservation, see Superintendent, Crow Indian Agency, to Area Director et al., Re: The Ten Year Goals of the Crow Reservation, July 13, 1964, 2–3, 8NN-75-92-206, box 9, folder "Res. Programs—Crow Res.," National Archives, Denver; and John Cummins and Otto Weaver, "Application to Lease Tribal Lands for Oil and Gas Purposes," May 17, 1963, 8NS–075–97–341, box 11, folder "Confidential Crow Requests for Oil and Gas Lease Sale," National Archives, Denver. As of 1967, the Department of the Interior reported the tribe had received only $3,665,000 in mineral revenue since 1920, with 40 percent of this coming over the previous five years. Senate Committee on Interior and Insular Affairs, *Granting Minerals, Including Oil and Gas, on Certain Lands in the Crow Reservation, Mont., to Certain Indians, and for Other Purposes,* 90th Cong., 1st sess., 1967, S. Rep. 690, 3. The law transferring reservation minerals to the Crow in perpetuity is at *An Act to Grant Minerals, Including Oil and Gas, on Certain Lands in the Crow Indian Reservation, Montana, to Certain Indians, and for other Purposes,* Public Law 90–308, 82 Stat. 123 (1968). In passing this law, Congress thwarted the expectation of individual allottees and surface owners who, under the 1920 Allotment Act, would have received mineral rights at the conclusion of the fifty-year period reserving these rights to the tribe. Despite this sudden change in future ownership, no widespread opposition seems to have materialized on the Crow Reservation. On the neighboring Northern Cheyenne Reservation, however, allottees challenged a similar law passed the same year transferring their minerals to tribal ownership. As discussed in chapter 7, the Supreme Court ultimately upheld the law, affirming that all reservation minerals belonged to the Northern Cheyenne, and by implication, the Crow as well. *Northern Cheyenne v. Hollowbreast,* 425 U.S. 649 (1976); see chapter 7, note 6 and accompanying text.

8. As to tribal governance under the 1948 constitution, see Crow Tribe, *Crow Tribal Report, Presented to the American Indian Policy Review Commission* (Crow Agency, MT: Crow Tribal Council, 1976), 77–78 and 86–87. For how this "open council" form of government led to Crow factionalism, see ibid., 76–87, and Hoxie, *Parading through History,* chapter 8.

9. The resolution creating the Oil and Gas Committee is at Fred Froze, "Resolution," November 13, 1952, Eloise Whitebear Pease Collection, 16:54, LBC Archives. Subsequent clarification of this committee's powers is found at John Cummins, "Resolution No. 64–09, Resolution of the Crow Tribal Council Granting

Power to the Oil and Gas Committee to Transact Business and for Other Purposes," July 13, 1963, Eloise Whitebear Pease Collection, 16:54, LBC Archives; and James Torske to Westmoreland Resources, February 18, 1972, Eloise Whitebear Pease Collection, 16:54, LBC Archives.

10. For local media coverage of the emerging demand for Crow coal, see "Indians Could Be Big Winners in Coal Boom," *Billings Gazette,* September 14, 1967. The resolution conferring unilateral powers to the tribal chairman is at Edison Real Bird, "Resolution No. 68–2: A Resolution of the Crow Tribal Council Authorizing the Crow Tribal Council Chairman to Issue Prospecting Permits and to Grant Mining Leases of Coal Resources of the Crow Tribe of Indians and for Other Purposes," October 31, 1967, Eloise Whitebear Pease Collection, 16:20, LBC Archives.

11. Thomas Kleppe, "Decision of the Secretary of the Interior Relating to Crow Tribe v. Kleppe, Et Al.," January 17, 1977, 1–3, Eloise Whitebear Pease Collection, 14:37, LBC Archives. Peabody's bonus was $1.00 an acre, Gulf's was approximately $3.50, and Shell paid $12.00 per acre. These figures are not insignificant, but as we well see, none of the companies ever developed their coal rights and thus never provided a steady, lucrative revenue stream to the Crow tribe.

12. The act transferring Crow land in the Ceded Strip to the federal government is at Act of April 27, 1904, Public Law 58–183, 33 Stat. 352 (1904). Although negotiated in 1899, this transaction was not formalized until several years later, when Congress unilaterally adjusted the payment terms. For the negotiations leading to the land cession and Congress's alteration of the terms, see Hoxie, *Parading through History,* 233–39. The act transferring mineral rights back to the Crow is at Act of May 19, 1958, Public Law 85–420, 72 Stat. 121 (1958). For a helpful review of the Ceded Strip's convoluted history, see *Crow Tribe of Indians v. U.S.,* 657 F. Supp. 573 (D. Mont., 1985), 575–78. To be clear, though the tribe owned mineral rights in the Ceded Strip and the federal government acted as a trustee over these subsurface rights, the surface area was not part of the reservation. See *Crow Tribe v. Montana,* 650 F.2d 1104, 1107 (9th Cir. 1981) (noting the opinion in *Little Light v. Crist,* 649 F.2d 682, 685 [9th Cir. 1981]) that "the ceded area is not a part of the reservation").

13. For the negotiations between Norsworthy & Reger, the Crow tribe, and the BIA that resulted in an oral auction for Crow coal rights, see Jase Norsworthy to J. O. Jackson, September 5, 1969, Central Classified Files, 1958–75, Crow, decimal #323, box 38, RG 75, National Archives, Washington, DC; Office of Area Director to Commissioner of Indian Affairs, September 29, 1969, Central Classified Files, 1958–75, Crow, decimal #323, box 38, RG 75, National Archives, Denver; A. F. Czarnowsky, Regional Mining Supervisor, to Area Realty Officer, September 30, 1969, Central Classified Files, 1958–75, Crow, decimal #323, box 38, RG 75, National Archives, Washington, DC; and George Hubley, Commissioner of Indian Affairs to Area Director, Billings Area, October 20, 1969, Central Classified Files, 1958–75, Crow, decimal #323, box 38, RG 75, National Archives, Washington, DC. To be clear, oral bidding was available only to firms that had first submitted sealed, written bids. Bruce Ennis to Louis R. Bruce, July 17, 1970, Central Classified Files, 1958–75, Crow, decimal #323, box 38, RG 75, National Archives, Washington, DC. Recall that the following month, in October 1970, Northern

Cheyenne Tribal President Allen Rowland demanded the same oral auction procedure for his tribe's third, final, and most lucrative coal sale. See chapter 3, note 16 and accompanying text. The results of the Crow's third coal sale are at Bureau of Indian Affairs, "Abstract of Sealed and Oral Bids on Coal Sale #3," September 16, 1970, Central Classified Files, 1958–75, Crow, decimal #323, box 38, RG 75, National Archives, Washington, DC; and BIA Regional Office to Commissioner of Indian Affairs, September 22, 1970, Central Classified Files, 1958–75, Crow, decimal #323, box 38, RG 75, National Archives, Washington, DC.

14. For the various per cap distributions following the Crow's coal sales, see Edison Real Bird, "Resolution No. 68–21: A Resolution Providing for the Appropriation of Tribal Funds for Social and Economic Purposes," April 13, 1968, Eloise Whitebear Pease Collection, 16:20, LBC Archives; Edison Real Bird, "Resolution 68–31: A Resolution of the Crow Tribal Council Providing for the Appropriation of Tribal Funds for Social and Economic Purposes," April 26, 1968, Eloise Whitebear Pease Collection, 16:4, LBC Archives; and James Canan to Edison Real Bird, October 16, 1970, John Melcher Papers, series 1, box 113, folder 12, Mansfield Library, University of Montana.

15. For Westmoreland's acquisition of Norsworthy & Reger coal rights and Crow water rights, see A. E. Bielefeld to Norsworthy & Reger, May 19, 1971, Westmoreland Coal Company Records, Acc. #1765, "Sarpy Creek, Land Questions, 8–71–6-73, WE3FEB2," box 830, Hagley Museum and Library, Wilmington, DE (hereafter Hagley Museum); United States Bureau of Reclamation, "Contract among the United States, Norsworthy & Reger, and Westmoreland Resources to Assist Contract No. 14–06–600–329A for Furnishing Water for Industrial Use," July 22, 1971, Westmoreland Coal Company Records, Acc. #1765, "Sarpy Creek, Land Questions, 8–71–6-73, WE3FEB2," box 830, Hagley Museum; R. L Freeman to Charles Stewart, October 22, 1971, Eloise Whitebear Pease Collection, 17:8, LBC Archives; Lucille Cooke to Walter Fenney, November 16, 1971, Eloise Whitebear Pease Collection, 17:8, LBC Archives; and Clarence Stewart, "Resolution of the Crow Tribal Mineral Committee," January 25, 1972, Eloise Whitebear Pease Collection, 17:8, LBC Archives. For constructing a railroad line to the Ceded Strip and unifying Westmorland's leases, see Eloise Pease, "Annual Overall Economic Development Program Progress Report (For the Calendar Year 1971)," 1972, 4, Eloise Whitebear Pease Collection, 7:7, LBC Archives; Eloise Pease, "Meeting of Mineral Committee [Handwritten] Minutes," February 4, 1972, Eloise Whitebear Pease Collection, 16:57, LBC Archives; Ralph E. Moore to Mineral Committee, June 2, 1972, Westmoreland Coal Company Records, Acc. #1765, "Misc. Correspondence, 1974–76," box 837, Hagley Museum; and United States Bureau of Indian Affairs, "Coal Mining Lease Indian Lands, Contract No. 14–20–0252–3863," June 6, 1972, Eloise Whitebear Pease Collection, 16:66, LBC Archives. For coverage of the royalty negotiations and the tribe's rejection of the amended terms, see Pease, "Meeting of Mineral Committee [Handwritten] Minutes"; Minturn Wright to Pemberton Hutchinson, May 8, 1972, Westmoreland Coal Company Records, Acc. #1765, "Sarpy Creek, Land Questions, 8–71–6-73, WE3FEB2," box 830, Hagley Museum; Theodore Voorhees to Louis R. Bruce, May 9, 1972, Westmoreland Coal Company Records, Acc. #1765, "Sarpy Creek, Land Questions, 8–71–6-73, WE3FEB2," box 830, Hagley Museum; and "Memorandum:

Westmoreland Resources," October 22, 1972, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum. To be clear, Westmoreland was not the only energy company that elected to transform its prospecting permit into a lease. Shell and AMAX also decided to "go to lease" in summer 1972, but these companies were much further away from beginning actual mining operations. With their prospecting permits set to expire, it appears AMAX and Shell determined to take leases and simply pay the Crow penalties under their contracts' minimum production requirements in lieu of forfeiting all rights to Crow coal. United States Bureau of Indian Affairs, "Coal Mining Lease Indian Lands, Contract No. 14–20–0252," June 5, 1972, Eloise Whitebear Pease Collection, 17:26, LBC Archives; United States Bureau of Indian Affairs, "Coal Mining Lease Indian Lands, Contract No. 14–20–0252–3863"; and United States Bureau of Indian Affairs, "Coal Mining Lease Indian Lands, Contract No. 14–20–0252–3917," September 12, 1972, Eloise Whitebear Pease Collection, 16:66, LBC Archives.

16. Internal Westmoreland correspondence documents this dispute within the tribe over the terms of their deal. According to Westmoreland officials, the BIA was especially wary of approving any lease terms that might contradict the desires of a large portion of the Crow tribe, thus Westmoreland executives expended considerable efforts to demonstrate to the BIA why the amendments to their coal contract were necessary to make their projects viable and that the Crow tribe was fully informed and supported these changes. Minturn Wright to Pemberton Hutchinson, May 4, 1972, Westmoreland Coal Company Records, Acc. #1765, "Sarpy Creek, Land Questions, 8–71–6-73, WE3FEB2," box 830, Hagley Museum; Minturn Wright to Pemberton Hutchinson, May 8, 1972; and Theodore Voorhees to Louis R. Bruce, May 9, 1972. David Stewart's new list of demands to Westmoreland are detailed at "Memorandum: Westmoreland Resources," October 22, 1972, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum.

17. In *Davis v. Morton,* the Tenth Circuit Court of Appeals rejected the BIA's stance that the National Environmental Policy Act did not apply to the issuance of Indian mineral leases. 469 F.2d 593 (10th Cir. 1972). Westmoreland communication with BIA officials, who then were tasked with preparing the required environmental analyses, makes clear that the BIA was prepared to delay its report due to Crow dissatisfaction with the current royalty. Theodore Voorhees to Pemberton Hutchinson, March 15, 1973, 2 and 6, Westmoreland Coal Company Records, Acc. #1765, "Legal Correspondence, 1974–76," box 836, Hagley Museum. As for Crow intervention into the Sierra Club suit, Westmoreland's payment of attorney's fees, and Crow demands for advanced royalties, see Charles Brinley, "Westmoreland Resources Meeting Minutes," September 13, 1973, Westmoreland Coal Company Records, Acc. #1765, "Directors' Meetings, 1–71 to 9–81, #58.04," box 831, Hagley Museum; Pemberton Hutchinson to Evalyn Carson, September 21, 1973, Westmoreland Coal Company Records, Acc. #1765, "Sierra Club v. Morton, et al., 9/73–1/76, #350.10" box 832, Hagley Museum; and Pemberton Hutchinson to Partners, September 21, 1973, Westmoreland Coal Company Records, Acc. #1765, "Sierra Club v. Morton, et al., 9/73–1/76, #350.10," box 832, Hagley Museum. Hutchinson's comment about not wanting the Crow to develop Cheyenne

attitudes is at Pemberton Hutchinson to Partners, June 18, 1973, 2, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum; see also Charles Brinley, "Westmoreland Resources Meeting Minutes," May 17, 1973, 3, Westmoreland Coal Company Records, Acc. #1765, "Directors' Meetings, 1–71 to 9–81, #58.04," box 831, Hagley Museum. Additional correspondence making clear tribal support for the Ceded Strip's environmental impact statement depended on securing higher royalties is at Daniel Israel to Pemberton Hutchinson, January 30, 1974, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum; Charles Brinley to Partners, February 1, 1974, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum; Pemberton Hutchinson to Daniel Israel, February 14, 1974, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum; and Charles Brinley, "Westmoreland Resources Meeting Minutes," March 13, 1974, Westmoreland Coal Company Records, Acc. #1765, "Misc. Correspondence, 1974–76," box 837, Hagley Museum. This correspondence also makes clear that the federal government was withholding final issuance of the environmental analysis until the tribe secured satisfactory royalties.

18. "Coal (Crow) Agency," October 1973, 1, Joseph Medicine Crow Collection, 24:12, LBC Archives.

19. Crow Tribe Community Action Program, "Crow Coal Survey and Preliminary Social Impact Report," October 1973, 2–3, Eloise Whitebear Pease Collection, 16:52, LBC Archives.

20. David Stewart, "Resolution No. 74–09: A Resolution of the Crow Tribal Council Providing for the Election of a Mineral Committee of the Crow Tribe, Defining the Powers and Duties of Said Mineral Committee, Rescinding and Repealing Any and All Resolutions Heretofore Passed and Adopted by the Crow Tribal Council Which Are in Conflict with the Provisions of This Resolution, and for Other Purposes," October 13, 1973, 2, Eloise Whitebear Pease Collection, 22c:3:1, LBC Archives. Although the enacting resolution unambiguously charged the Minerals Committee with handling all mineral development, a subsequent resolution gave the committee more specific directions for negotiating with Westmoreland. Tribal attorney Thomas Lynaugh later argued that this subsequent resolution limited the Minerals Committee's authority to dealing only with the Westmoreland lease. "Resolution No. 74–17: A Resolution of the Crow Tribal Council Authorizing the Mineral Committee of the Crow Tribe to Take Certain Actions, and for Other Purposes," January 12, 1974, Eloise Whitebear Pease Collection, LBC Archives; and Thomas Lynaugh to Bud Lozar, November 8, 1976, Eloise Whitebear Pease Collection, 16:19, LBC Archives.

21. Israel's first meeting with the Mineral Committee is documented in Eloise Pease, "Mineral Committee Meeting [Handwritten] Minutes," December 4, 1973, 1, Eloise Whitebear Pease Collection, 16:52, LBC Archives. As to Israel's coordination with the Crow's community action program, see Daniel Israel to Ken Toineeta, December 13, 1973, Eloise Whitebear Pease Collection, 16:57, LBC Archives. In July 1973, the Crow had received a $125,000 grant from the Department of Health,

Education, and Welfare to study the best method for managing their coal resources. Caspar Weinberger to Lee Metcalf, January 23, 1974, Eloise Whitebear Pease Collection, 16:52, LBC Archives. The hired consultants' assessment of past deals and their advice to the Crow is at Daniel Israel, "Memorandum: Meeting with Carmel Patton on November 28, 1973," November 29, 1973, 1, Eloise Whitebear Pease Collection, 16:57, LBC Archives.

22. For the Crow's strategy to focus on the Westmoreland deal and use it as the basis for subsequent negotiations, see Daniel Israel to Crow Mineral Committee, December 20, 1973, Eloise Whitebear Pease Collection, 16:57, LBC Archives. For the actual negotiations, see Daniel Israel to Pemberton Hutchinson, February 8, 1974, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum; Pemberton Hutchinson to Partners, February 8, 1974, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum; Pemberton Hutchinson to Daniel Israel, February 14, 1974; Pemberton Hutchinson to Partners, March 1, 1974, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum; Pemberton Hutchinson to Dan Israel, March 11, 1974, Eloise Whitebear Pease Collection, 16:54, LBC Archives; and Eloise Pease and Pemberton Hutchinson, "Memorandum of Understanding," March 13, 1974, Eloise Whitebear Pease Collection, 16:35, LBC Archives. Israel's quote is at Dan Israel and Dale Emling to Crow Mineral Committee and Crow Tribal Leaders, May 20, 1974, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum. For tribal meetings that resulted in postponing a decision on the Westmoreland amended contract, see Pemberton Hutchinson to Partners, March 25, 1974, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum; and Pemberton Hutchinson to Partners, April 9, 1974, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum. For additional consultants advising the Mineral Committee and Crow candidates, see P. J. Stevens to Robert Howe, April 10, 1974, Westmoreland Coal Company Records, Acc. #1765, "Misc. Correspondence, 1974–76," box 837, Hagley Museum; Charles Beasley to Alex Birdinground, April 16, 1974, Eloise Whitebear Pease Collection, 16:48, LBC Archives; Pemberton Hutchinson to Partners, April 18, 1974, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum; Charles Brinley to Partners, May 2, 1974, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum; and Dan Israel and Dale Emling to Crow Mineral Committee and Crow Tribal Leaders, May 20, 1974. The decision to postpone any vote on Westmoreland's deal until after tribal elections is at Eloise Pease to Crow Tribal Members, May 3, 1974, Eloise Whitebear Pease Collection, 16:54, LBC Archives. Finally, Howard Frey's bloody tomahawk is found in Pemberton Hutchinson to Partners, April 9, 1974.

23. For the May 1974 election turnout, see Eloise Pease to Members of the Crow Tribe, May 14, 1974, Westmoreland Coal Company Records, Acc. #1765, "Land Questions, 7–73 to 3–75, WR3FEB2," box 830, Hagley Museum. Stands Over

Bull's quote is in Donald Fixico, *The Invasion of Indian Country in the Twentieth Century: American Capitalism and Tribal Natural Resources* (Boulder: University of Colorado Press, 1998), 146. The mining moratorium resolution is at Patrick Stands Over Bull, "Resolution No. 75–06A: A Resolution Providing General Direction on Matters Concerning Pending Coal Development on Tribally Owned Coal Resources and on All Coal Resources within the Boundaries of the Crow Indian Reservation," July 13, 1974, Apsaalooke Nation Council and District Records, Crow Tribal Government Building, Crow Agency, MT. For Stands Over Bull's private negotiations with Westmoreland, see Pemberton Hutchinson to Partners, July 8, 1974, Westmoreland Coal Company Records, Acc. #1765, "Misc. Correspondence, 1974–76," box 837, Hagley Museum; and Patrick Stands Over Bull, "Resolution No. 75–12: A Resolution Authorizing a Delegation of the Crow Tribal Council to Negotiate Specific Matters in Order to Obtain a Final Agreement on Tracts 2 and 3," October 12, 1974, Apsaalooke Nation Council and District Records, Crow Tribal Government Building, Crow Agency, MT.

24. For the amended agreement's terms, see Crow Delegation to Crow Tribal Council, November 3, 1974, Joseph Medicine Crow Collection, 24:12, LBC Archives; Charles Brinley to Partners, November 4, 1974, Westmoreland Coal Company Records, Acc. #1765, "Legal Correspondence, 1974–76," box 836, Hagley Museum; and Patrick Stands Over Bull, "Resolution No. 75–17: A Resolution Approving a Final Agreement between the Crow Tribe of Indians and Westmoreland Resources with Respect to Coal Leases on Tracts 2 and 3," November 23, 1974, Apsaalooke Nation Council and District Records, Crow Tribal Government Building, Crow Agency, MT. The actual tribal council vote was 343 for the amended Westmoreland deal versus 33 opposed.

25. Daniel Israel, "Report on the Shell Coal Lease," December 4, 1974, 2–3, 21–22, Eloise Whitebear Pease Collection, 17:13, LBC Archives (emphasis in original).

26. The tribal poll is at "Crow Tribal Coal Survey, 1975," *Hardin Herald,* April 6, 1975, 1.

27. For Shell's reliance on Crow coal, see Israel, "Report on the Shell Coal Lease," 23–24. Shell's letter to tribal members is at N. J. Isto to Joe Medicine Crow, June 30, 1975, Joseph Medicine Crow Collection, 24:12, LBC Archives; see also Richard H. Geissler, "Crows Criticize 'Fraudulent' Offer," *Billings Gazette,* July 9, 1975.

28. The Coal Office's mandates are at "Crow Tribal Coal Survey, 1975," 1. Examples of information sheets can be found at Office of Coal Research, "Information Sheet #1–75," February 17, 1975, Eloise Whitebear Pease Collection, 17:13, LBC Archives; Office of Coal Research, "Information Sheet #2–75," April 25, 1975, Eloise Whitebear Pease Collection, 16:49, LBC Archives; and Office of Coal Research, "Information Sheet #3–75," June 25, 1975, Eloise Whitebear Pease Collection, 16:1, LBC Archives.

29. Angela Russell to Joe Medicine Crow, August 22, 1975, Joseph Medicine Crow Collection, 24:12, LBC Archives. The participants' survey is at Office of Coal Research, "Black Mesa Site Visit," November 8, 1975, 6–10, Joseph Medicine Crow Collection, 24:12, LBC Archives.

30. Edmund Littlelight, Jr., to *Hardin Herald* Editor, December 17, 1975, Eloise Whitebear Pease Collection, 22c:3:1, LBC Archives.

31. Stands Over Bull's first quote comes from Patrick Stands Over Bull to N. J. Isto, July 3, 1975, Lee Metcalf Papers, General Correspondence, Collection No. 172, box 161, folder 161–5, Montana Historical Society, Digital Library and Archives, Helena, MT. The chairman's public statement is at Patrick Stands Over Bull, "Statement of Patrick Stands Over Bull, Chairman Crow Tribal Council," September 19, 1975, 3, Eloise Whitebear Pease Collection, 16:11, LBC Archives; see also Patrick Stands Over Bull, "Statement from the Crow Tribal Chairman, Patrick Stands," August 29, 1975, 1, Joseph Medicine Crow Collection, 24:12, LBC Archives; and Patrick Stands Over Bull, Tyrone Ten Bear, Jiggs Yellowtail, and Oliver Hugs to Crow Tribal Members, September 19, 1975, Joseph Medicine Crow Collection, 24:12, LBC Archives. For helpful reviews of the tribal ordinances enacted to control coal mining, as well as interpretations of their legality, see Kent Frizzell to Patrick Stands Over Bull, March 22, 1976, Eloise Whitebear Pease Collection, 16:11, LBC Archives; and Department of the Interior Solicitor, "Solicitor to Secretary," October 13, 1976, Joseph Medicine Crow Collection, 4:31, LBC Archives. Stands Over Bull's preconditions for further agreements are found in Patrick Stands Over Bull to Keith Doig, March 12, 1976, Eloise Whitebear Pease Collection, 16:11, LBC Archives; and Patrick Stands Over Bull to Amax Coal Company, March 19, 1976, Eloise Whitebear Pease Collection, 16:11, LBC Archives.

32. Formal protests lodged against the October 1975 Mineral Committee election show that tribal members disputed whether Stands Over Bull properly noticed the special election or instead simply forced through his preferred candidates. "Crow Tribal Response to Protest of the October Quarterly Council Meeting Filed by Robert Howe, Jr.," October 1975, Eloise Whitebear Pease Collection, 22d:1:2, LBC Archives.

33. In spring 1976, Stands Over Bull was negotiating with at least four different coal companies: Westmoreland, Shell, AMAX, and Gulf. See Keith Doig to Pat Stands Over Bull, February 12, 1976, Eloise Whitebear Pease Collection, 17:26, LBC Archives; Patrick Stands Over Bull to AMAX Coal Company, March 19, 1977; R. B. Crowl to Patrick Stands Over Bull, March 24, 1976, Eloise Whitebear Pease Collection, 16:11, LBC Archives; Patrick Stands Over Bull to Charles Brinley, March 25, 1976, Eloise Whitebear Pease Collection, 16:11, LBC Archives; Keith Doig to Patrick Stands Over Bull, March 29, 1976, Eloise Whitebear Pease Collection, 16:11, LBC Archives; Charles Brinley to Patrick Stands Over Bull, March 30, 1976, Eloise Whitebear Pease Collection, 16:11, LBC Archives; and R. J. Gocken to Patrick Stands Over Bull, March 30, 1976, Eloise Whitebear Pease Collection, 16:11, LBC Archives. For tribal members complaining at the spring council meeting about these on-reservation mining negotiations, see "Public Hearing at Crow Tribal Building," March 16, 1976, Eloise Whitebear Pease Collection, 16:11, LBC Archives. As for attacks on Stands Over Bull's coal policy and allegations of public drunkenness, see John Pretty On Top, "So the People May Know!," May 1976, Joseph Medicine Crow Collection, 4:16, LBC Archives. The four candidates opposed to reservation mining were Sargie Howe, Andy Russell, John Pretty On Top, and Jiggs Yellowtail, the last being Stands Over Bull's vice chairman. Joseph Medicine

Crow, "May 8, 1976 Tribal Election Results [handwritten]," May 8, 1976, Joseph Medicine Crow Collection, 4:16, LBC Archives.

34. For a complete history of the fight over the Bighorn River dam, see Megan Benson, "The Fight for Crow Water: Part 1, The Early Reservation Years through the New Deal," *Montana: The Magazine of Western History* 57, no. 4 (Winter 2007): 24–42; and Megan Benson, "The Fight for Crow Water: Part 2, Damming the Bighorn," *Montana: The Magazine of Western History* 58, no. 1 (Spring 2008): 3–23. Ultimately, neither side could claim victory; the tribe decided to sell the land for a dam but never received the full agreed-upon payment. Meanwhile, Northsider leader Robert Yellowtail suffered the indignity of having the dam he opposed named after him. As for pre-reservation Crow divisions, see Hoxie, *Parading through History,* chapter 2. The third major group was a subgroup of the Mountain Crow, known as the Kicked In the Bellies. For the division between and characteristics of the River Crow/Southsiders versus Mountain Crow/Northsiders, see Timothy P. McCleary, "An Ethnohistory of Pentecostalism among the Crow Indians of Montana," *Wicazo Sa Review* 15, no. 1 (Spring 2000): 123; and Mardell H. Plainfeather, "Factionalism among Contemporary Crow Indians," n.d., unpub. manuscript, Little Bighorn College Library, Lame Deer, MT.

35. For Sonny Yellowtail's vote against his father, see Constance J. Poten, "Robert Yellowtail, the New Warrior," *Montana: The Magazine of Western History* 39, no. 3 (July 1, 1989): 40.

36. Frederick Hoxie also argues that generational differences greatly influenced Crow positions on reservation allotment during the early twentieth century. According to Hoxie, older, "long hairs" generally opposed the breakup of communal land, while younger, "short hairs" were more comfortable with individual plots and believed allotment to be the only way to preserve Indian land. Hoxie, *Parading through History,* 260–63. Kindness's quote is found in National Congress of American Indians, *Proceedings from the National Congress of American Indians, Indian Energy Conference, Billings, Montana, August 28–29, 1974,* August 28, 1974, folder "Natural Resources," box 147, no. 4 (reel 71), 30, Native America: A Primary Record, series 2: Assn. on American Indian Affairs Archives, General and Tribal Files, 1851–1983.

37. Kindness's quote is at National Congress of American Indians, *Proceedings from the National Congress of American Indians, Indian Energy Conference,* 29.

38. For details on this protest and quotes of the participants, see Bryce Nelson, "Custer Relative Has No Role in Helping Mark 100th Anniversary of 'Last Stand,'" *Los Angeles Times,* June 26, 1976; Bryce Nelson, "Indians Stalk Custer Ghost: After 100 Years Wounds of Bighorn Still Festering," *Los Angeles Times,* June 25, 1976; and *Akwesasne Notes,* August 1976, 21. For a discussion of the changing and various meanings attached to the Battle of the Little Bighorn site, see Edward Tabor Linenthal, "Ritual Drama at the Little Big Horn: The Persistence and Transformation of a National Symbol," *Journal of the American Academy of Religion* 51, no. 2 (June 1, 1983): 267–81.

39. Lipton's recommendation to establish a Crow operating company is at Charles Lipton to Patrick Stands Over Bull, October 1, 1976, Eloise Whitebear Pease Collection, 16:8, LBC Archives. The Coal Authority's enacting resolution is

at Patrick Stands Over Bull, "Resolution 77–08: A Resolution Setting Forth Terms for Discussions with Off Reservation Energy Companies: Establishing a Crow Coal Authority, Setting Qualifications and Duties for Said Authority: Protecting the Crow Reservation: And Providing for a Per Capita Distribution," October 9, 1976, Apsaalooke Nation Council and District Records, Crow Tribal Government Building.

40. Eloise Pease to Stephen Lozar, October 19, 1976, 3, Eloise Whitebear Pease Collection, 22c:4, LBC Archives; see also Patrick Stands Over Bull to Stephen Lozar, November 12, 1976, Eloise Whitebear Pease Collection, 16:38, LBC Archives. As to the competing bodies negotiating with different mining firms, see Stephen Lozar to Eloise Pease, October 29, 1976, Eloise Whitebear Pease Collection, 22c:4:4, LBC Archives; Thomas Lynaugh to Bud Lozar, November 8, 1976, Eloise Whitebear Pease Collection, 16:19, LBC Archives; and Thomas J. Lynaugh to Crow Tribal Officers, Members of Executive and Minerals Committees, December 13, 1976, Eloise Whitebear Pease Collection, 16:44, LBC Archives. Varying accounts of the violent December 22 meeting are found in Phillip White Clay, "Crow Tribal Special Council Meeting Minutes," December 22, 1976, Eloise Whitebear Pease Collection, 16:43, LBC Archives; Eloise Pease, "Statement of Eloise Pease, Parliamentarian at the Council of December 22, 1976," Eloise Whitebear Pease Collection, 14:15, LBC Archives; and Urban Bear Don't Walk to Ben Reifel, January 24, 1977, 8, Eloise Whitebear Pease Collection, 14:15, LBC Archives. This special council meeting was called after Stands Over Bull's supporters gathered a petition to create yet another minerals committee to conclude negotiations with Shell. At the December 13 executive council meeting that considered the petition, however, anti-coal opponents countered with their own petition to suspend Stands Over Bull. "Executive Committee Meeting Minutes," December 13, 1976, Eloise Whitebear Pease Collection, 14:15, LBC Archives. As to Stands Over Bull's actions to adjourn and leave the meeting, see Patrick Stands Over Bull to Stephen Lozar, December 27, 1976, Eloise Whitebear Pease Collection, 22c:4:4, LBC Archives.

41. The BIA order invalidating Stands Over Bull's suspension is at *Patrick Stands Over Bull and Urban J. Bear Don't Walk v. Billings Area Director, BIA,* 6 IBIA 98 (June 6, 1977), 110. In a clear nod to tribal sovereignty, the Board of Indian Appeals held that the question of Stands Over Bull's suspension was a parliamentary issue that only the tribe could resolve. Because the tribal council never affirmed this action and, in fact, voted down a subsequent suspension resolution on January 8, 1977, the appeals board found the suspension ineffective. The January and April meetings' minutes are at Phillip White Clay, "Quarterly Crow Tribal Council Meeting Minutes," January 8, 1977, Eloise Whitebear Pease Collection, 2c:4:4, LBC Archives; and Phillip White Clay, "Crow Tribal Council Minutes, April 9, 1977," April 9, 1977, Eloise Whitebear Pease Collection, 2c:4:1, LBC Archives. Pease's quote comes from the January meeting, at 2.

42. *Patrick Stands Over Bull and Urban J. Bear Don't Walk v. Billings Area Director, BIA,* 6 IBIA 98 (June 6, 1977), 109.

43. Philip Whiteclay, "Crow Tribal Council Meeting Minutes," July 9, 1977, 2–4, 8, 9, 11, 12, and 17, Eloise Whitebear Pease Collection, 2c:4:2, LBC Archives. The opposition argued the popular practice of walking "through the line" to support

a resolution pressured individuals to follow clan lines rather than vote their conscious, which was at odds with their conception of sovereignty emanating from the free will of the people.

CHAPTER 6. TAKING THE FIGHT NATIONAL

1. Department of the Interior News Release (October 3, 1972) (found in *Kleppe v. Sierra Club,* 427 U.S. 390 [1976], Appendix, 132 and 134). For a concise description of the overall project, see *Kleppe,* 427 U.S. at 396–97.

2. Morton's quote is located in Department of the Interior News Release (October 3, 1972) (found in *Kleppe,* 427 U.S. at Appendix, 133). Nixon's April energy address can be accessed at Richard Nixon, "Special Message to Congress on Energy Policy," April 18, 1973, The American Presidency Project, ed. Gerhard Peters and John T. Woolley, http://www.presidency.ucsb.edu/ws/?pid=3817. In his first energy message to Congress, on June 4, 1971, the president called for an increased supply of domestic, "clean" energy. In 1973, the president repeated this call for increased domestic production in dozens of addresses, though the emphasis on clean energy had conspicuously disappeared. The most significant of these 1973 messages were delivered on April 18, June 29, November 7, and November 25. These speeches and remarks are available online at The American Presidency Project, ed. Gerhard Peters and John T. Woolley, www.presidency.ucsb.edu.

3. Native American Rights Fund, "An Unfinished Drama: The Declaration of Indian Independence," *Announcements* 3, no. 2, part 1 (April–June 1975): 28; Native American Natural Resource Development Federation, "Native American Natural Resources Management Program: A Proposal to Provide Management-Development Plans to the Member Tribes of the Native American Natural Resource Development Federation," April 1, 1975, 2–3, series 6: NCAI Committees and Special Issues, box 236, "Energy (General) 1975 [1 of 2]," National Congress of American Indians Collection, National Museum of American Indians Archive Center, Suitland, MD (hereafter NCAI Collection).

4. Native American Rights Fund, "Unfinished Drama," 28–31.

5. Ibid.; Native American Natural Resource Development Federation, "Native American Natural Resources Management Program," 2–5. For Burnette's involvement with the NCAI and his own tribal political career, see Thomas W. Cowger, *The National Congress of American Indians: The Founding Years* (Lincoln: University of Nebraska Press, 1999), 141–48. As for Burnette being the first to conceive of the Trail of Broken Treaties, see Robert Burnette and John Koster, *The Road to Wounded Knee* (New York: Bantam Books, 1974), 195–98; and Paul Chaat Smith and Robert Allen Warrior, *Like a Hurricane: The Indian Movement from Alcatraz to Wounded Knee* (New York: New Press, 1996), 139. For more on the Trail of Broken Treaties and its influence, or lack thereof, on the Northern Cheyenne's protest against energy development, see chapter 4, notes 21–22 and accompanying text.

6. Native American Rights Fund, "Unfinished Drama," 9–35; Native American Natural Resources Development Federation "A Declaration of Indian Rights to the Natural Resources in the Northern Great Plains," quoted ibid., 29.

7. Native American Natural Resource Development Federation, "Native American Natural Resources Management Program," 5.

8. George Crossland to Stuart Jamieson, February 13, 1974, series 6: NCAI Committees and Special Issues, box 238, "Surface Mining Legislation, etc. (Strip Mining) 1974," NCAI Collection; George Crossland to Chuck Trimble, March 25, 1974, 4 and 9, series 6: NCAI Committees and Special Issues, box 235, "Energy (General) 1974 [1 of 2]," NCAI Collection.

9. For the NCAI's founding and early tactics, see generally Cowger, *National Congress of American Indians*. For NCAI's moderate approach in the early 1960s, see ibid., 146–49; and Bradley Shreve, *Red Power Rising: The National Indian Youth Council and the Origins of Native Activism* (Norman: University of Oklahoma Press, 2011), 119 and 208. For a discussion of how the 1964 election of Vine Deloria, Jr., as NCAI's executive director reenergized and redirected the organization toward a more activist bent, see Charles F. Wilkinson, *Blood Struggle: The Rise of Modern Indian Nations* (New York: Island Press, 2005), 106–12. To be clear, even though the NCAI consistently disavowed direct action protests, it was instrumental in forging the Red Power Movement, most specifically by organizing the American Indian Chicago Conference that launched the National Indian Youth Council. Cowger, *National Congress of American Indians,* 133–41; and Shreve, *Red Power Rising,* 89–93. The NCAI's own description of its "industrial show" type approach is at National Congress of American Indians, "A Proposal to the Office of Native American Programs and the Economic Development Administration to Develop and Implement a National Indian Economic Development Program," April 15, 1974, 3, series 6: NCAI Committees and Special Issues, box 235, "Energy Resources Seminar—NCAI," NCAI Collection.

10. National Congress of American Indians, "Proposal to the Office of Native American Programs and the Economic Development Administration," 1–5. NCAI Executive Director Chuck Trimble repeated this explanation for his organization's change in reservation development strategy at the first Indian Energy Conference held in Billings, Montana, on August 28, 1974. National Congress of American Indians, *Proceedings from the National Congress of American Indians, Indian Energy Conference, Billings, Montana, August 28–29, 1974,* August 28, 1974, 7, folder "Natural Resources," box 147, no. 4 (reel 71), Native America: A Primary Record, series 2: Assn. on American Indian Affairs Archives, General and Tribal Files, 1851–1983.

11. Dan Israel and Tom Fredericks to Stu Jamieson, July 19, 1974, series 6: NCAI Committees and Special Issues, box 235, "Energy—Energy Seminar, Billings, Mont., August 28–29, 1974," NCAI Collection; and Dan Israel and Tom Fredericks to Stu Jamieson, July 24, 1974, series 6: NCAI Committees and Special Issues, box 235, "Energy—Energy Seminar, Billings, Mont., August 28–29, 1974," NCAI Collection. As to NARF's influence on the Indian Energy Conference's agenda, compare Dan Israel and Tom Fredericks to Stu Jamieson, July 24, 1974, with "NCAI Sponsors National Indian Energy Resources Conference," *Sentinel: National Congress of American Indians Bulletin* (July–August 1974).

12. National Congress of American Indians, *Proceedings from the National Congress of American Indians, Indian Energy Conference,* 6 and 29.

13. Ford Foundation, Energy Policy Project, *A Time to Choose: America's Energy Future* (Cambridge, MA: Ballinger, 1974), 325. Specifically, the report concluded that, among a host of possible alternatives, "a conservation oriented energy policy provides benefits in every major area of concern—avoiding shortages, protecting the environment, avoiding problems with other nations, and keeping real social costs as low as possible."

14. National Congress of American Indians, *Proceedings from the National Congress of American Indians, Indian Energy Conference,* 8.

15. Ibid., 10–11.

16. Ibid., 16.

17. Ibid., 128.

18. As for the creation of the Federal Energy Office, see Executive Order No. 11748 (December 4, 1973); and Richard Nixon, "Remarks Announcing Establishment of the Federal Energy Office," December 4, 1973, The American Presidency Project, ed. Gerhard Peters and John T. Woolley, http://www.presidency.ucsb.edu/ws/index.php?pid=4060. For the Federal Energy Administration's creation and its duties, see Federal Energy Administration Act of 1974, Public Law 93–275, 88 Stat. 96 (1974); and Executive Order No. 11790 (June 25, 1974), The American Presidency Project, ed. Gerhard Peters and John T. Woolley, http://www.presidency.ucsb.edu/ws/index.php?pid=59130. For background on these and other 1970s energy agencies, see Jack M Holl, *The United States Department of Energy: A History* (Washington, DC: Department of Energy, 1982). As Holl explains, the Energy Reorganization Act of 1974 redefined the roles of several energy agencies and created another entity, the Energy Research and Development Administration, to coordinate federal support of energy research and development. However, despite the seeming transfer of research and development responsibility to this new institution, the FEA continued to support nonfederal efforts to expand domestic production, particularly those taken by energy tribes.

19. Old Coyote's quote is at National Congress of American Indians, *Proceedings from the National Congress of American Indians, Indian Energy Conference,* 129.

20. Trimble's quote is found ibid., 131. Mahkijani's quote is found in National Congress of American Indians, *Proceedings from the 31st Annual Convention of National Congress of American Indians, Workshop Five: Tribal Natural Resources,* October 23, 1974, 9, folder "Natural Resources," box 147, no. 4 (reel 71), Native America: A Primary Record, series 2: Assn. on American Indian Affairs Archives, General and Tribal Files, 1851–1983. Crossland's comments are ibid., 4 and 19.

21. The meetings in Washington, DC, and the letter to President Ford is described in Bob Hanfling, "Final Edition of the Indian Position Paper for John Hill," May 8, 1975, 1, series 6: NCAI Committees and Special Issues, box 236, "Energy (General) 1975 [1 of 2]," NCAI Collection. The request to Zarb is described in Wilkinson, Cragun and Barker, "General Memorandum No. 75–36," April 30, 1975, 1, series 6: NCAI Committees and Special Issues, box 236, "Energy (General) 1975 [2 of 2]," NCAI Collection.

22. The Indian Caucus, "Position Paper of the Indian Caucus, The Federal Energy Administration Consumer Workshop," April 22, 1975, 2, series 6: NCAI Committees and Special Issues, box 238, "FEA [Federal Energy Administration] Energy Meeting 1975," NCAI Collection. The Washington, DC, meeting with Zarb is described in Hazel Rollins to [numerous recipients], June 1975, series 6: NCAI Committees and Special Issues, box 238, "FEA [Federal Energy Administration] Energy Meeting 1975," NCAI Collection; Wilkinson, Cragun and Barker, "General Memorandum No. 75–36"; and Hanfling, "Final Edition of the Indian Position Paper for John Hill," 2.

23. Hazel Rollins to [numerous recipients], June 1975; Wilkinson, Cragun and Barker, "General Memorandum No. 75–36"; "Indian Energy Task Force Forms," *Sentinel: National Congress of American Indians Bulletin* (July 1975); and Hanfling, "Final Edition of the Indian Position Paper for John Hill," 1–3.

24. The Council of Energy Resource Tribes to Frank G. Zarb, September 16, 1975, series 6: NCAI Committees and Special Issues, box 236, "Energy Meeting—Billings, Montana (Ramada Inn) 10/13–14, 1975 I," NCAI Collection; "Indian Energy Tribes Task Force Meeting," September 16, 1975, series 6: NCAI Committees and Special Issues, box 236, "Energy Meeting—Billings, Montana (Ramada Inn) 10/13–14, 1975 II," NCAI Collection; Wilkinson, Cragun and Barker, "General Memorandum No. 75–50," September 24, 1975, series 6: NCAI Committees and Special Issues, box 239, "Task Force on Indian Resource Development and FEA," NCAI Collection; and Marjane Ambler, *Breaking the Iron Bonds: Indian Control of Energy Development* (Lawrence: University Press of Kansas, 1990), 91–94. Lohah's quote is ibid., 91.

25. Compare Council of Energy Resource Tribes, "Organization Charter of Council of Energy Resource Tribes (CERT)," September 16, 1975, 1, series 6: NCAI Committees and Special Issues, box 236, "Energy Meeting—Billings, Montana (Ramada Inn) 10/13–14, 1975 I," NCAI Collection with the Council of Energy Resource Tribes to Frank G. Zarb, September 17, 1975, 1–2. For a brief description of the two separate documents, see also Wilkinson, Cragun and Barker, "General Memorandum No. 75–50." The FEA's influential role in organizing CERT is further evidenced by the fact that agency officials took responsibility for gathering final versions of these foundational documents and circulating them to the energy tribes for final approval. Hazel Rollins to Participants of the September 16 Indian Energy Tribes Task Force Meeting, September 24, 1975, series 6: NCAI Committees and Special Issues, box 236, "Energy Meeting—Billings, Montana (Ramada Inn) 10/13–14, 1975 I," NCAI Collection.

26. Allen Rowland to Charles E. Trimble, September 23, 1975, series 6: NCAI Committees and Special Issues, box 236, "Energy Meeting—Billings, Montana (Ramada Inn) 10/13–14, 1975 I," NCAI Collection.

27. "National Congress of American Indians, Energy Meeting, Billings, Montana, October 13–14, 1975," October 13, 1975, 19, 33, 35, 37, series 6: NCAI Committees and Special Issues, box 236, "Energy Meeting—Billings, Montana (Ramada Inn) 10/13–14, 1975 II," NCAI Collection. Frederick's line-by-line analysis is found ibid., 29–41. This conversation continues in part 2 of the proceedings,

and a marked-up copy indicating the changes is attached as a "supplement." All documents are found in the same location in the archives.

28. Ambler, *Breaking the Iron Bonds,* 95–96. CERT initially requested $1 million in federal funds for its resource inventory but received only $200,000. As we will see, the reluctance of the federal government to fully fund CERT's endeavors pushed the organization to look elsewhere—including to OPEC—for additional support.

29. For Carter's emphasis on energy policy during his first ninety days in office, see Daniel Yergin, *The Prize: The Epic Quest for Oil, Money, and Power* (New York: Simon and Schuster, 1991), 661–64. For MacDonald's frustration with the lack of federal support and the conflict between FEA and BIA, see Ambler, *Breaking the Iron Bonds,* 95; Bill Strabala, ""Indian Tribes Seek to Form OPEC-Style Energy Cartel" *Denver Post,* July 10, 1977; "U.S. Indians Ask OPEC, Third World Nations to Help in Developing Resources," *Washington Post,* July 10, 1977; and William Greider, "Indians Organize Own Energy Combine: Patterned after OPEC," *Washington Post,* July 17, 1977. According to Ambler, the BIA argued it was already conducting an inventory of Indian resources and that such an action was not within the FEA's mandate. Ultimately, the FEA would provide $250,000 for this initial resource inventory, and the BIA reluctantly offered an additional $200,000 for establishing an "energy information clearinghouse." MacDonald's quotes are at Strabala, "Indian 'OPEC' Formed; Navajo Leader Tells Why," *Denver Post,* July 10, 1977.

30. The full text of Carter's April 1977 address can be found at Jimmy Carter, "Address to the Nation on Energy," April 18, 1977, The American Presidency Project, ed. Gerhard Peters and John T. Woolley, http://www.presidency.ucsb.edu/ws/?pid=7369. The CERT statement is at Council of Energy Resource Tribes, "Statement of the Council of Energy Resource Tribes (CERT)," April 8, 1977, series 6: NCAI Committees and Special Issues, box 239, "Energy Meeting—White House, 4/8/77 and Related Energy Material," NCAI Collection.

31. Numerous reputable newspapers reported on the CERT-OPEC meetings, though it is unclear whether MacDonald was their only source. Bill Strabala, "Indian Tribes Seek to Form OPEC-Style Energy Cartel" *Denver Post,* July 10, 1977; "U.S. Indians Asks OPEC, Third World Nations to Help in Developing Resources," *Washington Post,* July 10, 1977; William Greider, "Indians Organize Own Energy Combine: Patterned after OPEC," *Washington Post,* July 17, 1977; and William Endicott, "Indians Seek Help from OPEC: Ask for Advice on Development of Energy Resources," *Los Angeles Times,* October 16, 1977. Winona LaDuke later questioned whether these meetings ever took place or whether rumors of the meetings were spread by MacDonald as part of his grand strategy to gain federal support. Winona LaDuke, "The Council of Energy Resource Tribes," in Joseph Jorgensen, *Native Americans and Energy Development II* (Boston: Anthropology Resource Center and Seventh Generation Fund, 1984), 59. MacDonald's quote on "federal red tape and foot dragging" comes from Endicott, "Indians Seek Help from OPEC." MacDonald's insistence on seeking long-range technical help comes from "U.S. Indians Asks OPEC," *Washington Post,* July 10, 1977, wherein MacDonald also noted: "We've found how (energy) companies have dealt with [OPEC nations]

in the past—bad leases and one-sided operations. We wanted to see if they could give us some technical assistance we can't get from the United States government." For MacDonald's use of anticolonial rhetoric to bolster his support on the Navajo Reservation, see Todd Andrew Needham, "Power Lines: Urban Space, Energy Development and the Making of the Modern Southwest" (PhD diss., University of Michigan, 2006), 326–30; see also chapter 2, notes 40–41 and accompanying text. MacDonald's quote to the *Navajo Times* is at Jim Benally, "Navajos, Arab-Style, to Cash in on Resources," *Navajo Times,* March 13, 1974 (quoted in Needham, "Power Lines," 335).

32. For the public backlash against CERT generally, see Ambler, *Breaking the Iron Bonds,* 96–99. For the various causes and impacts of this Second Energy Crisis, see Yergin, *Prize,* 674–98.

33. For CERT's 1978 financial requests to the federal government, see Gaylord Shaw, "Tribes Put Off on Bid for Resource Aid: Indians May Go Back to OPEC," *Los Angeles Times,* February 15, 1978; see also "Tribes Seek Fuel-Catalog Grant," *Arizona Republic,* November 20, 1978. As to CERT's 1979 requests, reports differ whether the organization sought $700 million over ten years or $60 million per year. Compare Council of Energy Resource Tribes, "$24 Million," *CERT Report* 2, no. 5 (March 17, 1980): 3, with Mark Potts, "Tribes Mining Independence: Energy Resource Bring Change," *Chicago Tribune,* February 3, 1980. The *Denver Post* editorial is at "Indians in OPEC?" *Denver Post,* August 13, 1979.

34. Carter's full address is at Jimmy Carter, "Address to the Nation on Energy and National Goals: 'The Malaise Speech,'" July 15, 1979, The American Presidency Project, ed. Gerhard Peters and John T. Woolley, http://www.presidency.ucsb.edu/ws/?pid=32596. Peter MacDonald's correspondence is at Peter MacDonald to President Carter, July 20, 1979 (quoted in Ambler, *Breaking the Iron Bonds,* 100).

35. Ambler, *Breaking the Iron Bonds,* 100–101; and Council of Energy Resource Tribes, "$24 Million," *CERT Report* 2, no. 5 (March 17, 1980): 3. CERT and others quickly pointed out that not all the $24 million represented new federal commitments and that much of this money was simply redirected from other Indian programs. Still, earmarking these funds specifically for Indian energy development represented a major coup for the energy tribes.

36. Ambler's quote is at Ambler, *Breaking the Iron Bonds,* 102. LaDuke's description of disgruntled Navajo tribal members is in Winona LaDuke, "The Council of Energy Resource Tribes," in Jorgensen, *Native Americans and Energy Development II,* 60. Gabriel's quote is at Ambler, *Breaking the Iron Bonds,* 101.

37. CERT's statement that federal funds would flow directly to tribes is at Council of Energy Resource Tribes, "$24 Million." For CERT's shifting tactics to focus on technical assistance, including moving staff to the Denver office, and their success in obtaining funds, see Marjane Ambler, "Uncertainty in CERT," in Jorgensen, *Native Americans and Energy Development II,* 71–74. Stone's quote also comes from ibid., at 74.

38. Even though CERT helped obtain the funding and feasibility studies for several Indian energy projects, many, like the Crow's synthetic fuel facility, were never constructed. Council of Energy Resource Tribes, "Synfuels Awards," *CERT Report* 2, no. 13 (July 18, 1980): 4–5; Dan Jackson and Charlene McGrady, "Mine

Development on U.S. Indian Lands," *Engineering and Mining Journal* (January 1980); and Ambler, "Uncertainty in CERT," in Jorgensen, *Native Americans and Energy Development II,* 75–76.

39. Winona LaDuke, "The Council of Energy Resource Tribes," in Jorgensen, *Native Americans and Energy Development II,* 62–63.

40. Gabriel's comments and Baker's quote are in Ambler, "Uncertainty in CERT," in Jorgensen, *Native Americans and Energy Development II,* 73, and 76–77.

CHAPTER 7. RECOGNIZING TRIBAL SOVEREIGNTY

1. For putting the federal grant money to work, see Daniel Israel, "New Opportunities for Energy Development on Indian Reservations," *Mining Engineering* (June 1980): 652. The 1980 proposed regulations are found at Indian Mineral Development Regulations, 45 Fed. Reg. 53164 (proposed August 11, 1980) (to be 25 C.F.R. § 171.4 and § 182.9), 53166 and 53175. To be clear, these proposed regulations did not include a section on coal mining on Indian lands, as the DOI determined to separate out this mineral for regulation under a separate provision. The agency, however, did not issue proposed new regulations for coal until after the passage of the 1982 Indian Mineral Development Act, when the entire regulatory structure was amended to comply with new tribal powers afforded by that act. Council of Energy Resource Tribes, "BIA Indian Minerals Rules," *CERT Report* 2, no. 14 (August 29, 1980): 1–2; and Mining Regulations, 48 Fed. Reg. 31978 (proposed July 12, 1983) (to be codified at 25 C.F.R. § 211).

2. Council of Energy Resource Tribes, "CERT Board Meeting," *CERT Report* 2, no. 17 (September 12, 1980): 1 and 3–4.

3. Wilfred Scott's quote comes from ibid., at 1. As for Interior's position on the Northern Cheyenne/ARCO agreement, see Council of Energy Resource Tribes, "ARCO–N. Cheyenne," *CERT Report* 2, no. 18 (September 26, 1980): 2–3.

4. For Martz's qualifications and standing as a leader in natural resource law, see Senate Committee on Energy and Natural Resources, *Clyde O. Martz Nomination,* 96th Cong., 2d sess., May 12, 1980; University of Colorado–Boulder Law School, "Clyde Martz Passes," http://lawweb.colorado.edu/news/showArticle.jsp?id=606 (accessed July 7, 2014); and "Clyde Martz Was Natural-Resources Expert, Who Served Two Presidents," *Denver Post,* June 7, 2010. Martz's statement on the legality of alternative contracts is at Council of Energy Resource Tribes, "Alternative Minerals Contracts Disputed," *CERT Report* 2, no. 18 (September 26, 1980): 1–2.

5. MacDonald's statement is at Council of Energy Resource Tribes, "Alternative Minerals Contracts Disputed," at 2.

6. The 1926 Northern Cheyenne Allotment Act reserved to the tribe all "timber, coal or other minerals, including oil, gas, and other natural deposits" found on the reservation, but provided that after fifty years, these resources "shall become the property of the respective allottees or their heirs." Northern Cheyenne Allotment Act of June 3, 1926, 44 Stat. 690, 691 (1926). As to the 1968 law, see Public Law 90–424, 82 Stat. 424 (1968); Senate Committee on Interior and Insular Affairs, *Granting Minerals, Including Oil, Gas and Other Natural Deposits, on Certain*

Lands in the Northern Cheyenne Indian Reservation, Mont., to Certain Indians, 90th Cong., 2d sess., 1968, S. Rep. 1145,esp. 4–5. For the Supreme Court decision, see *Northern Cheyenne Tribe v. Hollowbreast,* 425 U.S. 649 (1976), esp. 655–56.

7. Compare Alvin M. Josephy, Jr., "Agony of the Northern Plains," *Audubon* 75, no. 4 (July 1973): 87, with Alvin M. Josephy, Jr., "The Murder of the Southwest," *Audubon,* July 1971, 55.

8. The 1970 Clean Air Act's initial implementing regulations are at 40 C.F.R. § 52.21(c)(3)(i), 39 Fed. Reg. 42509 (December 5, 1974). For an explanation of these regulations' impact to tribal governments, see Wilkinson, Cragun and Barker, "General Memorandum No. 74–59," December 27, 1974, series 6: NCAI Committees and Special Issues, box 235, "Energy (General) 1974 [1 of 2]," National Congress of American Indians Collection, National Museum of American Indians Archive Center, Suitland, MD (hereafter NCAI Collection). For Montana's approval of the Colstrip expansion, see Grace Lichtenstein, "Montana Ruling Won by Utilities: 2 Plants Using Strip-Mine Coal Are Approved," *New York Times,* November 22, 1975; and *New York Times,* "Montana Allows 2 Power Plants," June 26, 1976. Allen Rowland's announcement that the Northern Cheyenne intended to reclassify the reservation to Class I standards is at Allen Rowland to Department of Intergovernmental Relations, July 2, 1976, Montana Air Quality Bureau Records, Subject Files, record series 38, box 4, Tribal Assistance Northern Cheyenne Reservation: Prevention of Significant Deterioration (PSD) redesignation (1976–1981), Montana Historical Society, Digital Library and Archives.

9. As to the Northern Cheyenne being the first land manager to request an upgrade in air shed status, see Marjane Ambler, "Northern Cheyenne Ask for Class 1 Air," *High Country News,* August 1976. For the Northern Cheyenne's title of "Environmentalist of the Year," see Elliot Rockler, "Environmentalists of the Year," *Borrowed Times,* January 1977. Transcripts of tribal members testifying in opposition to Colstrip's expansion can be found in the Montana Energy Division Records, 1972–1990, record series 328, box 18, vol. 38, Montana Historical Society, Digital Library and Archives; see also David Robinson, "Northern Cheyenne Landowners Association Statement to the Montana Department of Natural Resources and Conservation Concerning the Proposed Generating Plants, Colstrip 3 and 4," December 14, 1974, 2, Montana Energy Division Records, 1972–1990, record series 328, box 15, Public Hearing File: Colstrip 3 and 4 Proposal—Ashland, Montana Historical Society, Digital Library and Archives. The tribe's official comments are at Tom Scheuneman, "Statement of the Northern Cheyenne Tribe before the State of Montana Department of Natural Resources and Conservation," December 30, 1974, Montana Energy Division Records, 1972–1990, record series 328, box 15, DNRC Public Hearings on Colstrip 3 and 4, Montana Historical Society, Digital Library and Archives (quotes at 3 and 4, emphasis in original). Rowland's quote is found in Northern Cheyenne Research Project and Richard Monteau, *The Northern Cheyenne Air Quality Redesignation Report and Request,* December 11, 1976, in author's possession (emphasis in original).

10. For EPA's denial of Colstrip's expansion permit, see Alan Merson to William H. Coldiron, September 30, 1977, Montana Energy Division Records, 1972–1990, record series 38, box 28, Colstrip Units 3 and 4—Federal Corresp.,

Environmental Protection Agency, Montana Historical Society, Digital Library and Archives; Bill Richards, "Indians Block Electric Plant in Montana," *Washington Post,* June 13, 1978; and "Cheyenne Indians Block Construction of 2 Power Plants," *New York Times,* June 13, 1978.

11. For the Northern Cheyenne's lawsuit and negotiations with Colstrip's owners, see Patrick Dawson, "Is Cheyenne Air for Sale?," *Billings Gazette,* October 1979. Gabriel's comment is at Ed Gabriel, "News and Views," *News and Views* 1, no. 4 (May 5, 1980), folder "Council of Energy Resource Tribes," box 85, no. 11 (reel 26), Native America: A Primary Record, series 2: Assn. on American Indian Affairs Archives, General and Tribal Files, 1851–1983. Dahle's first quote is in Council of Energy Resource Tribes, "Northern Cheyenne," *CERT Report* 2, no. 8 (April 28, 1980): 3. Dahle's second quote comes from Clara Caufield, "Northern Cheyenne Tribe Saw Victories on Energy," *Indianz.com,* April 9, 2014, at http://www.indianz.com/News/2014/013181.asp.

12. For the 1978 shift in the Cheyenne's approach to energy development, see James Boggs, "The Challenge of Reservation Resource Development: A Northern Cheyenne Instance," in Joseph Jorgensen, ed., *Native Americans and Energy Development II* (Boston: Anthropology Resource Center and Seventh Generation Fund, 1984), 221–23. Rowland's quote is in Steve Jessen, "Northern Cheyenne Tribe Fights Mines, Woos Drillers," *Billings Gazette,* September 21, 1980.

13. For the 1978 orientation program, see *Tsistsistas Press* (Lame Deer, MT), September 1978; "Official Agenda: Orientation for the New Tribal Council," September 13, 1978, series 7: U.E.T. (United Effort Trust), box 9, "UET Northern Cheyenne," NCAI Collection. For the background and objectives of the Northern Cheyenne Research Project, see Northern Cheyenne Research Project and Robert Bailey, *Northern Cheyenne Research Project: Life Support Systems, First Annual Report* (Lame Deer, MT: Northern Cheyenne Research Project, 1974), esp. 31–32; and Joe Lamson, *Northern Cheyenne Research Project: Second Annual Report* (Busby, MT: Northern Cheyenne Research Project, 1975), esp. 3–5.

14. Boggs, "Challenge of Reservation Resource Development," in Jorgensen, *Native Americans and Energy Development II,* 221–22.

15. Ibid., 221–23. Little Coyote's quote comes from Len Ackland, "Mineral Wealth Gives Indians a Bargaining Tool to Shape the Future," *Chicago Tribune,* February 22, 1981.

16. Boggs, "Challenge of Reservation Resource Development," in Jorgensen, *Native Americans and Energy Development II,* 223–27.

17. As to Northern Cheyenne advertising for development partners, the response received, and the request for BIA technical assistance, see Allen Rowland to James Badura, February 27, 1980, Select Committee on Indian Affairs, 97th Congress, Legislative Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC. For the Northern Cheyenne using its own expertise to evaluate these proposals, see Allen Rowland to Members of the Northern Cheyenne Tribe, December 5, 1980, Select Committee on Indian Affairs, 97th Congress, Legislative Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC. As to disputes whether the loss of the NCRP left the tribe with adequate expertise to evaluate proposals, see Boggs, "The

Challenge of Reservation Resource Development," in Jorgensen, *Native Americans and Energy Development II,* 227–29; Ackland, "Mineral Wealth Gives Indians a Bargaining Tool to Shape the Future"; and Len Ackland, "U.S. Lets Indians Make Their Own Deals," *Chicago Tribune,* March 4, 1981. The details of the ARCO deal can be found at Boggs, "Challenge of Reservation Resource Development," 206–8; and Council of Energy Resource Tribes, "ARCO—N. Cheyenne," *CERT Report* 2, no. 18 (September 26, 1980): 2–3. As to the duties of the tribal Oil and Gas Office to monitor ARCO's activities, see Allen Rowland to Bill Benjamin, November 25, 1980, Select Committee on Indian Affairs, 97th Congress, Legislative Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC.

18. As to the two referenda, see Senate Select Committee on Indian Affairs, *Hearings on S. 1894,* 97th Cong., 2d sess. (Washington DC: Government Printing Office, February 12, 1982), 86–89; and Council of Energy Resource Tribes, "ARCO—N. Cheyenne," 3. Rowland's and Little Coyote's statements are in Steve Jessen, "Northern Cheyenne Tribe Fights Mines, Woos Drillers," *Billings Gazette,* September 21, 1980. Interior's environmental assessment is summarized in Council of Energy Resource Tribes, "Northern Cheyenne," *CERT Report* 2, no. 19 (October 10, 1980): 5.

19. For a review of the various federally approved alternative contracts since 1975, see Senate Select Committee on Indian Affairs, *Hearings on S. 1894,* 1982, 72; see also Council of Energy Resource Tribes, "Energy Agreements Affected by Joint Venture Bill," *CERT Report* 4, no. 11 (September 13, 1982): 19–20. For details on the Navajo and Blackfeet deals, and the BIA quote, see "Indians Want a Bigger Share of Their Wealth," *Business Week,* May 3, 1976, 100. Black is quoted in Molly Ivins, "Indians' Tribal Chairmen's Group Demanding a Voice in Energy Policy," *New York Times,* August 4, 1979.

20. Senate Select Committee on Indian Affairs, *Hearings on S. 1894,* 70–77. At these spring 1982 hearings, Interior officials identified six negotiated agreements that had been approved under various legal theories. These involved energy projects on the Navajo, Jicarilla Apache, Blackfeet, Crow, and Wind River Reservations and included four oil and gas agreements, one coal contract, and one uranium project. Later that fall, however, CERT identified fifteen negotiated agreements between western tribes and energy companies, eight of which the Department of the Interior had approved, and seven that were being held up until Congress clarified tribal authority to negotiate energy contracts. As opposed to Interior's list of approved contracts, CERT noted that the Crow's 1980 negotiated coal agreement with Shell Oil was never formally approved. Council of Energy Resource Tribes, "Energy Agreements Affected by Joint Venture Bill."

21. Senate Select Committee on Indian Affairs, *Hearings on S. 1894,* 87 and 92; Council of Energy Resource Tribes, "ARCO—N. Cheyenne," 3; and Ackland, "U.S. Lets Indians Make Their Own Deals."

22. For Martz's view on the legality of the Northern Cheyenne-ARCO deal, see Ambler, *Breaking Iron Bonds,* 87. Ambler actually interviewed Martz shortly after his decision. Hiwalker's quote is at Senate Select Committee on Indian Affairs, *Hearings on S. 1894,* 87. As to the process that produced the legislative solution,

see Council of Energy Resource Tribes, "'Alternative Agreements' Bill Passes Both Houses, Awaits Final Actions," *CERT Report* 4, no. 11 (September 13, 1982): 17. Although both the Department of the Interior and Senator Melcher drafted their own versions of the proposed legislation, the two sides shared draft bills and worked cooperatively. See Tim Vollman to Ginny Boylan, May 5, 1981, Select Committee on Indian Affairs, 97th Congress, Legislative Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC; Senate Select Committee on Indian Affairs, *Hearings on S. 1894,* 87; and Ambler, *Breaking the Iron Bond,* 88.

23. For Reagan's views on Indian Policy, see George Pierre Castile, *Taking Charge: Native American Self-Determination and Federal Indian Policy, 1975–1993* (Tucson: University of Arizona Press, 2006), esp. 50–52. After pledging to support the Indian self-determination policy as a candidate, President Reagan did not issue a formal Indian policy statement until 1983. In that message Reagan confirmed his commitment to Indian self-determination, though he noted that "there has been more rhetoric than action." "To reverse this trend," the statement continued, the president would "remov[e] the obstacles to self-government by creating a more favorable environment for the development of healthy reservation economies." In other words, Reagan viewed free markets as the key to self-determination. Ronald Reagan, "Statement on Indian Policy," January 24, 1983, The American Presidency Project, ed. Gerhard Peters and John T. Woolley, http://www.presidency.ucsb.edu/ws/?pid=41665. For Reagan's cuts to federal Indian programs, see Council of Energy Resource Tribes, "Indian Programs Hit Hard in Proposed Budget Cuts," *CERT Report* 3, no. 5 (April 3, 1981): 1–3. These cuts extended beyond agencies typically charged with administering Indian programs, like the BIA and the Indian Health Service, and included deep cuts at the Department of Energy that would remove support for Indian energy projects. See Council of Energy Resource Tribes, "Planned Energy Department Cuts Hit Tribes Hard," *CERT Report* 3, no. 6 (April 24, 1981): 3–4.

24. The Energy Department's cuts and MacDonald's quote are covered in Council of Energy Resource Tribes, "Planned Energy Department Cuts Hit Tribes Hard," 3. For James Watt's recent work with the Mountain States Legal Foundation, see Council of Energy Resource Tribes, "Interior Secretary," *CERT Report* 2, no. 22 (December 19, 1980): 4–5; and Council of Energy Resource Tribes, "Watt Approved as Interior Secretary," *CERT Report* 3, no. 1 (January 23, 1981): 1–2. The case for which Watt filed the amicus brief involved the Jicarilla Apache tribe's authority to tax oil and gas companies operating on their reservation. In a landmark decision for tribal sovereignty, the Supreme Court held that tribal authority to tax "is an essential attribute of Indian sovereignty because it is a necessary instrument of self-government and territorial management." *Merrion v. Jicarilla Apache Indian Tribe,* 455 U.S. 130 (1982), 130.

25. For energy tribes' fight against Reagan's proposed cuts, see Council of Energy Resource Tribes, "Indian Programs Hit Hard in Proposed Budget Cuts"; Council of Energy Resource Tribes, "Planned Energy Department Cuts Hit Tribes Hard"; Council of Energy Resource Tribes, "House Panel Proposes to Restore Indian Budget," *CERT Report* 3, no. 6 (April 24, 1981): 1–2; and Council of Energy

Resource Tribes, "Tribal Leaders Angry over Budget Cuts," *CERT Report* 3, no. 7 (May 26, 1981): 1–2. For tribal reaction to Reagan's proposed reduction in federal Indian programs generally, see Castile, *Taking Charge,* 51–56. For the percentage of CERT's budget tied to federal support, see Ambler, *Breaking the Iron Bonds,* 106. Gabriel's letter is at Ed Gabriel, "Open Letter from Ed Gabriel," September 1981, series 5: Records of Indian Interest Organizations, box 149, "C.E.R.T.," NCAI Collection.

26. Peter MacDonald, "Statement, CERT 1981 Annual Meeting," October 26, 1981, 4 and 9, folder "Council of Energy Resource Tribes," box 85, no. 11 (reel 26), Native America: A Primary Record, series 2: Assn. on American Indian Affairs Archives, General and Tribal Files, 1851–1983. At this gathering, MacDonald also addressed the recent cuts in federal spending. A staunch Republican, Reagan supporter, and proponent of free market principles, the CERT chairman did not oppose the transition from federal to private support for Indian energy development, but he feared the drastic reduction in federal funding could so damage tribal communities as to shake Indians' faith in the private sector. Thus, MacDonald tacitly supported some budgetary "belt-tightening," but he argued for "a little bit of realism, a little bit of political pragmatism with the [free market] ideology that all of us were willing to try out." "I buy the ideology of the private sector and am prepared to back governmental efforts to apply that ideology," MacDonald explained, but "there comes a point when the disparity between reality and ideology is so great that people throw out the baby with the bath water." Ibid., at 4. For other speakers at the CERT annual conference and Halbouty's quote, see Council of Energy Resource Tribes, "It's Time the Private Sector Discovered Indian America, Speakers Tell Tribal Leaders at 1981 CERT Annual Meeting," October 26, 1981, folder "Council of Energy Resource Tribes," box 85, no. 11 (reel 26), Native America: A Primary Record, series 2: Assn. on American Indian Affairs Archives, General and Tribal Files, 1851–1983; and Lynn A. Robbins, "'Doing Business with Indian Tribes': The 1981 Annual Meeting of the Council of Energy Resource Tribes," in Jorgensen, *Native Americans and Energy Development II,* 52–57.

27. MacDonald, "Statement, CERT 1981 Annual Meeting," 1. For more on tribal leaders' improving knowledge of the energy industry and their desire to employ this expertise in private-tribal projects, see Jim Hendon, "Indian Tribes Hope for More Energy Flexibility," *Rocky Mountain News,* October 25, 1981.

28. For coverage of the concluding resolutions and MacDonald's statement, see Council of Energy Resource Tribes, "CERT Board of Directors Calls for an End to Economic Dependence for Indian Tribes," October 28, 1981, folder "Council of Energy Resource Tribes," box 85, no. 11 (reel 26), Native America: A Primary Record, series 2: Assn. on American Indian Affairs Archives, General and Tribal Files, 1851–1983. NARF's opinion regarding tribes' existing authority to enter into alternative contracts is at Richard B. Collins to Council of Energy Resource Tribes, October 13, 1981, Select Committee on Indian Affairs, 97th Congress, Legislative Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC. The resolution opposing Melcher's and Interior's bills is at Council of Energy Resource Tribes, "Resolution No. 81–10, Amendment of the 1938 Indian Mineral Leasing Act," October 28, 1981, Select Committee on Indian Affairs,

97th Congress, Legislative Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC.

29. In contrast to CERT's and Melcher's proposals, Interior proposed a convoluted process for approving alternative contracts. The agency's bill authorized tribes to negotiate deals, but before they could be approved, the federal government would have to determine whether an agreement conveyed an interest in land. If it did, under Interior's approach, the old 1938 Leasing Act would determine the deal's validity. If, however, Interior found the agreement was not a lease—meaning it did not convey a property interest—then the agency would follow the new law's procedures to determine whether to approve the negotiated contract. Compare Tim Vollman to Ginny Boylan (Interior's draft) with "Senator Melcher of Montana," *Congressional Record* (November 30, 1981): S14127–28 (Melcher's draft), and Richard B. Collins to Council of Energy Resource Tribes, October 13, 1981 (CERT/NARF's draft). The Department of Justice's endorsement is at Robert McConnell to David Stockman, October 20, 1981, 2, Select Committee on Indian Affairs, 97th Congress, Legislative Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC. For further details of Melcher's bill, see "Senator Melcher of Montana," *Congressional Record* (November 30, 1981): S14127–28; Council of Energy Resource Tribes, "Sen. Melcher Introduces 'Alternative Agreements' Bill for Tribal Minerals," *CERT Report* 3, no. 16 (December 21, 1981): 1–2; and Association on American Indian Affairs, Inc., "Memorandum No. 81–36, Proposed Tribal Mineral Rights Legislation," December 30, 1981, folder "Legislative and Administrative Memoranda, 1976–1982," box 293, no. 1–6 (reel 3), Native America: A Primary Record, series 3: Assn. on American Indian Affairs Archives, Publications, Programs and Organizational Files, 1851–1983.

30. Harrison's and Burton's quotes are at Senate Select Committee on Indian Affairs, *Hearings on S. 1894,* 34 and 10, respectively. For additional corporate support, see ibid., at 106, 111, and 162.

31. Ibid., 57. For additional opposition to Melcher's bill based on the fear that uneducated Indians would be taken advantage of, see ibid., 121–36; Paul Frye to Jennie Boylan, May 11, 1982, Select Committee on Indian Affairs, 97th Congress, Legislative Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC; and Paul Frye to Debby Brokenrope, May 25, 1982, Select Committee on Indian Affairs, 97th Congress, Legislative Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC. In addition to opposition based on this fear, other detractors of the bill included a minority faction of Northern Cheyenne opposed to all mineral development, an energy company seeking to ensure that federal courts, not tribal judges, retained jurisdiction over disputes arising from alternative contracts, and state officials seeking to clarify their ability to tax mineral proceeds generated by alternative agreements. Senate Select Committee on Indian Affairs, *Hearings on S. 1894,* 20–26 and 93–103; Terry O'Conner, "Testimony of Terry O'Conner, Director of Legal and Governmental Affairs, Rocky Mountain Division, Peabody Coal Company, on S. 1894," July 27, 1982, series 6: NCAI Committees and Special Issues, box 238, "Mineral Resources—S. 1894," NCAI Collection; Chris Farrand to John Melcher, August 27, 1982, Select Committee on Indian Affairs, 97th Congress, Legislative

Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC; and Ted Schwinden to John Melcher, June 15, 1982, Senate Select Committee on Indian Affairs, 97th Congress, 1st sess., Bill Files, box 17, Records of the United States Senate, RG 46, National Archives, Washington, DC. Further, the Northern Cheyenne tribal government opposed the retroactive authorization provision as written because they feared it could be interpreted to imply their ARCO agreement was invalid without congressional approval; or alternatively, the new law could preclude the Northern Cheyenne from later challenging certain provisions of its agreement. Senate Select Committee on Indian Affairs, *Hearings on S. 1894,* 17–19, 86–92; Allen Rowland to John Melcher, March 2, 1982, Senate Select Committee on Indian Affairs, 97th Congress, 1st sess., Bill Files, box 17, Records of the United States Senate, RG 46, National Archives, Washington, DC; and George Hiwalker, "Statement of George Hiwalker, Jr., Vice President, Northern Cheyenne Tribal Council," July 27, 1982, series 6: NCAI Committees and Special Issues, box 238, "Mineral Resources—S. 1894," NCAI Collection. For similar reasons, energy companies with previously executed alternative agreements also opposed the proposed retroactive authorization clause. See Mary Anne Sullivan to John Melcher, September 10, 1982, Select Committee on Indian Affairs, 97th Congress, Legislative Files, box 97–2, National Archives, Washington, DC; and Forest Gerard to William S. Cohen, October 20, 1982, Select Committee on Indian Affairs, 97th Congress, Legislative Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC. Ultimately, this provision was amended to establish a set of guidelines the Department of the Interior must use to evaluate past deals for approval, rather than simply providing blanket authorization for all existing alternative agreements. *Indian Mineral Development Act of 1982,* S. 1894, 97th Cong., 2d sess., *Congressional Record* (December 8, 1982): S14194–96; and *Permitting Tribal Agreements to Dispose of Mineral Resources,* S. 1894, 97th Cong., 2nd sess., *Congressional Record* (December 10, 1982): H9440–41.

32. Senate Select Committee on Indian Affairs, *Permitting Indian Tribes to Enter into Certain Agreements for the Disposition of Tribal Mineral Resources and for Other Purposes,* 97th Cong., 2d sess., 1982, S. Rep. 472, 7. Paradoxically, existing law arguably allowed "competent" allottees to negotiate their own mineral leases, even though this new bill would not authorize them to negotiate alternative agreements. Act of March 3, 1909, 35 Stat. 781 (1909), codified as amended at 25 U.S.C. § 396 (1980), implementing regulations at 25 C.F.R. § 172.1–172.33 (1980); see also Senate Select Committee on Indian Affairs, *Hearings on S. 1894,* 121–22 and 126–27.

33. Gabriel's testimony is at Senate Select Committee on Indian Affairs, *Hearings on S. 1894,* 84. The Department of the Interior's letters in support are at Ken Smith to William S. Cohen, March 15, 1982, 2–3, Select Committee on Indian Affairs, 97th Congress, Legislative Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC; and Roy H. Sampsel to Morris K. Udall, August 9, 1982, 2–3, Select Committee on Indian Affairs, 97th Congress, Legislative Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC.

34. The difference between the Senate and House versions of the bill related largely to the retroactive authorization of past alternative contracts and did not

affect the general thrust of the legislation to recognize tribal authority to negotiate alternative agreements. See Association on American Indian Affairs, Inc., "Memorandum No. 82–20, S. 1894 Status Report," July 30, 1982, folder "Legislative and Administrative Memoranda, 1976–1982," box 293, no. 1–6 (reel 3), Native America: A Primary Record, series 3: Assn. on American Indian Affairs Archives, Publications, Programs and Organizational Files, 1851–1983; Council of Energy Resource Tribes, "'Alternative Agreements' Bill Passes Both Houses, Awaits Final Actions"; and John Melcher to Morris Udall, September 23, 1982, Select Committee on Indian Affairs, 97th Congress, Legislative Files, box 97–2, Records of the United States Senate, RG 46, National Archives, Washington, DC. For Udall's and Bereuter's explanation of the need for an updated law, see *Indian Mineral Development Act of 1982,* S. 1894, 97th Cong., 2d sess., *Congressional Record* (August 17, 1982): H6044–46; and Council of Energy Resource Tribes, "'Alternative Agreements' Bill Passes Both Houses, Awaits Final Actions." Melcher's quote is at *Indian Mineral Development Act of 1982,* S. 1894, 97th Cong., 2d sess., *Congressional Record* (December 8, 1982): S14196. Bereuter's is at *Permitting Tribal Agreements to Dispose of Mineral Resources,* S. 1894, 97th Cong., 2d sess., *Congressional Record* (December 10, 1982): H9440. Also, the House Committee on Interior and Insular Affairs held abbreviated, and largely redundant, hearings in July 1982. No transcript of these hearings was published, but according to staff notes from the National Congress of American Indians, only representatives of the Department of the Interior, the Ute Mountain Utes, the Northern Cheyenne, and Peabody Coal testified. All supported the legislation. Naomi Iizuka, "Notes on House Interior and Insular Affairs Cmte Hearing on Tribal Indian Mineral Resources Agreements," July 27, 1982, series 6: NCAI Committees and Special Issues, Box 238, "Mineral Resources—S. 1894," NCAI Collection.

35. Melcher's quote is in "Sen. Melcher Explains New Indian Mineral Bill," *Williston Basin Report,* January 19, 1983. Reagan's quotes are at Reagan, "Statement on Indian Policy," January 24, 1983, The American Presidency Project, ed. Gerhard Peters and John T. Woolley, 2 and 3–4, at http://www.presidency.ucsb.edu.

EPILOGUE

1. Marjane Ambler, *Breaking the Iron Bonds: Indian Control of Energy Development* (Lawrence: University Press of Kansas, 1990), 107. CERT officials labeled the 1982 annual conference "Indian Energy Development in the New Economic and Legislative Environment" to reflect the major legislative changes working their way through Congress and the altered energy economics caused by a rising glut of global oil supplies. In addition to the impending passage of the 1982 Indian Mineral Development Act, Congress had established a new Minerals Management Service to better track tribal oil and gas production and to ensure tribes received their share of royalties. Ed Gabriel, "Open Letter from Ed Gabriel," October 1982, series 5: Records of Indian Interest Organizations, box 149, "Council of Energy Resource Tribes (CERT)," National Congress of American Indians Collection, National Museum of American Indians Archive Center, Suitland, MD.

2. Council of Energy Resource Tribes, "David Lester Becomes New Executive Director of the Council of Energy Resource Tribes," November 17, 1982, box 43, folder 10, LaDonna Harris Papers and Americans for Indian Opportunity Records, 1953–2010, University of New Mexico, Center for Southwest Research; Marjane Ambler, "New CERT Director Has Made Career Out of Indian Economic Development," *Denver Post,* December 16, 1982. Marjane Ambler argues Reagan's budget cuts greatly influenced CERT's decision to close its DC offices, forcing the organization to prioritize tribal technical assistance over federal lobbying. Ambler, *Breaking the Iron Bonds,* 109–11.

3. Daniel Yergin, *The Prize: The Epic Quest for Oil, Money, and Power* (New York: Simon and Schuster, 1991), 717–22.

4. The Shell decision is at R. M. Rice to Crow Coal Commission, 30 1985, Eloise Whitebear Pease Collection, 17:13, Little Bighorn College Archives, Crow Agency, MT (hereafter LBC Archives). Shell officials also noted that the "continuing uncertainty regarding the application of Montana's severance tax to Crow coal" was another factor inhibiting their ability to proceed. The Supreme Court later clarified that states have the right to impose additional state taxes on Indian resources so long as the tax is not so high as to unfairly damage the marketability of tribal minerals. *Cotton Petroleum v. New Mexico,* 490 U.S. 163 (1989). As to Westmoreland's release, see C. J. Presley to Forest Horn, March 16, 1981, Eloise Whitebear Pease Collection, 16:49, LBC Archives.

5. Ambler, *Breaking the Iron Bonds,* 241–43; see also Garrit Voggesser, "The Evolution of Federal Energy Policy for Tribal Lands and the Renewable Energy Future," in Sherry L. Smith and Brian Frehner, eds., *Indians and Energy: Exploitation and Opportunity in the American Southwest* (Santa Fe: SAR Press, 2010), 69. Voggesser reports the 1982 peak of tribal oil and gas revenues to be $198 million but then notes the drastic fall over the next four years.

6. As to the attempted removal of David Stewart (1972–74), see Pauline Small, "Crow Tribal Council Minutes, January 13, 1973," January 13, 1973, Eloise Whitebear Pease Collection, 22c:3:1, LBC Archives. In chapter 4, I cover in detail the impeachment of Patrick Stands Over Bull (1972–77). For Forrest Horn (1977–82), see "Article of Impeachment against Crow Tribal Chairman Forest Horn," April 1979, Eloise Whitebear Pease Collection, LBC Archives. For Donald Stewart (1982–86), the removal of his executive powers, and a helpful summary of previous impeachment proceedings see Roger Clawson, "Crow Council Deposes Chairman," *Billings Gazette,* April 16, 1985.

7. For energy firms' appeal to the Department of the Interior for clarity, see Joan Davenport to John Bookout, November 15, 1977, Eloise Whitebear Pease Collection, LBC Archives; Joan Davenport to Lowry Blackburn, November 15, 1977, Eloise Whitebear Pease Collection, LBC Archives; and James Joseph to Cale Crowley, November 15, 1977, Eloise Whitebear Pease Collection, LBC Archives. Interior's almost identical response to the energy firms is found at Joan M. Davenport, Department of the Interior acting secretary, to Lowry Blackburn, AMAX Coal Company president, November 15, 1977; Joan M. Davenport, Department of the Interior acting secretary, to John F. Bookout, Shell Oil Company president, November 15, 1977; and Joan M. Davenport, Department of the Interior acting

secretary, to Cale Crowley, attorney for Gulf Oil Corporation and Peabody Coal Company, November 15, 1977, Eloise Whitebear Pease Collection, LBC Archives. The Westmoreland Company continued its mining on the Ceded Strip but supported efforts to have the Department of Energy restructure the Crow's apparatus for dealing with energy companies. Charles Brinley to James Joseph, November 17, 1977, Eloise Whitebear Pease Collection, 7b, LBC Archives. In the Crow's petition to the Energy Department for assistance in amending its government, the tribal attorney actually derided the federal government's reluctance to get involved with internal tribal politics: "The doctrine and the policy of the Congress is to grant 'self-determination' to the Indian people, which quite frankly, is a policy of saying 'go paddle your own canoe.' The canoe won't float with so many holes in it." Harold G. Stanton, Crow attorney, to James Furse, Department of Energy, November 17, 1977, Eloise Whitebear Pease Collection, 7b, LBC Archives.

8. For the disbandment of the Coal Authority, see Forest Horn, "Resolution No. 80–16: A Resolution Pertaining to Coal Negotiations with Shell Oil Company and to Clarify Which Committee and Entity within the Tribe Has the Authority to Continue Negotiations with the Shell Oil Company," January 24, 1980, Apsaalooke Nation Council and District Records, Crow Tribal Government Building, Crow Agency, MT. For passage of the 2001 constitution and the new governing structure, see "Takeover Marks Crow 'New Beginning,'" *Billings Gazette,* January 11, 2001; and "New Crow Constitution Wins Federal Approval," *Helena Independent Record,* December 2, 2001.

9. For Westmoreland's expansion onto the reservation proper, see Shelley Beaumont, "Absaloka Mine South Extension Approved," *Big Horn County News,* October 23, 2008; and Susan Gallagher, Associated Press, "Proposal Would Move Mining onto Crow Reservation," *Helena Independent Record,* April 4, 2008. Old Coyote's quote and revenue figures from the Absaloka Mine are at Darrin Old Coyote, "Testimony of Crow Nation Tribal Chairman Darrin Old Coyote," 3, in House Committee on Natural Resources, Subcommittee on Energy and Mineral Resources, *Oversight Hearing on "Mining in America: Powder River Basin Coal Mining the Benefits and Challenges,"* 113th Cong., 1st sess., July 9, 2013, available at http://docs.house.gov/meetings/II/II06/20130709/101096/HHRG-113-II06-Wstate-OldCoyoteD-20130709.pdf.

10. The Crow Reservation economic figures come from the Harvard Project on American Indian Economic Development, "On Improving Tribal-Corporate Relations in the Mining Sector: A White Paper on Strategies for Both Sides of the Table," April 2014, 87, available at http://hpaied.org/images/resources/general/miningrelations.pdf. In 2013, the Crow granted Westmoreland another lease for an additional 145 million tons of coal adjacent to the company's existing mine in the Ceded Strip. Susan Olp, "Crow Tribe Leases 145 Million Tons of Coal," *Billings Gazette,* April 11, 2013. In 2008, the Crow announced a partnership with the Australian-American Energy Co. to build a coal-to-liquids plant on the reservation that would extract 38,000 tons of Crow coal per day. Fluctuating global oil prices, however, once again caused that project to be restructured to reduce its scale, and as of February 2013, it is unclear whether the tribe will pursue the liquefication project. Erica Gies, "Rich in Coal, a Tribe Struggles to Overcome Poverty," *New*

York Times, October 25, 2011. In January 2013, the Crow announced an agreement with Cloud Peak Energy that would authorize the Wyoming mining company to excavate 1.4 billion tons of coal from the reservation. This coal, which is more than the United States consumes in a year, is earmarked for export to Asian markets, pending approval and construction of coal export ports in the Pacific Northwest. Sue Olp, "Crow Tribe Signs 1.4B Ton Coal Deal with Cloud Peak Energy," *Billings Gazette,* January 24, 2013. Finally, in March 2013, the Crow reached another agreement with Signal Peak Energy to prospect 400 million more tons on the reservation. Associated Press, "Signal Peak Energy Eyes Coal on Crow Reservation," *Billings Gazette,* March 19, 2013.

11. For the uranium moratorium and closures of Black Mesa Mine and Mohave Generating Station, see Dana E. Powell and Dáilan J. Long, "Landscapes of Power: Renewable Energy Activism in Diné Bikéyah," in Sherry L. Smith and Brian Frehner, eds., *Indians and Energy: Exploitation and Opportunity in the American Southwest* (Santa Fe: SAR Press, 2010), 235; and Enei Begaye. "The Black Mesa Controversy," *Cultural Survival Quarterly* 29, no. 4 (Winter 2005). For the failed Desert Rock Energy Project and Navajo Transmission Project, see Powell and Long, "Landscapes of Power," 236–43; Laura Paskus, "The Life and Death of Desert Rock," *High Country News,* August 16, 2010; and Sierra Crane-Murdoch, "On Navajo Nation, Power Authority Slips Away," *High Country News,* April 7, 2011.

12. Winona LaDuke, "Monster Slayers: Can the Navajo Nation Kick the Coal Habit?," *Indian Country Today,* July 31, 2013; Noel Lyn Smith, "Navajo Nation Enters the Coal Mining Business," *Daily Times,* November 2, 2013; Emily Guerin, "Navajo Nation's Purchase of a New Mexico Coalmine Is a Mixed Bag," *High Country News,* January 7, 2014; and Rebecca Fairfax Clay, "Tribe at a Crossroads: The Navajo Nation Purchases a Coal Mine," *Environmental Health Perspectives* 122, no. 4 (April 2014): A104–A107.

13. For ARCO's abandonment of the project and the impact to the tribal economy, see Jim Bruggers, "Energy Slump, Isolation and Turmoil: The Plight of the Northern Cheyenne," *Great Falls Tribune,* November 16, 1986. Tribal President Llevando Fisher recently testified to Congress that Northern Cheyenne unemployment remains above 60 percent. Llevando Fisher, "Statement of Llevando 'Cowboy' Fisher, President, Northern Cheyenne Tribe," 6, in House Committee on Natural Resources, Subcommittee on Indian and Alaska Native Affairs, *Hearing on H.R. 4350: The Northern Cheyenne Lands Act,* 113th Cong., 2d sess., May 7, 2014, available at://naturalresources.house.gov/uploadedfiles/fishertestimony5-7-14.pdf. The 2010 census figures are provided on the tribal government-endorsed blog "A Cheyenne Voice," available at http://acheyennevoice.com/northern-cheyenne.

14. Fisher, "Statement of Llevando 'Cowboy' Fisher," at 5–6.

15. United States Surface Transportation Board, "Section 106 Consultation Meeting for the Tongue River Railroad Construction Project: Transcript of Proceedings," February 13, 2014, 74–75, available at http://www.tonguerivereis.com/documents/021314_section_106_transcript.pdf. In this meeting, Llevando Fisher discusses the tribe's 2006 referendum, in which tribal members were asked whether they would rather pursue traditional coal mining or coal bed methane

development. The tribe chose the former. See also David Melmer, "Northern Cheyenne to Vote on Resource Extraction," *Indian Country Today,* November 1, 2006, available at http://indiancountrytodaymedianetwork.com/2006/11/01/northern-cheyenne-vote-resource-extraction-128945. For additional coverage of the impending referendum, see Clara Caufield, "Northern Cheyenne Tribe to Vote on Coal Project," *Indianz.com,* February 24, 2014, available at http://www.indianz.com/News/2014/012639.asp; and Clara Caufield, "Northern Cheyenne Tribe Remains Split on Coal," *Indianz.com,* April 1, 2014, available at http://www.indianz.com/News/2014/013086.asp.

16. Passions over the new constitution ran so high that opponents forcibly, though temporarily, took over tribal offices to prevent its implementation. "Takeover Marks Crow 'New Beginning,'" *Billings Gazette,* January 11, 2001. To those opposed to reservation mining during the 1970s, the biggest concern with the new constitution was that it stifled public participation, preventing tribal members from raising concerns about energy projects negotiated by their leaders. In fact, members of the opposition group that orchestrated Patrick Stands Over Bull's 1977 impeachment claim that had the 2001 constitution been in place during the 1970s, the Crow "would be nonexistent now" because their faction would not have been able to "inform the people" of the dangers of development. John Doyle, Urban Bear Don't Walk, Larry Kindness, Dale Kindness, Dewitt Dillon, interview by the author, August 17, 2009, Crow Agency, MT, in author's possession.

The Corporation and the Tribe

JOANNE BARKER

A PROLOGUE

> The system ain't broke. It was built to be this way.
> Tom B. K. Goldtooth (Diné/Dakota)

This article examines how the foundational legal definitions of the "corporation" and the "tribe" between 1790 and 1887 worked together to establish and protect imperialist social relations and conditions in the United States between powerful financial interests, both government and corporate, and Indigenous peoples. While the analysis is focused historically, I want to frame it by the current political debates and organizing efforts against government and corporate collusion and fraud represented by Occupy Wall Street (OWS) and my engagement with Occupy Oakland. I hope this will help to better understand how the history of the territorial dispossession and collusive fraud enacted by the US government and corporate interests against Indigenous peoples clarifies the kinds of issues of government and corporate collusion and fraud that OWS has addressed. To be clear, the 1 percent did not show up in 2008. They have been around all along, targeting Indigenous peoples and their territories over which the US empire was built and continues to operate.

On September 17, 2011, OWS began in Zuccotti Park (Liberty Plaza) in Manhattan's financial district with the goal of "fighting back against the corrosive power of major banks and multinational corporations over the democratic process, and the role of Wall Street in creating an economic collapse that has caused the greatest recession in generations."[1] From

my particular viewpoint in Oakland, California, it seemed that OWS had swiftly coalesced the demands of a wide array of grassroots-based organizations and individuals for solidarity against and open debate about the more insidious legal protections of government and corporate collusion. For instance, discussions facilitated by OWS exposed the gross misrepresentations of congressional representatives and energy industry CEOs about job creation and public safety in Canada's Keystone XL Pipeline and its proposed extensions through the United States and then linked these lies to the ongoing struggles of Indigenous peoples for environmental justice.[2] When so many Occupy Oakland participants began showing up in solidarity at Indigenous actions in the Bay Area, such as the Chochenyo Ohlone's Annual Emeryville Shellmound Protest on Black Friday, I genuinely believed that the OWS movement had succeeded in opening a critical space for much-needed discussions about the structural, ideological, and social links between the foreclosure of many blacks, Asian Americans, and Latina/os from their homes and the US dispossession of Indigenous peoples from their territorial homelands. I was optimistic—unusually so for me—that these discussions would facilitate meaningful solidarity and transformation.

Many things happened that changed my mind and thinking so much that I began the research that informs this article. The first occurred on October 27, 2011, when a group of us failed to convince those present at an Occupy Oakland General Assembly to change the name of Occupy Oakland to Decolonize Oakland in recognition of the fact that Oakland is already on occupied lands. While the assembly did pass a rather nonthreatening statement of solidarity with Indigenous peoples, they accused us then and in the Bay Area press of trying to "guilt trip" them into some larger-than-life demand for Indigenous land reparations that went far beyond, they argued, the urgent issues of the foreclosure crisis and the militarized crackdown on OWS in Oakland that they cared about. They argued with us more sincerely, and ironically, that changing the name from Occupy to Decolonize would result in them losing "brand recognition" and so affiliation with the broader movement.[3]

We responded by organizing a series of teach-ins to more carefully work people through the historical, legal, and social connections between the foreclosures on black, Asian American, and Latina/o homes and the dispossession of Indigenous peoples in the Bay Area. Along with several other mostly Indigenous women, we hosted the teach-ins

just before the General Assembly from mid-December 2011 through early May 2012 at Oscar Grant Plaza and then at community centers within walking distance of the plaza. Initially the teach-ins gathered a diverse range of individuals. But almost immediately Indigenous peoples—particularly Ohlone—stopped attending. This seemed to be because of the hostile resistance we experienced against the historical links we argued existed between the foreclosure crisis and the dispossession of Ohlone people. The most severe expression of this hostility occurred when a man who identified himself to me as a "member of the black community" accused me of having a "hidden agenda" to move "Indians" into the "family homes of black people" that the banks had foreclosed on.

The intergenerational consequences of foreclosure and the pain and frustration of the rampant evictions of black families from their homes in Oakland were real and vicious. After several such exchanges, I came to believe that those involved in the Occupy movement had not done so well (including myself) at fulfilling the core pedagogical mandate of movements like it to provide the historical and social contexts needed for non-Indigenous communities to understand why Indigenous peoples might perceive the foreclosure crisis as merely (though importantly) the most recent representation of a long history of collusive and fraudulent land issues defining the US economy as an imperialist one.

This article results from my reflection on the pedagogical approaches and content needed within movements like OWS to build lasting solidarities across the very community divides—perceptual, structural, and other—on which the US imperial formation depends. These approaches must be characterized by compassion, generosity, reciprocity, and responsibility and must be historical, social, and legal. Working to reform a bad set of laws that protect Wall Street banking interests from taxation or bringing criminal charges against banking executives will not—on their own—adequately address the needs of our diverse communities. Corrections or amendments or enforcement, in other words, do not demand any real structural change. The kind of social transformations needed can only happen from a place of genuine understanding—compassionate, respectful, and informed—about *all* of the historical and social complexities of oppression and exploitation that inform the perceptions and experiences of our communities.

AN INTRODUCTION TO "CORPORATIONS" AND "INDIAN TRIBES"

How does the historical and ongoing dispossession of Indigenous peoples clarify the "corrosive power of major banks and multinational corporations over the democratic process" within the United States? How is "the role of Wall Street in creating an economic collapse that has caused the greatest recession in generations" more effectively understood in relation to ongoing Indigenous struggles against jurisdictional and territorial dispossession than within its more popular frame of reference to the Great Depression?

This article, divided into two main sections, considers these questions by examining how the core foundational definitions of the legal status and rights of "corporations" and "Indian tribes" worked in concert to establish and protect imperialist social relations and conditions between powerful financial interests, both government and corporate, and Indigenous peoples. The first part of the article examines the limitations of the status and rights of "Indians tribes" to trade—commercially and in lands and resources—by the US Congress through treaties between 1778 and 1871, the six Acts to Regulate Trade and Intercourse with the Indian Tribes between 1790 and 1834, and the pivotal decision of the Supreme Court of the United States (SCOTUS) in *Johnson's Lessee v. McIntosh* of 1823. I compare the consequences of these laws to the SCOTUS decisions regarding corporate rights in *Fletcher v. Peck* of 1810 and *Trustees of Dartmouth College v. Woodward* of 1819. Therein, SCOTUS ruled that the US Constitution provided that (1) states were restricted from invaliding contracts that carried out the sale and acquisition of tribally treatied lands, irrespective of any fraud or the possession of proper title on which those contracts were based; and (2) corporate charters qualified as contracts between private parties with which states could not interfere.

In the second part of the article, I examine how the legal status and rights of "Indian tribes" were all but decimated by the US Senate's unilateral suspension of treaty making in 1871 and the terms and administration of the General Allotment Act of 1887. I link the loss of treaty-making powers and territorial dissolution to the SCOTUS decision in *Santa Clara County v. Southern Pacific Railroad Company* of 1886. In that decision, SCOTUS ruled that corporations possessed Fourteenth

Amendment rights analogous to those of "persons," a stark contrast to the way concurrent law was stripping tribes of any and all legal protections to governance and lands.

Focused historically between 1790 and 1887, this article provides a legal analysis of core US statutes and court decisions in the definition and provision of corporate and tribal status and rights. While focused historically, it anticipates a readership that cares about how this history matters in thinking through the sociolegal importance of the questions raised by OWS and movements like it in relation to Indigenous strategies for political coalition and legal revolution. It assumes that the US dispossession of Indigenous peoples clarifies the "corrosive power of major banks and multinational corporations over the democratic process" as well as "the role of Wall Street in creating an economic collapse that has caused the greatest recession in generations" by bringing into sharp relief the collusive and fraudulent relations between the US Congress, courts, and corporations.[4] In doing so, it does not presume the current system's catastrophes—marked by the 2008 foreclosure crisis—are aberrations or abnormalities of US democracy. Rather, as Tom B. K. Goldtooth (Diné/Dakota), executive director of the Indigenous Environmental Network, said during a 2012 Toronto symposium entitled "The Occupy Talks: Indigenous Perspectives on the Occupy Movement," "The system ain't broke. It was built to be this way."[5]

PART 1: INDIAN TRIBES AND CORPORATE ARTIFICIALITY

The Trade in "Indian Tribes"

"Indian tribes" appear only once in the US Constitution. Article 1, section 8 enumerates the powers of the US Congress, including jurisdiction over taxation; the national debt and borrowing; naturalization law; bankruptcy and counterfeit law; coinage; post offices and roads; copyright protections; appointment of tribunals; prosecution of crimes on the high seas and offenses against foreign nations; the declaration of war and the commission of armies, naval forces, and militia; and the construction of public buildings. It provides that Congress will "make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this Constitution in the government of the United States, or in any department or officer

thereof." Clause 3 provides specifically that Congress has the power "to regulate commerce with foreign nations, and among the several states, and with the Indian tribes."

Congressional power to regulate commerce with Indian tribes was enacted in 371 ratified treaties between 1778 and 1871 and six separate statutes in 1790, 1793, 1796, 1799, 1802, and 1834 titled An Act to Regulate Trade and Intercourse with the Indian Tribes. In ratified treaties, Congress established the boundaries of tribal territories and secured tribal rights to governance within them, excepting jurisdiction over US citizens and slaves or Indians who committed crimes against them. The ratified treaties frequently provided for forms of economic self-sufficiency unique to the tribal signatory/ies, such as protecting hunting and fishing rights in "usual and accustomed places." They often provided for annuities, including payments and goods, in compensation for land cessions. They explicitly guaranteed that no US citizen would be permitted to illegally settle, hunt, or fish within tribal territories. They affirmed congressional authority in tribal trade and protected tribal rights to trade with US citizens.

The Act to Regulate Trade and Intercourse with the Indian Tribes of 1790 established a federally regulated licensing system for US citizens wanting to trade with tribes, strict punishments for crimes committed against tribes on tribal lands by US citizens, the prohibition of liquor sales on tribal lands, and restriction against tribal land sales to anyone but Congress by treaty: "That no sale of lands made by any Indians, or any nation or tribe of Indians the United States, shall be valid to any person or persons, or to any state, whether having the right of pre-emption to such lands or not, unless the same shall be made and duly executed at some public treaty, held under the authority of the United States."[6] In response to rampant treaty violations, the 1793 and 1796 acts provided stricter measures for federal oversight and licensing and for horse sales and an affirmation of treaty provisions respecting tribal boundaries. Anyone attempting to settle on tribal lands was to be expelled, fined up to $1,000, and imprisoned up to one year.[7] These measures were strengthened in 1799, 1802, and 1834.

Established by the Indian Trade and Intercourse Acts (as they were known), trading houses or posts operated under federal oversight from 1796 to 1822 "to supply the Indians with necessary goods at a fair price and offer a fair price for the furs in exchange" (at the time, furs were the most common trade item).[8] The superintendent of Indian trade, a

position established in 1806, and the agents at the posts were appointed through the Office of the President, and their accounts were managed by the secretary of the treasury.[9] The posts were closed in 1822 in large part because fur traders had so effectively circumvented the posts' oversight that they became obsolete.[10] In 1824 the secretary of war created the Bureau of Indian Affairs (BIA) in part to oversee trade with the tribes.[11] The BIA was transferred to the Department of the Interior in 1849.

Even while the US Congress recognized and protected the rights of Indian tribes to commerce and trade over/within their territories by ratified treaties and the Indian Trade and Intercourse Acts, it subjected the terms and exercise of those rights to its own plenary authority. This subjugation coalesced in the SCOTUS decision in *Johnson's Lessee v. McIntosh* of 1823.[12] On the surface, the case involved competing claims to the same eleven thousand acres of land in the state of Illinois. The lands fell within the unique territorial boundaries of the Piankeshaw Nation, whose particular borders had been affirmed by 1773 and 1775 treaties with the Crown. Even SCOTUS argued that the United States inherited the obligations of these treaties from the Crown by the Treaty of Paris in 1783.

The plaintiffs were the legal heirs of Thomas Johnson, who along with several other British citizens claimed to have lawfully purchased the acreage and neighboring areas from the Piankeshaw and Illinois Nations. The defendant was William McIntosh, who claimed to have acquired a deed to the land in 1818 from the US Department of the Interior. The question before the SCOTUS, as Chief Justice John Marshall framed it, was what kind of title the Piankeshaw Nation held in the lands. But before deciding, the Court had to address two facts: (1) the US Congress had acknowledged in its ratified treaties with Indian tribes—as had all European nations before it—that tribes possessed a land title that they could treat upon; and (2) the treaties themselves referred to Indian tribes as sovereign nations with all commensurate jurisdictional rights over and within their territories.

While not missing the import of treaty language, SCOTUS sided with McIntosh on the grounds that Indian tribes had never been recognized as equal "sovereign, independent states."

> The uniform understanding and practice of European nations, and the settled law, as laid down by the tribunals of civilized states, denied the right of the Indians to be considered as independent

> communities, having a permanent property in the soil, capable of alienation to private individuals. They remain in a state of nature, and have never been admitted into the general society of nations.

This understanding, SCOTUS maintained, was reflected in the treaties:

> All the treaties and negotiations between the civilized powers of Europe and of this continent . . . have uniformly disregarded their supposed right to the territory included within the jurisdictional limits of those powers. Not only has the practice of all civilized nations been in conformity with this doctrine, but the whole theory of their titles to lands in America, rests upon the hypothesis, that the Indians had no right of soil as sovereign, independent states.

Effectively, SCOTUS rewrote treaty history to find that treaties with Indigenous nations functioned internationally in a way contrary to the precepts of international law. Instead of recognizing Indigenous sovereignty, nationhood, and territorial rights, the Court argued that the treaties had, all along, "disregarded" Indigenous legal status and rights as sovereign nations. The Court argued that the evidence for this fact of disregard was discovery:

> Discovery is the foundation of title, in European nations, and this overlooks all proprietary rights in the natives. The sovereignty and eminent domain thus acquired, necessarily precludes the idea of any other sovereignty existing within the same limits. The subjects of the discovering nation must necessarily be bound by the declared sense of their own government, as to the extent of this sovereignty, and the domain acquired with it. Even if it should be admitted that the Indians were originally an independent people, they have ceased to be so. A nation that has passed under the dominion of another, is no longer a sovereign state. The same treaties and negotiations, before referred to, show their dependent condition.

The Court claimed that by virtue of their relationship to the land as Lockean hunter-gatherers, having *always already* passed into a Hegelian subservience to dominant sovereigns owing to their need for the master's protection, Indigenous peoples had been made "subject to the sovereignty of the United States." These were well-established facts, the Court contended, of colonial law, which had wisely understood Indige-

nous people "as an inferior race of people, without the privileges of citizens, and under the perpetual protection and pupilage of the government" on the basis that they were not in full possession of the lands over which they "wandered."

In lieu of full title or property in the lands, SCOTUS offered "aboriginal title" as the kind of title and so rights Indigenous people possessed in the lands. Essentially, aboriginal title was the right to use and occupy lands, "a mere right of usufruct and habitation." It was not a right of ownership—with the implied "power of alienation." Consequently, the title could be extinguished if found to be in lack. In other words, tribes not making adequate use or occupation of their lands forfeited all claims to the lands. The *Johnson* decision nullified the rights of Indigenous peoples to own and trade over/within their territories by subjecting the terms and conditions of all commerce in goods and lands to the plenary authority of Congress in evaluating whether or not tribes were properly and adequately using and occupying their lands.

In *Conquest by Law: How the Discovery of America Dispossessed Indigenous Peoples of Their Lands*, Lindsay G. Robertson provides an exceptional analysis of the collusions informing *Johnson's Lessee v. McIntosh*.[13] Johnson's and McIntosh's attorneys were hired by the same land development company operating out of New England and for decades illegally buying up lands from Indigenous nations all over North America. Even the particular plot of land in question was not in dispute; Johnson and McIntosh held title to lands in Illinois that were fifty miles apart. The case, however, served to create the legal fiction Congress and SCOTUS needed about tribal land title amounting to nothing more than a benefit of federal guardianship, the terms of which were left to the discretion of federal authorities in assessing "use and occupancy" in relation to their own and corporate interests in development.[14]

The Contract in "Artificial Beings"

The unilateral suspension of treaty making, the Indian Trade and Commerce Acts, and the *Johnson's Lessee v. McIntosh* decision are but one cluster of the myriad efforts by US officials to decimate Indigenous territorial rights. Simultaneously, there was a steady centralization and entitlement of corporate rights to buy, lease, develop, and extract from tribal lands and natural resources. In other words, legally contorting Indig-

enous nations into the function and operation of "Indian tribes" in all matters of trade under congressional authority worked to subject Indigenous peoples and their territories to corporate interests altogether indistinguishable from congressional ones by goal and office.

In the early laws of European kingdoms and nation-states, a king, a parliament, or a pope issued charters to establish institutions such as municipalities, universities, guilds, and churches that were considered self-governing, able to hold property, and enter into contracts.[15] Virtually absent from these early charters were business entities; almost always the charters were aimed at civic bodies that would provide some form of public service. They were called corporations, "from the Latin word corpus, meaning body, because the law recognized that the group of people who formed the corporation could act as one body or one legal person."[16]

By the seventeenth century, charters began to be issued to trading companies that operated as finite partnerships that dissolved at the conclusion of a specifically commissioned job, usually entailing naval exploration and a guaranteed monopoly, such as in the spice trade.[17] Different from earlier chartered entities, these companies did not have the "features of perpetual succession, identifiable persona, and asset separation."[18] Because they proved to be financially risky, they were stabilized by England in 1600 with the charter of the East India Company and by the Netherlands in 1602 with the charter of the Dutch East India Company, both of which were soon granted charters *in perpetuity* to protect their "building, populating, and governing" of the colonies.[19] In other words, by the early 1600s, chartered corporations were entirely enveloped within the colonial projects of empire building, invested by their respective kingdoms and then nation-states with the powers of government and military.[20] In fact, corporate executive officers were often given state titles (governors) and corresponding authority to purchase land, administer trade, and wage war.

The US Constitution provided that state legislatures take over the responsibility of respecting preconstitutional charters and the task of issuing new ones.[21] The legal veracity of state charters was established by article 1, section 10, clause 1 of the US Constitution, known as the contract clause, which provided that "no State shall enter into any Treaty, Alliance, or Confederation; grant Letters of Marque and Reprisal; coin Money; emit Bills of Credit; make any Thing but gold and silver Coin a Tender in

Payment of Debts; pass any Bill of Attainder, ex post facto Law, or Law impairing the Obligation of Contracts, or grant any Title of Nobility."

The first US Supreme Court decision, issued under Chief Justice John Marshall, on the legal import of the contract clause was in *Fletcher v. Peck* of 1810.[22] In *Law and Politics in the New Republic: Yazoo: The Case of* Fletcher v. Peck, C. Peter Magrath provides an important examination of the collusions and fraud that informed the landmark decision and so anticipated those involved in *Johnson's Lessee v. McIntosh*.[23]

In 1789 three land companies formed in Georgia with the purpose of buying land in the Yazoo River area, then included within the treatied boundaries of the Cherokee Nation. The governor signed a deal to sell nearly sixteen million acres of these lands to the companies for $200,000 (1 cent per acre). In 1790 President George Washington issued a stern warning to Georgia regarding the treaty rights of the Cherokee Nation to the lands and the potential of the deal to solicit armed conflict with the Cherokees and their allies among the neighboring Chickasaw, Choctaw, and Creek Nations. Undeterred, the state passed a resolution requiring that the payment for the lands be made in gold and silver, which the companies could not do. The deal fell through.[24]

Several years later, four new land companies formed, again with the purpose of buying lands in the Yazoo River area. These companies included speculators from Georgia and Pennsylvania, as well as two senators (one from Georgia and one from Pennsylvania), two members of the House (one from Georgia and one from South Carolina), three judges (including Supreme Court Associate Justice James Wilson), and the Tennessee territorial governor. Between 1794 and 1795, several Georgia legislators received large grants of land in the eastern part of Georgia. In 1795 they passed the Yazoo Land Act. By the act, Georgia claimed fee title to thirty-five million acres of land and sold them to the four companies for $500,000 (1.4 cents per acre). The act likewise directed a resolution to the US president requesting that the necessary treaty be made with the Cherokee Nation securing the extinguishment of the Cherokees' land title and so allowing the sale to proceed.[25]

By this time, the Cherokee Nation had entered into treaties with the United States in 1785 and 1791 that delineated the nation's boundaries in lands within and bordering Georgia. The 1791 boundaries were reaffirmed by treaty in 1794. The boundaries were not redrawn until the treaty of 1798 and then again in treaties of 1804, 1805, 1806, 1816, 1817, and 1819. By

each treaty Georgia sought further and further land cessions from the Cherokees. Georgia would achieve its goal for the complete cession of Cherokee land title with the Cherokee removal treaty of 1835.[26]

Meanwhile, the Yazoo Land Act of 1795 was exposed in state politics as a collusion and taken up in debates between Georgian Federalists and Republicans as the 1796 state election approached. The result was felt when Georgia's voters, enraged by the state's creation of large land monopolies, rejected most of the incumbents. The newly elected officials worked quickly to pass a law that repealed the 1795 act and so the titles issued under its provisions. However, the land companies had already begun selling Yazoo lands throughout the country, in some cases making nearly 650 percent profit on their original investments. One of the most important of these sales was of eleven million acres to the New England Mississippi Land Company, which included wealthy merchants, former elected officials and judges, and land speculators in the New England region. When Georgia legislators repealed the Yazoo Land Act in 1796, the company mobilized its network to challenge the state's repeal law and secure its land claims. Failing to secure passage of a congressional law that would have compensated it for alleged financial losses incurred as a result of the repeal act, the company took its complaints to federal court.[27]

The complaint was orchestrated by the New England Mississippi Land Company in 1803 between land speculator Robert Fletcher (of New Hampshire) and the company's director, John Peck (of Massachusetts). Fletcher alleged that he had bought fifteen thousand acres from Peck and that Peck breached the contract of sale by not having legal title.[28] Peck contended that Georgia's repeal act was invalid. In 1810 the US Supreme Court agreed with Peck.[29]

SCOTUS conceded that there had been fraud underlying the original sale of the Yazoo River lands but rejected Fletcher's argument that Georgia had the power to repeal the 1975 act on the grounds of the fraud. It argued instead that Peck had entered into two valid contracts—one when purchasing and one when selling the land—and that those contracts operated outside the original fraud: "When a law is in its nature a contract, when absolute rights have vested under that contract, a repeal of the law cannot divest those rights." Fletcher's claim was dismissed, and Georgia's law repealing land titles was nullified.[30]

While the ruling made frequent passing remarks about "Indian title,"

it failed in all regards to address the substantive questions of the state's claim to fee title in the lands, the state's rights to sell the lands, the fact that tribal title had not been extinguished by treaty when the claim and sale were enacted by state law, and the fact that the US Congress was not a party to the sale in violation of the Constitution. Instead, SCOTUS sashayed over "Indian title" as if it posed no legal challenge whatsoever to the question of whether or not a state could breach a contract between individuals without violating the Constitution. This fundamentally shifted the significance of the contract clause away from its implication of tribal treaty rights—"No State shall enter into any Treaty . . . or Law impairing the Obligation of Contracts"—and toward service to corporate interests. It allowed, if not outright encouraged, collusive investment practices in land speculation that could be easily legalized by the exchange of money and contractual signatures between those parties committing the fraud.[31]

The second US Supreme Court decision on the legal import of the US Constitution's contract clause was in *Trustees of Dartmouth College v. Woodward* of 1819.[32] The New Hampshire legislature amended Dartmouth's charter to change it from a private to a public institution with trustees to be appointed by the governor. The trustees challenged whether or not the state could unilaterally amend the terms of the school's charter.

The suit raised the question about whether or not charters—the mechanism by which corporations were created—fell under constitutional protections. SCOTUS ruled that they did. However, it explained that the entities created by charters—corporations—were created under state authority:

> A corporation is an artificial being, invisible, intangible, and existing only in contemplation of law. Being the mere creature of law, it possesses only those properties which the charter of its creation confers upon it either expressly or as incidental to its very existence. These are such as are supposed best calculated to effect the object for which it was created.

These "properties" included the right of the individuals making up corporations to "act together as a single person for purposes of holding property, entering into contracts, and suing and being sued in court." The court ruled that charters

> enable a corporation to manage its own affairs and to hold property without the perplexing intricacies, the hazardous and endless necessity, of perpetual conveyances for the purpose of transmitting it from hand to hand. It is chiefly for the purpose of clothing bodies of men, in succession, with these qualities and capacities that corporations were invented, and are in use.[33]

The artificiality of chartered entities pretended that corporations were overdetermined by constitutional law and state jurisdiction. It so invested and protected corporate property rights *in perpetuity*, figuratively clothing male executives in liberties and freedoms from having their corporate-held property and individual investments (and so profits) divided, taxed, or otherwise burdened by regulation.[34] Protected as a constitutional right, corporate property rights trumped tribal territorial claims, even when secured by a treaty, and even when corporations acquired the lands by fraud. *Fletcher* and *Dartmouth* thereby represented the rearticulation of "Indian tribes" into a legal and economic structure predicated on imperialist capitalism without any corporate accountability.

PART 2: INDIAN TRIBES AND PERSONS

The legal status and rights of "Indian tribes" were all but decimated in the Reconstruction period by Congress's unilateral suspension of treaty making in 1871 and the consequences of the General Allotment Act of 1887, which brought about both the privatization of tribal lands and an expansive yet inefficient system of federal administration over remaining tribal lands, natural resources, and financial assets. This virtual obliteration of tribal rights contrasts sharply with the juridical expansion of corporate rights by the SCOTUS decision in *Santa Clara County v. Southern Pacific Railroad Company* of 1886. SCOTUS ruled that corporations possessed Fourteenth Amendment rights analogous to those of "persons," including due process and equal protection. This emboldened, entitled position—and the surrounding rhetoric of the overburdened regulation and taxation borne by corporations—evaded public and federal accountability for the role of railroad and related companies in the dispossession and genocide of Indigenous peoples.

Reconstruction

During and after the Civil War, Congress enacted a series of laws meant to suspend the secession of the Confederacy, emancipate African slaves, prohibit racial discrimination, and stimulate a free labor economy. The Thirteenth Amendment of 1865 and the Fourteenth Amendment of 1868 required that southern states, and the tribes that had aligned with them in part or in whole during the war, modify their constitutions and bylaws to abolish slavery and prohibit racial discrimination. For southern states, these requirements were satisfied technically but met with grossly uneven implementation and conflict marked by fiercely contested elections, such as within Georgia over its constitutional revisions in 1865 (when it repealed secession and abolished slavery), 1868 (when it extended suffrage to all male citizens), and 1877 (when previous provisions were strengthened). Conflict was also marked more popularly by the formation of the Ku Klux Klan in 1865, initially in Tennessee, and state-sanctioned practices condoning and facilitating all manner of racial segregation, including those within education and voting.

For tribes, particularly those who had been removed from the South and into Indian Territory, the requirements of Reconstruction were imposed through treaties, such as those ratified in 1866 with the Cherokee, Choctaw and Chickasaw, Creek, and Seminole Nations.[35] The treaties provided that the tribes abolish slavery, enfranchise African freedmen, reintegrate those factions that had fought for the South, and restore property confiscated from those factions during the war. The treaties also provided that tribal territories were to be subjected to the "right of way" of railroads but for the first time required that federally issued licenses to individual and corporate traders be approved by tribal governments (up to then, the BIA issued licenses, often without consulting with tribes). The provisions of abolition and enfranchisement of blacks were deeply contested in intra- and intertribal politics, including those that denied the existence of black-Native lineage, property, and voting rights.[36] These provisions also engendered multiple forms of opposition to allotment and statehood, including armed militia and subversive acts of defiance.[37]

The complexities of postwar national politics included many social movements against racial discrimination and segregation and for the enfranchisement of women, as well as intertribal military and unarmed alliances against US treaty violations. At the same time, there was an

explosive growth of business-minded corporations: from 7 in 1780, to 335 in 1800, to several thousand in 1850, to over half a million in 1900.[38] Many of these corporations were aimed at the development of tribal territories (railroad tracks, postal routes, townsites, cattle grazing) and the extraction of tribal resources (timber, oil, coal, gold) and directly or implicitly involved in violence and fraud against non-Indigenous people and Indian tribes that resisted.[39] In an effort to protect their often illegal investment/development schemes against opposition, corporate boards and their attorneys worked to claim constitutional protections, particularly through the Fourteenth Amendment of 1868.

The Fourteenth Amendment modified article 1, section 2, clause 3, which enumerated the powers of the House of Representatives and determined the apportionment of representatives and taxes. It is the only appearance of "Indians" in the Constitution: "Representatives shall be apportioned among the several states according to their respective numbers, counting the whole number of persons in each state, excluding Indians not taxed." It provided that

> all persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the state wherein they reside. No state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any state deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.

In 1870 the Fifteenth Amendment provided that the "right of citizens of the United States to vote shall not be denied or abridged by the United States or by any state on account of race, color, or previous condition of servitude."[40] Together, the amendments attempted to address the social politics of abolition and enfranchisement, as well as protecting the rights of all citizens to be represented fairly in Congress and protected against unlawful government actions or deprivations of "life, liberty, or property, without due process of law."

As the amendments were being debated and passed, so too was Congress assessing its financial obligations to tribes by treaty, no doubt in immediate concern over the nation's economy following the war but also in looking forward to the expansion of its territories into the Pacific and Caribbean. In 1871 the House of Representatives took the ini-

tiative in adding a rider to the annual Indian Appropriations Bill before it moved to the Senate:

> No Indian nation or tribe within the territory of the United States shall be acknowledged or recognized as an independent nation, tribe, or power with whom the United States may contract by treaty; but no obligation of any treaty lawfully made and ratified with any such Indian nation or tribe prior to March 3, 1871, shall be hereby invalidated or impaired.[41]

The US Senate agreed. "Indian tribes" were no longer to be recognized as independent authorities with whom the United States would "contract by treaty" and so incur any further debt, though existing treaties and financial obligations were to be fulfilled.

The suspension of tribal treaty making invited corporate collusion with federal efforts to subject remaining tribal territorial rights to the goals of capitalist development, coalescing in the perfect sociolegal storm of the privatization of tribal lands and the vast extension of federal administration over remaining lands by the General Allotment Act of 1887 and its amendments by the Curtis Act of 1898, the Burke Act of 1906, and the Omnibus Act of 1910.[42] The acts provided for reservations to be broken up in severalty and issued to members as parcels, which ranged from forty to six hundred acres each based on the value of the lands and the members' marital and dependent status.[43] The issuance of title was supposed to be based likewise on assessments of individual "competency." Those deemed incompetent were given trust titles, their property held in trust by the BIA for a period not supposed to exceed twenty-five years, during which time they were to get educated in proper land use. Despite the suspension of trust titles by the Burke Act of 1906, there are 10.6 million acres of individually owned lands that are held in trust even now.[44] The gross mismanagement of these lands was addressed by the largest class-action suit in US history, *Cobell v. Salazar* of 1996, which was concluded by the Claims Resolution Act of 2010.[45] Meanwhile, those who were deemed competent were issued fee titles, awarding them with US citizenship and so subjecting them to property taxes. Almost 60 percent of lands issued in fee were lost within a decade, the majority of them to state property tax foreclosure.[46]

Surplus lands, or lands unassigned to tribal members, were sold to nonmembers. Allotted and surplus lands were divided by the practice of

checkerboarding and fractionated heirship. Checkerboarding scattered tribal allotments in between nontribal lands to disrupt tribal governance and collective forms of economic self-sufficiency. It rendered shared-use practices such as collectively operated agriculture and forest conservation impossible. Fractionated heirship divided allotments among heirs who share an undivided interest in the land. Over time, this has meant that an allotment can have thousands of owners. In most cases, heirs are absentee leaseholders, with leases that render them without the ability to use the lands for their own economic self-sufficiency, little financial benefit, and no collateral for developing credit.[47]

While total tribal and individual landholdings were reduced by about two-thirds through allotment (from 148 to 48 million acres), many of these lands were configured in such a way by checkerboarding and heirship that nonmembers came to dominate the use if not the control of tribal lands. This was furthered by the fact that even before but especially after allotment of a given reservation, corporations had secured thousands of leases for grazing and licenses for resource extraction from both reservations and allottees whose titles were held in trust.[48] Allotment's "Indian tribe" was no match for *Santa Clara County*'s corporate "person." The tribe had suspended rights to treaty making and was left only with an option to agree or not with federal mandates, sometimes but not always negotiated through finite contracts, but both of which were overshadowed by corporate interests in expansive development and figured entirely through an "Indian tribe" that was all but stripped of legal status.

The Equal Protection of "Persons"

In what are known as the *Slaughterhouse Cases* of 1872, the US Supreme Court issued its first opinion on the legal merits of the Fourteenth Amendment.[49] The cases emerged from three suits in New Orleans, Louisiana, where residents had suffered eleven cholera outbreaks and related ill health as a result of animal matter from slaughterhouses polluting the city's drinking water. In 1869 the state legislature passed a law that allowed New Orleans to charter a single corporation (the Crescent City Livestock Landing and Slaughterhouse Company) with the promise that it would centralize all slaughterhouse operations in the city, confine butchers to areas that kept them away from the city's water supplies, and facilitate

better regulatory oversight. Represented by former Supreme Court justice John A. Campbell (whose Confederate loyalties had forced him to resign from the Court), over four hundred members of the Butchers' Benevolent Association sued to stop the city's takeover of the slaughterhouse industry on the basis of the Fourteenth Amendment's protections for due process, equal protection, and the privileges and immunities clause (section 1, clause 2: "The Congress shall have power to make all laws which shall be necessary and proper to secure to the citizens of each state all *privileges and immunities* of citizens in the several states" [emphasis added]). Issued by Justice Samuel Freeman Miller, the SCOTUS held to a narrow interpretation of the amendment, arguing that due process applied only to procedure, that equal protection applied only to former slaves ("Freedmen"), and that the privileges and immunities clause applied only to national and not state citizenship rights.

The *Slaughterhouse* decision was overturned in *Santa Clara County v. Southern Pacific Railroad Company* in 1886.[50] In 1879 the California legislature ratified a new state constitution that among other things outlined strict rules for the assessment of railroad property values and taxes. In 1882 Santa Clara and Fresno Counties assessed the "franchises, road-ways, road-beds, rails, and rolling stock" of the Southern Pacific Railroad Company and the Central Pacific Railroad Company to recover taxes for the previous fiscal year, 1881–82, under the new rules. The court found that "the state board of equalization, in making the supposed assessment of said roadway of defendant, did knowingly and designedly include in the valuation of said roadway the value of fences erected upon the line between said roadway and the land of coterminous proprietors. Said fences were valued at $300 per mile." The railroad companies appealed, claiming that they were protected from such taxes under a federal statute of 1866, affirmed by an 1870 state law, that established "a right of way over the public domain" with liberal access to "public lands" in order to construct and maintain a continuous railroad line from Missouri to the Pacific "subject to the use of the United States for postal, military, naval, and all other government service, and to such regulations as congress might impose for restricting the charges for government transportation."

SCOTUS found that in neither federal nor state law were fences to be assessed differently from the railroads and adjacent lands and that therefore the state board did not have the power to include the fences

in its assessment of the railroads' property values. The Court concluded that "upon such an issue, the law, we think, is for the defendant. An assessment of that kind is invalid, and will not support an action for the recovery of the entire tax so levied."

In framing its conclusion, the Court claimed that corporations were protected against such actions under the Fourteenth Amendment: "One of the points made and discussed at length in the brief of counsel for defendants in error was that 'corporations are persons within the meaning of the Fourteenth Amendment to the Constitution of the United States.' Before argument, Mr. Chief Justice Waite said: The court does not wish to hear argument on the question whether the provision in the Fourteenth Amendment to the Constitution, which forbids a State to deny to any person within its jurisdiction the equal protection of the laws, applies to these corporations. We are all of the opinion that it does." SCOTUS thereby overturned the strict interpretation of *Slaughterhouse* on the questions of procedural due process and equal protection for "former slaves" not by extending those protections to substantive due process and other racialized groups but by assuming that the protections applied to corporations. This almost dismissive caveat—"We are all of the opinion that it does"—would be the first time SCOTUS ruled that corporations possessed Fourteenth Amendment rights analogous to those of "persons."

Irrespective of the Court's intent, which has been much debated in legal scholarship, the opinion served as precedence for the application of Fourteenth Amendment protections to corporations. So consequential was the decision that it created what has since been referred to as "corporate personhood."[51] The rationale was that the US Constitution upheld the rights of individuals, so their individual guarantees of due process, et cetera, should extend naturally to corporations as mere amalgams of those individuals.[52]

Nowhere within *Santa Clara County* is there any reckoning—even to an imaginary of conquest as a fait accompli—for Indigenous territorial rights, either within the counties suing the railroad for back taxes, more broadly within the state of California, or within the US imperial formation plummeting the nation forward into global capitalism marked by the illegal annexation of Hawai'i and the war with Spain over Pacific colonies in 1898. This lack of reckoning underscores the way "Indian tribes" were perceived to be so thoroughly situated under a federal plenary authority serving corporate interest as to be locally irrelevant.

What changes in our understanding of "corporate personhood" if we insist on an account of Indigenous territorial rights within it?

When Spain began its imperial efforts in the region where California was to become a state, it is estimated conservatively that the tribal population was around three hundred thousand. Forced into slavery and starvation by the Spanish military and Catholic Church working in concert to bring about Spanish-Catholic power, about one hundred thousand people died between the first mission of 1769 and Spain's cession of the territory to Mexico in 1821. At the close of the US-Mexican War and the acquisition of California as part of the Treaty of Guadalupe Hidalgo of 1848, another fifty thousand died as slavery, starvation, and armed conflict characterized tribal-Mexican relations as they had tribal-Spanish. After the gold rush of 1848, US miners, agriculturalists, and railroaders settlers quickly outnumbered everyone else. Tribes were aggressively removed from their territories in violation of the 1848 treaty, which had provided that the United States would protect tribal land grants. Undeterred, US citizens displaced and outright murdered tribal peoples to gain hold of their lands and coerce survivors into servitude.[53]

California was admitted to the United States as a free state in 1850. In 1851 the legislature passed the Act for the Government and Protection of the Indians, which allowed any "white" to force into work any "Indian" found to be "vagrant." Since Mexicans were then classified as "whites" in state law, this facilitated the enslavement of tribal peoples by all property owners in the state. Since "Indians" could not testify against "whites" in court, tribal people had no recourse to challenge either their forced removal or enslavement or the physical and sexual violence that often came with it. For despite its status as a free state, California permitted the open sale and indenture of tribal people for labor and sex trade purposes.[54]

In 1851, in his inaugural address to the legislature, Governor Peter H. Burnett promised that "a war of extermination will continue to be waged between the two races until the Indian race becomes extinct."[55] In 1853 the legislature ordered the "extermination" of all Indians. Reimbursed by the federal government, state bounties were paid per Indian scalp or severed head, and all expenses related to the efforts were reimbursed, including the cost of ammunition, guns, and horses. Within two years, California paid out about $1 million to individuals who submitted claims. It was inhumane. Whole tribes, bands, and families were massacred.

Describing this campaign in *Native Americans of California and Nevada*, Jack D. Forbes emphasizes that it was not merely military or state officials who participated in it: "The sequence of events is all the more distressing since it serves to indict not a group of cruel leaders, or a few squads of rough soldiers, but, in effect, an entire people; for the conquest of the Indigenous Californian was above all else a popular, mass enterprise."[56] By 1860 no more than twenty thousand of the tribal population had survived. Those who did were almost entirely dispossessed of their territories and living in conditions of gross poverty and ill health. Many had begun to identify as Mexican to secure paid work as farmhands, passing into an other, analogously complicated status in hopes of survival.

In 1851 the US Congress sent a commission to California to negotiate treaties with tribes for land cession. By 1852 eighteen treaties had been negotiated with more than one hundred tribes. The treaties would have provided the tribes with approximately 8.5 million acres divided into eighteen reservations. However, California's governor and senate actively opposed the treaties, seeing them as excessively generous and cumbersome to the state's goals. They, along with several private citizens (mostly ranchers and miners), lobbied hard to stop the ratification process. As a result, the US Senate put an "injunction of secrecy" on the treaties, which held until 1905. But the tribes were never notified that the treaties had not been ratified. Federal and state agents and militia moved many onto smaller reservations (often from several different tribes) under the auspices of carrying out treaty provisions while they purchased the "deserted" lands for themselves.[57]

In his definitive historical study of imperialism, *Violence over the Land: Indians and Empires in the Early American West*, Ned Blackhawk demonstrates how each invading power directly created the economic and social conditions in which the next prospered and all at Indigenous peoples' expense.[58] Spain and Mexico and then the immigrants who would form California and join the Union in 1850 flourished as a direct result of the genocide and dispossession that they enacted on Indigenous peoples, producing the very conditions through which miners, agriculturalists, and the railroad could lay claim to unfettered access and development of tribal territories and natural resources.

In other words, the "corporate persons" of *Santa Clara County* were able to claim tribal lands, resources, and bodies in California as a result

of their involvement in the genocide and dispossession of tribal peoples. *Santa Clara County* legitimated this history and then protected the "persons" involved as corporations with full constitutional rights. *Santa Clara County* was thereby consistent with the historical work of corporations in imperialism and its colonial projects as the entities through which the "building, populating, and governing" of the empire were enabled.[59]

A CONCLUSION

> Got land? Thank an Indian.
> Jeff Manard (Pine Creek First Nation)

The legal precedent set by the congressional statutes and court rulings read above deeply informed the re-formation of Indigenous governments into corporations of a particular kind. The Hawaiian Homes Commission Act of 1920, the Indian Reorganization Act of 1934, and the Alaska Native Claims Settlement Act of 1971 configured "Native Hawaiian organizations," "American Indian tribes," and "Alaska Native villages" as bodies possessing analogous rights between them to enter contracts. But by the time these statutes were passed into law, tribes had long since been stripped by SCOTUS of the ability to own and alienate the lands they used and occupied or to enter into contractually binding agreements with each other or other political and economic entities without federal oversight and approval. These serious limitations underscore the core capitalist ideologies and practices that undergird the United States as an imperialist power and social formation. In a state whose capitalism is *always already* reaching out globally, of course Indigenous peoples cannot have equal or commensurate claims to any lands and resources that might compete with corporate-as-the-government's interests to expand, extract, and profit some more. Of course.

The problematic erasures of the historical contextualization of Indigenous territorial rights within the pedagogical mandates of OWS is not about a forgetting of an imperial-colonial past that can be fixed with a liberalist project of recovery or memorandum of solidarity.[60] As if we just included the facts about the historic wrongs of corporate-federal collusion and fraud in the dispossession and genocide of Indigenous peoples, all would be righted in radical social justice efforts against "the

corrosive power of major banks and multinational corporations over the democratic process."

The erasures of Indigenous territorial rights and historical experiences of corporate-government collusion and fraud are, rather, a politic of epistemology—an ideology and practice of knowledge making—that takes the imperial-colonial narrative for granted in its understanding of US imperialism and in its thinking through strategies of opposition against its injustices. That narrative believes in its own success story—that Indigenous peoples are conquered, disappeared, lost, gone. Tragically but nonetheless as an objective truth: the Indigenous has been eliminated from the lands and resources of the empire and so from relevance to current political debate.

The question for OWS and related movements is why any effort against the US empire needs a scandal of corporate-federal collusion and fraud like that of the Wall Street foreclosure and securities crisis around which to organize. Why OWS so early figured that scandal as a battle of the 1 percent against the 99 percent. Why OWS's resolutions have often been about arrest and redistribution and not a radical transformation of the system. Why Wall Street's current behavior is exceptionalized. As if the US "democratic process" has been merely corrupted and would otherwise not be but for the selfish greed of a few.

It seems Jean Baudrillard's *Simulacra and Simulation* is important again for understanding that the public performance of scandal is really an act of concealing that there is no scandal at all—that the social relations and conditions registered by the scandal-performed are the norm.[61] This is especially difficult to confront from any political perspective predicated on contrasting the altruism of US democracy with the collusive fraud of Congress and Wall Street. But what if US democracy has only ever been a façade, a mask, a costume? A performance that conceals? That the formative values at work in the US Constitution were not liberty, freedom, and equality as celebrated but were aimed at establishing and protecting government and corporate power of a government invested? What if it is "US democracy" that is "the truth which conceals that there is none"?

This would certainly seem to be the case in the story of the multiple kinds of racialized and gendered inequalities between "artificial entities" and "Indian title," "persons" and dis-treatied "Indian tribes" that have been articulated historically through corporate, court, and congressio-

nal racketeering in Indigenous territorial rights. An epistemological practice that begins with the presumption of the centrality of Indigenous territorial-based claims to sovereignty and self-determination in the constitution of the US political-economic system might more directly expose not only that the "man behind the curtain" has *always-already* been there but that all along there has been a meaningful role of the audience in maintaining the theater of democracy's performance. Leaving behind the goal of trying to fix or correct that which is broken or corrupted, of trying to revenue share our way into social justice, we might be able to think more productively together about the necessity for meaningful and substantive social reformation if we insisted on the empire's accountability to the territorial rights of Indigenous peoples.

The Late Rueben Snake
Chairman, Winnebago Indian Tribe

INTRODUCTION

"Rivers are nature's landscape painters."[2] And nature may have no better landscape artist than the Missouri River.

Society, however, has tried to harness the power of this great river. In response to catastrophic flooding in the lower Missouri basin, Congress enacted the Flood Control Act of Dec 1944.[3] This statute

1 DANIEL MCCOOL, COMMAND OF THE WATERS: IRON TRIANGLES, FEDERAL WATER DEVELOPMENT AND INDIAN WATER 178–79 (1987).

2 DANIEL B. BOTKIN, PASSAGE OF DISCOVERY: THE AMERICAN RIVERS GUIDE TO THE MISSOURI RIVER OF LEWIS AND CLARK 7 (1999).

3 Flood Control Act of 1944, Pub. L. No. 78-534, 58 Stat. 887 (codified in scattered Sections of 16, 33, and 43 U.S.C.), *available at* http://www.usbr.gov/power/legislation/fldcntra.pdf.

authorized the Army Corps of Engineers to construct and operate five massive earthen dams on the main stem of the Missouri River for flood control, navigation and hydropower.[4] The Bureau of Reclamation was authorized to build numerous smaller dams on the tributaries to the Missouri River, primarily for irrigation and recreation.[5] The projects authorized in the 1944 Flood Control Act are collectively referred to as the "Pick-Sloan Plan."[6]

The Pick-Sloan Plan devastated the Indian Reservations along the Missouri River.[7] The large dams on the Missouri River main stem inundated over 356,000 acres of Tribal land in the late 1950s and early 1960s.[8] The wooded Missouri River riparian bottomlands—the aboriginal homeland of the region's tribes—were completely destroyed.[9] Entire tribal communities were relocated to new town sites, situated on the barren plains above the river valley.[10] These areas lacked the rich riparian resources of the tribes' aboriginal homelands.[11]

The new town sites lacked infrastructure, such as roads, water systems, schools and community facilities. The statutes authorizing the taking of Reservation lands required the Corps of Engineers to replace the infrastructure,[12] but the Corps failed to do so.[13] This exacerbated the long term adverse effects on the tribes.[14]

12 The Secretary of the Army . . . is authorized and directed . . . to locate and construct on tribal land selected by the Crow Creek Tribal Council and with the approval of the Secretary of the Interior, a townsite adequate for fifty homes,

This Article provides an overview of the historic and ongoing impacts of the Pick-Sloan project on the affected Indian tribes. There is a discussion of the Flood Control Act of 1944 and subsequent federal legislation authorizing the acquisition of tribal lands for the site of the reservoirs. The resulting relocation of entire Reservation communities disrupted the socioeconomic and cultural life of these Tribes.[15] This paper will assess the adequacy of compensation authorized by Congress, along with the need for additional federal action.

Many tribes have expressed concern with the ongoing impacts of the operation of the dams on the remaining tribal land and water.[16] Accordingly, there is a discussion of the disproportionate impacts on the Reservation environment, and on the impacts to Native American cultural resources. The future challenges posed by water demands for Mississippi River navigation and hydraulic fracturing are also discussed.

I
OVERVIEW OF THE MISSOURI RIVER BASIN PICK-SLOAN PROGRAM

A. The Natural Missouri River and its Vast Watershed

The vast Missouri River watershed has been described as follows:

> The Missouri [River] Basin thus presents us with a world of striking contrasts.

> including streets, utilities, including water, sewage, and electricity . . . a community center containing space and facilities for community gatherings, tribal offices, tribal council chamber, Bureau of Indian Affairs and Public Health Service offices and quarters and a combination gymnasium and auditorium.

> The upper basin, which is usually thought of as that area north of Sioux City, Iowa, has no major city. It is in the upper basin, however, that we find the Great Sioux nation, the northern great plains, and large Sections of the Rocky Mountains. The lower basin includes such cities as Omaha, St. Louis and Kansas City. If the upper basin finds its history in the old west, range life, and the agricultural settlements generated by the homestead movement, the lower basin finds its history in the Mark Twain world of river commerce . . . . Whereas the economy of the upper basin remains agricultural that of the lower basin has risen with the tide of post-World War II investment and industrial growth.[17]

The rushing waters of three alpine rivers, the Jefferson, Madison, and Gallatin, converge on the central Montana prairie to form the Missouri River.[18] The Missouri flows north and then east into North Dakota.[19] Engulfing minor sloughs, as well as major tributaries such as the Yellowstone River, the Missouri widens as it caroms across the plains.[20] One boat runner at the turn of the century described the Missouri River this way:

> The river runs crooked through the valley; and just the same way the channel runs crooked through the river . . . . The crookedness you see ain't half the crookedness there is.[21]

The Sioux called the river *Mni Sose*, referring to the dark, murky color of the sediment-laden waters.[22] For their part, "farmers joked that the river's water was, 'too thick to drink and a mite too thin to plow.'"[23]

The river veers southward on the central plains, bisecting the Dakotas, and meandering to the east, where it flows through farm lands, and eventually drains into the Mississippi River at St. Louis. By the time it reaches its confluence with the Mississippi, the waters

of the Missouri River will have traveled nearly twenty-five hundred miles, and drained one-sixth of the United States.[24]

One court described the Missouri Basin as "one of the largest and most beautiful in our country."[25] Lewis and Clark described "dozens of species previously unknown to science, ranging from coyotes to prairie dogs to cutthroat trout."[26] The river they encountered, "featured thousands of islands and sandbars separated by two constantly shifting channels."[27] "Dense forests, shallow wetlands, and endless prairie bordered the river. . . . [It was] a land filled with thousands of buffalo, elk, antelope, and grizzly bears."[28] And of course, there were Indians.

The tribes of the upper plains wintered along the Missouri River and its tributaries, for thousands of years.

> Indian Tribes in the Upper Missouri River Basin were fierce, warlike, and willing to defend their homelands against the intruding non-Indian population. That fact forced the United States to invoke the most basic power of a sovereign—to wage wars and to effectuate peace by Treaties resolving the differences between nations.[29]

Accordingly, the United States entered a number of treaties with the Indian Nations of the Missouri Basin.[30] The Fort Laramie Treaty of September 17, 1851, outlined the territory of several Missouri Basin tribes, including the Sioux Nation, and the Mandan and Arikara Tribes.[31] The Mandans and their sister Tribes were renowned for their agriculture in the lush Missouri bottomlands of the upper plains.[32] The Sioux Nation, which developed the great horse culture of the plains, established the Great Sioux Reservation in the 1868 Fort Laramie

Treaty.[33] The vast reservation comprised all of present-day South Dakota west of the Missouri River, with the river's east bank delineating the reservation boundary.[34] The Missouri River Basin truly was Indian Country.[35]

B. Enactment and Implementation of the 1944 Flood Control Act

The dust bowl drought on the plains during the 1930s gave way to successive wet years.[36] Severe floods in the early 1940s led to a clamor in the lower Missouri Basin for more federal assistance for flood control.[37] The federal water management agencies, the Army Corps of Engineers and Bureau of Reclamation, developed competing plans for the impoundment of water in the upper basin.[38]

The Chief of Engineers for the Corps was Colonel Lewis A. Pick.[39] Under Pick's leadership, the Corps developed a plan for five massive dams on the main stem of the Missouri River to hold back floodwaters in huge reservoirs in the Dakotas.[40]

> The plan called for five dams and reservoirs, all of them of monstrous. Garrison Dam, in western North Dakota, was the largest . . . . Two and one-half miles long, 210 feet high, the dam would be the second biggest structure on earth . . . . The other dams, Oahe, Gavins Point, Big Bend, Fort Randall—would be smaller, but large enough to dwarf anything else around.[41]

The Bureau of Reclamation planned a different approach. Established under the Reclamation Act of 1902, the agency's mission

involved water supplies for irrigation in the semiarid west.[42] Accordingly, the agency proposed numerous small dams on the tributaries to the Missouri River in the upper basin.[43] The Reclamation projects would utilize the impounded waters for flood control, hydropower, and irrigation, thereby providing economic benefit to the smaller, rural communities in the Dakotas and Montana.[44] This proposal became known as the "Sloan Plan," named after Glenn Sloan, the director of the agency's Billings, Montana Regional office.[45]

The two agencies pitched their respective plans.[46] The Corps appealed to urban communities in the lower basin, which suffered the loss of life and property in the recent flooding.[47] The Corps' plan also fit neatly with the Roosevelt administration's vision of large projects, and comprehensive planning.[48] But, the governors of Wyoming, Montana, and North Dakota came out for the Sloan plan.[49] Like the Pick Plan, the estimated costs and proposed benefits of the irrigation projects appeared dubious.[50] However, the Sloan Plan was presented with greater engineering detail, while the Corps' plan seemed oversold by the blustery Colonel Pick.[51] As historian Michael Lawson explained, "Congress now had to consider two plans representing the contending claims, goals, and ambitions of two powerful federal agencies with fundamentally different interests."[52]

It would take the emergence of a third proposal for the development of the Missouri River, to break the logjam. On August 18, 1944, Montana Senator James Murray introduced legislation to establish a Missouri Valley Authority, based upon the independent

public corporation model of the Tennessee Valley Authority.[53] The prospect of a decentralized and independent agency empowered with the comprehensive planning and development of the Missouri Basin prompted the Corps of Engineers and Bureau of Reclamation to join forces.[54] In what a critic called, "a shameless, loveless shotgun wedding," the two agencies agreed simply to combine their two plans.[55] Thus, the "Pick-Sloan Program" came about.[56]

The resulting compromise was enacted as the Flood Control Act of 1944.[57] Section 9(a) of the act contains the operative language.[58] This Section reads as follows:

> The general comprehensive plans set forth in House Document 475 and Senate Document 191, Seventy-eighth Congress, second session, are hereby approved and the initial stages recommended are hereby authorized and shall be prosecuted by the War Department and the Department of the Interior as speedily as may be consistent with budgetary requirements.[59]

The act authorized "channel and major drainage improvements" in the lower Missouri Basin.[60] Along with work conducted under the authority of the River and Harbors Act,[61] this resulted in the construction by the Corps of a 9-foot-wide and 300-foot-deep artificial channel from Sioux City, Iowa, to the mouth of the Missouri, at St. Louis.[62] The large dams and reservoirs in the upper basin remain the cornerstone of Pick-Sloan. However, it is the fledging navigation in the lower Missouri basin, enabled by the channelization

and water flows supplied by the dams, that became the source of controversy over water management under the Pick-Sloan program.[63]

The Flood Control Act authorized the Bureau of Reclamation's Sloan Plan, which included numerous irrigation projects in the more arid upper basin.[64] The 1944 Flood Control Act also authorized the development of dams, diversion works and irrigation for 2,927,100 acres of land in the Dakotas and Montana.[65] However, only a small portion of the irrigation authorized under the Pick-Sloan program was actually developed.[66] The economic infeasibility of most of the projects, along with environmental concerns, stifled most of the irrigation projects authorized in the 1944 Flood Control Act.[67]

Yet these projects remain congressionally authorized components of Pick-Sloan. This had the effect of easing the repayment of the federal debt for the overall program. Section 9 of the Flood Control Act provided that those project functions more able to pay (e.g., hydropower) were to repay to the U.S. Treasury the federal investment for those project functions less able to repay their cost (e.g., irrigation).[68] This Section also provided that the federal cost of Pick-Sloan irrigation was to be reimbursed on the same terms as those prescribed under the Reclamation Act of 1902.[69] The highly subsidized repayment structure under the Reclamation Act included principal payment deferment and zero percent interest on the federal cost of the project.[70] Consequently, the favorable repayment terms for these nonexistent projects was applied to the repayment of the debt for the entire Pick-Sloan program.[71]

Thus, the Congress established extremely generous principles for the repayment of the federal investment for the Pick-Sloan program.[72] This enabled the federal government to market the hydropower produced at the Pick-Sloan dams at very low rates.[73] In fact, Pick-Sloan's hydropower benefit became its most economically valuable project function.[74]

Section 6 of the Flood Control Act authorized "contracts with States, municipalities, private concerns, or individuals . . . for domestic and industrial use for surplus water that may be available at any reservoir."[75] This Section contemplated that after all of the dams and irrigation works authorized in Section 9 were completed and water supplied accordingly, the Corps of Engineers could market surplus waters remaining in the reservoirs. However, little of the irrigation authorized was developed.[76] Recent determinations by the Corps for the amount of surplus water available in the Missouri River main stem reservoirs led to considerable controversy.[77]

The Flood Control Act lacked any mitigation provisions for the affected Indian Tribes. The only mention of Indians in the act itself is in Section 9(c), which provides that the few Indian irrigation projects authorized in the Sloan Plan would be operated "in accordance with the laws relating to Indian lands."[78]

C. A River Transformed

"Today, Lewis and Clark (as well as the Indians who helped them) would hardly recognize much of the Missouri River."[79] The river "would simply be *unrecognizable* to them."[80] "This historic river is

now one-third reservoirs, one-third dredged channels, and only one-third ecologically vulnerable free-flowing water."[81]

The Corps of Engineers' dams on the Missouri River are huge. When full, they impound 73.4 million acre-feet of water in the Dakotas and Montana.[82] This constitutes "the largest amount of water stored on any United States river system."[83] These dams transformed the free-flowing Missouri River into a chain of very large reservoirs in the upper basin.[84] The reservoirs inundated vast riparian forests of the Missouri River bottomlands, resulting in a dramatically altered landscape.[85] Damming permanent disrupted patterns of flooding and sedimentation and altered the geomorphology of a river spanning twenty-five miles.[86]

The river channel was dammed, the riparian habitat inundated, and huge reservoirs replaced the braided, rolling river.[87] "The worst natural damage was the flooding of some of the best riparian waterfowl habitat in the world."[88] The wooded river bottomlands on numerous Indian Reservations were destroyed.[89] The Indians relied on this land for fish, game, timber, and agriculture.[90] It was their aboriginal—and treaty protected—homeland.

The Corps of Engineers channelized the lower Missouri, and constructed levees for the retention of flood waters.[91] This enabled the Corps to alter the natural hydrograph pattern of spring flooding, and stabilize water flows for navigation.[92] The Corps of Engineers provided lower Missouri basin residents everything one would want from a river—a perfect artificial channel, steady stream flows, flood protection—everything except a natural river.

There is nothing natural about the Missouri River today. As Professor John Davidson explained,

> The continuing story of the Missouri Basin is the story of river development. To understand the history of this river's development, one must recognize that it is the result of the constant playing-out of the tensions and conflicts inherent in the basin. Today's river is intensively developed. In the upper basin there are six massive main stem reservoirs which convert the river north from Yankton, South Dakota into one large flat-water lake. South from there the river is channeled in order to support navigation and guide the river to its mouth near St. Louis. Flows from the Missouri are, in turn, an essential component of Mississippi River navigation.[93]

II
IMPACTS OF DAM CONSTRUCTION ON THE INDIAN RESERVATIONS ALONG THE MISSOURI RIVER

A. Inundation of Land and Relocation of Tribal Communities

The Fort Laramie Treaty of 1851 established the upper Missouri Basin as Indian Country.[94] Article 5 of the treaty delineated the "respective territories" of the Sioux Nation, Gros Ventre, Mandan, and Arikara Nations, the Assiniboine, Blackfoot, Crow, and other Tribes, stretching south from the headwaters of the Yellowstone River to the Arkansas River.[95] Subsequent treaties and agreements established reservations for the Tribes within their 1851 Treaty-recognized territory, with some Tribes forced to relinquish claims to larger land areas.[96]

The Missouri River main stem flows through the Fort Berthold Reservation in North Dakota, established by Executive Order on April 12, 1870, for the Mandan, Hidatsa, and Arikara Nations.[97]

Downstream, the Missouri's main channel is the eastern boundary of the Standing Rock Sioux, Cheyenne River Sioux, Crow Creek Sioux, and Lower Brule Sioux Indian Reservations, as established in the Act of March 2, 1889.[98] These Tribes, along with the Yankton Sioux Tribe and the Nebraska Tribes downstream, were directly and severely impacted by the Pick-Sloan program.[99]

Numerous Tribal communities were established on these reservations in the Missouri River riparian bottomlands.[100] The thick, wooded lands of the Missouri River corridor in the upper basin became the Treaty-protected Reservation homelands of numerous Tribes.[101] There was plenty of timber and natural cover for livestock and the soil was fertile.[102] Wildlife was abundant and the water supplies were plentiful.[103] As the U.S. Senate Committee on Indian Affairs recently explained,

> From 1851 to 1889, the United States entered into treaties and agreements with the tribes and bands of the Three Affiliated Tribes of the Fort Berthold Reservation and the Sioux Nation. In these treaties and agreements, the United States recognized the Indians' territories, and the tribes and bands reserved lands for their permanent homelands. Seven of these reservations are along the Missouri River in the states of North Dakota, South Dakota and Nebraska: the Fort Berthold Reservation, the Standing Rock Sioux Reservation, Cheyenne River Sioux Reservation, Lower Brule Sioux Reservation, Crow Creek Sioux Reservation, Yankton Sioux Reservation, and the Santee Sioux reservation.
>
> Although these reservations were significantly smaller than the tribes' former territories, the seven reservations were strategically located along the resource rich Missouri River. The Missouri River's wooded bottomlands provided the tribes' reservation economies with fertile agricultural lands, timber for lumber and fuel, coal deposits, seasonal fruits, habitat for wild game, medicines, shelter for domestic animals, and plentiful supplies of clean water. These lands were also an important part of the tribes' social,

> cultural, and spiritual lives. Much of the tribes' community infrastructure was located along the river, including, tribal homes, schools, hospitals, government buildings, churches, graveyards, and roads.[104]

The Corps of Engineers' dams on the Missouri River main stem would decimate these lands.[105] The Corps located the dams so as to minimize the impact of the reservoirs on the cities along the river in North and South Dakota.[106] The Corps targeted Tribal lands, which were inundated as the sites of the reservoirs.[107] Two dams, Fort Randall at Yankton[108] and Big Bend at Lower Brule and Crow Creek, were built on Indian Reservations.[109] The largest reservoirs, Sakakawea at Fort Berthold and Oahe at Standing Rock and Cheyenne River, largely overlaid lands taken from the Tribes.[110]

The scholar Vine Deloria, Jr., an enrolled member of the Standing Rock Sioux Tribe, described Pick-Sloan as "the single most

104 S. REP. NO. 111-357, at 1-2 (2010), *available at* http://www.gpo.gov/fdsys/pkg/CRPT-111srpt357/html/CRPT-111srpt357.htm.

105 This Article focuses on Pick-Sloan's impacts on those upper Missouri Basin Tribes most directly affected by the main stem dams and reservoirs. Some Tribes in the upper basin are located on major tributaries to the Missouri River, and have suffered the degradation of riparian lands and water resources due to reclamation projects authorized under Pick-Sloan. For example, the Bureau of Reclamation's Yellowtail project impounded the Big Horn River on the Crow Indian Reservation. United States v. Crow Reservation, 162 F. Supp. 108 (D. Mont. 1958); *see also* S. 2489, 110th Cong. (2008) (a bill to establish a trust fund in the amount of $90.5 million for the mitigation of damage on the Pine Ridge Indian Reservation, resulting from Reclamation's Angostura Unit). Additionally, lower basin Tribes, such as the Omaha Tribe and Winnebago Tribe, suffer the loss of Reservation wetlands, cultural sites, and other resources associated with the natural free-flowing river, which no longer exist. *See* U.S. ARMY CORPS OF ENG'RS, NORTHWEST DIV., *supra* note 62, at 3-8. Yet the massive upper basin reservoirs on the Missouri main stem, which have generated region-wide and national benefits, caused very extreme hardship on the Indian Reservations on which they are located.

109 *See* Lower Brule Sioux Tribe v. South Dakota, 104 F.3d 1017, 1023–24 (8th Cir. 1997) (finding that lower Brule Tribe lacks jurisdiction over non-Indian hunting on Corps of Engineers' Fort Randall and Big Bend project land within the Reservation).

110 *See* South Dakota v. Bourland, 508 U.S. 679, 689 (1993) (finding that Cheyenne River Sioux tribe lacks jurisdiction over non-Indian hunting on Corps of Engineers' Oahe project land within the Cheyenne River Reservation).

destructive act ever perpetuated on any tribe by the United States."[111] The Army Corps of Engineers relocated entire Tribal communities against their wishes in the late 1950s and early 1960s, to make way for the reservoirs created on the Missouri River under the Pick-Sloan Plan.[112] The replacement housing was located on the plains above the river valley, which was less fertile with scarce groundwater or vegetation making it a much less hospitable environment.[113] Community infrastructure was destroyed and not replaced by the Army Corps of Engineers.[114] Although Congress authorized the Corps to relocate Tribal cemeteries from the taken area, the Corps failed to do so.[115]

The Indian livestock economy on the Fort Berthold, Standing Rock, Cheyenne River, and Lower Brule Reservations never fully recovered.[116] Jobs in timber, livestock, and agriculture disappeared; subsistence hunting and gardening became much less productive. The replacement housing was inadequate.[117] The historian Michael Lawson described the plight of the affected Sioux Tribes as follows,

> Damages caused by the Pick-Sloan projects touched every aspect of Sioux life. Abruptly the tribes were transformed from a subsistence to a cash economy and forced to develop new ways of making a living. The uprooting of long-standing Indian communities disrupted and disorganized the social, economic, political, and religious life of well-integrated tribal groups and had a serious effect on the entire reservation population. It was an onerous imposition for tribal members to be forced to move their community halls, churches, and religious shrines. It was even harder for them to disturb the graves of their ancestors. Yet . . . the largest cemeteries and most of the private burial grounds had to be excavated and moved elsewhere. (footnote omitted).

> . . . Psychological and aesthetic damages were more difficult to measure. . . . Because of their close relationship with nature, the Sioux had a sacred attachment to their land. The areas along the river had afforded them a comfortable and relatively scenic environment with resources enough to sustain their way of life. The loss of this land and livelihood had a strong emotional impact on them. . . . Unlike others affected by public works projects, they were not able to duplicate their old way of life by moving to a similar environment. No Indian lands like the ones vacated existed after inundation.[118]

The Three Affiliated Tribes of Fort Berthold objected strenuously to the construction of the Garrison Dam.[119] The Tribal Council passed a resolution opposing the sale of Tribal land for the reservoir site. The resolution explained,

> The lands which will be flooded are practically all the lands which are of any use or value to produce feed for stock or winter shelter. We are stockmen and our living depends on our production of cattle . . . . All of our people have lived where we now are for more than 100 years. Our people have lived on and cultivated the bottomlands along the Missouri River for many hundreds of years. We were here before the first white man set foot on this land. We have always kept the peace. We have kept our side of all treaties. We have been, and now are, as nearly self-supporting as the average white community . . . . [W]e cannot agree that we should be destroyed, drowned out, removed, and divided for the public benefit . . . .[120]

The Tribal Council Resolution was prophetic.

B. Pick-Sloan as an Exercise of Plenary Power in the Termination Era

Nevertheless, "[t]he Pick-Sloan Plan was presented . . . as a fait accompli."[121] Pursuant to the 1903 Supreme Court decision in *Lone Wolf v. Hitchcock* the federal courts deferred to Congressional authority in the taking of Tribal lands for most of the twentieth century.[122] This is the case even if the Tribe's title to forcibly acquired land was guaranteed by Treaty.[123]

122 Lone Wolf v. Hitchcock, 187 U.S. 553, 565 (1903).

123 *Id.*

The so-called "plenary power" doctrine stemmed from developments in the southern plains. The 1867 Treaty of Medicine Lodge Creek established a Reservation for the Kiowas, Comanches, and Apaches in what is now Oklahoma.[124] Article XII of the treaty provided that any further cession of land would require the signatures of "at least three-fourths of all adult male Indians occupying the same."[125] In a scene to be repeated throughout the west, a government commission approached the Tribes in 1892, proposing to divide the Reservation land into allotments for individual Indian heads-of-households, and to purchase the remaining tracts for use by non-Indian homesteaders.[126] The Indian resisted, but an agreement was ultimately reached.

The Commissioners drafted a document and obtained signatures of approval by the Tribe, per Article XII of the Medicine Lodge Creek Treaty.[127] However, the document presented contained different terms than the agreement the parties had reached.[128] The altered terms were presented and approved by Congress.

Lone Wolf, a Kiowa Chief, initiated a legal action to enjoin implementation of the act, contending that it violated Article XII of the Treaty.[129] Ultimately, the Supreme Court would not stand in the way of the taking of Treaty-protected Tribal land. It held that, "Plenary authority over the tribal relations of the Indians has been exercised by Congress from the beginning, and the power has always been deemed a political one, not subject to be controlled by the judicial department of the government."[130] Moreover, "[T]he power exists to abrogate the provisions of an Indian treaty."[131]

With respect to fraud, the Court in Lone Wolf stated, "these matters, in any event, were solely within the domain of its legislative authority, and its action, conclusive upon the courts."[132] In a

concurring opinion, the fraud perpetuated on the Kiowas was described as "the usual process."[133]

Under the "plenary power" doctrine of the *Lone Wolf* case, the courts have largely deferred to Congress on the disposition of Indian land.[134] This left the upper Missouri Basin Tribes with no remedy to the Pick-Sloan plan.[135]

Nevertheless, a taking of Indian land must be authorized by Congress.[136] Executive branch agencies lack the authority to exercise eminent domain over these lands.[137] This is because the United States generally has recognized the Tribes' title to their lands by Treaty or statute.[138] The Secretary of the Interior holds trust title to Indian lands for the purpose of maintaining the Indian land base through

134 *See* United States v. John, 437 U.S. 634 (1978).

135 The "Plenary Power" doctrine established in *Lone Wolf* was severely curtailed in United States v. Sioux Nation of Indians, 448 U.S. 371 (1980) ("Lone Wolf's presumption of congressional good faith has little to commend it as an enduring principle . . . ." *Id.* at 414.). The Court will review acts of Congress affecting Tribes to ensure they pass constitutional muster under the Fifth Amendment due process clause; Delaware Tribal Bus. Comm. v. Weeks, 420 U.S. 73 (1977), as well as the takings clause; Sioux Nation of Indians, 448 U.S. at 390–95; *see also* Babbitt v. Youpee, 519 U.S. 234 (1997) (finding that Escheat provisions of the Indian Land Consolidation Amendments for small fractionated interests to Indian allotments violate takings clause). The plenary power doctrine has been discredited as a source of federal power over Indians. Nell Jessup Newton, *Federal Power over Indians: Its Sources, Scope, and Limitations*, 132 U. PA. L. REV. 195, 228–33 (1984) (providing an overview of Congressional acts providing for judicial review for Tribes); Robert A. Williams, Jr., *The Algebra of Federal Indian Law: The Hard Trail of Decolonizing the White Man's Indian Jurisprudence*, 1986 WIS. L. REV. 219, 263. Nevertheless, the Congress continues to exercise very broad authority over Indian affairs. *See, e.g.*, Tribal Law and Order Act of 2010, Pub. L. No. 111-211, 124 Stat. 2261–2301 (codified as amended at 25 U.S.C. §§ 2801–2815 (2012)); Indian Trust Fund Management Reform Act of 1994, 25 U.S.C. §§ 4001–4061 (2012); 25 U.S.C. §§ 151–162a (2012); Indian Gaming Regulatory Act of 1988, 25 U.S.C. §§ 2701–2721 (2012). This is often to the chagrin of Tribes and Tribal leaders. *See* Red Lake Band of Chippewa Indians v. Swimmer, 740 F. Supp. 9, 11–12 (D.D.C. 1990) (rejecting Tribe's contention that IGRA's requirement that Tribes compact with states for Class III Gaming unconstitutionally infringes on Tribal sovereignty).

136 United States v. Winnebago Tribe, 542 F.2d 1002, 1006 (8th Cir. 1976).

137 United States v. Dion, 476 U.S. 734, 740–43 (1986) (finding that Endangered Species Act abrogated Indians right to hunt protected species, even for feathers needed for religious and ceremonial uses).

138 *See* Tee-Hit-Ton Indians v. United States, 348 U.S. 272, 279 (1955).

restrictions on alienation.[139] The Court treated reservations established by Executive Order no differently than those established in treaties.[140]

The Standing Rock Sioux Tribe resisted the condemnation of its land by the Army Corps of Engineers for the site of Oahe Reservoir. The Corps initiated eminent domain proceedings for Tribal land in the Oahe Reservoir site.[141] The district court for South Dakota ruled in favor of the Tribe, enjoining the taking, for lack of prior authorization by Congress.[142]

The Flood Control Act authorized the project, but did not provide for the acquisition of the Indian lands where the Corps proposed to build the dams and reservoirs.[143] Consequently, it was necessary for Congress to enact additional legislation to authorize the acquisition of Reservation lands along the Missouri River for the construction of the Fort Randall, Oahe, and Garrison Dams.[144] In 1950, Congress passed a bill that directed the Army Corps of Engineers and Bureau of Indian Affairs to coordinate their efforts in appraising Indian land along the Missouri River, and negotiated for the acquisition of the lands needed by the Corps for the main stem reservoirs.[145]

The Corps of Engineers began construction before the Indian land being utilized for the dams and reservoirs was even acquired.[146] This resulted in harried and inadequate appraisals of the value of Tribal land.[147] It also intensified the pressure on the Tribes to agree to a sale price for their rich, fertile Missouri River bottomland forests.[148] Meanwhile, the Bureau of Indian Affairs used its authority for the approval of Tribal Attorney contracts to pressure Tribes into accepting unfavorable settlements.[149]

Moreover, the 1950s saw the onset of the "termination era" of Indian policy.[150] The cold war was underway.[151] Free markets and individual freedoms buttressed notions of Soviet collectivism.[152] Yet on Indian Reservations, there remained considerable amounts of Tribally-owned land and community-based microenterprises, such as the vast community gardens in the Missouri River bottomlands.[153] Certain policy-makers in Congress sought to impose the individualist American ethic on Tribal communities by terminating Tribal status and disestablishing Reservations.[154] This would relieve the budget of federal program outlays on the Reservations, though the programs to be eliminated were Treaty obligations.[155] There was an obvious element of racism to the "termination" policy.[156]

On August 1, 1953, Congress adopted House Concurrent Resolution 108, declaring the federal policy "to make the Indians . . . subject to the same laws and entitled to the same privileges and responsibilities as are applicable to other citizens . . . [and] to end their status as wards."[157] The following year, Congress passed legislation terminating seventy Tribes, most notably Oregon's Klamath Tribe and Wisconsin's Menominee Tribe.[158]

President Nixon formally repudiated the termination policy, in a 1979 Message to Congress. H.R. DOC. 91-363, 91st Cong. (1970). The Tribal status of the

In contrast, none of the upper Missouri Basin Tribes affected by the Pick-Sloan plan were terminated.[159] However, termination was the underlying policy environment in which these Tribes were forced to negotiate Congressional legislation for the sale of their best land. It proved to be an extraordinarily difficult task.[160]

C. Overview of Legislation Authorizing the Taking of Reservation Land

The Three Affiliated Tribes of Fort Berthold were the first Tribe to agree with the proposed legislation.[161] This resulted in the enactment of Public Law 81-437, which provided for the acquisition by the United States of 152,360 acres of the Missouri River riparian lands meandering across the middle of the Fort Berthold Reservation.[162] The Army Corps of Engineers had set aside $5.1 million from prior-year appropriations to acquire the Fort Berthold lands.[163] Public Law 81-437 authorized an additional $7.5 million payment for total compensation of $12.6 million.[164] Section 3 of the statute established a multi-agency appraisal board to appraise allotments and determine payments for individual landowners, who retained the right to appeal the appraisal.[165]

Under Section 14 of Public Law 81-437, Congress recognized the Three Affiliated Tribes as a public entity, eligible to acquire the low cost power generated at Garrison Dam under the Rural Electrification Act of 1936.[166] Although this merely codified the Tribes' preexisting status, it was an important recognition that the Indian Tribes should share in its hydropower benefits, in common with the rural electrical

---

Klamath Tribe was restored by Congress in 1986. 25 U.S.C. § 566 (2012). The Menominee Tribe regained its status as a federally recognized Tribe in the Menominee Restoration Act of December 22, 1973, 25 U.S.C. §§ 903–903f (2012).

159 *See* Rosebud Sioux Tribe v. South Dakota, 900 F.2d 1164 (8th Cir. 1990) (finding South Dakota did not obtain civil jurisdiction over Indian Reservations in the state under Publ. L. 280, a termination-era statute authorizing state jurisdiction in Indian Country for certain states).

cooperatives serving predominantly non-Indian communities. However, the U.S. Western Area Power Administration, which markets Pick-Sloan hydropower, refused to enter firm power contacts with the Three Affiliated and other Missouri Basin Tribes until January 1, 2000—over fifty years after Congress enacted this provision.[167]

Legislation approving the acquisition of Fort Berthold Reservation lands paved the way for the construction of Garrison Dam, the largest earthen dam in the United States.[168] The creation of Lake Sakakawea on the Reservation was devastating to the Three Affiliated Tribes; the lake forced relocation of eighty percent of the Tribal members and inundated one-fourth of all Reservation land, including all of the timber, agricultural and grazing land, and government agency facilities.[169] And so it would be for the Sioux Tribes downstream.

"The Oahe Dam destroyed more Indian land than any other public works project in America."[170] Separate acts of Congress provided for the acquisition of Indian land for the Oahe Reservoir from the Cheyenne River and Standing Rock Sioux Tribes.[171] The Cheyenne River Sioux Tribe obtained a settlement of $5.4 million as appraised taken land value plus $5.2 million for economic and social rehabilitation, for a total settlement of $10.6 million.[172] The Tribe lost 104,420 acres of Missouri River bottomlands, crippling the Reservation's livestock industry and causing the relocation of government facilities over sixty miles to Eagle Butte.[173]

Nevertheless, Cheyenne River's legislation contained important provisions. The rehabilitation funding was sorely needed by all affected Tribes. The rehabilitation provision in the Cheyenne River act represented the first time that Congress recognized the tremendous socioeconomic hardship the dams were causing on the

Reservations.[174] It was an important precedent that benefitted the other affected Tribes.

Section 10 of act also guaranteed Tribal members hunting, fishing, and grazing rights on the taken land—as well as access to the Oahe Reservoir—subject to Corps' regulations.[175] The Tribe also retained mineral rights subsurface to the taken land.[176] Significantly, the relocation and reconstruction of Tribal and federal facilities were to be paid out of Oahe project funds, not the Tribal compensation fund.[177] Tribal members retained the right to challenge Corps' appraisals in federal court;[178] although as a practical matter, few possessed the resources to do so.[179]

After the Standing Rock Sioux Tribe defeated the Corps' attempt to condemn Tribal lands, Congress acted. Under Public Law 85-915, the United States acquired 55,993.82 acres of Standing Rock Reservation bottomlands for payment of $5.3 million plus approximately $7 million in rehabilitation funds for a total settlement of $12.3 million.[180] Standing Rock—like Cheyenne River—retained hunting, fishing, and grazing rights on the taken lands, subsurface mineral rights, and guaranteed access to the reservoir.[181]

Significantly, Congress omitted payment to Standing Rock of compensation for the bed of the Missouri River within the Reservation.[182] Consequently, at least one Tribe affected by Pick-Sloan retained its claim to the title to the bed of the Missouri River.[183]

Cherokee Nation of Oklahoma, 480 U.S. 700, 705–06 (1986) (finding a clear congressional intent to compensate Tribe is needed to overcome navigation servitude).

The Fort Randall and Big Bend Dams are the other Missouri River main stem dams that impacted the Sioux Tribes.[184] Both projects affected the Lower Brule and Crow Creek Sioux Tribes.[185] Congress enacted separate bills on September 2, 1958 (the same day as the Standing Rock taking act), authorizing the acquisition of 7,997.67 acres of on the Lower Brule Reservation for $976,503[186] and 9,418.69 acres at Crow Creek for $1.4 million.[187] This land was inundated by Lake Francis Case, created by Fort Randall Dam.[188] These Tribes did not receive rehabilitation funds.

In a final blow, the last dam built on the Missouri River main stem, Big Bend, was installed at Fort Thompson, the largest community on the Crow Creek Reservation east of the river and the community of Lower Brule on that Reservation on the western shore.[189] Like at Fort Berthold, Standing Rock, and Cheyenne River, the entire communities of Fort Thompson and Lower Brule had to be relocated.[190]

Congress passed a second round of legislation taking more land from the Lower Brule and Crow Creek Tribes for the Big Bend Dam and Lake Sharpe. Public Law 87-735 provided for the acquisition of an additional 6,179 acres of the Crow Creek Reservation Missouri River bottomlands for $564,302 plus rehabilitation funding of $3.8 million.[191] Lower Brule was forced to cede an additional 14,299 acres for payment of $1.25 million plus approximately $2 million for rehabilitation.[192] The Big Bend legislation directed the Corps to replace cemeteries, schools, hospitals, and other community facilities at Fort Thompson and Lower Brule to be paid by project funds, not Tribal compensation or rehabilitation funds.[193] The Tribes retained

grazing, hunting, and fishing rights subject to the Corps of Engineers' regulations.[194]

Overall, Pick-Sloan caused more damage to Indian land and resources than any public works project in American history.[195] Approximately 356,000 acres of Indian Reservation lands were taken for Pick-Sloan, representing twenty-three percent of the 1,499,759 acres impacted by the main stem dams, reservoirs, and transmission lines.[196]

The upper Missouri River basin Indian Tribes were negatively and disproportionately affected by the Pick-Sloan program.[197] The payments authorized, often belatedly, were based on hasty appraisals, and were clearly inadequate in light of the harm that was suffered.[198] Congressionally-directed mitigation measures, such as the reconstruction of hospitals and government offices as well as the relocation of cemeteries, were often ignored by the Corps of Engineers.[199] The forced relocation of Tribal communities for the Pick-Sloan program caused socioeconomic depression which has lingered for decades.[200] For these reasons, Congress revisited the question of compensation to the Tribes a generation later.

D. Subsequent Compensatory Legislation for the Missouri Basin Tribes

1. Background–The Garrison Diversion

Efforts to properly compensate the Tribes for their tremendous injury resulting from the Pick-Sloan program arose in the context of non-Indian irrigation projects. The Sloan Plan had provided for the development of irrigation by the Bureau of Reclamation for approximately three million acres in the upper Missouri Basin.[201] A main component of this was the Missouri-Souris Project, a plan to irrigate 1,275,000 acres in North Dakota.[202] After the construction of Garrison Dam, the Bureau of Reclamation redesigned the project, using Lake Sakakawea as the point of diversion for the irrigation of one million acres in central and eastern North Dakota. The new plan, known as the Garrison Diversion, engendered national and even international controversy.[203]

Soon after the main stem dams and hydropower facilities were completed, concerns arose about the over-runs and cost-benefit ratio of Pick-Sloan, especially irrigation.[204] The Appropriations Act of August 14, 1964, required Congressional reauthorization of the irrigation projects approved as part of the Sloan Plan in the 1944 Flood Control Act.[205] Consequently, those irrigation projects authorized in the 1944 Act, but which had not received Congressional appropriations and had not been built, needed to be reapproved by Congress. Congress approved the first phase of the Garrison Diversion in 1965, authorizing construction of 250,000 acres of irrigation.[206]

205 Flood Control Act of 1944, Pub. L. No. 78-534, 58 Stat. 887 (codified in scattered Sections of 16, 33, and 43 U.S.C.).

206 Pub. L. No. 89-108, 79 Stat. 433–435 (1965).

The project as authorized was still a huge and inefficient inter-basin transfer of water.[207] Numerous large canals would crisscross the plains in North Dakota with drain irrigation run-off directed into Canada's pristine Hudson Bay basin.[208] The canals and other project facilities would remove thousands of acres of productive dry-land farms out of production, and destroy valuable prairie pothole wetlands.[209] The project's estimated cost at $334 million, to be repaid mostly by Pick-Sloan power revenues under the generous repayment provisions of Section 9 of the Flood Control Act, rendered it economically infeasible.[210]

Thus, Garrison prompted strong opposition among many North Dakota farmers and landowners, national environmental groups, and the Canadian government.[211] This opposition stifled Congressional appropriations in the years after the project was authorized.[212]

But many North Dakotans rallied around Garrison. The delay in its completion was perceived by some as a broken promise made by the federal government to the state. Consequently, Congress established the Garrison Diversion Unit Commission to make recommendations to scale down and reformulate the project. The statute recognized "the entitlement of the State of North Dakota to a federally-funded water development program as compensation for North Dakota's contribution to the Pick-Sloan program."[213]

Thus, the effort to build the Garrison Diversion was framed in terms of the loss of land in North Dakota for the site of the Garrison Dam, Lake Sakakawea, and the Oahe Reservoir.[214] On December 20, 1984, the Garrison Diversion Unit Commission issued its report with recommendations to significantly scale back the irrigation project and reformulate Garrison for municipal, rural, and industrial water supplies in North Dakota.[215] The Garrison Commission acknowledged that, of all North Dakotans, the Three Affiliated Tribes of Fort Berthold and the Standing Rock Sioux Tribe were perhaps most

affected by Pick-Sloan.[216] It recommended that the Secretary of the Interior appoint a second commission for the sole purpose of evaluating the impacts on the affected North Dakota Tribes.[217]

Congress generally accepted the Commission's recommendations and enacted the Garrison Diversion Unit Reformulation Act of 1986.[218] The Act de-authorized 876,180 acres of irrigation development, which Congress previously approved in the 1944 Flood Control Act and 1965 Garrison Act.[219] Funding was reauthorized for irrigation projects for 130,940 acres with the requirement of wetlands development equal in acreage to those wetlands impacted by the project.[220]

The thrust of the act was the significant authorization of funding for the development of municipal water supplies in North Dakota.[221] The sum of $200 million was authorized for "municipal, rural, and industrial" water development, to be matched with a twenty-five percent cost-share by the state of North Dakota.[222] Additionally, the act extended Pick-Sloan subsidized power rates to the new water systems.[223] This reflected a new political reality in which Pick-Sloan repayment resources shifted from inefficient irrigation projects to municipal water supplies.

The Congressionally-declared purpose of the act was "to offset the loss of farmland within the State of North Dakota resulting from the construction of major features of the Pick-Sloan Missouri Basin Program."[224] As stated above, in issuing its recommendations to

---

reformulate the project, the Garrison Diversion Unit Commission recognized that the Tribes suffered a tremendous loss of land that should be redressed.[225]Consequently, the Garrison Unit Reformulation Act contained $67 million for irrigation at Fort Berthold and Standing Rock and MR&I funding in the amount of $20 million for the two Tribes and the Spirit Lake Sioux Tribe.[226]

2. The Joint Tribal Advisory Committee for Standing Rock and the Three Affiliated Tribes of Fort Berthold

Meanwhile, former Secretary of the Interior Donald Hodel implemented the recommendation of the Garrison Commission by appointing another blue-ribbon committee of North Dakotan and national leaders, known as the Joint Tribal Advisory Committee ("JTAC"), to evaluate compensation for the two Tribes.[227] The JTAC issued its Final Report on May 23, 1986.[228] The committee recommended additional compensation to the Three Affiliated Tribes in a range of $178-411 million and to Standing Rock in a range of $181-350 million.[229] It also recommended full funding for Tribal municipal water and irrigation development, federal protection of reserved water rights, and the return to the Tribes of taken lands that were not inundated by the reservoirs.[230]

Congress acted on the JTAC Report with the passage of the Three Affiliated Tribes and Standing Rock Sioux Tribe Equitable Compensation Act of 1992.[231] The act included a finding that "Congress concurs in the Advisory Committee's findings and conclusions that the United States Government did not justly compensate such Tribes when it acquired those lands."[232]

Trust funds were established as equitable compensation in the amount of $149.2 million for the Three Affiliated Tribe of Fort

Berthold and $90.6 million for Standing Rock, each to be capitalized at a schedule equal to twenty-five percent of the gross revenues of the Western Area Power Administration.[233] An additional $60 million was added to the Fort Berthold fund from appropriations previously approved for irrigation at Fort Berthold in the 1986 Garrison Reformulation Act.[234] The principal of the trust funds were to remain untouched with interest to be transferred to the Tribes on an annual basis after the funds had been fully capitalized.[235] The funds were to be used by the Tribes for "educational, social welfare, economic development, and other programs," and could not be distributed on a per capita basis.[236]

Rather than compensate the Tribes at the level recommended by the JTAC, Congress based its figures on estimates provided by the Congressional General Accounting Office (GAO).[237] The JTAC had recommended higher levels of compensation based upon economic analysis of direct and indirect damages that were not accounted for in the land appraisals in addition to foregone capitalized resources to present-day values.[238] The GAO urged a different approach. It researched the legislative history and negotiations surrounding the acquisition of land from the Tribes in the 1940s and 50s and attempted to glean what an equitable deal would have been at that time, accounted for inflation.[239] Congress adopted the GAO approach and reduced the level of compensation to the Three Affiliated Tribes and Standing Rock Sioux Tribe from the level recommended by the JTAC.

The JTAC also recommended the return to the Tribes of surplus taken lands.[240] The Army Corps of Engineers acquired much more

land for the Pick-Sloan reservoirs than is used for the site of the reservoirs.[241] As a result, large tracts of federal lands enclosed the reservoirs.[242] Indeed, Section 1(b) of the Public Law 85-915, which authorized the taking of Standing Rock Reservation lands for Oahe Reservoir, provided that,

> Upon a determination by the Secretary of the Army . . . within two years from the date of this Act, that any of the [taken] lands . . . are not required for Oahe project purposes, title to such land shall be revested in the former owner . . . .[243]

Clearly, Congress contemplated the possibility that the amount of land which it authorized the Army Corps of Engineers to acquire from Standing Rock may exceed the amount of land actually required.[244] Nevertheless, the statutory provision vests discretionary authority with the Army Secretary to determine whether to return land to the Tribe.[245] It was not a mandate.[246] The Secretary did not exercise this authority during the two-year time period referenced in the statute and since has avoided calls for administrative action to transfer land back to the affected Tribes.[247]

The Equitable Compensation Act addressed this by requiring the Secretary of the Army to transfer title to the Pick-Sloan project land within the Fort Berthold and Standing Rock Reservation boundaries to the Secretary of the Interior.[248] The lands to be transferred were those tracts acquired from the Tribes or Tribal members but that lay above the reservoirs' maximum pool level.[249] The transfer was subjected to a flowage easement for reservoir operations, although by

definition they were above the reservoir pool elevation.[250] The Secretary of the Interior was then obligated to administer the former Tribal tracts and offered a right of first refusal to former owners or their heirs of former family-owned allotments to reacquire the land at present-day market value.[251] If the right was not exercised, then Secretary administered the land as Tribal land.[252]

The process prescribed by Congress to transfer surplus Pick-Sloan project lands to Standing Rock and the Three Affiliated Tribes of Fort Berthold was needlessly convoluted. It required the Secretaries of the Interior and Army to coordinate the offer of first refusal and title transfer to literally thousands of allottees.[253] The statute obligated the Interior Secretary to make the offer of first refusal to the Tribes and former landowners within one year.[254] The agencies failed to implement the act in a timely manner, and instead informed Congress that the cost of transferring the land would be $21 million—four times the estimated value of the land.[255]

Citing the controversy, North Dakota Senator Kent Conrad sponsored an amendment to the Emergency Supplemental Appropriations Act of 1994 to repeal the land transfer provisions of the Equitable Compensation Act.[256] Enacted as Section 407 of the statute, the Conrad amendment authorized the Corps of Engineers to transfer surplus Pick-Sloan project lands under its general land disposal authority for Tribes, rather than the procedure prescribed in

the Equitable Compensation Act.[257] The Corps conveyed only small tracts, however.[258]

Subsequently, Congress authorized the transfer of some Pick-Sloan project land above the main stem reservoirs in South Dakota.[259] The Water Resources Development Act of 1999 directed the Secretary of the Army to transfer the Corps of Engineers' land.[260] The Corps' land above the reservoir pools within the Cheyenne River and Lower Brule Sioux Reservations was to be transferred to the Secretary of the Interior to be held in trust for the respective Tribes.[261] And the project land in South Dakota outside of the Indian Reservations was to be transferred to the state.[262] The Water Resources Development Act of 1999 authorized $108 million for wildlife mitigation trust funds in South Dakota and $38 million for the two Tribes to share.[263] The Act also required that federal protections for historic properties under the National Historic Preservation Act[264] and Native American Graves Protection and Repatriation Act[265] were to remain in effect on transferred lands. Environmental statutes, such as the National Environmental Policy Act,[266] Clean Water Act[267] and Endangered Species Act[268] were also to remain in effect on transferred lands.

The Standing Rock and Crow Creek Sioux Tribes, like Cheyenne River and Lower Brule, had Pick-Sloan riverine lands on their Reservations acquired from the Tribe and laid fallow above the reservoirs.[269] But Standing Rock and Crow Creek chose not to be

257 "[S]ections 3508 and 3509 of the Three Affiliated Tribes and Standing Rock Sioux Tribe Equitable Compensation Act are repealed . . . . *Provided*, That the U.S. Army Corps of Engineers should proceed with the Secretary of the Interior to designate excess lands and transfer them pursuant to Public Law 93-599." included in the Water Resources Development Act.[270] There was concern amongst some Tribes and Tribal members with the transfer of the Corps of Engineers' land outside of Indian Reservation boundaries to the state of South Dakota because some of these lands were once part of the Great Sioux Reservation as established in the 1868 Fort Laramie Treaty.[271] The patchwork land management jurisdiction resulting from the transfer of federal riverine lands to the state and the potential impacts on historic preservation became a Tribal concern as well.[272]

3. Compensatory Legislation for the Sioux Tribes in South Dakota

Although Congress repealed the land transfer provisions of the Three Affiliated Tribes and Standing Rock Sioux Tribe Equitable Compensation Act, the establishment of trust funds for these Tribes served as precedent for the South Dakota Tribes. Congress enacted compensatory legislation for the Crow Creek Sioux Tribe in 1996,[273] the Lower Brule Sioux in 1998,[274] and the Cheyenne River Sioux in 2002.[275]

As with the original land-taking acts in the 1950s, the statutes for each of the Tribes have some similarities and some differences. The statutes for Crow Creek and Lower Brule authorized trust finds of $27.5 million and $39 million, respectively, to be financed according to the schedule of Pick-Sloan hydropower receipts as in the Three Affiliated Tribes and Standing Rock Sioux Tribe Equitable Compensation Act. The trust funds were deemed adequate by the Clinton administration because they were proportionate to those authorized for the North Dakota Tribes.[276] The authorized use of the

funds for Crow Creek and Lower Brule was targeted for facilities such as schools, hospitals, and government buildings—with an emphasis on infrastructure.[277] In the 1962 Big Bend Act, Congress directed the Corps of Engineers to replace these facilities out of the project budget when the communities of Fort Thompson and Lower Brule were relocated.[278] In the late 1990s, Congress' stated purpose in legislation for these Tribes was to finance the new community facilities promised to the Tribes when Big Bend Dam was built thirty years earlier.[279]

The Cheyenne River Sioux Tribe Equitable Compensation Act of 2002 established a $290 million trust fund reflective of the Tribe's larger land base and the sum of Reservation lands inundated by the Oahe Dam.[280] Unlike Crow Creek and Lower Brule, the schedule for capitalization of the Cheyenne River trust fund was unrelated to the receipts from the sale of Pick-Sloan hydropower. Deposits to the fund were made from appropriations to the general fund of the treasury.[281]

The compensatory legislation for all of the Missouri River Tribes required that they develop plans for the expenditure of funds for common developmental needs, such as "economic development," "infrastructure," and "educational, health, recreational, and social welfare objectives."[282] Every statute prohibits the distribution of funds to Tribal members on a per capita basis—with an emphasis on community-wide development.[283] All of the acts contained language prohibiting reductions in federal services or impacts on Treaty rights. The Cheyenne River Equitable Compensation Act contained additional language extinguishing any future damage claims relating to Oahe Dam.[284]

Unlike the Three Affiliated Tribes and Standing Rock Sioux Tribe Equitable Compensation Act, the settlements for the Sioux Tribes in

South Dakota contained no provisions for the return of Pick-Sloan project lands.[285] Congress dealt with this issue for the Cheyenne River and Lower Brule Sioux Tribes, along with the state of South Dakota, in the 1999 Water Resources Development Act.[286] As of the present, the issue of the transfer of surplus Pick-Sloan project taken lands on the Fort Berthold, Standing Rock, and Crow Creek Reservations remains unresolved.

Ultimately, the process by which the Missouri River Tribes obtained additional compensation for the taking of their valuable riparian land was as piecemeal and problematic as the legislative process for the original taking acts during the termination era of the 1950s. Consequently, some Tribes have continued to petition the Congress for land restoration or additional compensation.[287] On November 1, 2007, the Senate Committee on Indian Affairs conducted a hearing on unresolved Tribal claims under Pick-Sloan.[288] In testimony to the committee, the General Accounting Office (GAO) presented its established ranges of recommended compensation for each of the Missouri River Tribes.[289] The GAO testimony suggests that at least one Tribe, the Standing Rock Sioux, may be entitled to additional compensation, relative to the other Tribes.[290]

In the following Congress, North Dakota Senator Byron L. Dorgan introduced the Pick-Sloan Tribal Commission Act, to establish an expert commission to study the unresolved claims of the Indian Tribes directly affected by Pick-Sloan.[291] The bill was reported by the Committee on Indian Affairs,[292] but was not acted upon by the Senate. Its future remains uncertain.

ONGOING IMPACTS OF THE CORPS OF ENGINEERS' MISSOURI RIVER OPERATIONS ON THE INDIAN RESERVATIONS ALONG THE MISSOURI RIVER

A. The Corps' Operations Under the Missouri River Master Water Control Manual

The Corps of Engineers operates the dams on the Missouri River pursuant to the *Missouri River Mainstem Reservoir System, Master Water Control Manual,* (hereinafter "Master Manual").[293] The Master Manual prescribes the criteria to be followed by the Corps for water releases for navigation, flood control storage space, and other Pick-Sloan authorized uses.[294] Each year, the Corps publishes an Annual Operating Plan ("AOP"), which estimates the precipitation and run-off and applies the criteria prescribed in the Master Manual to establish flow rates at the dams.[295]

On the Missouri River main stem, six dams and reservoirs comprise the Pick-Sloan program.[296] Four of these projects—Gavins Point Dam, Fort Randall, Big Bend, and Oahe—are located in South Dakota.[297] The largest dam, Garrison, is located in North Dakota, and the upstream-most project, Fort Peck, is located in northeastern Montana.[298]

The upstream reservoirs—Oahe, Garrison, and Fort Peck, are used to store snow melt in the spring, and are drawn upon to provide water for downstream navigation, and storage space for flood control.[299] The vast reservoirs contain storage space for millions of acre-feet of water.[300] The three downstream projects—Gavins, Point Dam, Fort

Randall, and Big Bend—are smaller dams, whose reservoirs have less storage space.[301]

The water releases for navigation on the lower Missouri River are the central feature of the Missouri River system operation.[302] The Corps of Engineers generally releases 35,000 cubic feet per second daily from the Gavins Point Dam to the lower reach of the Missouri River, from March 15 to November 15 of each year.[303] That is a significant, steady flow of water for the lower Missouri basin. Gone are the spring flood waters, the deposit of sediments for sandbars, and the lower flows of late summer when the murky, braided river rolled slowly across the plains.[304] As a result of the operation of the Pick-Sloan program by the Corps of Engineers, the Missouri River below Gavins Point Dam (near Sioux City, Iowa) is now a steady chute of a significant quantity of water, from mid-March to mid-November.[305]

In the springtime, the large upstream reservoirs—South Dakota's Lake Oahe, North Dakota's Lake Sakakawea, and Lake Fort Peck in Montana—receive recharge from snow melt in the Rocky Mountains.[306] Beginning with the water releases for navigation on March 15 of each year, the waters stored in these large reservoirs are drawn down by the Corps.[307] The navigation releases cause the water levels in the reservoirs to decline precipitously during the course of the navigation season.[308]

The Corps also releases water from the dams periodically, for other Pick-Sloan program functions.[309] There are releases to generate hydropower during the off-navigation season, which are at their highest level when demand peaks in the winter.[310] During the off-

310 *Id.*

navigation season, the Corps maintains sufficient river levels below Gavins Point Dam, for municipal intakes and nuclear plants along the lower Missouri.[311] The Corps also releases water as needed to break up winter ice jams in the river reaches between the reservoirs to prevent flooding.[312] Some years, the Corps of Engineers will release water from Gavins Point to the lower basin, to create a spring rise—an artificial "flood" for the purpose of depositing silt for sand bars for the nesting of endangered least terns and piping plovers species.[313]

The Corps of Engineers first issued the Missouri River Master Manual in 1960.[314] The extent of the Corps' authority to manage the Missouri River main stem reservoirs, as well as its operational priorities under the Master Manual, have engendered controversy since that time.

In *ETSI Pipeline Project v. Missouri*, the Court held that the Flood Control Act vested authority to enter contracts for the industrial use of water from the Missouri River main stem reservoirs with the Corps of Engineers, and not the Bureau of Reclamation.[315] The state of South Dakota had granted a water permit to Energy Transfer Solutions, Inc. (ETSI) to use water for an interstate coal slurry.[316] The U.S. Bureau of Reclamation then contracted with ETSI for the withdrawal from the Missouri River's Oahe Reservoir of 20,000 acre-feet of water annually for forty years, for use by the coal slurry.[317] The states of Missouri, Iowa, and Nebraska successfully challenged the contract, as exceeding the Bureau of Reclamation's authority under the 1944 Flood Control Act.[318]

Significantly, Justice White's opinion stated, "The Sloan Plan recognized that the 'dominant function' of Lake Oahe and the other main-stem reservoirs would be flood control and navigation, and therefore these projects would come under the jurisdiction of the Army and its Corps of Engineers."[319] That language may go too far,

however. Section 1(b) of the 1944 Flood Control Act, known as the O'Mahoney-Millikin Amendment, provides that,

> The use for navigation, in connection with the operation and maintenance of such works herein authorized for construction, of waters arising in States lying wholly or partly west of the ninety-eighth meridian shall be only such use as does not conflict with any beneficial consumptive use, present or future, in States lying wholly or partly west of the ninety-eighth meridian, of such waters for domestic, municipal, stock water, irrigation, mining, or industrial purposes.[320]

Justice White cited part of the legislative history of Section 9 of the Flood Control Act, in support of his dicta that navigation is a "dominant" purpose of Pick-Sloan.[321] S. Doc. 191 contains the Sloan Plan originally contemplated by the Bureau of Reclamation.[322] The pronouncement that navigation is the primary Pick-Sloan function was based on language in S. Doc. 191 that the "dominant functions" of the main stem reservoirs would be navigation and flood control.[323]

The legislative history to Section 1(b) of the Flood Control Act conflicts with that. The intent of the O'Mahoney-Millikin Amendment was explained by North Dakota Representative William Lemke:

> We are not going to take the water from the people in the states where it originated so that some fellow may float a yacht down the lower Mississippi Valley, while the people and their cattle in the

323 *ETSI Pipeline Project*, 484 U.S. at 512; *see also* Dep't of the Army, Mo. River Div., Corps of Eng'rs Office of Legal Counsel, *The Role of Recreation in the Regulation of the Corps of Engineers Constructed and Operated Main Stem Reservoirs of the Missouri River*, 4 GREAT PLAINS NAT. RESOURCES J. 26, 33 (1999). The Corps' Office of Legal Counsel relies on the Joint Engineering Report in S. Doc. 247 to support the contention that navigation and flood control are the Pick-Sloan primary purposes, with other purposes secondary. "It seems a rational conclusion that the reconciled plan produced in Senate Document 247 intended the phrase 'and other uses' following its recitation of the above primary purposes to encompass the purposes of domestic and sanitary purposes, wildlife, and recreation, which the reconciled report identified in its closing paragraph." *Id*. The Corps believes that the mere fact that the legislative history references "navigation, flood control . . . and other purposes" means that the two specified functions take precedence over other Pick-Sloan authorized purposes. *Id.* at 30–31.

> upper regions go hungry on account of the lack of food and water.[324]

Indeed, the opinion in *ETSI Pipeline* actually acknowledged that the legislative history is inconclusive.[325] Footnote 7 reads in part, "The self-styled 'joint engineering report' contained in the final Senate Document that effected a reconciliation of the Pick and Sloan Plans did not shed any further light on how the administrative jurisdictions of the two Departments were to be circumscribed . . . ."[326]

Nevertheless, Justice White's dicta in *ETSI Pipeline* was cited by the Eighth Circuit Court of Appeals in *South Dakota v. Ubbelohde*, which upheld the level of navigation water service provided by the Corps, as a reasonable balance of competing water uses during severe drought.[327] South Dakota had argued that the continued water releases at the main stem dams during the drought violated the Flood Control Act, which includes numerous project purposes, including fish and wildlife.[328] The Eighth Circuit ruled that, "The dominant functions of the Flood Control Act were to avoid flooding and to maintain downstream navigation."[329]

This issue affects the Tribes in the upper Missouri basin, such as the Three Affiliated Tribes of Fort Berthold, and the Standing Rock and Cheyenne River Sioux Tribes, whose water supplies and Reservation environment are impacted by the levels of the Sakakawea and Oahe Reservoirs.[330] The priority afforded to navigation in the management of Missouri River stream flows by the Corps of Engineers reduces reservoir levels on these Indian Reservations and impedes the ability of the Tribes to utilize and perfect their reserved water rights.[331]

Due to the severity of drought conditions in the Upper Missouri River Basin during the late 1980s, the Corps of Engineers reviewed

the operational priorities of the Master Manual.[332] Tribal issues seemed cast aside in the regional conflict pitting upper basin reservoir water users and against lower basin municipal water users and the navigation industry.[333] The Supreme Court explained the respective water needs of the upper and lower basin, in *ETSI Pipeline Project v. Missouri*,

> The topography of this area, however, reveals two distinct regions that experience very different water problems. The upper part of the Basin, which includes large Sections of Montana, Wyoming, North Dakota, and South Dakota, is mostly arid or semiarid; there, the Missouri River and its tributaries are important because they represent a major resource for developing the agricultural and industrial potential of the area. The lower part of the Basin, which includes territory in Nebraska, Kansas, Iowa, and Missouri, is more humid, and there the rivers are used chiefly for navigation, though the critical problem in this region is to control flooding.[334]

Meanwhile, the *Missouri River Master Water Control Manual Review and Update* took nearly fifteen years to complete, and then only by court order.[335] On March 19, 2004, the Corps released the *Final Environmental Impact Statement: Missouri River Master Water Control Manual, Review and Update* (hereinafter "Final EIS") and the updated 2004 Master Manual.[336] They established "drought conservation measures," to enhance flexibility to reduce navigation releases from the dams during drought.[337] Under the 2004 revision to the Master Manual, the Corps will check the amount of water in storage in the Pick-Sloan reservoirs on March 15 and July 15 of each

year.[338] If the amount of stored water declines to identified "target" levels due to drought, the Corps reduces or eliminates navigation service.[339]

Essentially, in the Final EIS and 2004 Master Manual, the Corps maintained the status quo with respect to its operational priorities under its 1979 Master Manual.[340] The release of a high volume of water for navigation continues, but with the prospect of reduced streamflows during drought.[341] The *2004 Master Manual* provides administrative authority to the Corps to reduce the water releases for navigation during periods of extreme drought.[342] The Corps also committed to utilize its new adaptive management authority to experiment with water releases for a spring rise, and to develop new habitat for affected species.[343]

A series of lawsuits against the Corps of Engineers over the 2004 Master Manual by upper Missouri basin states,[344] lower basin states,[345] and environmental groups,[346] was consolidated in the District Court of Minnesota.[347] In *In re Operation of the Missouri River System Litigation*, the court evaluated the adequacy of the Final EIS under the National Environmental Policy Act and Endangered Species

Act.[348] The district court entered summary judgment for the Corps of Engineers and other named federal defendants,[349] and the Eighth Circuit affirmed.[350]

The Eighth Circuit explained that, under NEPA, "When the resolution of the dispute involves primarily issues of fact and analysis of the relevant information 'requires a high level of expertise, we must defer to the informed discretion of the federal agencies.'"[351] It held that, "The FCA 'clearly gives a good deal of discretion to the Corps in the management of the River.'"[352] The court also reiterated that under the *ETSI Pipeline* and *Ubbelohde* cases, flood control and navigation were deemed the "dominant functions" of the Pick-Sloan program.[353]

In *In re Operation of Missouri River System Litigation*, the Eighth Circuit did not address the potential conflict between the portion of the Flood Control Act's legislative history which may express a preference for navigation, and Section 1(b) of the Act (the O'Mahoney-Millikin Amendment), which prohibits navigation water use from conflicting with agricultural and industrial uses in the upper basin.[354] The court held that, "The Corps' balancing of water-use interests in the 2004 Master Manual is in accordance (with the Flood Control Act)."[355] Having upheld the Corps, the court stated, "we need not address appellee South Dakota's argument," that the O'Mahoney-Millikin Amendment expresses preference for upstream water uses.[356] Thus, the Eighth Circuit invoked its prior dicta that navigation is the

356 *Id.* at 630 n.8.

"dominant purpose" of the Flood Control Act, without addressing the fact that Section 1(b) of the act suggests otherwise.[357]

The Three Affiliated Tribes of the Fort Berthold Reservation intervened in the Missouri River litigation.[358] The circuit court upheld the finding that the Tribes did not suffer an adequately particularized "injury-in-fact" from the 2004 Master Manual, to justify standing under Article III.[359] The Missouri River Tribes have suffered and continue to be affected by the Pick-Sloan program. The treatment of the Three Affiliated Tribes' claims in *In re Operation of Missouri River System Litigation* demonstrates that, in litigation relating to the Missouri River, Tribes may need to show injury specific to their Reservation in order to have Article III standing.

As a result of the Corps' Missouri River operations under the Master Manual, the Oahe Reservoir, and Lakes Sakakawea and Fort Peck experience huge fluctuations in their water levels.[360] This has significant impacts on the water supply, aesthetics and natural environment in the Tribal communities along the upper Missouri River, including Fort Berthold.[361] Moreover, the ability of the Tribes to perfect and utilize their reserved water rights is jeopardized by the Corps' operations under the Master Manual.[362]

---

357 *Id.* at 629–30. The district court had addressed this directly,

> South Dakota maintains that the FCA subordinates navigation to upstream uses of irrigation and domestic water supply [under the O'Mahoney-Millikin Amendment] . . . . South Dakota argues that the 2004 Master Manual is in "conflict" with South Dakota's consumptive beneficial uses, because the 2004 Master Manual allows for lower levels in reservoirs such that South Dakota may be required to build extensions to irrigation lines or extend intake structures . . . . South Dakota's argument lacks merit. . . . [R]equiring South Dakota to build extensions for irrigation lines or drinking water is not in 'conflict' with South Dakota's consumptive beneficial uses, because there is no destruction or denial of South Dakota's water rights.

In re Operation of the Mo. River Sys. Litig., 363 F. Supp. 2d 1145, 1154–55 (D. Minn 2005) (citations omitted). On appeal, the Eighth Circuit explicitly left this issue for another day. *In re* Operation of the Mo. River Sys. Litig., 421 F.3d at 630 n.8.

B. Indian Reserved Water Rights to the Missouri River

Many Indian Tribes in the upper Great Plains possess reserved water rights to the Missouri River main stem.[363] Indeed, "Upper Missouri Basin Indians were the first to successfully assert prior and paramount rights to provide water for Reservation lands that would otherwise be uninhabitable."[364] In *Winters v. United States*, the Supreme Court established that when Montana's Fort Belknap Tribe reserved rights to land, they also reserved water rights as needed to survive on the Reservation.[365]

The prior appropriation doctrine of water law applies in most western states, including Montana.[366] Under a prior appropriation scheme, a state water engineer or other official issues permits to water users, authorizing them to divert an established quantity of water and put it to a beneficial use, as defined by state law.[367] The date in which water is first diverted and put to beneficial use is generally the priority date for that water use.[368] During periods of shortage, the holder of an earlier (senior) priority date to a source of water will retain the right to use their full permitted quantity.[369] Permittees with later priority dates obtain water only after more senior holders fulfill their water right.[370] Shortages are not pro-rated. Prior appropriation water law favors "first in time, first in right."[371]

In the *Winters* case, an irrigator on the Milk River, a tributary to the Missouri River, diverted water upstream from the Fort Belkap Indian Reservation.[372] The upstream diversion diminished water

372 *Winters,* 207 U.S. at 566–69.

needed on the Reservation for a Tribal irrigation project.[373] Under principles of prior appropriation, the upstream water user whose diversion of water predated the Indian project was safe. However, the Court noted that "the power of the Government to reserve the waters [for the Indian Reservation] and exempt them from appropriation under the state laws is not denied, and could not be. . . . [T]he Government did reserve them . . . and for a use which would be necessarily continued through years [sic]."[374]

The Court held that the prior 1888 Agreement between the United States and the Tribes, which established Fort Belknap Indian Reservation, implicitly reserved water for the Reservation lands.[375] Even though Winters' water use predated the Tribal irrigation project, the Indian water right prevailed because the Reservation was established before Winters began irrigating.[376] Federal law reserves Indian water rights, [377] regardless of whether state or local law requires an actual diversion or appropriation.

Indian water rights have been characterized as "prior and superior" to state-granted water rights.[378] "prior" because the reservations were established before most western states and are thus senior during periods of shortage, and "superior" because Indian reserved water rights exist pursuant to federal law, rather than state law. As explained in *Cohen's Handbook of Federal Indian Law*,

> The *Winters* decision established that the creation of an Indian reservation impliedly reserves water rights to the tribe or tribes occupying the territory; that those water rights are reserved in order to carry out the purposes for which the lands were set aside; and that the rights are paramount to water rights later perfected under state law.[379]

379 COHEN'S HANDBOOK, *supra* note 150, at § 19.03(1).

Many Indian Reservations were established with an agricultural purpose.[380] In *Arizona v. California*, the Court held that "when the United States created these reservations or added to them, it reserved not only the land but also the use of enough water from the Colorado to irrigate the irrigable portions of the reserved lands."[381] The Court recognized a reservation of a quantity of water "to satisfy the future as well as the present needs of the Indian Reservations and [] that enough water was reserved to irrigate all the practicably irrigable acreage on the reservations."[382] Ultimately, the over-arching purpose of most Indian Reservations is to provide a permanent homeland for that Tribe,[383] which encompasses water for all beneficial uses, including livestock,[384] fish and wildlife,[385] and ceremonial uses.[386]

The precise quantity of a Tribe's reserved water right may be determined in an adjudication or by compact.[387] In the Missouri Basin, the Shoshone-Arapaho Tribes of the Wind River Reservation

387 Robert T. Anderson, *Indian Water Rights: Litigation and Settlements*, 42 TULSA L. REV. 23 (2006); "[J]udicial determinations of reserved rights are being replaced increasingly with settlement agreements . . . ." COHEN'S HANDBOOK, *supra* note 150, at § 19.03.

in Wyoming had their water rights quantified by state court decree,[388] and several Montana Tribes have entered reserved water rights compacts with the State of Montana.[389] Neither the Three Affiliated Tribes of Fort Berthold in North Dakota, nor the Tribes of the Sioux Nation downstream on the Missouri River, have quantified their water rights.[390]

Under *Winters*, the priority date of the water right is the date which the Reservation was established,[391] or earlier.[392] Consequently, "the exercise of tribal water rights has the potential to disrupt non-Indian water uses."[393] That is the gravamen of the controversy involving Indian reserved water rights to the main stem of the Missouri River.

C. Impacts of the Master Manual on Indian Water Rights

As described above, the Army Corps of Engineers operates the main stem dams primarily for flood control storage, water supply for downstream navigation, and to generate hydropower.[394] The Fort Berthold Reservation, and the Standing Rock, Cheyenne River, Crow Creek, Lower Brule, Yankton, and Santee Sioux Reservations all border the Missouri River.[395] "Reserved rights presumably should attach to all water sources—groundwater, streams, lakes, and springs—that arise on, border, traverse, underlie, or are encompassed within Indian reservations."[396] Thus, the Missouri Basin Tribes possess *Winters* Doctrine claims for the right to use the water of the Missouri River for beneficial use on the Reservations.[397]

As of the present, those claims remain unadjudicated.[398] Accordingly, the Corps does not know how much of the stored water in the main stem reservoirs for flood control and released for navigation and water supply in the lower Missouri is subject to upstream depletions for presently unadjudicated Indian water rights.[399]

Indian water rights are property rights stemming from the Treaties and other agreements between the Tribes and United States.[400] The United States has assumed a trust responsibility to protect Indian property,[401] including water rights.[402] The trust responsibility has been

401 Johnson v. M'Intosh, 21 U.S. 543, 573 (1823) (conveyance of land by Tribe invalid, for lack of fee simple title by Tribe; adjudged to be held by the United States due to much criticized "doctrine of discovery"); 25 U.S.C. § 462 (2012) (trust title retained by United States under Indian Reorganization Act of 1934).

402 Section 2 of the Western Water Policy Review Act of 1992 provides that, "the Federal government recognizes its trust responsibilities to protect Indian water rights and assist Tribes in the wise use of these resources." Western Water Policy Review Act of 1992, Pub. L. No. 102-575, § 3002(9), 106 Stat. 4694, *available at* file:///C:/Users/Law Student/Downloads/STATUTE-106-Pg4600%20(3).pdf; *see also* Robert T. Anderson,

compromised by conflicts of interest[403] and politics.[404] Nevertheless, it imposes responsibilities on agencies managing waters subject to the reserved rights claims of Indian Tribes.[405]

In *Northwest Sea Farms v. U.S. Army Corps of Engineers,* the district court explained the nature of the Corps' obligation to an Indian Tribe affected by its programs.[406] The court upheld the denial by the Corps of a permit for sea bed farming, due to the potential impact on Treaty fishing rights.[407] The court stated,

> The Supreme Court has recognized "the undisputed existence of a general trust relationship between the United States and the Indian people." This obligation has been interpreted to impose a fiduciary duty owed in conducting "any Federal government action" which relates to Indian Tribes. . . . [T]he duty extends to the Corps . . . .
>
> In carrying out its fiduciary duty, it is the government's, and subsequently the Corps', responsibility to ensure that Indian treaty rights are given full effect. . . . [T]he Corps owes a fiduciary duty to ensure that the [Indian] Nation's treaty rights are not abrogated or impinged . . . .
>
> . . . .
>
> . . . It is this fiduciary duty, rather than any express regulatory provision, which mandates that the Corps take treaty rights into consideration.[408]

Thus, "the courts have recognized the obligation of the United States, as trustee of the Indian tribes and people, to preserve and

408 *Id.* (citations omitted).

protect the Indian rights to the use of water."[409] For example, in *Pyramid Lake Paiute Tribe v. Morton*, a water allocation regulation issued by the Secretary of the Interior was struck down as arbitrary and capricious under the Administrative Procedures Act because the Secretary failed to demonstrate how the allocation fulfilled his obligation to protect the water rights of the affected Tribe.[410] The court held that,

> In order to fulfill his fiduciary duty, the Secretary must insure, to the extent of his power, that all water not obligated by court decree or contract goes to [the Pyramid Lake Reservation].
>
> . . . .
>
> The Secretary was obliged to formulate a closely developed regulation that would preserve water for the Tribe.[411]

Under this principle, the Missouri River Master Manual must contain "a closely developed regulation" to preserve water to fulfill the Tribes' water rights.[412]Nevertheless, with respect to water releases at Oahe Dam, which directly affect the Standing Rock and Cheyenne River Sioux Reservations, the Master Manual states,

> Oahe's primary water management functions are (1) to capture plains snowmelt and localized rainfall runoffs . . . that are then metered out at controlled release rates to meet System requirements . . . (2) to serve as a primary storage location . . . [for] major downstream flood control regulation . . . and (3) to provide the extra water needed to meet project purposes that draft storage during low-water years, particularly downstream water supply and navigation.[413]

The Corps of Engineers' manual for the operation of the Oahe Dam establishes priorities of "downstream flood control" and "downstream water supply and navigation."[414] There are no provisions demonstrating how "all water not obligated by court decree or

414 *Id.*

contract with the District goes to [the Tribes'" as required in the *Pyramid Lake* case.[415] The Master Manual lacks any operational criteria to ensure that Tribal waters are protected, in light of the stream flow management for downstream flood control and navigation. In this respect, it fails to meet the requirements described in *Northwest Sea Farms* case.[416]

The Corps' historian, John R. Ferrel, explained, "Indian rights regarding water management were not clarified nor considered in operational plans."[417] Actually, the Master Manual purports to divest the Corps of its responsibilities to the Tribes, because Indian reserved water rights to the Missouri River main stem have not been quantified and put to consumptive use.[418] The Master Manual states in relevant part:

> Currently, Tribal Reservation-reserved water rights have not been quantified in an appropriate legal forum or by compact . . . .
>
> . . . .
>
> . . . When a Tribe exercises its water rights, these consumptive uses will then be incorporated as an existing depletion. Unless specifically provided for by law, these rights do not entail an allocation of storage. Accordingly, water must actually be diverted to have an impact on the operation of the System. Further modifications to System operation, in accordance with pertinent legal requirements, will be considered as Tribal water rights are exercised . . . .[419]

In operating the main stem dams, the Corps concerns itself only with water depletions— not reserved rights. The Tribes' water rights are reserved for both present and future uses.[420] The reserved water rights to the Missouri River for future Indian uses are not "existing depletions," and are not taken into account by the Corps.

In operating the Missouri River main stem dams under the Pick-Sloan program, the Corps of Engineers possesses an obligation to

protect Tribal water supplies.[421] Instead, the Corps' Missouri River operations under the Master Manual focus exclusively on downstream navigation and water intakes, to the detriment of water uses on the Indian Reservations.[422]

In 2003, water releases at Oahe Dam for downstream navigation, in combination with drought conditions, caused low water levels in the Oahe Reservoir.[423] Excessive silt deposits resulted in the breakdown of the intake for the Fort Yates public water system on the Standing Rock Reservation.[424] On November 23, 2003, three Tribal communities lost their drinking water supplies for ten days.[425] The Corps of Engineers' water releases contributed to adverse environmental conditions, which led to a public health crisis on the Standing Rock Reservation.[426]

In its Missouri River operations, the Corps of Engineers ignores the detrimental impact of the impoundment and management of the Missouri River stream flows on the Tribes' ability to put their water

to beneficial use.[427] The resulting uncertainty complicates the Tribes' ability to perfect their *Winters* Doctrine claims through an adjudication or negotiated settlement.[428]

The quantification of Indian reserved water rights involves economic feasibility determinations for future water development projects.[429] In *Arizona v. California*, the Court recognized the Tribal reservation of agricultural water for the "practicably irrigable acreage" on the Reservations.[430] This has led some state courts, when adjudicating Indian water rights, to delve into the minutiae of irrigation engineering and agricultural economics.[431] The Secretary of the Interior's *Criteria and Procedures for the Negotiation of Indian Water Settlements* include feasibility criteria for future water projects in settlement agreements quantifying Indian water rights.[432]

Moreover, the Supreme Court has determined that the quantity of water reserved by the United States when it established a national forest must be determined narrowly with sensitivity to the impact on existing water users.[433] The management by the Corps of Missouri River streamflows under the Master Manual guarantees water supplies for downstream navigation and consumptive uses, in all but the most serious of drought conditions.[434] The Court's "sensitivity

434 *See supra* notes 320, 321 and accompanying text.

doctrine" applies to federal reserved water rights for national forests and parks, not Indian reserved water rights.[435] Nevertheless, the economy in the lower Missouri basin has come to rely on the steady flow of Corps-managed water.[436] The reliance by the lower Missouri basin on the status quo imposes burdens on the Tribes, as they perfect and implement their reserved water rights, upstream on the Missouri River.[437]

Professor John Davidson has described the impact of the Corps' operations on Indian water rights, as follows:

> [T]he final Master Manual may lock in the status of the specific river uses with a firmness that is every bit as solid as many Supreme Court equitable apportionments. Any given process is as important as the finality and enforceability of the final decision, be it judicial, legislative or administrative. For Missouri River water users, the Master Manual process may be as important as the litigation in *Arizona v. California* was to Colorado River water users.[438]

D. Effect on Cultural and Environmental Resources

1. Cultural Resources

As discussed above, the Three Affiliated Tribes of Fort Berthold and the Sioux Tribes along the Missouri River had established traditional communities in the Missouri bottomlands, which were uprooted by the main stem dams.[439] Not all of the Tribal cemeteries were properly relocated.[440] The operation of the dams has resulted in the erosion of grave sites and other historical sites.[441] Native American human remains, and artifacts and cultural objects routinely wash up on the shores of the Missouri River.[442]

The Corps of Engineers has found,

> The lakes, shoreline zones, and adjacent uplands of the Mainstem Reservoir System contain a variety of archaeological site classes, including prehistoric sites of all periods . . . .
>
> . . . .
>
> The Fort Peck survey recorded 49 archaeological sites, including 12 historic and 37 prehistoric sites. These sites ranged from historic-era homesteads to scatters of stone tool waste, tipi rings, and rock cairn sites to a large communal bison kill and processing site.
>
> . . . .
>
> Archaeological surveys have resulted in the discovery of 1,402 archaeological sites in and adjacent to Lake Sakakawea.
>
> . . . .
>
> Surveys at Lake Oahe recorded 1,114 archaeological sites . . . .
>
> . . . .
>
> Archaeological surveys have recorded 165 other archaeological sites [at the remaining Pick-Sloan reservoirs].[443]

Two federal statutes, the Native American Graves Protection and Repatriation Act (NAGPRA),[444] and the National Historic Preservation Act (NHPA)[445] provide substantive protections and procedural rights to the affected Tribes. NAGPRA is designed to protect Native American human remains, funerary objects, and objects of cultural patrimony from disturbance on Federal and Tribal land.[446] Section 3(d) of NAGPRA governs the inadvertent discoveries of these objects.[447] Upon an unintended unearthing, the agency must cease the activity that caused the disturbance, protect the human remains and cultural objects *in situ*, and provide notice to the appropriate Tribe, with a right of repatriation.[448]

448 *Id.*; *see* Bonnichsen v. United States, 357 F.2d 962, 996–67 (9th Cir. 2004) (reversing agency decision on Tribal affiliation of prehistoric remains); Fallon Paiute-Shoshone Tribe v. U.S. Bureau of Land Mgmt., 455 F. Supp. 2d 1207, 1025–26 (D. Nev. 2006) (requiring agency to consider Tribal data on issue of Tribal affiliation of remains).

Water releases at the main stem dams cause wave action and erosion along the Missouri River.[449] This results in the unearthing of Native American human remains and cultural objects on the Corps of Engineers' Pick-Sloan project lands.[450] When this occurs, it constitutes an inadvertent discovery under Section 3(d) of NAGPRA, triggering the mitigation and repatriation requirements.[451] The federal court in the *Yankton Sioux Tribe v. U.S. Army Corps of Engineers* case explained the Corps' legal duties under NAGPRA, upon an unearthing of human remains due to reservoir fluctuations caused by water releases at the Missouri River dams.[452] The court stated,

> As the inadvertent discoverer of remains protected by §3002(d) and the federal agency with primary management authority over the land on which they were discovered, the Corps has three duties. First, the Corps must meet certain notification and certification requirements [for repatriation]. Second, the Corps must refrain from raising and lowering the water levels of the Lake over the cemetery for at least thirty days from the date of certification. . . . Finally, the Corps must take steps to protect the remains. As the discoverer of the remains, the Corps has a statutory duty to make "a reasonable effort to protect them"; as the federal agency responsible for managing the site, it must "further secure and protect inadvertently discovered human remains . . . including, where necessary, stabilization and covering."[453]

The NHPA is a procedural statute designed to ensure consideration of the impacts of federally-funded activities on historically-significant sites or objects.[454] Under Section 106 of the NHPA, federal agencies must, "prior to the approval of the expenditure of any Federal funds on the undertaking . . . take into account the effect of the undertaking on any district, site . . . or object that is included in or eligible for inclusion in the National Register [of Historic Places]."[455] The agency

engaged in the undertaking must consult with the Advisory Council on Historic Preservation in making this determination.[456]

A finding that a federal undertaking shall have an adverse impact on covered sites or objects will trigger mitigation requirements, as prescribed in the Advisory Council regulations.[457]

The regulations define "adverse effects," as including the "physical destruction of or damage to all or part of the property."[458] As the Corps of Engineers explained, "Of 380 Plains Village earthlodge villages . . . 43 are immediately threatened with destruction due to lake action . . . ."[459] Consequently, NHPA Section 106 applies when water releases by the Corps affect cultural sites along the Missouri River, and the Corps should comply with the requirements of Section 106 and the applicable regulations.

This includes consulting with the affected tribe, "to develop and evaluate alternatives to the undertaking that could avoid, minimize or mitigate adverse effects . . . ."[460] The Corps must attempt to reach a memorandum of agreement with the affected tribe.[461] If it is unable to do so, it must consult further with the Advisory Council.[462]

The Corps of Engineers purports to comply with these requirements with its *Final Programmatic Agreement for the Operation of the Missouri River Main Stem System for Compliance with the National Historic Preservation Act* (hereinafter PA).[463] The PA is an agreement between the Corps of Engineers, Bureau of Indian Affairs, State Historic Preservation Officers of Montana, North and South Dakota, stakeholders such as the National Trust for Historic Preservation, and a number of Missouri Basin Tribes.[464] Numerous tribes that are affected by the Pick-Sloan program, such as the

Standing Rock Sioux Tribe and Yankton Sioux Tribe, are not signatories to the agreement.[465]

The PA establishes consultation protocols under NHPA Section 106, and commits the Corps to conducting cultural resource management and enforcement plans.[466] The extent that the PA's consultation schedule and mitigation requirements are more beneficial than those outlined in the statute and regulations is debatable. Additionally, the level of NHPA compliance by the Corps with respect to the non-signatory tribes may be an ongoing issue.[467] Ultimately, the damage to Native American cultural resources from the operation of the Missouri River dams is extensive and ongoing—time is not on the Tribes' side.[468]

2. Environmental Justice Considerations

On February 11, 1994, President Clinton issued Executive Order 12,898 on *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*.[469] It provides that, "each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities," on minority and poor communities.[470] An interagency task force was established to coordinate its implementation.[471] There is an emphasis

471 Exec. Order No. 12,898 § 1-102.

on enhanced research and analysis of the impacts of agency actions on affected minority and low income communities, as well as public participation.[472] The Executive Order specifies that programs affecting Native Americans are to be included in the Environmental Justice mission of all federal agencies.[473]

Many of the functions contemplated in the Executive Order and its implementing memorandum are conducted in accordance with the National Environmental Policy Act (NEPA).[474] The Council on Environmental Quality (CEQ), which advises the President on NEPA implementation, has issued Guidance for complying with the Executive Order when conducting NEPA environmental reviews.[475] The Guidance provides for "tribal representation [in the NEPA process] in a manner that is consistent with . . . treaty rights."[476]

Major decisions or actions by the Corps of Engineers affecting the operation of the Missouri River main stem dams trigger NEPA.[477] Since the CEQ Guidance on Environmental Justice prescribe respect for Tribal Treaty rights in NEPA decision making,[478] the Corps of Engineers should be obligated to explain in some detail how its Missouri River operations affect Tribal Treaty rights, and describe

alternatives and mitigation measures.[479] Instead, the Corps' Missouri River Master Water Control Manual provides detailed criteria for water flow management for navigation and flood control in non-Indian communities downstream.[480]

Executive Order 12,898 states that it does not create a right of judicial review.[481] Consequently, some courts have refused to entertain environmental justice claims.[482] However, other courts have determined that if an agency undertakes an environmental justice analysis, then its findings are reviewable on appeal.[483] This includes the Eighth Circuit, in which most of the Missouri River basin is located.[484]

In *Mid States Coalition for Progress v. Surface Transp. Bd.*, the court explained that "an agency must compare the demographics of an affected population with demographics of a more general character (for instance, those of an entire state)."[485] That analysis, applied to the communities affected by the Missouri River operations of the Corps of Engineers, establishes disproportionate impact on Native Americans. For example, the 2010 U.S. Census reveals that the percentage of the population of Native Americans in the counties abutting the Oahe Reservoir in North Dakota and South Dakota is thirteen percent, or nearly twice the percentage for the two states as a whole.[486] The percentage of Indians in Sioux, Corson, Dewey, and Ziebach Counties—the area most directly affected by the Oahe Dam—is seventy-five percent, or ten times the percentage for the two states.[487]

487 *Id.*

Yet the Corps of Engineers has found that its stream flow management of the Missouri River has no disproportionate impacts on the affected Tribes.[488] It appears inevitable that tribes shall continue to be concerned with the Corps of Engineers' level of compliance with Executive Order 12898 on Environmental Justice, in its operation of the Pick-Sloan program.[489]

IV
NEW CHALLENGES FACING THE MISSOURI BASIN TRIBES

A. New Demands for a Limited Resource

1. Mississippi River Navigation

In recent years, the Midwest has suffered a repeating cycle of drought and heavy rain and run-off, causing flooding.[490] Reputable experts associate this with man-made climate change.[491] They predict that this pattern will continue, and perhaps intensify.[492]

The drought from 2012 to 2013 threatened to ground navigation in the lower Mississippi River.[493] This prompted a renewed call among Mississippi River states to release stored water in the Missouri River main stem reservoirs to augment Mississippi River flows for navigation. On November 16, 2012, Illinois Senator Richard Durban and fourteen other senators sent a letter to President Obama, the Army Corps of Engineers, and the Federal Emergency Management

Agency, requesting the immediate release of Missouri River stored water.[494]

The Corps of Engineers' has taken the position that its authority to supply water for navigation under the 1944 Flood Control Act was limited to Missouri River navigation.[495] The Corps' Missouri River Master Water Control Manual, which prescribes the criteria governing water releases at the main stem dams, contains no provisions for the release of water stored in the Missouri River reservoirs, for Mississippi River navigation.[496]

Nevertheless, the quantity of water released by the Corps of Engineers for lower Missouri River navigation and water supply intakes is significant, and much of it augments the flows of the Mississippi River at St. Louis.[497] Mississippi River navigation benefits significantly from the Corps' operations under the Missouri River Master Manual.[498] But during periods of drought, which may be increasing due to climate change, there have been proposals and political pressure to release water stored in the Missouri River main stem reservoirs for Mississippi River navigation flows.[499]

The navigation on the lower Mississippi River greatly exceeds that on the lower Missouri River. By substituting targeted releases of water for Mississippi River navigation in late summer for the eight-month long Missouri River navigation season, the Corps could enhance the value of Pick-Sloan navigation. Targeted releases would also allow the Corps to store more water in the upper basin reservoirs for tribal uses as well as fish and wildlife. The Congress should consider reforming the Corps' Missouri River operations to ensure adequate water supplies for the upper basin Tribes. More efficient use of water for navigation is one option for reform.

This intensifies the demands on the waters of the Missouri River main stem, claimed by the tribes under the *Winters* Doctrine.[500] It

further complicates the ability of the Missouri Basin Tribes to perfect their water rights.[501]

2. Hydraulic Fracturing in the Williston Basin and the Corps of Engineers' Surplus Water Reports

Since 2008, there has been a significant increase in oil and gas production in the Williston Basin of western North Dakota and eastern Montana.[502] The widespread technique of hydraulic fracturing is water-intensive in the construction and operation of production wells.[503] The Corps of Engineers received nine requests for easements at Lake Sakakawea, for the diversion of 34,150 acre-feet of water for energy development.[504]

The Corps responded by issuing the *Garrison Dam/Lake Sakakawea Project North Dakota Surplus Water Report*.[505] In this report, the Corps concluded that the demand for stored water at Lake Sakakawea for hydraulic fracturing necessitated identifying a specific quantity of "surplus water" for future municipal and industrial use.[506] It identified 100,000 acre-feet as surplus water in Lake Sakakawea, with easements to be granted upon entering five-year water supply contracts, with a recommended fee of $20.91.[507]

In 2012, the Corps released draft "Surplus Water Reports" for the other Missouri River main stem reservoirs, identifying a total of 282,917 acre-feet of stored water in the six reservoirs as surplus, to be available for municipal and industrial use over a ten-year period.[508]

The imposition of fees was delayed pending a formal rulemaking establishing a nationwide policy for storage fees.[509]

The draft surplus water reports outline the proposed requirements for future water uses of the Missouri River, from Gavins Point to Fort Peck. They include limiting future water use in the reservoirs to water identified as surplus, entering water supply agreements with the Corps of Engineers, and ultimately the payment of storage fees.[510] The reports explain that a prospective water user will be denied an easement over Corps project lands surrounding the reservoir, absent compliance with these requirements.[511]

Congress prohibited the Corps of Engineers from imposing water storage fees at the Missouri River main stem reservoirs, in Section 1046 of the Water Resources Reform and Development Act of 2014.[512] This prohibition expires ten years from the date of the act, and the Corps may attempt to impose water fees at that time.[513] Meanwhile, the prospect for enhanced federal regulation of stored water causes concern among Tribal and non-Indian water users in the upper Missouri River Basin.[514]

In issuing the proposed surplus water requirements, the Corps of Engineers relied on Section 6 of the Flood Control Act, which authorizes surplus water contracts for municipal and industrial uses by public and private entities.[515] Section 6 does not include tribes as among the water users to whom the surplus contracting authority applies. The plain language of the statute does not include Tribes.[516]

516 *See, e.g.*, Caminetti v. United States, 242 U.S. 470, 485 (1917) ("[T]he meaning of a statute must, in the first instance, be sought in the language in which the act is framed, and if that is plain . . . the sole function of the courts is to enforce it." *Id.*).

The prominent Indian water rights attorney and scholar, William Veeder, evaluated the Corps' authority under Section 6 of the Flood Control Act, as well as the Water Supply Act of 1958,[517] as it relates to Indian water rights to the Missouri River. Veeder wrote,

> These statutes, however, leave crucial issues unresolved. They do not propose to authorize the seizure of Indian water rights pursuant to the national power of eminent domain. There is no suggestion in any of the acts that the rights of the Indians would be subject to infringement . . . . Clearly the trust responsibility of the federal government to the Indian tribes involved is not to be abrogated or diminished without specific congressional authorization to that effect and provision for just compensation for any taking of Indian rights.[518]

Nevertheless, the Corps suggests that the surplus water requirements shall be imposed on the tribes as well as other prospective water users. The surplus water reports indicate that the proposed regulations apply to all water uses except those "specifically authorized by Congress to use Missouri River water."[519] According to the Corps of Engineers, "Tribes are not considered differently in this respect than a State or private water user."[520] This could subject non-federally funded Tribal water projects, and irrigation or other intakes sought by Indian allottees, to the proposed surplus water requirements. Thus, the Corps seeks to impose the surplus water requirements on the future water use by tribes and tribal members, even though the statute does not apply to Indians.

The Missouri River main stem reservoirs constitute the source for water supplies on North Dakota's Fort Berthold and Standing Rock Reservations, and to at least six Sioux Indian Reservations in South Dakota.[521] These Tribes possess reserved water rights for future municipal and industrial uses.[522] The specific quantity of water reserved by the Tribes for these purposes has not been established by court decree or compact.[523] The amount of water that is ultimately required to fulfill the reserved water rights for municipal and

industrial uses by the Fort Berthold and South Dakota Sioux Tribes may exceed 282,917 acre-feet, the amount identified by the Corps of Engineers as current surplus water in the Missouri River main stem reservoirs.[524] Consequently, the surplus water determinations by the Corps may conflict with Indian reserved water rights to the Missouri River.

The amount of water deemed surplus in each of the Missouri River main stem reservoirs and available for future municipal and industrial water use is small, as compared to the amount of water in storage, and the amount of water that flows naturally in the Missouri River. For example, the Corps identified 57,317 acre-feet as surplus water in Lake Oahe.[525] Yet the Corps' own Missouri River Master Manual indicates that Lake Oahe contains approximately 12 million acre-feet in multiple-use storage and 27.1 million acre-feet in total storage.[526] Moreover, the unregulated flow of the Missouri in the river reach between reservoirs near Bismarck, North Dakota, averaged 16.4 million acre-feet annually, from 1968 to 2010.[527] Thus, the water flow that would be available without any Pick-Sloan storage far exceeds the amount of water deemed surplus in the large reservoirs.

Indian reserved water rights stem from the natural flow of the waters of their reservations and aboriginal areas.[528] The Corps of Engineers' assertion of storage control over the waters of the natural flow of the Missouri, to which the Tribes have prior and superior water rights under the *Winters* Doctrine, suggests a Fifth Amendment taking of the Tribes' water rights.[529]

Comm'n 256 (1975); Nat'l Wildlife Fed'n v. Nat'l Marine Fisheries Serv., 524 F.3d

Significantly, the construction of the main stem dams and reservoirs did not diminish the Reservation boundaries of the affected Tribes—the reservoirs and portions of the bed of the Missouri River remain with the boundaries of the Fort Berthold and numerous Sioux Reservations.[530] The Tribes retain reserved water rights to the Missouri River, whose natural river bed borders or traverses their Reservations.[531]

In the surplus water reports, the Corps of Engineers leverages its land management authority over the project lands adjacent to the Pick-Sloan reservoirs, to control the right to divert water from the reservoirs. The reports explain,

> Easements are required for water pipelines and water intake structures on Corps project lands. No easement that supports a water supply agreement will be issued prior to the water supply agreement being executed by all parties.[532]

However, the Tribes retained certain rights in the Congressional acts which authorized acquisition of Tribal land for the reservoir sites. For example, Section 10 of Public Law 85-915, states that the Standing Rock Sioux Tribe and tribal members "shall be permitted to have, without cost, access to the shoreline of the reservoir . . . ."[533]

The legislative history evidences recognition by Congress that the Tribe used the Missouri River for domestic and economic use, as well as hunting and fishing.[534] Clearly, Congress intended that, notwithstanding the construction of Oahe Dam and the acquisition of

534 H.R. REP. NO. 85-1888, at 6 (1958).

Tribal land for Oahe Reservoir, the Tribe retained the right to access and divert water.[535] Thus, in implementing Section 6 of the Flood Control Act through the proposed surplus water requirements, the Corps of Engineers may be violating statutory rights of the Tribes along the Missouri River.

Moreover, the surplus water reports would create requirements for water diversions on the Missouri River between Gavins Point and Fort Peck, while nothing comparable applies on the Missouri River upstream from Fort Peck and downstream from Gavins Point. Since the Pick-Sloan dams were developed on the Missouri River main stem, the water depletions from Gavins Point downstream to Nebraska City, Nebraska, have far outpaced the depletions upstream from Gavins Point.[536] In the draft surplus water reports, the Corps of Engineers proposed making it more difficult to divert water above Gavins Point,[537] exacerbating the inequities with respect to the regional economic benefits of water supply under the Pick-Sloan program. This contravenes the Congressional declaration in Section 1 of the Flood Control Act for "comprehensive and coordinated development" of the Missouri River.[538]

The Corps of Engineers contends that it must identify surplus water in the Missouri River main stem reservoirs, to ensure that existing Pick-Sloan water uses (e.g., lower Missouri River navigation and water supply intakes) are not harmed by the increased demand for water for energy development in the upper basin.[539] But the surplus water reports ignore the fact that numerous Indian tribes possess reserved water rights to divert the water of the Missouri River for consumptive use on their Reservations, and that their water rights

United States, 657 F.2d 1126, 1141 (10th Cir. 1981) (Bureau of Reclamation exceeded authority in contracting with city of Albuquerque for San Juan-Chama project water surplus to meet the city's needs).

include future municipal and industrial uses.[540] Moreover, the tribes' statutory rights to access the Missouri River are being ignored in the rush to secure water for energy development.[541] As William Veeder testified to the Senate Committee on Interior and Insular Affairs in 1975, "the energy crisis is truly an Indian crisis."[542]

The Corps of Engineers has made it so, by proposing to limit future municipal and industrial water uses in the upper Missouri Basin, including Indian water uses. The Corps' proposed surplus water regulations lend uncertainty to the ability of the Tribes to develop water for future municipal and industrial uses—literally jeopardizing economic development on the impoverished Reservations. This uncertainty complicates the tribes' ability to perfect their rights, through a negotiated settlement or water rights adjudication.

B. Quantification of Indian Water Rights to the Missouri River

The state of South Dakota petitioned the Supreme Court to invoke original jurisdiction for an equitable apportionment of the Missouri River, but the Court refused to entertain the action.[543] This demonstrates the tension placed on the Missouri River between competing interests in the upper and lower basins.[544] That tension

540 Professor Frank J. Trelease has evaluated the impacts of federal water development on water rights from the perspective of the states. Frank J. Trelease, *Water Rights of Various Levels of Government—States' Rights vs. National Powers*, 19 WYO. L. REV. 189 (1965); Frank J. Trelease, *Government Ownership and Trusteeship of Water*, 45 CAL. L. REV. 638 (1957); Frank J. Trelease, *A Federal-State Compact for Missouri Basin Development*, 7 WYO. L.J. 161 (1953). He suggested that impending conflicts over the federal management of navigable and non-navigable rivers will be resolved in favor of extensive federal power, "except for some of the Indian cases." Trelease, *Government Ownership and Trusteeship of Water*, *supra*, at 652. The implication is that although the authority of federal water management agencies such as the Corps of Engineers may be broad with respect to state law, it is more limited in relation to the proprietary interests of the Tribes.

543 South Dakota v. Nebraska, 485 U.S. 902 (1988). A state may file an original petition to the Court, to apportion the water rights to an interstate river amongst two or more states. TARLOCK, *supra* note 366, at §§ 10.2 to 10.3. The Court developed the doctrine of equitable apportionment for the allocation of water rights between states. Kansas v. Colorado, 206 U.S. 46 (1907). The Court requires a high standard of injury to entertain such an action. Missouri v. Illinois, 200 U.S. 496 (1906).

544 *In re* Operation of the Mo. River Sys. Litig., 421 F.3d 618, 637 (8th Cir. 2005), *cert. denied*, North Dakota v. U.S. Army Corps of Eng'rs, 547 U.S. 1097 (2006); Tarlock, *supra* note 83, at 1–2.

affects Indian water rights also.[545] South Dakota initiated a general stream adjudication for the Missouri River and its tributaries, in order to quantify Indian reserved water rights, but the expensive and unwieldy action was dismissed without prejudice.[546]

The issue of the quantity of water from the Missouri River main stem, its tributaries, and groundwater, to which the North and South Dakota tribes are entitled, will ultimately be resolved by adjudication or negotiated settlement. Many of the tribes have resisted this, for good reason.[547] But there is too much demand on the valuable water resource of the Missouri River for Indian reserved water rights to remain unadjudicated indefinitely.[548]

There is considerable commentary on the respective merits of negotiation and litigation of Indian reserved water rights.[549] Suffice to say, the North and South Dakota tribes with water claims to the Missouri River main stem and its tributaries will be facing costly and time-consuming water rights litigation or negotiations, or both. The legal and policy environment in which that will take place is made more difficult by the Corps of Engineers' Missouri River operations under the Master Manual, and its proposed surplus water regulations.

CONCLUSION

The massive water development of the Missouri River Basin under the Corps of Engineers' Pick-Sloan program negatively and disproportionately impacted the Indian tribes. The socioeconomic hardship facing many of the upper Missouri Basin Tribes is directly attributable to Pick-Sloan. The water supplies needed by these tribal communities for economic and human development are controlled by the Corps of Engineers, through its operation of the main stem dams.

The Corps' Missouri River operations give priority in streamflow allocations to navigation and water supply in the lower basin. This degrades the water supplies of the tribes, and could affect their reserved water rights claims under the *Winters* Doctrine. The Corps possesses treaty, statutory, and trust responsibilities to preserve the Tribes' waters, but the criteria for streamflow management in the Corps' Master Manual focus exclusively on downstream water needs. Meanwhile, erosion caused by reservoir operations has destroyed significant Native American cultural resources and unearthed human remains and artifacts. Tribal water and environmental resources continue to suffer the ongoing effects of the Corps' operations of the main stem dams. Much of the harm could be mitigated through revisions to the Master Manual by modernizing the operational priorities to fulfill tribal rights.[550] However, with the release of the surplus water reports for Lake Sakakawea and the other main stem reservoirs, the Corps appears to be moving in the opposite direction by imposing limits and additional costs on future tribal water uses in the upper basin.

Consequently, Congressional action may be necessary to protect tribal waters for use on the Reservations in the upper Missouri basin. However, the navigation industry, municipal, and agricultural water users in the lower Missouri basin benefit from the status quo and have resisted reform.[551] The upper Missouri Basin Tribes face the dual challenges of perfecting their water rights and assuring that the Corps

---

550 The Standing Rock Sioux Tribal leader Mike Claymore described his Tribe's frustration in attempting to obtain administrative relief by the Corps of Engineers, for revisions to the Missouri River Master Manual: "We have corresponded, attended meetings, and been visited by officials of the Corps of Engineers . . . and all has been to no value to the Standing Rock Sioux Tribe. The Corps of Engineers has proven it cannot analyze our environmental impacts, much less impacts on our invaluable water rights." *Missouri River Master Manual: Hearing Before the Committee on Indian Affairs, U.S. Senate,* 108th Cong. 27 (2003).

551 *See supra* notes 333, 334 and accompanying text.

of Engineers reforms its Missouri River operations to ensure adequate water supplies on the Reservations.

The claims by tribes for proper equitable compensation for the lands, resources, and cultures that were inundated should also be revisited. All lands that were taken from the tribes for Pick-Sloan, but which are retained by the Corps of Engineers and lay fallow above the reservoirs, should be returned. Ultimately, environmental justice for the affected Tribes must be a central focus of the Pick-Sloan program moving forward.

Relating Divergent Worlds: Mines, Aquifers and Sacred Mountains in Peru

Fabiana Li *University of Manitoba*

Abstract: This article examines a conflict over the expansion, into Cerro Quilish (Mount Quilish), of the Yanacocha gold mine, in Northern Peru. In campaigns against the mine, Cerro Quilish was an aquifer (a store of life-sustaining water) and an Apu (usually translated from Quechua as "sacred mountain"). Neither the product of ancestral tradition nor the invention of antimining activists, Cerro Quilish came into being through knowledge encounters that brought together actors with diverse interests, although at times a single entity—water—became the central focus of debate, obscuring other realities. Drawing on science and technology studies literature, I examine the practices that bring entities into being and argue that contemporary conflicts involve an ongoing process of contestation over socionatural worlds.

Keywords: mining, water, social movements, environmental conflict, Peru

Résumé : Cet article s'intéresse à un conflit portant sur l'expansion de la mine d'or Yanacocha dans le Cerro Quilish (mont Quilish), au nord du Pérou. Dans les campagnes contre la mine, le Cerro Quilish était à la fois un aquifère (une réserve d'eau porteuse de vie) et un Apu (qu'on traduit habituellement du quechua comme « montagne sacrée »). Alors qu'il n'est ni le produit d'une tradition ancestrale ni l'invention des militants anti-mines, le Cerro Quilish a vu le jour par des rencontres de savoir réunissant des acteurs aux intérêts divers, bien qu'avec le temps une entité unique—l'eau—est devenue l'enjeu central des débats, cachant à la vue les autres réalités. Puisant dans la littérature des études des sciences et technologies, j'examine les pratiques qui amènent les entités à l'existence et soutiens que les conflits contemporains impliquent un processus continu de contestation des univers socionaturels.

Mots-clés : industrie minière, eau, mouvements sociaux, conflit environnemental, Pérou

Introduction

On the morning of 2 September 2004, protestors marched to Cerro Quilish (Mount Quilish), in the Northern highlands of Peru, to demand an end to mining exploration activity. At the peak of the 15 days of protesting, more than 10,000 people filled the town square in the city of Cajamarca, 18 kilometres from Cerro Quilish. As many would later remark, the defence of Cerro Quilish united the city and countryside, bringing together a diverse mix of people: urban professionals, irrigation canal users' associations, *Rondas Campesinas* (peasant "patrol" groups, one of the backbones of peasant political organizing in Peru), unions, students, religious organizations and other groups. The massive protests put a halt to the extraction of an estimated 3.7 million ounces of gold from Cerro Quilish. The proposed project was to be an extension of the Yanacocha mine, which was opened in 1993 and was already the largest gold mine in Latin America.[1] The mine is operated by Minera Yanacocha, a joint venture of the US-based Newmont Mining Company (with 51.35 per cent of shares), the Peruvian company Buenaventura (43.65 per cent shareholder), and the financial branch of the World Bank (with a remaining 5 per cent of the shares).

On the surface, the Quilish protests shared many characteristics with other mobilizations that emerged in the late 1990s and would intensify in the 2000s in response to mining expansion in Peru and elsewhere in Latin America (see Bebbington 2009). In this context of increased mining-related activism, the Quilish protests stand out not only because they effectively stopped the project but also due to their long-lasting impact on the popular imagination and political debates around mining activity in Peru. Like other mining-related conflicts, the controversy over the Quilish project centred on the costs and benefits involved in converting mountains into open-pit mines. But what made this case different was that Cerro Quilish emerged in the conflict as a particular kind of mountain: one that holds water and has special

significance for the local population. In antimining campaign materials and news reports, Cerro Quilish was presented as an aquifer—the source of the main rivers and tributaries that supply water to the city and rural communities. Activists argued that mining activity would compromise the quality of that water (due to increased sedimentation and the potential leaching of heavy metals and toxic substances into rivers and streams) and reduce the quantity of water available in what is already a drought-prone region. Protestors also argued that the mine should not be built because *campesinos* (peasant farmers) living in the area considered Cerro Quilish to be an *Apu*, a Quechua term that is commonly translated as "mountain spirit" or "sacred mountain."

Framed around the protection of an aquifer and an Apu, the aims and strategies of the antimining protests did not always fit within the discourses of existing political movements focused on economic justice or the nationalization of resources (e.g., local unions or left-leaning political parties). While arguments calling for nationalizing the mines or better pay and working conditions did surface in conflicts emerging throughout the country, activism against mining at once incorporated and exceeded established political discourses and practices. The Quilish protests became part of a movement "in defence of life" that encompassed water and livelihood, landscapes and cultural identity—but it was also more than this. The mountain was not just an economic resource to be defended but the embodiment of life itself. By calling Cerro Quilish an Apu, the protestors suggested that it was a living entity and, furthermore, that other lives (both human and nonhuman) depended on its existence. Arguments against mining in Cerro Quilish were entangled with discussions about water as a life-sustaining substance—life in a general biological sense but also with relation to the particular (and by some accounts, disappearing) ways of life in the *campo* (countryside). In addition, the mining industry's new ventures in Cajamarca and other parts of the country were coming up against unexpected forms of life: not only the animal and plant species deemed valuable by local people and environmentalists but also entities like Apus and other earth-beings that animate the Andean landscape. The invasive technologies of open-pit mining were disrupting landscapes and, along with them, the conditions necessary to sustain ways of living and interacting with those landscapes.

This article examines how Cerro Quilish emerged as an Apu and an aquifer in campaigns against the mine. As Blaser (2009) and de la Cadena (2010) have noted, many contemporary environmental conflicts are conflicts over different realities or worlds. The conflicts do not simply concern competing interpretations of Nature (which assumes the existence of many cultures but a single reality) but should be understood as struggles over the enactment, stabilization and protection of multiple socionatural worlds. In the conflict I examine here, Cerro Quilish was not only a mountain or a resource, nor was it simply *perceived* in different ways by the various constituencies involved in the controversy. Rather, it emerged as radically different entities—a valuable mineral deposit, a mountain that holds water, a sacred mountain and sentient being—through the practices of the actors involved.

I argue that recognizing Cerro Quilish's multiplicity can help us understand the dynamics of conflicts over mining. First, examining the controversies that brought Cerro Quilish into being—a perspective inspired by what Blaser (2009) and others call *political ontology*—can contribute to discussions about how natures and knowledges are made. I draw here on the work of scholars of science who have shown that entities in the world are not fixed or constant but are the effect of practices and require continuous enactment and stabilization (Law 2004; Mol 2002).[2] If a particular entity "hangs together," it is not because its coherence "precedes the knowledge generated about it, but because the various coordination strategies involved succeed in reassembling multiple versions of reality" (Law and Mol 2002). In the conflict I focus on here, we cannot simply take Cerro Quilish for granted as an element of a preexisting "reality-out-there" (Law 2004) or take as given its recognition as Apu or aquifer. Cerro Quilish's complex forms *came to matter* through knowledge encounters that brought together campesinos' experiences of a sentient landscape, Catholic sermons, hydrological studies, radio campaigns, geological explorations and antimining activism.

My use of the term *matter* refers to how elements of the landscape acquire political significance and become the focus of public concern. It also refers to the ways in which things take form and come to be known and experienced, as well as ongoing efforts required to solidify them into "facts." As scholars of science have noted, political theory has tended to focus on human agency while casting nonhumans out of the political sphere (see for example, Latour 1993). Thus, we tend to think of anything nonhuman (including the things of nature, such as mountains, minerals or water) as a resource or tool that enters political theory "only to the extent that it has *instrumental* value, but not in terms of its *constitutive* power" (Braun and Whatmore 2010:xv). Recognizing the ability of things to condition political life, I do not treat Cerro Quilish simply as a contested resource;

rather, I examine the kinds of politics that it enabled (and at times precluded) as it came into being as an aquifer and an Apu.

The Quilish conflict illustrates that political responses to mining activity in recent years do not simply cohere as "antimining" social movements. Mobilizations are loosely organized around multiple demands and involve a diverse group of actors. Significantly, demonstrations have been held in support of mining companies and not just against them. Participants involved in various kinds of mobilizations do not necessarily share common interests or an ideological stance that defines their position vis-à-vis extractive activity. My analysis of the Quilish conflict seeks to show how various actors came together in ways that strengthened the movement, in spite of their different interests and positions. At other times, different interests can lead to unpredictable effects. For example, the importance of Quilish as an aquifer helped make water into a focal point of debates over mining—not only in this conflict but in subsequent ones as well. While these arguments helped draw supporters to the movement against the mine, they also led the mining company to focus its public relations campaigns on technical arguments and water management programs. What I argue is that focusing on a single aspect of Cerro Quilish (water) reduced the complexity of the mountain and the challenge that it posed for the company. The shift from multiplicity to singularity helped neutralize opposition to the project. But, as I have already noted, the stabilization of facts requires constant effort. Thus, the potential for multiplicity remains, and conflicts that might seem to have been resolved are likely to reemerge.

The research presented in this article is based on two years of ethnographic research in Peru in 2005 and 2006. Although the article focuses on the Quilish controversy, the material I draw on is part of a larger project on conflicts over mining activity that intensified as a result of neoliberal reforms in the 1990s. As conflicts proliferated in Cajamarca and various other parts of the country, the significance of Cerro Quilish and continued tensions in Cajamarca led me to focus my fieldwork on the Yanacocha mine. Although I was based in the city of Cajamarca, I also conducted fieldwork in campesino communities in Porcón, the area where people responded most strongly against the Quilish mining project. Material for this article comes from participant observation, the analysis of documents related to the Quilish project and interviews with key leaders, activists and others who participated in the Quilish protests.[3]

The article is organized as follows. In the first part, I examine how a Catholic priest emerged as a key figure in the conflict and played a crucial role of translation that merged religious and scientific knowledges with the lived experiences of campesinos in the region. By emphasizing Cerro Quilish's multiplicity, the Quilish campaigns shifted the focus of debates on mining and enabled new forms of political activism. In the second part of the article, I describe how Cerro Quilish, as Apu and aquifer, enabled the antimining campaigns to travel from the local through regional, national and transnational networks. The campaigns tapped into, connected with and modified existing campesino knowledge practices that recognized the qualities of Cerro Quilish as an animate being and a source of water.

In the final part of the paper, I examine the company's attempts to narrow the scope of the Quilish debate by focusing it on water and its technical management. Protestors challenged this definition of Cerro Quilish as a resource to be managed; yet, the issues around water quality and quantity were ones that they helped introduce into the debate. I suggest that the ongoing conflicts around mining in Cajamarca attest to the unstable nature of objects as they emerge and change form through environmental controversies.

How Quilish Became an Apu and Aquifer

The protests over Cerro Quilish brought *mining conflicts* (a now-ubiquitous term) into the popular consciousness in Peru at a time when mineral extraction was being subjected to increasing public scrutiny. In 2003, the Tambogrande mining project in the department of Piura was brought to a halt after significant opposition and a concerted local and international campaign that included a popular referendum. In addition, conflicts in the smelter town of La Oroya and other mining centres began to receive more attention in the news media. In Cajamarca, complaints against Minera Yanacocha—from lands usurped from campesinos, to fish deaths and diminished water flows in irrigation canals—had been accumulating since the mine began operating. However, it was in 2000 that the company faced its biggest setback, with a mercury spill in the town of Choropampa, which was considered to be the largest mercury spill in the world. These events put in doubt the image of modern mining that the industry and government tried to promote: an image of safety, environmental responsibility and local development.

In this climate of increasing tensions between communities and Minera Yanacocha, the Cerro Quilish project proposal came to the fore. Educational materials distributed as part of the campaign to stop the project pointed out that Cerro Quilish and the city of Cajamarca are separated by a distance of a mere 14.5 kilometres as the crow flies. People also argued that Cerro Quilish was

only eight kilometres away from the city's water treatment plant, "El Milagro," and was the source of the Porcón and Grande Rivers, which together provided 70 per cent of the water consumed in the city. At least four campesino communities were considered to be within the area of the proposed Quilish project, but many more relied on irrigation canals and water springs that originate at Cerro Quilish. The protests against the mining project emphasized these various connections between people and bodies of water emerging from Cerro Quilish, thus securing the support and participation of a large segment of the rural and urban population.

Political activism against mining at Cerro Quilish did not erupt spontaneously but was the result of tenacious education and advocacy campaigns that spanned almost a decade. Spearheading these efforts was the NGO Grufides—and, in particular, Father Marco Arana, one of its founding members. Grufides is a small development organization that was formed in 2001 by recent graduates of the Universidad Nacional de Cajamarca (Cajamarca National University) under the guidance of Father Arana, who directed the University Parish. As in much of Latin America, liberation theology has been a significant influence for NGOs and individuals whose work merges Christian teachings with issues of economic justice, human rights and (more recently) environmental concerns.[4]

Father Arana, as well as other professionals from the city of Cajamarca, wrote extensively against Minera Yanacocha's continued expansion, pointing out the risks of cyanide leaching (Deza 2002) and evidence of water contamination from mining operations already underway (Seifert 2003). But it was Father Arana who, in numerous newspaper editorials, email missives and published reports, imbued the technical arguments against mining with what he saw as a cultural and moral dimension to the struggle against the mine. He based his arguments on the defence of a way of life rooted in a place called Porcón, an area made up of campesino communities that begins just beyond the city of Cajamarca and extends into the property of the mine. His experiences as a rural priest made him attuned to the hardships of campesinos and their particular ways of expressing their identity as "porconeros" (as the area's locals are called).

Undoubtedly, the effectiveness of narratives that centred on Cerro Quilish's role as aquifer and Apu rested on its seemingly timeless qualities. Since the mineral deposit was located in Porcón, a place that had become emblematic of a pre-colonial past, these narratives presumed that locals had always considered Cerro Quilish to be the primary source of water for the city and surrounding region and implied that it was an Apu according to "Andean tradition." On the other hand, counter-claims to disprove the validity of these arguments dismissed them as "inventions" with the intent to manipulate. Yet, both of these views ignore the dynamic and creative connections among people, technologies and landscapes that brought Cerro Quilish to the centre of a complex controversy.

This is the irony of Cerro Quilish: that its protagonism as an Apu took shape in a region where many people have turned to evangelism and where a Catholic priest became one of its most important spokespersons. It took a proposed mining project—with the threat of open pits, toxic chemicals and altered water courses—to make the latent "indigeneity" of Porcón and people's relationships to a sentient landscape politically visible and significant in the present. I use the term *indigeneity* recognizing the complex politics of class, language, ethnicity and race in Peru. First of all, the term *indigenous* is not used by people in rural Cajamarca (who tend to refer to themselves as campesinos). Also, I do not mean to suggest that people are more or less indigenous based on a set of prescribed characteristics (e.g., language or dress). As scholars have pointed out, we need to "move beyond thinking of indigeneity in the all-or-nothing terms of authenticity and invention, cultural survival and extinction" (see Garcia 2005:6). Recognizing the complex ways in which identities are made and negotiated, I want to explore how indigeneity came to be articulated through the engagement of various actors.

"Quilish is more than Quilish"

Three years after the 2004 protests, Father Arana wrote an article reflecting on the significance of the campaigns against mining at Cerro Quilish and asserting his unwavering commitment to protect it:

> If the ecological matter put forth by the avarice of gold that has laid eyes on Cerro Quilish is to be understood as merely a technical-scientific problem, then I'll always say no. And I'll do the same if these questions are reduced to problems of a cultural, social or religious-symbolic character. It is not with these half-truths that life will be protected and defended, but rather with the understanding and practice of ecology as an integral matter: scientific, cultural, social, political, historical, and ethical. [Arana 2007]

For Farther Arana, the Quilish conflict could not simply be addressed with technical solutions. If the controversy were to be considered from an *ecological* point of view, in his definition of the term, it would be necessary to take a holistic approach that incorporated the scientific,

socio-cultural, political, historical and ethical issues at stake. Considering one of these dimensions separately, without seeing the larger whole, would only produce "half-truths." Rejecting the perils of reductionist thinking, Father Arana wrote that "Quilish is more than Quilish." What was at stake in the protests, he explained, was not only the protection of this mountain; the defence of Quilish was also linked to the protection of local people's right to water, their cultural identity and the democratic right to prior consultation (Arana 2007). Evoking Cerro Quilish's multiplicity was fundamental for making the struggle known nationally and internationally.

Although he tried to play down his leadership role, no other individual has had as much of an impact on mining debates in Cajamarca or incited as much controversy as Father Arana. Father Arana was born in the city of Cajamarca, and his understanding of Cerro Quilish and its meaning for local people was shaped by a long relationship with rural communities that began with his appointment as parish priest in Lower Porcón in 1991. During his time as a rural priest, Father Arana made contact with people and established a reputation in the countryside that would last beyond his years in Porcón. His position as a trusted authority figure allowed him to hear firsthand about campesinos' initial altercations with the mining company and to intervene on their behalf. In the process, his day-to-day experiences in rural communities convinced him that Cerro Quilish was more than what could be captured by the utilitarian value of the resources it provided (land, water, pasturelands, etc.) and that might be compromised by mining activity. Campesinos told him they had always known Cerro Quilish contained gold and water and spoke of a "golden fountain" from which water sprung and flowed in two directions (Arana 2007). This, according to Father Arana, was an apt description of Cerro Quilish's location in the area of the continental divide separating the watersheds that drain into the Pacific and Atlantic oceans. They also told of how, if the first clouds of October appear above the crown of Cerro Quilish, it would be a year of heavy rains and bountiful harvests (Arana 2007). For Father Arana, the significance of Quilish was evidenced in the stories passed on from generation to generation and in the little "altars" made of rocks where campesinos would bring holy water, liquor, peppers, salt, candles, strands of lamb's wool or little pieces of leather. "They prayed first to God Almighty, Father of Jesus Christ, and then came the libations and offerings to the earth with trickles of water" (Arana 2007), he wrote, translating the practices of campesinos according to his understanding of religion. In this way, Cerro Quilish became a *sacred mountain*, a term that caught on in the media yet differed from what Cerro Quilish was to campesinos: an agentive being with whom people interacted and established relationships necessary to sustain life.

Like many priests working in the Peruvian countryside since the colonial period, Father Arana accepted the coexistence of Catholic saints and sentient entities, of special offerings left in rocky caves and processions in honour of Christ (like the Cristo Ramos celebrations held annually in Porcón). In his writings and reflections on Cerro Quilish, Father Arana seemed to tap into a consciousness of a world in which such mixtures were still possible, even if they were not always evident in peoples' everyday lives. In Porcón, Apus did not have the prominence that they do in the southern department of Cuzco, for example, where some mountains are the focus of yearly pilgrimages or recognized as important protectors.

In the Cajamarca region, by contrast, the influence of Spanish colonialism prevailed over many pre-colonial practices. The indigenous Quechua language is spoken only in a few communities, and a significant number of rural people attend the evangelical churches that now predominate in the region. As in other parts of Peru and Latin America, evangelical Protestantism has grown rapidly since the 1960s. According to the 2007 departmental census, 14 per cent of the population professes an evangelical religion (compared to 80 per cent who identify as Catholic). While this is a relatively small percentage, the rapid inroads made by evangelical religions in Porcón is evidenced by the proliferation of non-Catholic Christian churches. Also, since many Catholics are nonpracticing and regular church services are not available in each community, the majority of active churchgoers are evangelicals. Evangelism has had a significant influence on most aspects of everyday life, from politics and community leadership to personal habits, including the avoidance of alcohol. Evangelism also discouraged any practice that could be seen as violating its monotheistic teachings (e.g., making offerings to the dead or being fearful of places where earth-beings are said to hide).

It was in this setting that Father Arana argued Cerro Quilish was not only a mountain and not just a source of water. It was an Apu and a source of life. This message became part of his writings, interviews and sermons delivered during events organized in the defence of Cerro Quilish. The following are fragments of a homily given on Cerro Quilish during a march in August 2001:

> Quilish, for campesinos here, is still the APU, the mountain that is protector of all earthly and heavenly life. Pantheist paganism, might say those who do not understand that the campesino's relationship with nature, is the delicate thread that sustains all life.... Quilish is about to be seized from us, the destiny that the miners want to give Quilish is to transform it into some millions of dollars that will fill their pockets, without regard for the many people for whom Quilish is a source of water and, therefore, a source of life. Today we are here to tell ourselves, in the presence of God, that we renounce the avarice of gold; and that we will not allow others to transform our source of water into a handful of gold to satisfy their greed; that we will not permit that their idolatrous way of life, in which everything is sacrificed to a gold idol, continues without regard for how many lives depend on this, our source of water. (Arana 2002)

According to Father Arana, for "the miners" (meaning those involved with the mining company and more generally, its supporters), Cerro Quilish was a source of minerals and profits. That it could also be an Apu and an aquifer allowed for the moral condemnation of the materialism and greed that went along with the "idolatry of gold."

In addition Quilish's identity as an Apu challenged any arguments that justified mining activity based on economic calculations about the utilitarian value of resources. The fact that Quilish was an Apu made it incommensurable, in the sense that it was irreducible to gold or other forms of material benefits. The question ceased to be, How can Cerro Quilish be mined responsibly? (as the problem is often framed by corporations promoting an image of "Corporate Social Responsibility"); nor could the dispute be described simply as a disagreement over how communities would "benefit" from the project. The multiplicity of Cerro Quilish disrupted the equivalences at the root of proposals to "manage" the impacts of mining activity with technological solutions and compensation agreements with affected communities.

Father Arana's interpretations of Catholicism and of campesinos' relationships with Cerro Quilish were certainly controversial, and many accused him of being a "false prophet" and of introducing the idea of the Apu where it had never previously existed. Yet, the binary opposition between "authentic" indigenous tradition, on the one hand, and invented (and thus "fraudulent") interpretation, on the other, does not capture the way Cerro Quilish came to matter as both an Apu and a source of water. Father Arana's arguments were controversial precisely because they disrupted a "modern" understanding of politics, which stems from the separation of society and nature (Descola and Palsson 1996) and relegates politics to the representation of humans (society) and science to the representation of nonhumans (nature). This distinction rests on what Latour (1993:13) calls the "crossed-out God, relegated to the sidelines." Through the process of purification (the ever-increasing separation of society and nature), God was separated from the realm of the profane and relegated to the sphere of "spirituality," where it could not intervene in worldly affairs. God was made transcendent and also irrelevant and, thus, did not pose a threat to the rationality of science.

In protests against mining expansion and subsequent media coverage of these events, activists and journalists sometimes defined Cerro Quilish according to a Catholic conception of the "sacred" or a romantic vision of ancestral knowledge and relegated it to a "spiritual" dimension detached from its material properties. It could be said that Father Arana did this also and simply incorporated the idea of the Apu into his own (modern) understandings about Catholicism and environmentalism. In Father Arana's translation, an Apu is a "sacred mountain" according to "local beliefs"; this maintains the dualisms that keep earth-beings (and the worlds to which they belong) in the sphere of spirituality. Treated as *belief,* Cerro Quilish does not pose "an epistemic alternative to scientific paradigms (ecological or economic)" (de la Cadena 2010:349), making it easier to dismiss from politics.

However, it could also be said that Father Arana tried to reject reductionist analyses that interpreted the defence of Cerro Quilish in terms of two incompatible spheres: that of the mythical, spiritual, romantic and ideological or that of the technical and scientific (Arana 2007). By refusing this ontological separation, Father Arana connected the plane of the secular with that of sentient entities like Apus and infused his critique of capitalist mining with both religious teachings on morality and hydrological studies of aquifers. Thus, it could be said that Father Arana brought the "crossed-out God" back into the world of the secular (and, hence, into the realm of politics), making it impossible to settle the controversy solely through economic, technical and scientific arguments.

The campaigns in defence of Cerro Quilish evoked an animate landscape that was part of campesinos' experiences of the Cajamarca countryside. People's relationship to the beings that populated that landscape was not always expressed in everyday practice; nevertheless, it inspired the campaigns against mining at Cerro Quilish and contributed to its success. I went to Porcón with the hope of understanding people's relationships with the neighbouring mine, the resources that enabled their

subsistence and the mountain that had become so emblematic in debates over mining. I describe these experiences in the next section of the article to show that knowledge is not anchored in timeless, ancestral traditions but is constantly made through encounters and collaborative practices.

Knowledge Encounters in Porcón

In Porcón—a group of communities located along the main highway leading up to the Yanacocha gold mine—people's relationships with the mining company oscillated between dependence and rejection, resistance and cooperation. On the one hand, being part of Minera Yanacocha's "area of influence" made these communities eligible to receive various forms of support, from donations of classroom supplies to the primary school, to potable water projects, improved irrigations canals and electrification projects. On the other hand, the company's promise of employment and development went along with the recognition that mining could radically alter the landscape and ways of life, including the availability of water resources. The water used in many of these communities (for domestic and agricultural activities) originates in Cerro Quilish, and it is for this reason that many people from the area participated in the 2004 protests against the mine's expansion.

Porcón's distinctive characteristics—particularly its festivals, communal agricultural practices and artistic traditions, such as weaving and stonework—captured the imagination of urban intellectuals, NGOs, artists and activists, especially those critical of the mine. My initial contacts in Porcón were made through one such individual, Ernesto, whose fascination with what he termed the "Andean world view" (*la cosmovisión andina*) inspired his involvement in the Quilish campaigns. In one of our conversations, Ernesto explained to me that in spite of high rates of conversion to Adventism, this *cosmovisión* was something that people in Porcón carried with them and expressed in subtle ways, even if they had to outwardly behave according to evangelical teachings (which included strict codes for dress, diet and behaviour). Just as evangelical Christians could no longer participate in the Catholic festival of Cristo Ramos but still watched from a distance, he told me, the fact that people could not talk about the sun and water being "sacred" did not mean that people did not treat them as such. His enthusiasm for my plan to carry out fieldwork to learn more about life in the campo led me to Cochapampa, a small *caserío* or hamlet consisting of some 80 families that is part of Upper Porcón.

Scientists and Mountain Spirits

In Cochapampa, children and adults told me many stories about good and evil mountains, creatures that emerge from water springs at night, places one should not venture for fear of losing his or her spirit (*ánimo*), the dangers of rainbows, and the plants that cure *susto* (literally "fright," which afflicts young children in particular, when travelling in dangerous areas). Sometimes, I would ask about Cerro Quilish, thinking that people's stories could help me understand why so many had joined forces in its defence. Most of the stories I heard were not about a benevolent protector that might correspond to an environmentalist narrative or to the image of a "sacred mountain" that tended to surface in campaigns against mining. Instead, they were about harmful spirits lurking in caves and water springs, especially in mountains that, like Cerro Quilish, concealed precious minerals and other treasures to entice humans into the underworld where evil spirits reside.

These stories coincide with those in a monograph by anthropologist Ana de la Torre (1986) titled *Los dos lados del mundo y del tiempo*, which is based on research conducted in communities around Cerro Quilish between 1979 and 1980. Her informants described a *Shapi*, a being that emerges from the underworld through tunnels that end at water springs. From these water springs, the Shapi waits for its victims to steal their ánimo, tempting them with the promise of sweets, gold coins, livestock and other offerings. "Bad" mountains are those associated with the source of rivers and water springs, since water is considered the property of the Shapi. The danger of the Shapi lies in its evil intentions as well as its ability to fascinate and entice humans with promised gifts; this contradictory nature, the tension between danger and desirability, destruction and fecundity, is what produces the natural order.

When I asked about Cerro Quilish and the community's sources of water, people explained to me that the water used in Cochapampa came from the Kunguna, a small mountain with a distinctive rock façade, and the water from the Kunguna came from Cerro Quilish. Mount Kunguna was considered one of those places that one ought to approach with care, since the presence of water springs and the entities that could emerge through them could bring danger to those who ventured near them. People described the beings that emerged from the water springs as demons or evil bird-like creatures. One day I walked to the Kunguna with a group of school kids, up to the top where a wooden cross was decorated with flowers and offerings from the few practicing Catholics who have not converted to evangelism.

As we climbed on the rocks and explored Kunguna's caves, a teenage boy in the group told us, "At midnight, the mountains talk to each other."

During my time in Porcón, people's stories and accounts made evident their detailed knowledge about the location of water springs, the flow of rivers, the routes of irrigation canals and other details pertinent to their agricultural livelihoods. But my conversations with people also reminded me that the intimate, lived experience of everyday life that is often conceived as "local" knowledge, is always born from encounters (Lowe 2006; Raffles 2002; Tsing 2005). Anthropologist Julie Cruikshank explores three different types of knowledge encounters in her account of the socionatural history of glaciers in Alaska: encounters take the form of actual meetings between strangers; they are interactions between humans and a rapidly changing landscape; and they concern ongoing exchanges between stories and their subsequent readers and listeners (2005:16). Similarly, some of the knowledge encounters that shaped the socionatural history of Porcón include interactions among *porconeros* and state agents, Catholic priests, evangelical missionaries, NGOs and mining engineers. But knowledge encounters also involve elements of the surrounding landscape (both before and after mining's transformative effects) and the animate entities that make that landscape. Furthermore, encounters take place as stories about Cerro Quilish travel outside Porcón and when these stories become translated, reinterpreted and perhaps reincorporated into different knowledge practices. I learned about these multiple encounters during a conversation with Margarita, a 29-year-old mother whose husband worked at the mine. As we chatted in her house, we were joined by her 12-year-old son, Jaime. Jaime liked telling me stories about devils inhabiting the Yanacocha mine, which he had heard from his father and uncle who worked there. I asked Margarita what she knew about Cerro Quilish.

Margarita: The water that we drink comes from Quilish, they say. They say that, in Quilish, there's a lagoon inside, which rises every which way.

F: Who says this, the elders?

M: The scientists. They study it, that's why they say this. This is what they tell us.

Jaime: It's also on the radio.

M, J: They talk to each other. The devils talk to the gringos.

J: [Mount] Kunguna also talks to [Mount] Aliso.

M: And Aliso talks to Quilish.

J: They recorded this, when they talked and they play it on the radio. They speak in Quechua, in English.

F: What else do the scientists say?

M: Quilish has a lagoon inside, they say. It springs every which way.

F: That's where the water comes from?

J: Yes, it springs from the foot of the mountain. There they made a reservoir and then it comes through the pipes. That's where they take the potable water and it reaches our house.

F: So this water from the tap comes from Cerro Quilish?

M: That's what they say. A lagoon, they say.

F: Before you heard it on the radio, did people tell stories about Cerro Quilish?

M: No, we hear them on the radio. "Quilish is life." If it's mined the water will be contaminated and we'll die, like chickens [laughs].

J: There used to be frogs, but these are dead now.

M: There are no frogs now; before there were, green ones.

J: Now the mine has contaminated them.

M: On the path, you'd find them ... it's been seven, eight years that there aren't any. I used to be afraid to walk there; we'd find the little frogs, around the rocks, green ones.

Margarita went on to recount some stories her grandfather had told her, about mountains that contained gold. I asked if her grandfather had also told her stories about Cerro Quilish, and she replied:

> They used to say Cerro Quilish was evil. It would eat you. Yanacocha couldn't get there, the water springs would suck you in. Quilish was such an evil one! Little boys would die, dried up. But not anymore. It's become tame. I don't know how. Now we can get there, we're not afraid at all. Before they used to believe, our grandparents... And because of their beliefs, the children would die. But now we know the word of God and we don't believe anymore [in evil spirits]. We're not even afraid.

Margarita's account combines her grandfather's stories and NGO campaigns against mining with her own observations of water springs at the foot of Cerro Quilish and the experience of walking on paths full of frogs to the nearby community of Chilimpampa (named after the *chilin*, one of the types of frogs commonly found in the area). Many campesinos commented on the absence of frogs as a consequence of mining activity, and this concern was picked up by environmentalist campaigns and the mine's own counter-campaigns. The "scientists" she mentions could refer to members of local NGOs or to international consultants who went to Cajamarca to lend support to the Quilish campaigns. For example, a public event held in March 2004 to

present observations to Yanacocha's Environmental Evaluation Study included the participation of members of the NGO Grufides, a lawyer from Lima and an environmental scientist from Belgium. Radio spots, printed materials and educational workshops run by NGOs usually made reference to studies carried out by local and international organizations, even though the information was translated into nontechnical language. Thus, the "lagoon" refers to scientific descriptions of Quilish as an aquifer that holds water, but this idea merged with stories told in Andean communities about large subterranean lakes that exist beneath mountains. While rivers, lakes and water springs are obvious sources of water, mountains themselves can also be considered sources of water, even if they show no evidence of being so (Sherbondy 1998:229).

Jaime and Margarita attributed their knowledge about Cerro Quilish to what they heard on the radio, but in their accounts, the radio spots (produced by NGOs to raise awareness about mining) became entangled with their own conceptions about mountain beings. Mountains have human qualities and "talk to each other." They referred as well to versions of stories about gold-bearing mountains and greedy individuals who meet a tragic fate when they are confronted by evil spirits. In recent versions of this oft-told story, the "gringo" perpetrators are North Americans and Peruvians from the capital city working for Minera Yanacocha. The NGO campaigns drew from these stories to reach a rural audience, even though, as Margarita claims, people who converted to evangelism "don't believe" in them anymore. At the same time, she continued to attribute agency to Cerro Quilish when she explained that the reason Cerro Quilish no longer harms people is that "it's become tame."

The stories told by Margarita and Jaime mesh "scientific" narratives about the importance of Quilish with a world of spirits and agentive mountains. Both were necessary in order for stories about Cerro Quilish to travel outside the boundaries of Porcón and the Cajamarca region. While hydrological arguments appeal to universalizing ideals of science and environmentalism, testimonials of Cerro Quilish as an animate being appeal to the particularities of local knowledge. However, as I was constantly reminded in the field, what are usually thought of as "scientific" and "traditional" knowledge are both the result of global/local encounters that are unequal, unstable and have unpredictable effects.

Neither science nor local stories are fixed and unchanging. As they become part of new transnational contexts of global mining, environmentalism and cultural rights, they are transformed and, in turn, help transform those contexts with which they merge. Sometimes these different types of knowledge connect and sometimes they slide apart (Cruikshank 2005) but, as the Quilish case makes clear, these knowledges do not have to be based on shared interests or a common understanding of the world. Divergent knowledges can also communicate and come together in unexpected ways. One of the ways in which noncongruent knowledges came together in the Quilish controversy was in discussions around water. As I will show, arguments about the importance of Cerro Quilish as a water source were important for the campaigns against the mine, but they also helped further the interests of those in favour of the project.

Stabilizing Multiple Worlds

If the image of Cerro Quilish as an Apu held romantic appeal and added a new dimension to the antimining struggle, it was the language of aquifers that gave it scientific validity. One of the principal arguments made by activists who opposed the mining project was that the local population, both urban and rural, depended on this mountain for its water needs. Looking through papers he had collected over many years campaigning against Minera Yanacocha, Reinhart Seifert, then-president of the Cajamarca Defence Front, pulled out an old article from a local paper. He said this was where the first reference to Cerro Quilish as a mountain that "holds water" appeared. The 1996 article from a local weekly publication read: "Mayor Guerrero indicated that these mountains are the water 'sponges' or 'cushions' of the city of Cajamarca and showed concern over the possible activities of the mining company" (*Clarín* 1996). Having the city's mayor refer to Cerro Quilish as a water source was a major step in a campaign that gradually gained supporters.

Mr. Seifert had arrived from Germany in the 1980s to work for a development agency and made Cajamarca his permanent home. His radical antimining stance and fiery temperament made him a controversial figure among both critics and supporters of the mine. While recounting his involvement in the campaigns against Minera Yanacocha, he distinguished between the different strategies used to defend Mount Quilish: it was Father Arana, he told me, who embraced and helped disseminate the imagery of the sacred Apu; by contrast, he, as a scientist, was more interested in the technical arguments against mining. Their joint efforts—even if part of a sometimes conflictive relationship—are indicative of a wider network of collaboration that contributed to the effectiveness of the Quilish campaign. Even if

their interests did not always converge, an alliance was nevertheless possible.

Cerro Quilish's multiple forms—mineral deposit, Apu, sacred mountain, aquifer, "mountain that holds water" and so on—overlapped or diverged at various times throughout the conflict, and this flexibility was essential for making the struggle known beyond Cajamarca. National and international news stories that circulated about the Quilish protests consistently described the conflict as one that revolved around the defence of Cajamarca's primary source of water. For example, *La República*, a national daily with a liberal slant, referred to Cerro Quilish as an aquifer that supplies water to the city (*La República* 2004). Some national media reports mentioned the need to conduct hydrological and hydrogeological studies of the watershed before any exploration work could continue, a point that was written into an agreement between the mining company and local leaders that put an end to the protests (*El Comercio* 2004).

In missives from organizations such as Oxfam America and the international press, descriptions of Quilish as a source of water were often accompanied by references to its local significance as a sacred mountain. An article from AFP newswire stated that "campesinos justified their attitude [against exploration activity] alleging that the mountain is sacred and that the gods of Andean mythology (Apus) gave it to them 'in concession' to take care of them" (Cisneros 2004). In another article, titled "Protests Continue against Gold Prospecting on Sacred Peruvian Mountain," a journalist from the Associated Press wrote that Cerro Quilish was "historically considered an 'apu,' or deity, by local Indian communities" (Caso 2004). In the national press, the term *Apu* did not appear with great frequency, but the alleged sacredness of Cerro Quilish was nevertheless present in media coverage (e.g., Sandoval 2004) and influenced public opinion on the issue.

Before the Quilish protests, Apus and other entities were usually relegated to studies of "folklore" (or more recently, to tourism and to "New Age" and environmentalist discussions) but were not taken seriously in political debates. In addition, the idea that Cerro Quilish was an important aquifer set the conflict apart from earlier disputes around mining activity in the country. Certainly, water had previously been a concern in mining regions, particularly when rivers and streams were contaminated by mine runoff. However, the idea that a mountain needed to be protected *because* it was a source of water marked a shift in thinking about mining, water and the environment. Water helped make the Quilish issue compelling and drew the support of people who did not necessarily identify with an "environmentalist" or "antimining" stance.

In part, the shift to discussions about water related to new technologies of open-pit mining that involve moving massive quantities of earth and using chemicals that could leach into bodies of water, as well as using large quantities of water in the mining process. In modern mines like Yanacocha, the unknown and unpredictable risks associated with mining operations are the most worrisome for neighbouring communities: the lowering of the water table, the reduction of water flows in rivers and irrigation canals and contaminants that are often undetectable to the naked eye. Once Cerro Quilish was identified as a key source of water for the region, these unseen and unforeseen hazards became more tangible. Activists used these arguments to put a stop to the project and made water a key element of future conflicts.

Quilish as Water

The Quilish antimining protests, unprecedented in the country's history, prompted Minera Yanacocha's withdrawal from Cerro Quilish. Bowing to public pressure, Minera Yanacocha asked the Ministry of Energy and Mines to revoke its exploration permit. Following the protests, the mining company emitted a communiqué in which it recognized its mistakes:

> The events that took place in September have made us understand the true dimension of the preoccupations that our insistence to initiate exploration studies and activity in Quilish generated in the population, both in the countryside and the city.
>
> We have listened to the preoccupations expressed by people of the countryside and the city, with regard to the quality and quantity of water. In this respect, we will work jointly with communities with the objective of obtaining an integral and transparent solution that will allow us to protect this precious resource. (Yanacocha 2004)

Activism against the Quilish project, including scientific arguments about the importance of Quilish as an aquifer, helped make water the common language in which mining issues were discussed. During the Quilish controversy and in subsequent mining conflicts, protestors maintained that extractive activity threatened the water supply of local communities. Another recurrent argument was that mining "at the headwaters of the river basin" (*en cabecera de cuenca*) would inevitably affect the water of communities downstream and should

not be permitted. Arguments about the reduction of water in irrigation canals, toxic pollution and the disappearance of lakes and water springs made water a central actor in protest actions against mining expansion.

The focus on water in mining debates emerged alongside a national concern about water issues that were not restricted to the impacts of extractive activity but ranged from potable water and sanitation in urban areas to global water scarcity and privatization. However, "water and mining" became a prominent theme in the many water-related conferences, forums and educational events that were organized in Cajamarca and throughout the country in the years following the Quilish protests. These conferences often saw the participation of international experts and key figures, such as Father Arana and spokespeople from the mining sector. In May 2007 in Cajamarca, for example, the "First Water Forum" (organized by a coalition of actors that included Minera Yanacocha) brought together representatives from corporations, government and civil society to discuss a water management strategy for the province. In several conferences on mining organized by NGOs, water also took precedence in the presentations and discussions.

While arguments about Cerro Quilish's role as a source of water contributed to an antimining discourse, Minera Yanacocha also began to give water more attention in its public relations campaigns. These campaigns transformed Cerro Quilish into an object for technical and scientific management and sought to counter criticisms against the mining company. Much of Minera Yanacocha's public relations work focused on water issues that activists themselves had helped introduce into the debate; for example, the company disputed the claim that mining processes compromise water availability for local communities. Instead, Minera Yanacocha's educational materials and public presentations suggested that the problem was not one of water *scarcity* but of water *management*. In its public relations materials, the company argued that Cajamarca had abundant water, but it was "lost" because it was not captured and used to its full advantage before it flowed into the sea.[5] Thus, the solution lay in capturing more water by constructing water reservoirs, dykes and water tanks. Other company-sponsored projects focused on improving irrigation systems by lining canals to reduce water loss and introducing spray irrigation technologies. The company also invested in various participatory water monitoring programs that involved state institutions and local communities. These strategies reflected the company's efforts to promote an image of environmental responsibility, institutional transparency and public participation, all legitimized by scientific arguments. This emphasis on the technical dimensions of water issues reduced the complexity of Cerro Quilish and facilitated the company's efforts to refocus the debate to emphasize the management of resources.

Although not everyone accepted Minera Yanacocha's claims of environmental responsibility, its focus on water management provided the company's supporters with arguments to delegitimize the opposition and posed an additional challenge for activists. After the events of 2004, the social movement "in defence of life" that Cerro Quilish had inspired became promptly fragmented. Those who continued to protest against the mine's effects on water quality and quantity or who mobilized to oppose other expansion projects, grew frustrated by the lack of popular support at marches and other organized events. Many of them felt that Minera Yanacocha had co-opted local leaders and that the promise of jobs and development projects had effectively neutralized any opposition in communities surrounding the mine—including those in Porcón.

Conclusion

In her classic study, June Nash (1993) wrote about spirits and other beings that inhabit the mountains and have long been part of mining activity, engaged in complex negotiations with mine workers facing the dangers of the underground mines. Similarly, the Apu is part of a sentient, animate landscape disrupted by recent large-scale mining projects. However, Cerro Quilish did not already exist as an Apu according to a traditional "Andean cosmology"; rather, it came into public view through multiple interactions and knowledge practices that revolved around the antimining protests.

Father Arana's evocations of Cerro Quilish's "sacredness" resonated with urban residents, including those who shared his Catholic background. The protection of the environment from mining contamination, and the defence of Cerro Quilish in particular, came to be seen by some within this group as an intrinsic part of their Catholic duty. The idea of the "sacred" helped to translate the relationship between campesinos and Cerro Quilish into the language of Catholicism. At the same time, Cerro Quilish's identity as an Apu travelled beyond a religious audience, enrolling journalists, environmentalists and other supporters including campesinos themselves, who embraced Cerro Quilish's multiple forms in ways that helped to strengthen their claims.

The struggles over Cerro Quilish involved a large number of participants whose interests both overlapped and diverged in productive ways, contributing to the strength of the campaign against the mine. As I have

tried to show in this article, Cerro Quilish's multiple forms made it possible for the campaign to draw a diverse base of supporters and travel through international activist and media networks. I am not suggesting that Quilish's multiplicity was planned or intentionally fabricated; rather, the various actors and events I have described helped shape and bring to the forefront the particular forms that Cerro Quilish was to take at various stages in the controversy.

When the movement was at its strongest, the multiplicity of Cerro Quilish posed a challenge for Minera Yanacocha. Yet, as I have sought to show, "making matter" requires continuous effort, and the precariousness of those multiple worlds became evident at times when the movements against mining expansion became fragmented and activism weakened. Arguments about water quality and quantity that antimining activists introduced into the debates, along with the mining industry's technocratic solutions centred on environmental management, had the effect of destabilizing Cerro Quilish's multiplicity and enabling a singular reality (water) to take hold. This singularity seemed to obscure (at least temporarily) other realities from view. Yet the potential for ongoing conflict remains, for those other realities do not cease to exist. An attention to multiple worlds reveals the collaborative processes of enactment that brings entities into being. Contemporary conflicts over mining can thus be understood as an ongoing process of contestation over socionatural worlds. This is always an unfinished process and will continue as Cerro Quilish's multiple forms are enacted and reenacted in an evolving context of mining expansion in Peru.

Acknowledgments

I would like to thank Suzana Sawyer, Ben Orlove, Joe Dumit and Penny Harvey for reading and commenting on earlier versions of this article. I am especially grateful to Marisol de la Cadena for many challenging and inspiring conversations that helped me develop the ideas presented here. I would also like to thank Mario Blaser for his insightful feedback and two anonymous reviewers for their helpful comments. I am deeply grateful to friends in Cajamarca who made my fieldwork possible. Finally, I would like to acknowledge the support of the Social Sciences Research Council and the University of California's Pacific Rim Research Program.

Notes

1 At the time, the property of the mine covered more than 535 square miles (1,386 sq km) (Newmont Mining Corporation 2005). The mine is located within four major watersheds spanning the continental divide.

2 For an overview of anthropological engagements with the materiality of resources, see Richardson and Weszkalnys (2014).

3 All interview excerpts and quotes from print sources are my own translation from Spanish, the language that is primarily spoken in Cajamarca.

4 Liberation theology had a particularly strong influence in Cajamarca, in part as the legacy of José Dammert, Bishop of Cajamarca between 1962 and 1992. His work with the *Rondas Campesinas* and Cajamarca's rural poor inspired many people involved in social justice activism. Bishop Dammert was a mentor to Father Arana and created the Cristo Ramos Parish in Porcón in 1990, where Father Arana served as parish priest.

5 A 2007 advertisement by Minera Yanacocha reads: "We are collecting some of the water that Cajamarca looses at sea. There is [enough] water. Let's all think about how we can collect more of it." (*Ya estamos juntando algo del agua que Cajamarca pierde en el mar. Agua hay. Pensemos todos en cómo juntamos más*).

CONSUMING INTERESTS: Water, Rum, and Coca-Cola from Ritual Propitiation to Corporate Expropriation in Highland Chiapas

JUNE NASH
City University of New York

A growing demand for water that exceeds scarce resources is changing political and social alignments and provoking the emergence of water wars. The scarcity of water is a result of deforestation, the contamination of existing water sources, and the diversion of groundwater to commercial enterprises. These commercial enterprises include irrigation agriculture and, increasingly, consumer beverage production, especially of bottled water, now sold to people who face growing water scarcity. A natural resource once considered a blessing for all people granted by the rain gods is now a contested commodity exacerbating the growing divide between classes.

In this article, I examine ways in which a consuming interest in water that once promoted community integration in early civilizations in Mesoamerica has become a multibillion-dollar industry with sales throughout the world, based on a commodity that many local people cannot afford. The concern of preconquest civilizations to ensure the water supply was transformed by the Spanish conquerors, who drained and diverted the abundant waters in the Aztec capital and then introduced commercialized cane and maguey used in the production of rum and tequila. Adopted by indigenous pueblos as a libation in ceremonies offered to the saints and divine powers during colonial and independence times, the demand was finally diverted to the consumption of Coca-Cola and other soft drinks imported by local concessionaires responding to corporate inducements. Today the major extraction of groundwater in San Cristobal de Las Casas, Chiapas is done by the Coca-Cola

CULTURAL ANTHROPOLOGY, Vol. 22, Issue 4, pp. 621–639. ISSN 0886-7356, online ISSN 1548-1360. *DOI: 10.1525/can.2007.22.4.621.*

Company. The company now bottles the water and sells it throughout the world and to the people from whom it was expropriated.[1]

The transformation of water from a deified resource to a commodified multi-billion dollar industry reveals how a public interest can be distorted by unregulated privatized expropriation. It is a morality tale that applies equally to other resources such as gold, silver, oil, and tin. Unlike these other resources, however, water has a human rights dimension; without water, humans cannot live. I have concentrated on water as a consumption product in this article because it is intrinsic to the social relations linking indigenous pueblos to their environment.[2] I include in my critique of privatized exploitation of water resources the failure of national and local governments to reach consensus on policies to address the growing shortages.

WATER IN PRECONQUEST CITY STATES

The availability of drinking water was a significant factor in the location of populations throughout Mesoamerica from the earliest known settlements hundreds of years before the Christian era to the present. In prehispanic times, growing concentrations of populations that depended on a communally controlled water supply propitiated deities who were believed to ensure a continuous flow. The confidence gained by fulfilling their obligations to the gods in ritual cycles encouraged people of early empires to perform spectacular engineering feats to control rivers and contain springs.

Possibly at the same time or even before the great ceremonial center of Teotihuacán near Mexico City developed their water control cultivation system about 500 B.C.E., precursors of the Mesoamerican civilizations in the central valleys of the state of Jalisco in western Mexico were developing chinampas, or cultivated islands anchored in lakes connected by canals that became the leading edge of horticultural activities in Mexico's central plateau. Archeological research over the past three decades by Phil Weigand and Acelia Garcia, who have examined the ecosystems of the Guachimontones site in Teuchitla, indicates that cultivators in this fragile environment were knowledgeable and concerned about soil fertility and water resources.

When I toured the site with Phil Weigand in April 2006, he pointed out the monumental lagoon where the chinampas were built and remain as islands grouped in regular blocks in canals that connected lakes. The extensive hydraulic engineering ensured the flow of water and capture of eroded topsoil in constantly enriched sites for sustained farming by inhabitants of over 2000 villages. It also provided a habitat for a variety of fish and animal species. These chinampas are, according to the

site brochure "among the earliest, most extensive and best designed cultivation fields within swamps in the whole of Mesoamerica" (Weigand and Esparza Lopez 2004:31).

Massive ritual mounds built at ceremonial sites near the springs and other sources of water, and the presence of a 2,200 meter square ball court, reveal the prosperity of the people who also developed fine pottery and sculpture. Sculptured figurines depicting dances and domestic life found in this early site and displayed in the Teuchitla museum suggest the collective basis for social organization. The widespread distribution of tools from more than 150 obsidian mines at the Guachimonton site attests to the part these people played in the circulation of ideas and techniques throughout Mesoamerica.

In the centuries after the Christian era, images of the rain god Tlaloc in Teotihuácan, and those of the Mayan rain god Chac in Palenque and Chichenitza, give further evidence of the power accorded to deities worshipped as the givers of water. This power extended to the gods of maguey and corn that produced fermented liquor that enabled humans to communicate with spiritual beings. Among the Aztecs, the goddess Mayahuel was venerated as the deity who gave pulque, the fermented juice of maguey, to humans.[3] The corn god, Ixim, was venerated not only as the provider of the main dietary staple but also as the very source of human life among Mayas throughout the Yucatan, Chiapas, and the western highlands of Guatemala. Rituals in their honor solidified the social group dedicated to maintenance of the environment, but failure in cases of drought, often led ruling elites to exact human sacrifices for the gods that promoted conflicts and even cultural collapse.

The Aztecs left their homeland in Aztlan, whose geographic location is not known, about C.E. 820, arriving in the Central Plateau about three centuries later. There they introduced chinampa cultivation into the densely populated centers where they served as mercenaries for the Culhuacán and other kingdoms. Within two centuries they were able to use their military skills to forge powerful alliances; and by the mid–13th century they established a kingdom of their own, known as Tenochtitlán. Located in a river basin encompassing 70–80-thousand hectares, the capital city was set on an island in a lake surrounded by a chain of lakes, including the marshy sweet waters of Chalco-Xochimilco, the salty bitter waters of Texcoco, and the sweet waters of Zumpango verging into the salty lake Xaltocan (Tortolero Villaseñor 2000:23).

The setting for the major Aztec temple, the templo mayor, is that of a chinampa rising out of the lake that surrounds the ceremonial center. Tlaloc, the rain god, was enthroned in the vertex of the pyramid, and four of the 18 months in the

ceremonial calendar were dedicated to the gods of rain. Like all powers of nature, the Aztecs conceived of water in the form of rains, floods and storms as potentially destructive as well as beneficial to humankind (Tortolero Villaseñor 2000:24). The lakes provided fish, turtles, frogs, toads, mollusks, and algae, and supported ducks and birds and many species of animals. Highly developed hydraulic systems made up of dykes, locks, and water transport all attest to the engineering skills of the Aztec administration, enabling them to take advantage of an abundant supply of food in areas that had been abandoned by the enemies they had defeated.

Undoubtedly, the Aztec mastery of chinampa cultivation contributed to their power in the central plateau, offering them sustained irrigated lands that were replenished with rich fertilizers from the lake bottom. They fortified this material base with an ideological and ritual structure honoring the power of rain and water deities that were related to the moon, Coyolxauki; but they placed the tribal god of war Huitzilopochtli at the apex. A gigantic image of Tlaloc, the god of water, found in the biggest chinampa site of Lake Texcoco, has recently been removed to the entrance of the National Museum in Chapultepec Park. The population density of the area—hundreds of thousands in the Valley of Mexico at the height of Aztec civilization—attests to the success of hydraulic cultivation (Sanders and Price 1968:202). But the increasingly onerous demands for sacrificial offerings of human captives to their gods engendered the hostility of neighbors and even their own population so that the Spaniards found ready allies in their invasion.

Until recently, Mayas who inhabited areas to the south in Mexico and Guatemala were thought to have relied on swidden cultivation, an extensive slash and burn process requiring that large land areas be left fallow for future use. Certain of the classic sites in Chiapas seem to be chosen for the proximity of still lakes, particularly characteristic of Ch'inkultik, just south of Palenque where the dominant ceremonial site rises about 200 meters above a series of still freshwater lakes. In the streams that flow between them one can still find lilies growing. Linda Schele and Peter Mathews (1998) hypothesize that the recurrence of the lily as an emblem of kingship in Mayan glyphs may have related to the kings' responsibility to maintain chinampas that were sustained by the tuberous roots of the lily. As yet this hypothesis has not been substantiated by any archeological dig.

In these preconquest city states, hydraulic systems reveal economic and social integration extending over large regions that were strongly focused on the control and conservation of water resources. The importance granted to water and the responsibility taken to guarantee its continued abundance contrasts with the culture introduced by the Spaniards and even more so with intensive commercial crop

cultivation promoted after 1960s. Where these practices dominate the landscape, the valuation of nature and the commitment to balance in the cosmos found in the Mesoamerican formative era are violated, just as they were by warring elites before the conquest when deforestation caused the collapse of lowland civilizations. Today for example, the Teuchitla area in western Mexico is environmentally devastated, and the river and lakes have shrunk or disappeared. The national government subsidizes extensive irrigation systems for the production of cane sugar and maguey that divert water from subsistence cultivation. Tequila, the chief product made from maguey, is a product identified not only with the town from which the name is derived but also with Mexico as a nation, yet it was recently sold to a foreign corporation, along with the water rights that sustain its production.[4] Mexico City is experiencing a water shortage, and water supplies in most large urban centers are threatened with contamination or scarcity.

I now turn to the logic and practices of the Spanish invaders and conclude by highlighting the attempts now being made by Mayas to pursue an autonomous course of development reinstating small plot cultivators and craftspeople.

THE SPANISH CONQUEST AND THE DRIVE TO DESICCATE WATERLANDS

Spaniards expressed awe and admiration for the beauty of the Aztec capital, overflowing with vegetation, flora, and birds. Fountains and canals connected lakes from which rose the artificial islands or chinampas capped with flowers and fruits. Yet coming from the arid lands of Asturias, Andalusia, and Madrid the colonial bureaucrats were bent on draining the water that impeded their plans to replace the temples and palaces of Tenochtitlan with replicas of the quarried stone cathedral and government offices that still stand in Mexico City's zocalo. They are a testament not only to the dominance and control exercised by the conquerors but also to their insensitivity to the knowledge and artistry of the people and to the environment.

In the century following their conquest of the Aztecs, the Spaniards proceeded to carry out what Tortolero Villaseñor (2000:33 et seq.) calls "an ecological destruction without parallel" in the world. They diverted waters from the lakes and canals, constructing dams in ways that caused the waters to stagnate and the fish and plants to die. They burned woodlands to make pasture for cattle, introduced plow cultivation so deep that it caused erosion, and brutally disrupted the marshy lake bottom. The soft subsoil could not support the weight of their stone buildings. Lacking the constant flow of waters through canals that kept the lake waters oxygenated, the dead waters no longer maintain the life of plants and fish.

Given their own failure to dry out the landscape, the Spaniards hired a Dutchman, De Boot, because Dutch engineers had recovered 80-thousand hectares of land from the sea between 1540 and 1615. His plan to dig a ditch around the city, expel the surplus waters with hydraulic pumps as they did in Holland, and connect the lakes with canals was rejected because it too closely replicated what the Indians had had. He was denounced as a Dutchman and a Calvinist, a spy and a heretic, and condemned to death by the Inquisition in 1636. Although the sentence was suspended, he died, apparently of natural causes, in 1638 (Tortolero Villaseñor 2000:37).

Colonial government policies were guided by the attempt to dry out the urban environment of the capital city they replaced, in effect replicating the arid environment from which the Spaniards had come. Subsequent projects spread the Spaniard's ecological disaster with the advance of hacienda cultivation in the north and in the flatlands to the east and south. The destruction that followed the conquest was accelerated through the ineptitude of bureaucrats and the rejection of often-superior techniques and practices of the Indians, setting the stage for local rebellions that ultimately brought down Spanish rule. This insensitivity to the environment persisted after independence when buildings such as the Palacio de Bellas Artes and the interrupted Benito Juarez monument meant to celebrate the power of the state sank several meters. Floods resulting from the destruction of the intricately engineered canals continue to plague the population, with Lake Texcoco periodically disgorging its waters on the Mexican capital.

CHIAPAS AND THE DELAYED REVOLUTION

The highlands of the state of Chiapas did not attract many Spaniards during the colonial period. Without the participation of indigenous people, the decision to join forces with Mexico rather than Guatemala was made by the few land barons who dominated the state in 1824, three years after Mexico had gained its independence. Promoted by liberal policies in the last quarter of the 19th century, the descendants of these elites and immigrant Europeans seized coastal lands and the better lands of Indian pueblos in highland valleys. There they established a racially divided society that maintained an impoverished, geographically isolated majority of Indians in the highlands, reduced to a subordinated status, deprived of education, and dispirited by alcoholism. Mexico's independence from Spain did not bring freedom for the indigenous people, but, rather, greater freedom for the descendants of Spaniards, deculturated and mixed blood Indians, or ladinos, to exploit Indians in feudal institutions of work. The relative isolation of indigenous townships allowed some precolonial practices to survive until the mid–19th century when the attrition of

restricted lands previously granted to Indian pueblos by the crown forced many to migrate temporarily or become peons in coastal plantations. The vision that fostered the growth of empires dedicated to cosmological forces was further attenuated by commercial activities dominated by Europeans and a growing population of ladinos.

Throughout pre-Colombian Mexico, consumption of fermented beverages was an intrinsic part of religious and secular celebrations. Powerful seers *(iloletic)* or shamans imbibed these intoxicating beverages and smoked strong tobacco cheroots to enhance their communication with the animal spirit of the patients and their malefactors to carry out a cure or intercept witchcraft. After the conquest the fermentation and distillation of sugarcane liquor, or rum, became a monopoly of religious *cargo* (lit. "burden") holders who required the drinking of *posh,* or home brewed cane liquor, in all celebrations in the calendar cycle of saints, and in curing ceremonies, betrothal rites, and in funerals. In some towns, such as Chamula, a Tzotzil speaking municipality contiguous with San Cristobal de La Casas, both the production and distribution of posh was monopolized by the elders themselves. In other towns such as Amatenango liquor production became a cottage industry with rudimentary stills discretely located in hamlets surrounding the town center.

When I was living in Amatenango during the 1960s, drinking was institutionalized in every celebration within the home as well as in the church and town hall. Civil and religious officials addressed prayers, called pat'otan (behind the heart), to the ancestors *(me'iltatil),* asking permission to swallow the drink. Liquor was considered to be the gift of our Lord Jesus Christ, derived from the bath water of the crucified Christ when he was taken down from the Cross *(s'mahtan sapilyok, sapilsk'aab yu'un tatik Jesu Kristo).* During civil and religious celebrations, officials tested each other's manliness, equated with the ability to drink a great deal without staggering. When they reached their limit of tolerance, they could not refuse it but were allowed to pour the offering into bottles carried by young boys who accompanied each official. Every young man produced his first batch of posh when he started his campaign to win a wife, a long drawn out series of visits to her parents in which gifts of liquor along with bread, chocolate, and brown sugar, played an important part. When the parents of the girl accepted the drink, the troth was announced, and then the big production of liquor for the wedding began (Nash 1973). The worth of a woman was measured in the number of liters of posh given by a youth in the betrothal match, and years after the marriage the quantity was remembered and remarked on.

In 1957, Pedrero, one of the largest cane growers who owned the sugar refinery of Pujiltic on the lower slopes of the central Chiapas plateau, used his

political connections throughout the state to make home distilled beverages illegal. Soon afterward, state police were dispatched to the towns and proceeded to flush out the moonshiners in the hill towns. I was told after the campaign that there were two killed on each side of the fight. Sensing the futility of the military campaign, the state government called in the National Indigenist Institute (INI). They proposed a reward for anyone who brought in their equipment, in exchange for which they received ancient copper coils and metal drums. These items, including pottery tinajas (or water carriers) used to capture the evaporation of the boiling sugar, made for a fine museum collection, but in the following weeks the stills were back in operation with updated copper tubing. The owners of the 41 stills operating when I was there resisted attempts by federal police to locate them, broadcasting warnings in Tzeltal of the impending raid on loudspeakers that played popular songs to attract young men to the bars they operated in town.

Given the prevalence of this consuming interest in liquor, anthropologists were attracted to the subject, resulting in a large-scale research project and extended computer analysis during the 1960s, when this technology was not much in use. The book that resulted from the investigation in three towns, Amatenango del Valle, Chamula, and Oxchuk, was entitled *Drinking Patterns in Highland Chiapas: A teamwork Approach to the Study of Semantics through Ethnography* (Siverts 1973). It was a triumph of structural functional investigation, showing minutely the functioning of the civil religious hierarchy based on age, gender, and rank as this was played out in drinking order. In the process, a great deal of liquor was imbibed, both by anthropologists and "informants," possibly promoting what was called rapport in those days. The requisite drinking in ceremonial occasions may have promoted conviviality, as the authors claimed (and I was one of them), but it also promoted a compulsive addictive behavior that was ruining the health of local people and promoting domestic violence. The interpretations generated by the research ignored both the overarching structures of inequality that held Indians in bondage and the way in which drinking behavior reproduced the relations of subordination.[5]

The high consumption of liquor not only increased the brutalizing impoverishment of indigenous people who expended so much of their labor and land on cane sugar liquor but also succeeded in anesthetizing Indians to the injustice in which they were held captive. Those who became conscious of this, especially women who were not so engaged in the ceremonial life requiring that they imbibe copious amounts of liquor, chose to convert to Protestantism because it absolved them of participating in the civil religious hierarchy. This strategy was notable, especially in Oxchuk where in the late 1940s over 5,000 adults had converted to escape the

required drinking in civil and religious ceremonies, and particularly in curing rituals where drinking was considered an essential part of the cure (Villa Rojas 1990). Women were among the first to convert and made up the majority of the converts that Villa Rojas recorded during his field work in the 1940s. The women, who were the first to accept the new faith, often converted their husbands because drinking was prohibited in the congregation, a pattern that Christine Eber (1995) recorded over two decades later in Chenalhó.

Aware of growing concern about alcohol, traditional religious leaders began to substitute soft drinks for the liquor, establishing concessions with the Coca-Cola Company or PepsiCo that were making inroads in indigenous markets during the 1980s. In Chamula, leaders of the hierarchy reinstated their monopoly with the new product replacing posh. The Coca-Cola Company advertised the beneficial health effects of the nonalcoholic drink, and the religious brotherhoods provided the infrastructure for the promotion of Coca-Cola in local celebrations that had previously served locally distilled cane liquor. The monopoly of this sale was granted by elders of the civil religious hierarchy to the Coca-Cola Company. In Amatenango, the concessions were granted through party allegiance, with Institutional Revolutionary Party (PRI) officials purchasing Coca-Cola and Party of the Democratic Revolution (PRD) officials favoring Pepsi. When I returned to Amatenango in 1987 after a 20-year absence, I found that these soft drinks were dispersed with the same ceremonial practices and prayers that had accompanied the distribution of posh during celebrations in the past. Soft drinks, including national brands as well as the U.S. brands that tended to be distributed in accord with monopolized markets, have even replaced the gift of posh in the elaborate household ceremonies of betrothal and death.[6]

The consumption of both posh and soft drinks opened indigenous society to wealth opportunities for a few, engendering a class system that divided the town between those who were part of the cacicazgo—political leaders dependent on the ruling party—and those who were not. The cacicazgo fostered political alliances between indigenous leaders and the state that debilitated indigenous autonomy more than any previous colonial or independence institutions. It became a key factor in the extreme marginalization of Chiapas after the Revolution of 1910–17, in which it perpetuated the rule of feudal land barons long after they had been superseded by modernizing agents in other states. Government services, including education, health clinics, electricity, and piped water, came late or not at all. Indigenous villages did not have any piped water service when I arrived in Amatenango in 1957, and it was not available even to residents in the center of town until a decade later. When

it was finally introduced in the late 1960s and 1970s, it was given out preferentially; those who lived in outlying hamlets or were marginalized from the government largess were the last to receive piped water, and often the hamlets that were opposed to the party in power never gained it.

Piped water has created another basis for partisan discrimination and conflict within communities. When piped water was first proposed by the INI, the curers in Amatenango did not want to have the spring waters covered and tapped with pipes because this was the site of curing rituals where patients were bathed. It was only after a year's negotiation that INI reached a compromise and diverted a stream for curing purposes. In the spring of 2004, Zinacantán's PRD officials who occupied the town offices refused to grant water to nonparty members. The resulting conflict caused two deaths. In Chamula, residents in the hamlet of Petet were discriminated against when potable water was first introduced in 1995 because they voted for the party opposed to that of incumbent PRIistas. Remote hamlets of Amatenango have never received running water.

These local conflicts are not caused by the corporations that enter into market relations with indigenous communities, yet the concession granted to soft drink companies have aggravated deep-seated conflicts based on religious and political party schisms by promoting access to privatized gains. To resist the influence of corporations requires more than a boycott of the product, as the people of Mitzitón learned in 2004 when they opposed the order of a township official who demanded that they purchase twenty cases of Coca-Cola per week for meetings so that he could retain his concession with the company. Faced with expulsions and even death threats for refusing to buy Coca-Cola from the incumbent official, the dissidents had to leave their community and colonize a new settlement in Teopisca on the basis of Catholic Word of God principles (CIEPAC 2004:3).

Many indigenous communities are beginning to reject the authoritarian rule of traditional leaders and the increasing threat to land and water resources by foreign private enterprises. Some seek autonomy, following the path of Lacandon communities that support the Zapatista Army of National Liberation that constituted themselves as Regional Autonomous Pluriethnic Pueblos on October 12, 1993. This group drafted the demands that were later codified in the San Andrés Agreement signed but never implemented in 1996 by President Zedillo.[7]

This course is being pursued by Chamula residents who have settled on the slopes of Huitepec, the volcanic peak where the major springs that supply water for the department of San Cristobal and many of its surrounding indigenous communities are found. During the presidency of Vicente Fox, who had served as the

chief executive officer of Mexico's Coca-Cola Company prior to his taking office, the federal water agency gave permission to the company to tap deep groundwater resources. The water is not metered, and the municipality does not receive reimbursement. Perhaps to confirm the concession of this precious resource, the newly installed Partido Acción Nacional president Felipe Calderon declared Huitepec a national environmental reserve. This step, which allows the federal government to abrogate land and water rights of localities, has been taken in many of the water rich environments throughout the state. Following this preemptive act, the new paramilitary organization that has been active in prime Lacandon sites since Calderon's inauguration arrived in the area and threatened the long-term settlers, claiming that they were cutting down trees in the new reserve. The settlers claim that they have not done any more than cut small trees for firewood as they have done for the past six or seven decades of residence, and that the large-scale cutting was done by the intruders. Meanwhile, Maderos del Pueblo, an activist NGO of Great Britain, supports the residents and has called environmental and human rights organizations in the area to rally around the threatened residents. When I visited the encampments of volunteers on April 12, 2007, they reported a lull in hostilities but were maintaining daily tours to ensure that no new cutting of trees occurred.

The Coca-Cola Company, which moved its headquarters from the state capital of Tuxtla Gutierrez a few years ago to take advantage of the excellent water supply in San Cristobal, has expanded its fleets of trucks that canvass the neighborhoods of the city, proclaiming their presence with a happy jingle that draws adults and children to purchase their soft drinks and the increasingly popular bottled water. The company claims to be trying to recruit indigenous workers, but the manager complained to me in an interview (March 2006) that the level of education is too low for the jobs they need to fill. As a result, he said, they are giving grants to communities such as Chamula to upgrade the educational level. When I visited the town soon after, officials told me that, to their knowledge, Coca-Cola has not invested in any educational program in town.

PRIVATIZED APPROPRIATION OF WATER IN A NEOLIBERAL ECONOMY

In global markets, the links between resource bases and consumption needs have changed. Instead of rendering liquor, candles, tobacco, and incense to the gods in thanks for their gift of water, public officials now grant concessions to foreign firms that allow them to extract unlimited quantities of an increasingly valuable

resource. In the new exchange relationship the ritual responsibilities that promoted communal integration are waived, and in their place class differences have created the basis for growing conflicts among indigenous people.

The demand for commoditized bottled water has grown as a result both of contamination of existing water supplies and new industrial uses, particularly in agroindustry. It has also grown because of the diversion of groundwater and springs to the companies that sell bottled water. During 2004, more than 154-billion liters of bottled water were consumed worldwide. The United States is a foremost consumer with 26-billion liters and Mexico is the second highest consumer with 18-billion liters.[8] The biggest gains in the sale of bottled water are in Third World countries, which face growing scarcity of clean water along with rising populations. Companies like Coca-Cola, PepsiCo, and Nestle that have always drawn on world water resources for their beverages, now use their water rights to exploit groundwater for sale. In countries that are experiencing the greatest growth in the world economy, bottled water conduces to the scarcity of potable water: in India Coca-Cola's export sales of water called Dasani have reduced the capacity of 50 cities to meet the needs of the people.

Although not always healthier than tap water in countries that purify piped water, bottled water is 10,000 times more costly if one takes into account the energy expended in bottling, commercialization, and recycling. Bottled water is also highly costly for the environment. There are few government regulations on the production of bottled waters, and some bottling companies simply take tap water and add minerals, a practice that has not always proved healthful (*La Jornada* 2006: 6a).

Investment in water services has low return when the server does not hold monopoly control of water. The Mexican government had hardly begun to provide water services to indigenous areas when the transfer of water services to the municipality began to be privatized illegally in l982. Privatization was then legalized by the reform of Article 27 of the Constitution in 1992 during Salinas's presidency. The drive to privatize rights to exploit groundwater and make it available to foreign private companies surged during Vicente Fox's presidential term. As former president of Mexico's Coca-Cola Company, Fox was instrumental in assessing the wealth of subsoil waters and asserting the need of foreign capital with the perforation technology to dig deep wells. It was no surprise when he introduced the new Law of National Waters in 2004 that authorizes the privatization of the entire hydraulic infrastructure of federal property—dams, canals, and irrigation ditches—and prioritizes the rights of extraction of water by corporations. These resources had been

considered the patrimony of the nation. The new Law of National Waters expands the creation of markets of water, taking advantage of the small farmers who can sell their right of extracting water. During his presidency the Fox administration has granted rights to exploit more groundwater in a country than ever before. The country now faces water shortages owing principally to the use of subterranean water, by large-scale agribusiness.[9]

The water hunters are now actively entering the new markets opened up by the Fox administration's reforms. Carlos Slim, a man who made his multibillion-dollar fortune in the privatization of telecommunications rights over a decade ago, has now offered to assist Mexico City with its water supply. The reform in the law at the federal level has enabled the Coca-Cola company to exploit deep wells in San Cristobal de Las Casas. Although the municipality of San Cristobal does not receive any rent or payments for the rights of exploitation of the wells, Coca-Cola Company is now selling not only their signature soft drink but also 400 product lines that now include bottled water for this increasingly scarce resource. The corporation's new distribution center in San Cristobal consolidates its market gains in consumption of Coca-Cola in indigenous territory while taking advantage of low prices for clear water in territory that was known for abundant water supplies. The market has expanded with the demands of a growing tourist industry and also of low income ladinos and Indians who have no access to groundwater. Consumption of bottled water in Mexico has doubled from 1999 to 2004 as a result of increasingly contaminated waters, and the buyers are not just tourists or young urban professionals. Indigenous entrepreneurs use the corporate frame to enhance political party goals internally at the same time that the corporation uses the local concessions to promote sales and secure their position in a sovereign nation on their own terms.

THE WORLD RESOURCE WAR IN WATER

The tenuous link between consumer and producer, stretched in the western expansion and consolidation of the capitalist market system in the 20th century, is now being severed in the third millennium. Privatization had already been legislated in the North American Free Trade Agreement, railroaded through Congress during the Clinton administration and ratified by Carlos Salinas in 1993. That agreement defines water as a tradable good, obliging all parties to sell their water resources to the highest bidder under threat of being sued by private companies that want it. These parties will be strengthened by the proposed Free Trade Area of the Americas (FTAA), which would allow foreign investors to sue and demand compensation from

governments for any law or rule that affects their profits, even when these laws are motivated by environmental considerations. (Americas Program 2004). The World Bank is now making its loans to countries conditional on the privatization of water services and resources.

We are on the brink of a new resource war that will divide the populations of the world into the haves and have-nots of water. The first major water war grew out of Bolivian popular resistance to the privatization of the Cochabamba water system. It was set off when Aguas del Tunari and Abengoa Corporations, subsidiaries of Bechtel's operations in Bolivia acquired the rights to manage the water service of Cochabamba in 1999. This concession was a response to the IMF offer of a development loan to Bolivia's government on the condition that Bolivia would sell to private corporations the municipal water system of Cochabamba and the national oil refineries. The offer was cunningly related to a World Bank report advising that no relief be granted to ameliorate the increase in water tariffs that took place (Albro 2004:235 et seq.) Massive popular mobilizations ensued, involving large segments of both indigenous and chola or mestizo populations. In the process, they generated what Albro calls a "plural popular" subject that was neither Indian nor elite and that became the base for the political success of the indigenous leader, Evo Morales in the presidential elections of 2006.

Other countries in Latin America have followed the example set by Bolivia's popular resistance to privatization. In Uruguay a 2004 plebiscite limited private participation in water services, and in Argentina the government restricted the benefits that had been customary in water contracts to private companies. This could happen in Colombia, too. Costa Rica is one of the few Latin American countries that provides public water services for all, whereas in Haiti only 50 percent are served. Water has become yet another measure of the poverty index, and investments in water services for Latin America are considered a poor market risk.

The Fourth World Water Forum, held in Mexico City in March 2006, differed markedly from the First World Forum on Water held in Marrakech. The First World Forum was organized by civil society with groups such as the Coalition of Mexican Organizations for the Right to Water and the movement for an alternative to privatization and for recognition of water as a human right setting the agenda. The agenda for the Fourth World Forum was set by financial organizations that now support it, including the Interamerican Development Bank and the World Bank. (As I have mentioned, the World Bank financing for installing water service is in fact conditional on privatizing water.) These organizations prevailed on the assembled

groups not to proclaim water as a human right (Galan et al. 2006: 43). The watered down (no pun intended) declaration, simply says that water is important for health and for the poor.

Local initiatives and community-level projects to supply, conserve, and treat water were overshadowed by very different neoconservative concerns. As a result, the NGOs and indigenous dissenters held an alternative Water Forum outside in the streets of Mexico City. An estimated l0,000 demonstrators were blocked from marching to the meeting site. They included members of communities threatened with sewage contamination, Indians whose water is being diverted to supply big cities, and farmers whose lands are scheduled to be flooded by hydroelectric projects. Mazahuas carried out a ritual asking for protection of water. Representatives of Pueblos Indígenas of Latin America announced that water is not merchandise, but life, and it ought not to be sold. "We know that some chiefs of State have not accepted satisfactorily that the liquid of the indigenous pueblos is like blood for the land; it is sacred, and therefore we respect it and for it we demand that the agenda of agreements of this forum establish actions that include us." As the most threatened consumers, they were the most forceful in protesting the threatened scarcity of water. Capitalist providers might take note that the break between consumption and production will also terminate their survival.

CONCLUSION

This brief review of transformations in the social organization of water systems from preconquest to colonial to independence to modern times reveals the need for a holistic analysis to ensure sustainable development and equitable distribution of such a basic necessity. The imposition of Spanish rule interrupted well-established adaptations to fragile environments and in so doing aggravated the scarcity of water in heavily populated areas and contributed to the concentration of power and wealth. In the early colonial period, the conquerors were able to reach water with wells of nine meters, now they have to dig 450 meters to find water.

The transformation from ritual propitiation of the gods that engaged entire populations in collective action to the private expropriation of water resources is having a profound impact on the indigenous pueblos that are now major consumers of these costly products. The shift from rum to Coca-Cola or Pepsi Cola is not entirely negative; the devastating effects of alcoholism are not nearly as apparent today as when I worked in the highlands during the 1960s. Yet the immediate effects are the dental caries that afflict the population coming of age in the 1970s, and the dehydration of infants and elders with parasites that sometimes causes

death. The delayed effects are environmental changes that are already becoming apparent, along with the increasing scarcity of a gift of the gods that is becoming too costly for the poor. The alliances made between corporate and government leaders to secure water rights without redistribution of profits to the consumers remain the most pernicious effect of privatization and monopolization of this precious resource.

The magnitude of the water crisis is made clear by the indigenous people who live on the frontiers of capitalist expansion. They are the most forceful in addressing the values that are threatened in the new resource wars for water. They remind us of a culture that promoted collective rights through practices that enhanced the environment, and the will of those who were the "keepers of water and earth" (Enge and Whiteford 1989) in earlier epochs. The privatization of a resource once considered to be the gift of gods and nature threatens universal access to a primary resource that many think should be protected by human rights covenants.

ABSTRACT

In this article, I trace consumption chains motivated by religious and secular rituals that have promoted demand for water, rum, and soft drinks in Mesoamerican communities for over 2,000 years. It describes transformations in the social organization of water systems, and how these transformations have affected indigenous communities in particular. In preconquest ceremonial centers the collective effort of the entire community contributed to the engineering of water projects and the celebration of deities who ensured the supply of water. Spanish rule brought a new array of saints, often identified with deities of natural forces, and with them cane sugar and rum with which Indians celebrated sacred holidays. Religious fraternities that once promoted imbibing of rum to facilitate communication with the gods and saints during the colonial and independence periods turned to Coca-Cola and other commercial beverages in the 1970s. The Coca-Cola Company promoted the health effects of their nonalcoholic drink and religious brotherhoods provided the infrastructure or local promotion of the drink during celebrations that once served locally distilled cane liquor in the annual cycle of fiestas. Federal concessions for extracting the groundwater of Chiapas now enable the company to produce their internationally sold products along with their newly featured bottled water. Rituals once made to the rain gods as givers of water are supplanted by political concessions to transnational corporations working with local officials in contemporary Mesoamerican communities. The transformation from ritual propitiation of the gods that engaged entire populations in collective action, to the private expropriation of water resources, has a profound impact on indigenous pueblos that are major consumers of these costly products.

NOTES

Acknowledgments. I have benefited from the many helpful suggestions of David Barkin, Robert Benfer, and Frank Reynolds in clarifying this article. I am grateful for the assistance of Elizabeth Story for her web search that netted some of the global stories cited.

1. Federal permits to the Coca-Cola Company were granted during the presidency of Vicente Fox, who was formerly chief executive officer of the Coca-Cola Company in Mexico. The municipality does not receive compensation for the unmetered pumping from deep groundwater reserves.
2. Intensive agricultural exploitation uses far more of the country's water supply than does bottled water, as studies to the north of Chiapas amply demonstrate. Enge and Whiteford (1989) have noted the remarkable feats accomplished by small plot farmers in the Tehuacán Valley who retain a collective organization and control of the irrigation system they devised. Roberto J. Gonzalez (2001) also indicates the scientific acuity of Zapotec farmers who have adapted the new coffee crops without abandoning their cultivation of subsistence crops. Although the impact of privatization is emphasized here, I do not overlook the dangers of government programs that ignore or reject the solutions that indigenous people make.
3. Eloise Quiñones Keher (1995), traces the roots of worship of Maguey through the goddess Mayahuel in her book *Codex Telleriano, Remenses: Ritual, Divination, and History in a Pictorial Aztec Manuscript*. Like pulque, made from maguey, mushrooms and tobacco were used by Aztec shamans to conjure up demons and the devil himself. Yucatec Mayan shamans could send diseases inflicted by underworld rulers back to the realm of the dead.
4. Researchers in the Latin America Data Base (vol. 17, no. 35, September 2006): Source Mex, Economic and Political News on Mexico. Latin American and Iberian Institute, University of New Mexico) reported the sale of Casa Herradura, on August 28, 2006, to U.S.-based Brown-Forman Corp. Other firms have recently been acquired by U.K.- and U.S.-based brands. The sale that occurred during the month for celebration of Mexican independence was usually toasted with tequila, now a bitter potion for Mexicans.
5. Sergio Navarro Pellicer's (1988) incisive analysis of aguardiente examines the way in which aguardiente reproduces the relations of subordination in Chenalhó. Eber (1995) analyzes the double subordination of women as victims of domestic abuse and ethnic subordination aggravated by alcohol.
6. Another variation in this party alliance was played out in Mitzitón where the Coca-Cola Company gave the town's storekeeper a refrigerator, chairs, tables, and free gifts in a contract that required him to sell 20 cases of soft drink a week. The storekeeper used his links with the PRI-controlled community council to force the sale of the drink on all members. When the people refused to buy the costly drinks, the PRI monopoly threatened them, and they were forced into exile (Centro de Investigaciones Económicas y Políticas de Acción Comunitaria [CIEPAC] n.d.).
7. On October 12, 1994, the Lacandon communities that supported the Zapatista Army of National Liberation constituted them as Regional Autonomous Pluriethnic Pueblos and drafted the demands that were later codified in the San Andreas Agreement signed by President Zedillo. The state has failed to implement the policies.
8. See *La Jornada* (2006: 6a) and the anthology prepared for the Fourth World Forum on Water.
9. Felix Hernández Gamundi, an engineer working with indigenous communities, spoke in Taller Popular en Defensa del Agua, April 2005, printed in *La Jornada* (Gamundi 2006). has been chipping away at the nationalized enterprises of Pemex and the Federal Commission of Electricity, permitting foreign exploitation of natural gas, illegal contracts to Repsol, Petrobras, Techint, Teikoku, and Lewis Energy Group.

   Editor's Note: Other *Cultural Anthropology* articles have examined ways capitalism reorients desire and consumption. See, for example, Debra Curtis's "Commodities and Sexual Subjectivities: A Look at Capitalism and Its Desires" (2004), Nickola Pazderic's "Recovering True

Selves in the Electro-Spiritual Field of Universal Love" (2004), and Adeline Masquelier's "Of Headhunters and Cannibals: Migrancy, Labor, and Consumption in the Mawri Imagination" (2000).

Dam Indians: The Missouri River

Posted on March 10, 2010 by Ojibwa

The Missouri River has an important place in American history. In 1803 the United States purchased the rights to govern the Louisiana Territory, an area which spread from the Mississippi River west to the headwaters of the Missouri River. The Lewis and Clark expedition was then sent out to find the headwaters of the Missouri, to make contact with the Indians, and to report on the economic potential for the new territory. Soon after, the Missouri became the highway for non-Indian fur traders, explorers, miners, and settlers.

In 1944 Congress approved the Pick-Sloan Plan for flood control and navigation on the Missouri River. The primary beneficiaries of the Pick-Sloan plan were non-Indian farmers. The Plan involved the construction of four dams – Garrison, Fort Randall, Oahe, and Big Bend – which would impact twenty-three Indian reservations and result in the forced relocation of nearly 1,000 Indian families. Many Indian leaders would later charge that the project selected Indian lands for dam sites rather than non-Indian lands. In carrying out the plan, the Army Corps of Engineers negotiated settlements with the Indians, ignoring tribal sovereignty, Indian law, and treaty rights.

The Bureau of Indian Affairs was fully informed about the project and its impact on Indian reservations. The BIA made no objections to the project while it was debated in Congress. None of the tribes affected by the project were consulted about it.

Former Commissioner of Indian Affairs Philleo Nash would later say that Pick-Sloan “caused more damage to Indian land than any other public works project in America.” The plan ignored Indian water rights and the Winters Doctrine.

In 1946 the Army Corps of Engineers began construction on the Fort Randall Dam in South Dakota. The dam flooded 22,091 acres of Yankton Sioux land and dislocated 136 families. The reservoir also covered Fort Thompson, the largest community on the Crow Creek Reservation. As a result, the Bureau of Indian Affairs Offices were moved to Pierre, South Dakota and the Indian Health Service facilities were moved to Chamberlain, South Dakota. By placing these two services – BIA and HIS

– in two different communities it became more difficult and less convenient for the Indians needing these services.

The Army Corps of Engineers, ignoring the Yankton Treaty of 1858, tribal sovereignty, and Indian law, simply condemned the Indian land that it needed. The amount offered to Indian land owners was often significantly less than the amount offered to non-Indian land owners.

The Army Corps of Engineers also entered the Fort Berthold Reservation in North Dakota to begin construction of the Garrison Dam. The Three Affiliated Tribes of the Reservation — Mandan, Hidatsa, Arikara — had not been informed of the project. The dam would flood every acre of productive land on the Fort Berthold reservation.

When the tribes informed the Department of Interior that the homes and lands of 349 families with 1,544 people were to be flooded, the BIA simply told them to start looking for new homes.

While the Army Corps of Engineers altered the project's specifications without Congressional authorization to protect the non-Indian town of Williston, they did nothing to protect the Indian communities. The Fort Berthold tribes protested to Congress and managed to stop the funding for the project until a settlement was reached.

At one reservation conference attended by General Pick of the Army Corps of Engineers, Indians in full ceremonial dress denounced the talks. General Pick flew into a rage, canceled the negotiations, and repudiated all of the agreements which had been reached as of that time. By his failure to understand the situation, the general clearly revealed his basic ignorance of the people with whom he was dealing. General Pick's contention that the Indians were belligerently uncooperative was used by him as a reason to dictate his own settlement terms to Congress.

In 1948 the Army Corps of Engineers began construction of Oahe Dam in South Dakota. The Oahe Dam would destroy more Indian land than any other public works project in America. The project destroyed 90 percent of the timber land on the Standing Rock Sioux and Cheyenne River Sioux reservations as well as the most valuable rangeland, most of the gardens and cultivated areas, and the wild fruit and wildlife resources.

The Department of the Interior (of which the BIA is a part) signed the final agreement in 1948 for the Pick-Sloan plan to build dams which would flood the Fort Berthold Reservation in North Dakota. While the Pick-Sloan plan took great care not to drown any non-Indian towns along the Missouri River, it flooded 155,000 acres of the most fertile Indian farmland in the Great Plains.

The agreement denied Indians the right to use the reservoir shoreline for hunting, fishing, grazing, or other purposes. It also rejected tribal requests for irrigation development.

In 1950 Congress enacted legislation which established the guidelines for the negotiation of a settlement for Indian lands taken by the Oahe Dam project in South Dakota. The legislation made the Army Corps of Engineers and the Secretary of the Interior responsible for negotiating favorable settlements with the tribes. The legislation required that the settlement include payment for Indian land and improvements as well as for relocation costs.

The Standing Rock Sioux in 1951 attempted to hire their own attorney, to be paid out of tribal funds, to help in the negotiations regarding lands taken in the Pick-Sloan dam projects. The tribe wanted legal counsel which would be totally independent from the politics of the Department of the Interior. However, Commissioner of Indian Affairs Dillon Meyer rejected their choice of an attorney and allowed only a one-year contract.

The attorney selected by the tribe, James Curry, was an outspoken critic of the BIA and was one of a number of Indian claims lawyers against whom Meyer had a personal vendetta. The tribe protested Meyer's decision to the Department of Interior. The Department of the Interior did nothing as Meyer continued to publicly attack Curry.

Federal representatives from the Army Corps of Engineers and the BIA met with the Standing Rock Sioux and the Cheyenne River Sioux in 1952 to seek an agreement over lands taken from them under the Pick-Sloan dam projects on the Missouri River.

The Standing Rock Sioux asked that they be allowed to spend $500 to have their attorney attend the conference with them. Commissioner of Indian Affairs Dillon Meyer refused the request, calling it a "highjacking game." The Secretary of the Interior overruled Meyer's decision.

According to one representative from the Cheyenne River Sioux: "This is not a happy occasion. We are here to participate in the gutting of our reservation."

Representatives of the Cheyenne River Sioux in South Dakota testified before Congress in 1954 regarding land claims from the Oahe Dam of the Pick-Sloan Project. The representatives paid their own way for the BIA would allow them only five days in Washington which was not enough time to cut through the federal bureaucracy. The representatives also realized that Congress was more comfortable hearing from Indian stereotypes than real Indians. Thus, Little Cloud was instructed to speak in Lakota at the hearings, and Chasing Hawk was to translate his remarks into broken English, even though both men spoke their adopted language fluently. Members of Congress were delighted.

In the end, Congress awarded the Cheyenne River Sioux nearly $11 million which was $13 million less what the Indians felt was just compensation for their losses.

In 1958 the Army Corps of Engineers filed suit to condemn Standing Rock Sioux land which was needed for the Oahe Dam. Tribal attorneys countered with a motion to dismiss because Congress had not given specific authorization to condemn tribal land. Support for the Indian's case was provided in the 1868 Sioux Treaty which stated that land can be taken only upon payment of just compensation and the consent of adult tribal membership.

Judge George Mickelson, a former South Dakota governor, found for the tribe stating: "It is clear to this Court that Congress has never provided the requisite authority to the Secretary of the Army to condemn this tribal land. Such action is wholly repugnant to the entire history of Congressional and judicial treatment of Indians."

Two weeks after the Oahe Dam was closed and the reservoir began filling, Congress passed a settlement which provided a little more than $12 million to the Standing Rock Sioux. This was $14 million less than they had requested.

In 1959 the Army Corps of Engineers began work on the Big Bend Dam in South Dakota. The project was located on lands belonging to the Crow Creek Sioux and the Lower Brule Sioux and would take 21,026 acres of Sioux land. The reservoir would flood the town of Lower Brule.

In addition, the reservoir created by the dam would flood the reservation lands which had the greatest potential for irrigation and thus destroy the possibility of implementing plans proposed by the BIA and the Bureau of Reclamation for irrigation projects on the two reservations.

The Army Corps of Engineers filed a condemnation suit against the Crow Creek Sioux and the Lower Brulé Sioux in 1960 to obtain land for their Big Bend Project. Congress had not specially designated any power of eminent domain to the Army and the Army ignored the Court ruling regarding the Standing Rock Sioux. The Army Corps of Engineers was allowed to take title to the land. Neither the tribes themselves, their lawyers, the BIA, nor any of the Indian rights organizations protested this decision.

In South Dakota, the Army Corps of Engineers delivered payment to the Standing Rock Sioux for lands needed for the Oahe Dam project in 1960. In the midst of a fierce winter, the tribe was also given an immediate eviction notice. Indian families were forced to gather their possessions and leave the land. However, the government had not yet made available funds for the construction of new homes and the people were forced to live in trailers which they had to maintain at their own expense. The eviction date established by the Corps had been an arbitrary one. Tribal members could have remained in their old homes until the more favorable months of summer without interfering with the completion of the Oahe project.

Under 1944 legislation dealing with the electricity generated by the Pick-Sloan dams, Indians should have qualified as preferential low-cost power customers. However, the government simply ignored this and the Indians did not receive low cost electricity from the dams located on their land. It took Congress nearly 40 years to recognize that a wrong had been committed. Therefore, in 1982 authorized the Departments of Energy and Interior to make Pick-Sloan pumping power available to the Standing Rock, Cheyenne River, Crow Creek, Lower Brule, and Omaha Reservations in South Dakota and Nebraska. However, Congress did not provide for the construction of new transmission lines to these Indian projects. Existing lines owned and operated by Rural Electrification Administration cooperatives were unable to give the tribes a reduced delivery rate.

In 1983 the state of South Dakota attempted to exercise exclusive jurisdiction over hunting and fishing in the Fort Randall and Big Bend Dam project areas on the Lower Brulé Reservation. The Court of Appeals ruled in favor of the Indians and as a result both the state and the tribe enforced their regulations within the area. The state, however, was limited to enforcement over non-Indians.

In 1988 the Cheyenne River Sioux Tribe announced that they would no longer recognize South Dakota hunting licenses in the Oahe Dam project area and that hunters must obtain a tribal hunting license.

Congress authorized in 1992 nearly $91 million to the Standing Rock Sioux in compensation for damages caused by the Oahe Dam project. The legislation also established an irrigation area on the reservation and transferred the administrative jurisdiction of the land taken in the project from the Secretary of the Army (Corps of Engineers) to the Secretary of the Interior (Bureau of Indian Affairs).

In 1999 Lakota protesters established a camp on LaFramboise Island in the Missouri River in South Dakota. The camp was in protest of the Water Resources and Development Act (WRDA) which would give treaty lands to the state of South Dakota. The lands were taken from the Cheyenne River and Lower Brulé Sioux tribes by the Army Corps of Engineers in 1947 as a part of the Pick-Sloan dam project. The land was no longer needed by the Corps.

In 2000 the Army Corps of Engineers agreed to delay raising water levels in Lake Francis Case in South Dakota to allow the Yankton Sioux Tribe to recover scattered human remains. The Indian burial site was uncovered when the water levels behind Fort Randall Dam dropped. Supposedly the Army Corps of Engineers had relocated all burials in 1950 before the reservoir filled.

Although Idle No More began before Chief Spence's hunger strike, and will continue after, her strike is symbolic of what is happening to First Nations in Canada. For every day that Spence does not eat, she is slowly dying, and that is exactly what is happening to First Nations, who have lifespans up to 20 years shorter than average Canadians.

Idle No More has a similar demand in that there is a need for Canada to negotiate the sharing of our lands and resources, but the government must display good faith first by withdrawing the legislation and restoring the funding to our communities. Something must be done to address the immediate crisis faced by the grassroots in this movement.

I am optimistic about the power of our peoples and know that in the end, we will be successful in getting this treaty relationship back on track. However, I am less confident about the Conservative government's willingness to sit down and work this out peacefully any time soon. Thus, I fully expect that this movement will continue to expand and increase in intensity. Canada has not yet seen everything this movement has to offer. It will continue to grow as we educate Canadians about the facts of our lived reality and the many ways in which we can all live here peacefully and share the wealth.

After all, First Nations, with our constitutionally protected aboriginal and treaty rights, are Canadians' last best hope to protect the lands, waters, plants, and animals from complete destruction—which doesn't just benefit our children, but the children of all Canadians.

OCCUPY(ED) CANADA:
The Political Economy of Indigenous Dispossession

Shiri Pasternak

The political economy of Canada rests on claims of ownership to all lands and resources within our national borders. So, what, in concrete terms, does it mean to talk about Occupy(ed) Canada to express the demands of the 99 percent?

Last week, *The Globe and Mail* reported that the Canadian Forces' National Counter-Intelligence Unit has been keeping tabs on the activities of Indigenous organizations. While the Department of National Defence—the unit that released the surveillance documents—is tasked with protecting citizens from espionage, terrorists and saboteurs, the content of these co-intel reports do not contain a single shred of evidence that Canadians' safety is at stake. In fact, what these surveillance reports starkly reveal is that the self-determination, well-being, and territorial heritage of Indigenous peoples are at the heart of Indigenous protest and land reclamation.

Even Indian and Northern Affairs Canada (INAC) confirm this observation. In a 2007 presentation to the RCMP, INAC states that "the vast majority of Hot Spots" of so-called Native unrest are "related to lands and resources," with most conflicts "incited by development activities on traditional territories." It seems, in other words, that "Native unrest" is largely a euphemism for bands that are protecting their lands from ecological damage, or in the case of land claim disputes, from dispossession. More broadly, "Native unrest" has become rhetoric of dismissal for the struggle to exercise inherent Indigenous rights. So why is the Department of National Defence spying on Indigenous communities in Canada?

It is the fear of economic disruption that is driving Canada to spy on Indigenous peoples. Moreover, in recent years, it has become the fear of an exceedingly more dangerous risk to business-as-usual in this country than paranoid phantoms of espionage. It is the fear of Aboriginal Title. Since 1997, Indigenous politics in Canada have unfolded against a changing landscape of economic consequence. In that year, the Supreme Court of Canada recognized in Delgamuukw v. British Columbia that Aboriginal Title is the collective proprietary interest of Aboriginal peoples in their unceded traditional territories. Therefore, wherever treaties had not been signed, Aboriginal proprietary rights underlie provincial, federal, and private property lands. And in addition to unceded or unsurrendered lands, as Arthur Manuel and Nicole Schabus pointed out in an article in Chapman Law Review in 2005, "Many Indigenous Peoples argue that the 'spirit and intent' of the treaties also ensures Indigenous control over their traditional territories."

Unceded and treatied lands cover a massive amount of territory in Canada from coast to coast, translating into significant uncertainty for industry and government. There is no question that the active defence of Indigenous rights and lands has major economic consequences for Canada. In 1990, INAC commissioned a study by Price Waterhouse on the economic value of uncertainty associated with Indigenous claims in B.C., for example. The report concluded that around $1 billion of capital expenditures involving up to 1,500 jobs in the mining and forestry sectors would likely be affected by the land claims process.

This problem is not going away. It is only intensifying with the current global scramble for energy, minerals, oil and gas. Key natural resource projects cannot proceed without Indigenous consent and cooperation. In the last few years alone, Kitchenuhmaykoosib Inninuwug shut down Platinex mining in northern Ontario Ojicree territory, 64 B.C. First Nations threaten the development of the west coast Enbridge pipeline to the Pacific Coast from the Alberta tar sands, and local Tsilhqot'in Nation sank the Prosperity copper and gold mine at Fish Lake in B.C. Moreover, mega-projects like the Canadian Boreal Forest Agreement, Plan Nord in Quebec, and the Ring of Fire in northern Ontario have all been hampered by the failure of ENGOs, government and industry to recognize the land rights of Indigenous peoples.

These developments are hardly new. Indigenous peoples have been on the geographic frontier of capital accumulation for over 500 years of permanent resistance. Indigenous peoples' labour and lands have shaped the political economy of Canada, from the time of the fur trade to bankrolling industrialization with their lands and resources, and today, by confronting neo-liberal policy in the form of continental restructuring and intensified resource grabs.

One example of the economic role of Indigenous lands historically and today can be found in the case of railways, to which Canada maintained a pre-emption right to clear Indigenous lands, and that facilitated the industrial pathways for capitalist development. Over a hundred years later, authorities have become well aware of the risky correlation between Indigenous lands and the steel rails that cross the country from coast to coast. In an RCMP briefing to CSIS on operational responses to Aboriginal occupations and protest, the RCMP warn: "The recent CN strike [referring to the Tyendinaga Mohawk rail blockades in April 2007] represents the extent in which a national railway blockade could affect the economy of Canada." In addition to these massive expanses of treaty areas and unceded traditional territories, Indigenous lands were historically fragmented into isolated and remote reserves by successive colonial administrations. There are over 2,600 Indian reserves across Canada today.

This forced settlement resulted in a unique spatial phenomenon that unwittingly placed Indian reserves on the frontier of vital national and regional boundaries: frontiers, for example, for natural resource extraction, suburban development, military training grounds, oceans and inland waterways, state borders, and energy generation. Despite their wealth in land and resources, economic racism prevents Indigenous peoples from obtaining financial benefits from their traditional territories. Their proprietary interests have been largely ignored and Aboriginal Title is extinguished through the land claims settlement process. Chronic underfunding of reserves has deepened the gap formed by deprivation from traditional subsistence economies due to land loss and ecological deterioration. The Royal Commission on Aboriginal Peoples (RCAP) commissioner stated in 1996 that "current levels of poverty and underdevelopment are directly linked to the dispossession of Indigenous Peoples from their lands and the delegitimization of their institutions of society and governance."

In addition to systemic impoverishment, and where Indigenous populations join the 99 percent, austerity programs attack the weakest first. Murray Angus, in his slim but critical book "And the Last Shall be First: Native Policy in an Era of Cutbacks," gives three main reasons for why Indigenous people are the first ones out of the social security boat when austerity programs roll around: (1) funding—money for Indigenous people comes from the "social envelope," which is under attack; (2) demographics—Indigenous peoples are the fastest growing population—so even maintaining programs is expensive; (3) and racism—white people will look after their own first.

The government has been doling out austerity programs to Indigenous peoples for decades by downloading their responsibilities onto provincial and territorial governments, as well as through bogus self-government policies. But as bureaucrats cast around for deep cuts that Harper has demanded, austerity measures will trim whatever is left

in Aboriginal budgets that cannot be tied down. In 2010, the Aboriginal Healing Foundation lost funding, an organization that financed community-based programs to address abuse suffered at residential schools. That same year, Harper's Conservatives cut funding to the Sister in Spirit research project that brought to light hundreds of cases of missing and murdered Indigenous women. Most recently, Department of Aboriginal Affairs Minister John Duncan announced upcoming budget cuts to his department amounting to a $100 million slash.

The wealth of the nation still depends fundamentally on land. Financial investment for resource development projects is funneled through the same banks protested against across the U.S. and Canada, such as RBC Royal Bank that funds tar sands development on Treaty 8 lands. Global structural inequality can only be addressed then by questioning the sources of authority by which resources are bought and sold. If you don't own it, Canada, how can you give it away?

DECOLONIZING TOGETHER:
Moving Beyond a Politics of Solidarity Toward a Practice of Decolonization

Harsha Walia

Canada's state and corporate wealth is largely based on subsidies gained from the theft of Indigenous lands and resources. Conquest in Canada was designed to ensure forced displacement of Indigenous peoples from their territories, the destruction of autonomy and self-determination in Indigenous self-governance, and the assimilation of Indigenous peoples' cultures and traditions. Given the devastating cultural, spiritual, economic, linguistic, and political impacts of colonialism on Indigenous people in Canada, any serious attempt by non-natives at allying with Indigenous struggles must entail solidarity in the fight against colonization.

Non-natives must be able to position ourselves as active and integral participants in a decolonization movement for political liberation,

social transformation, renewed cultural kinships, and the development of an economic system that serves rather than threatens our collective life on this planet. Decolonization is as much a process as a goal. It requires a profound recentering on Indigenous worldviews. Syed Hussan, a Toronto-based activist, states: "Decolonization is a dramatic reimagining of relationships with land, people, and the state. Much of this requires study. It requires conversation. It is a practice; it is an unlearning."

Indigenous Solidarity on its Own Terms

A growing number of social movements are recognizing that Indigenous self-determination must become the foundation for all our broader social justice mobilizing. Indigenous peoples in Canada are the most impacted by the pillage of lands, experience disproportionate poverty and homelessness, are overrepresented in statistics of missing and murdered women, and are the primary targets of repressive policing and prosecutions in the criminal injustice system. Rather than being treated as a single issue within a laundry list of demands, Indigenous self-determination is increasingly understood as intertwined with struggles against racism, poverty, police violence, war and occupation, violence against women and environmental justice.

Incorporating Indigenous self-determination into these movements can, however, subordinate and compartmentalize Indigenous struggle within the machinery of existing leftist narratives. Anarchists point to the antiauthoritarian tendencies within Indigenous communities, environmentalists highlight the connection to land that Indigenous communities have, anti-racists subsume Indigenous people into the broader discourse about systemic oppression in Canada, and women's organizations point to the relentless violence inflicted on Indigenous women in discussions about patriarchy.

We have to be cautious not to replicate the Canadian state's assimilationist model of liberal pluralism, forcing Indigenous identities to fit within our existing groups and narratives. The inherent right to traditional lands and to self-determination is expressed collectively and should not be subsumed within the discourse of individual or human rights. Furthermore, it is imperative to understand that being

George Gillette, chairman of the Fort Berthold Indian Tribal Council weeps as he watches Secretary of the Interior A.J. King sign away the tribe's rights to the Missouri River and the loss of 700 miles of the most fertile of tribal lands on May 20, 1948. Krug is signing a contract that turned over 155,000 of the reservation in North Dakota for the Garrison Dam and Reservoir project. In a prepared statement, Gillete said: "The members of the Tribal Council sign this contract with heavy hearts. Right now the future does not look good to us."

Echoes of Oak Flat: 4 Pick Sloan Dams That Submerged Native Lands

CHRISTINA ROSE | 9/11/15

The Oak Flat land grab is just one of many acts of the federal government that has seized Indian land or despoiled it. Dams, mines, railroads, timber roads—the reasons may vary but the results are sadly familiar.

RELATED: Rambler: 'Mining Will Never Satisfy Its Appetite'

In 1946, the U.S. Army Corps of Engineers began construction on the first of four Pick-Sloan Flood Control Act dams that ultimately submerged nearly 700 miles of

tribal lands in the Missouri Valley from Yankton, South Dakota, to Williston, North Dakota.

Until the enactment of the Pick-Sloan plan, devised to reduce flooding and improve irrigation and travel, Indian Law and the Fort Laramie Treaty protected the rights of tribal nations to their land and water. However, once the plan was accepted by Congress, The Corps condemned the land and seized it through eminent domain.

Tribal citizens were forced from their homes in the bottomlands—the forested, naturally flooded habitat to a wide variety of plants and animals. The new dams created reservoirs, but no plans for those who were displaced by them. Medicine and food plants that had always sustained the Plains lifestyles were submerged, and loss of access to water and fishing devastated traditional lifestyles. The remaining reservation lands were primarily the less fertile prairies. In the introduction to "Dammed Indians Revisited," Vine DeLoria called the Pick-Sloan Plan "without doubt, the single most destructive act ever perpetrated on any tribe by the United States."

In Flooding The Missouri Valley: The Politics Of Dam Site Selection And Design, author Robert Kelley Schneiders explained that tribal lands were selected for damming to avoid building near established businesses and white communities, though a few were also affected. Expensive real estate would have increased the cost of the dams and tribal lands were considered inferior and underutilized, and therefore less expensive. Natives were considered easier to relocate than town and city residents who had purchased land, built homes, farms and businesses.

Construction lasted from 1946 until 1966. An article on the Daily Kos, described how the dams built at Oahe, Fort Randall, and Big Bend affected 23 reservations and forced the relocation of nearly 1,000 Native families.

Fort Randall Dam

The Fort Randall dam totally submerged the community of White Swan. Some resistant families refused to leave their homes until the water started flooding their land.

Ellsworth Chytka, now almost 80 years old, was a longtime spokesman for the Yankton Sioux Tribe. He described to ICTMN the effects of the dam on White Swan, a town and Yankton cemetery along the river.

Recalling his family's history, he said: "When they first started construction, there was a big burial mountain there, and they were putting in big steel tracts. It was just pushing them bones up right at the face of the dam. People were standing there crying. They never did consent for the dams to be built, but the government forced it."

Trauma May Be Woven Into DNA of Native Americans

Fort Randall Dam and Lake Francis Case. c. 1965. The Corps of Engineers began storing water behind Fort Randall Dam in November 1952. Within a few months Fort Randall Reservoir stretched 25 miles upstream. By the fall of 1954 the reservoir (later named in honor of South Dakota Senator Francis Case) approached its maximum level inundating vast tracks of valley bottomland on the Crow Creek and Lower Brule Indian reservations. (Courtesy Missouri River Division/U.S. Army Corps of Engineers, Omaha, Nebraska)

In 1990, lower water levels exposed ancestral remains that had been raised and scattered by the flooding caused by the dam. “There was pipes, beads, arrowheads and other stuff laying around. We tried to tell the Army Corps of Engineers that was a spiritual area, but they would not let us use the word spiritual. Over and over they would say, ‘No, it's just a cemetery.’ Well, the government said they were going to take all the remains to the Episcopal church, and some down to Marty, South Dakota.”

Chytka said the court retained an Oklahoma company to move the remains. “But they didn’t,” he said. “I would hear them talking about, ‘Wow, you should see what we found today.’ They pilfered the graves. They never moved them. They lied to us.”

“They were literally destroying culture. Each one of them dams was put on Native land, and all of the tribes had land,” he said.

In 2000, The Corps allowed the water to remain low long enough for the Yankton Sioux Tribe to recover and rebury their ancestors’ remains.

In the May 1999 Congressional Record, Senator Thomas Daschle petitioned congress to provide funding to the Yankton and Santee nations for the flooding and erosion of more than 4,000 acres.

Garrison Dam

The Garrison Dam took 152,360 acres from the Mandan, Hidatsa, and Sahnish and forced the relocation of 325 families—94 percent of their farmland was lost. The government refused to pay the market value of $21,981,000 and instead offered the tribes a settlement of $12,605,625, about $144 an acre.

The devastating aftereffects of the Garrison Dam are still being felt, and include a wave of diabetes. The affliction had been extremely rare among people of The Tribes until their way of life was changed and they were forced to rely on government commodities due to the loss of farmland. For an in depth look at the situation see the ICTMN article below.

The Garrison Dam nearing completion in the early 1950s. (Courtesy State Historical Society of North Dakota 0073-097)

RELATED: A Dam Brings of Flood of Diabetes to Three Tribes

"The Garrison Dam could have been built at an alternate site, north of the reservation, but it wasn't," said Biron Baker, a tribal member who was interviewed in the 2006 film, Waterbuster. "We lost the 156,000 acres of fertile bottomland, rich with our history, our traditions and culture. It's all gone. And I cannot imagine not having a sense of loss and anger over that."

Big Bend Dam

Big Bend Dam in South Dakota took more than 121,026 acres of Crow Creek and Lower Brule's land best suited for irrigation.

A 1997 Senate Report stated the Fort Randall and Big Bend Dams washed away 22,000 acres of bottomland resources affecting traditional tribal lifestyle and economy.

Portions of the original Indian community of Lower Brule. (Courtesy Missouri River Division/U.S. Army Corps of Engineers, Omaha, Nebraska)

Oahe Dam

According to Native American Netroots, the Oahe Dam destroyed more Native land than any other public works project in America by flooding 90 percent of the timber and bottomland of the Standing Rock and Cheyenne River Nations.

Ronald Campbell, a Sioux Indian known as Oldest Son among his tribal brothers at the Pierre Indian Agency reins in his pony beside a 90-foot channel where the Missouri River once ran wide and free on July 19, 1958. Oldest Son had donned the ceremonial regalia of a Sioux chief for an official visit to Oahe Dam near Pierre, South Dakota. (AP Photo)

In 2000, the Standing Rock Sioux joined suit with the Yankton Sioux's NAGPRA filings when falling water levels behind the Oahe exposed remains and cemeteries. "We are doing this to protect our rights under federal law, and to defend the rights of the lineal descendants," Standing Rock Sioux Chairman Charles W. Murphy told Indian Country Today at the time. No other people in the United States are

subject to having the government conduct its affairs in such a manner as to unearth the remains of their relatives. It should not happen to the descendants of one of our chiefs."

The Sum of the Devastation

According to Flooding The Missouri Valley:

> The Pick-Sloan dams are among the largest in the world.
>
> The reservoir created by the Oahe Dam stretches 250 miles.
>
> All of the Missouri Valley bottomlands in the Crow Creek, Lower Brule, Cheyenne River Sioux, Standing Rock, and Fort Berthold reservations were submerged.
>
> How much land? According to "Dammed Indians Revisited" The dams "flooded more than 203,000 acres of Sioux land on the Standing Rock, Cheyenne River, Lower Brule, Crow Creek, Rosebud, and Yankton reservations in North and South Dakota and the Santee reservation in Nebraska.
>
> The Yankton, Rosebud, and Santee reservations lost a total of 353,313 acres for reservoir water storage.
>
> The towns of Fort Thompson (Crow Creek Reservation), Lower Brule (Lower Brule Reservation), Cheyenne River Agency (Cheyenne River Reservation), and nine towns on the Fort Berthold Reservation were flooded.
>
> Approximately 3,538 Natives were forced to relocate from the valley lands to the uplands or to off-reservation towns. Additionally, another 6,900 Indians were affected in varying degrees of severity.

Oahe Powerhouse near Pierre, South Dakota. (Wikipedia)

Glimmer of Hope?

"Now, nearly 70 years after Pick-Sloan, efforts to restore some of the Missouri River ecosystems form and function are underway—this time, with representatives of tribal nations with a voice at the table," wrote Lorraine Jessep in ICTMN.

"Members of the Missouri River Recovery Implementation Committee (MRRIC) met during the first week of May in Overland Park, Kansas. Authorized by Congress and established in 2008, MRRIC is a basin-wide collaborative forum to develop a shared vision and comprehensive plan for Missouri River recovery. It

consists of Missouri River basin tribes, states and federal agencies, stakeholders and local government."

With natural flora and fauna suffering the consequences of having the natural landscape altered, the MRRIC is trying to undo some of the damage to the environment. While the land cannot be returned unless dams are removed, as stewards of the land the tribal nations are in the best position to help improve the surrounding areas.

In British Columbia, indigenous group blocks pipeline development

To stop oil projects from moving forward, the Unist'ot'en have set up an encampment on traditional territory

August 20, 2015 5:00AM ET

This is the second in a two-part series on Canadian government monitoring of First Nations groups over land and environmental issues. Read the first part here.

HOUSTON, British Columbia — In a remote mountain pass connecting the Pacific Coast to the interior of British Columbia, a region brimming with wild berries and populated by grouse and grizzly bears, felled and painted trees have been laid across a logging road to form an enormous message. Directed at air traffic, it reads "No pipelines! No entry!" The warning marks off land where the government of Canada and a First Nations clan hold irreconcilable views of what should happen to a 435-square-mile area each claims as its own.

Starting in 2009, the government of Canada began to issue permits for a pipeline corridor to link British Columbia's fracking fields and Alberta's tar sands with export facilities and tankers on the Pacific coast. Seeking to become a global energy superpower, Canada staked its economic future and legislative agenda on the rapid expansion of its resource and fossil fuel sectors, envisioning pipelines as the arteries of trillion-dollar hydraulically fractured gas and bitumen industries.

That year the Unist'ot'en clan of the Wet'suwet'en nation began to establish a permanent community directly in the path of three approved projects — Enbridge's $6.1 billion Northern Gateway, Chevron's $1.15 billion Pacific Trail Pipeline and TransCanada's $3.7 billion Coastal GasLink. These pipelines were to run through land that Unist'ot'en were forced from in the early 1900s, and after reoccupying the territories, the clan banned all pipelines under a hereditary governance system that predates Canada.

Although the Unist'ot'en clan, along with most other First Nations peoples in British Columbia, never relinquished its territories to Canada by way of treaty, land sale or surrender, the provincial and federal governments assert jurisdiction over these lands and have authorized widespread development. While the government maintains that First Nations must be consulted about development — though they ultimately lack veto power — by controlling access to their traditional territories, the Unist'ot'en clan is attempting to require that the government gain "consent for any activities and development that take place," as the clan put it in an Aug. 6, 2015, declaration.

"The Unist'ot'en do not recognize or honor any permits by provincial or federal regulatory or governing bodies related to our unceded traditional territories," read a letter sent by the clan to pipeline giant TransCanada. "We honor only our traditional law and are guided by our ancestors' direction to protect our territories from destruction."

Since June, the hereditary chiefs of the Unist'ot'en clan and dozens of supporters have physically impeded the Royal Canadian Mounted Police (RCMP) and TransCanada and Chevron pipeline work crews from entering the territory. Although the pipeline companies have modified their projects to skirt the Unist'ot'en's main encampment, they remain intent on building through land traditionally used by the clan.

Rejecting this prospect, the Unist'ot'en have fortified their perimeter. With heavy chains, a pickup truck, a newly installed plywood and barbed wire gate, spotlights and an emergency siren, the clan transformed a bridge to their traditional territory into an international border, monitored by a fluctuating crew of volunteer guards.

Holding their ground

Freda Huson confronts RCMP oficers on the bridge to traditional Unist'ot'en territory.

Michael Toledano

In the past three months, a series of encounters with pipeline companies and law enforcement officials have occurred at checkpoints on logging roads that lead to the clan's traditional territories. To access these roads, visitors are required to answer five questions posed by a clan representative: "Who are you?" "Where are you from?" "Do you work for industry or government that's destroying our land?" "What skills do you bring?" and "How will your visit benefit the Unist'ot'en?" The protocol is inspired by the U.N. Declaration on the Rights of Indigenous Peoples and by the clan's history of monitoring its territorial boundaries and enforcing trespass laws.

Though loggers, tree planters and a guide outfitter have been granted access to the territory since the clan instituted this protocol, pipeline contractors have been turned away. Throughout June, safety officers and TransCanada crew members, some wearing body cameras, repeatedly approached the boundary and asked camp supporters their names and if crews would be in danger if they entered the territory. Clan members believe that energy companies are gathering information to obtain a court injunction, which would oblige police to force the roads open in order to ensure that pipeline crews can work unimpeded.

On two occasions, helicopters carrying TransCanada crews were found entering the traditional territory without permission. The first crew was confronted by Unist'ot'en supporters and immediately complied when asked to leave. The second crew, escorted by an ex-military pilot and security staff, completed a day of work before volunteers grounded their helicopter by staging a sit-in beneath its rotor blades.

At the end of July, representatives of the Chevron-backed Pacific Trail Pipeline arrived at the Unist'ot'en boundary. "We're here to talk to you about doing work on your land and are requesting access onto your territory," said pipeline vice president Rod Maier.

"We've already written you letters saying that you guys don't have our consent," Freda Huson, a spokeswoman for the clan, replied. "We're not letting the last stitch of our land be taken over so we can't hunt, fish and trap or teach our young ones who they are and where they belong."

Huson's home, a cabin built five years ago in the path of Enbridge and Chevron's projects, has transformed into a base of operations for the northwestern anti-pipeline movement. Pipeline maps sprawl across her living room table, two-way radios and scanners bleat updates from remote outposts throughout the territory, and quarters of bear meat are canned in her kitchen. Her front door swings open and shut as a steady stream of activists from across North America and beyond rush in and out to grab supplies.

Outside the cabin, a community thrives in the pipelines' paths. A permaculture garden, a solar-powered electric grid, a bunkhouse, elders' trailers, campgrounds, a root cellar, a traditional Wet'suwet'en pithouse and a two-story healing center with an industrial kitchen and counseling space have all been built with crowd-sourced funds and volunteer labor.

Zeroing in

As pipeline crews have increased their presence throughout the region, so too have the RCMP. In late June, police initiated what the clan called "a campaign of harassment and intimidation on and around Unist'ot'en territory." Two police checkpoints were established on roads used by the Unist'ot'en under the pretense of ensuring safety.

For approximately two weeks, officers asked drivers and passengers traveling in the region for identification and information about their travel plans. The driver of a vehicle associated with the Unist'ot'en was stopped and questioned in a nearby town.

Some American tourists visiting the Unist'ot'en reported that they were stopped four times by RCMP officers and warned that they could be criminally charged, deported and banned from Canada if their vehicle was found impeding road access. The British Columbia Civil Liberties Association expressed concern in a letter to police that "the sudden and repeated presence of mandatory checkpoints at this location has the appearance of targeting people who are lawfully traveling to and from the camp."

'This is Unist'ot'en territory. It's not Canada. It's not [British Columbia]. We make our own laws here.'
Freda Huson

Unist'ot'en spokeswoman

Brett Rhyno, a longtime supporter of the clan, was stopped three times by police in two hours.

In the first stop, an officer rested his hands in the vehicle and indicated that he had prior intelligence on Rhyno. At the next, officers pointed a camera into the vehicle and photographed me in the backseat. I was asked to

identify myself but declined, in compliance with Canadian law. At the final stop, officers asked me to identify myself again. When I remained silent, officers identified me by name, without having been provided my personal information.

“They were using scare tactics to try and scare our supporters away,” Huson said. “It worked a bit.”

Several weeks later, two officers of the RCMP attempted to cross into Unist’ot’en territory and were stopped by clan supporters. Blocked by a volunteer who repeated, “You do not have jurisdiction to walk through here,” Sgt. Steve Rose of the Houston RCMP insisted, “Yes, I do,” and threatened to make arrests. “The RCMP have access to all of Canada to enforce the laws of Canada,” he told Huson.

“This is Unist’ot’en territory. It’s not Canada. It’s not B.C.,” Huson replied. “We make our own laws here.”

Surveilling First Nations

On Unist'ot'en territory, a large sign made of wood warns aircraft, “No pipelines, no entry.”

Michael Toledano

On Aug. 7, a suspicious person was removed from the Unist’ot’en encampment for taking photos and video without permission — the third time that the clan has suspected a police infiltrator among their supporters.

Police attention to the community dates back to at least 2010, when direct action workshops held by the clan were subject to RCMP surveillance. An RCMP intelligence report from September 2011 devotes a section to the Unist’ot’en.

More broadly, the RCMP has monitored First Nations and environmental groups at hundreds of protests, on the Web, with drones and through the use of field agents or spies. Police investigated a 71-year-old woman as a terrorist threat after she took photos of a petroleum storage facility in Vancouver. They violently dismantled an indigenous anti-fracking blockade in Elsipogtog, New Brunswick. And last year they made over 100 arrests on Burnaby Mountain, where members of the public used civil disobedience to resist the construction of a tar sands pipeline.

RCMP officials have held regular meetings with energy corporations and granted industry representatives security clearance and access to classified information. A report prepared for the petroleum industry by the

RCMP's critical infrastructure intelligence team, deemed activists with "anti-petroleum ideology" a "realistic criminal threat to Canada's petroleum industry, its workers and assets and to first responders."

In the report's appendix, an article on the Unist'ot'en published in British Columbia's Georgia Strait is reproduced in full. Summarizing threats to the Enbridge Northern Gateway, a project that the Unist'ot'en community obstructs, the report reads, "The [second] most urgent anti-petroleum threat of violent criminal activity is in northern British Columbia, where there is a coalition of like-minded violent extremists who are planning criminal actions to prevent the construction of the pipeline."

"They're trying to categorize us as violent extremists so they can legitimize what they're doing, so they can try and force their projects through here," Huson argued. "The RCMP are there to enforce the government's permits, even though they're illegal."

Since the clan issued a call for support on July 19, reinforcements and supplies have arrived daily. Helicopters and low-flying planes have conspicuously circled the camp and photographed its occupants. In Toronto, Montreal, Vancouver, Victoria and Seattle, activists have dropped banners, occupied investors' offices and held rallies in solidarity with the Unist'ot'en. At a Montreal rally, police arrested one protester and fined eight others for obstructing a roadway.

Despite being on high alert, over a long weekend in honor of British Columbia, the Unist'ot'en and their supporters sang and danced to celebrate Knedebeas Day — a holiday named for a clan head chief who instructed her grandchildren, "Let no man take this land."

They ate wild salmon pizza from a wood-fired oven and drank river water as kids played on a teeter-totter made of 2-by-4s. Elders cleaned buckets of huckleberries, and a warrior sat by the campfire sharing stories from Kanehsatake and Gustafsen Lake — armed standoffs in which Canada used military force against indigenous activists asserting their sovereignty.

On the other side of the border, Chevron crews and security teams move closer to the Unist'ot'en every day as they conduct studies and survey for a pipeline right of way. Yet, aside from the distant whir of helicopters and the occasional siren of an emergency preparedness drill, the community lives quietly, in peace.

THE WATER EMPIRE: 1983
Selected Features.

Standing on a green Appalachian ridge and scanning west, with their backs to the crowded, constrained world of the past, early Americans found it easy to dream extravagantly of power and glory. Below them, thrown down at their feet as it were, lay an endless stretch of hardwood and pine forests, immense open parklands with deep black soils inviting a plow, a rich lacing of brooks, seeps, springs, creeks, lakes as large as seas, and in the hazy blue distance the mighty Father of Waters. They took it as self-evident that personal wealth and national power must follow such natural abundance. What they were completely oblivious of was a precisely contradictory and more plausible proposition: that power is more likely to be strenuously sought and won under the pressure of continuing environmental scarcity than of ready-to-hand abundance. The pursuit of power may go on in any setting, of course, but it generally loses impetus without the constant goad of deprivation, whether real or imagined: The experience of overwhelming bounty can blunt the drive for technological conquest, can diminish the urgency of survival, of acquisitiveness, and say to people: relax, take it easy, why worry, the future will look out for itself, already you are in paradise.

Beyond the hundredth meridian the necessary goad was more starkly, emphatically present—a dry throat, a daily uncertainty, always the danger, the anxiety, of life in a desert or near-desert. Travelers found themselves in an even more awesome space, grander by far than any Appalachian vista, one big enough for dreaming, all right, but a land too empty, barren, dusty, and austere to invite the soul to loaf and take its ease. This landscape, in its elemental scarcity of life-supporting resources, was more clearly suited to driving people on and on to power than any part of the humid, vegetative East. Though it took a while to discover the fact, the West was the natural home of the American Empire.

How could deprivation be translated into wealth and power and influence? That was the problem posed to the arid region from the beginning. The answer, as tracked in the preceding pages, was that its people had to

bend themselves to the discipline of conquest, had to accept the rule of hierarchy and concentrated force. That acceptance they seldom acknowledged, at least publicly. Again and again they told themselves and others that they were the earth's last free, wild, untrammeled people. Wearing no man's yoke, they were eternal cowboys on an open range. But that was myth and rhetoric. In reality, they ran along in straight, fixed lines: organized, regimented, incorporated men and women, the true denizens of the emergent West. It might have been otherwise, but then they would not have made an empire.

After World War Two, the western empire came at last into its own. It reigned from the 1940s on as the undisputed agricultural leader, supplying food and fiber for the nation, for the world. It took on the outlines of a new industrial behemoth, with steel mills, coal and uranium mines, assembly plants for aircraft and armaments, a scattering of scientific research institutes. Mass entertainment radiated from its cities, from Hollywood, Disneyland, the streets of San Francisco, Las Vegas, Aspen, and Dallas, radiated out over most of the globe, shaping the mass urban mind in Minneapolis and Louisville, in Manila and Rio. Out of the region came too a new generation of influential national political leaders, from Richard Nixon and Lyndon Johnson to Henry Jackson, Barry Goldwater, and Ronald Reagan, leaders whose prime instinct in many cases was to assume that America's good was the good of the American West. Accompanying that shift of economic, cultural, and political weight came a steady current of moving Americans, going West to live in unprecedented numbers. In 1965, California replaced New York as the most heavily populated state in the union—as the new empire state—counting 18.6 million inhabitants, a state richer as well as more populous than any of its eastern counterparts. And as California filled and filled, it spilled over into Oregon, Washington, Nevada, Arizona, and Colorado, buttressing its preeminence with a ring of satellites and clones. All that is not to say the West came to dominate the country in every respect. The eastern seaboard still had its Wall Street and Pennsylvania Avenue, its universities and publishing firms, and the Midwest its automobile manufacturers and Corn Belt. But the flow of power westward was unmistakable. And not to put too fine a point on it, the command over water in the region was, more than any other single factor, what made that flow possible.

The traditional notion of empire, as characterized, say, in the Old World regimes of Charlemagne or Kublai Khan or King George the Third, was of an extensive dominion ruled by a single, despotic head of state. In the hands of the Americans, empire has always been a more impersonal and indefinite notion. Emperors have not been wanted, empire has been: a condition of

absolute sway, supreme command, undisputed control over nature that would give front rank, not to any one individual, but to an entire people, their values, and their institutions. They professed to seek a technological empire, a money empire, one built on and devoted to the principles of liberal democracy, one opposed to despotism and coercion. From the beginning, however, it was a notion shot through with illusion. Imperial ambitions, whatever shape they take, must at last create imperial societies, bearing a family resemblance one to another. The empire of liberal democracy, for all its contrary promises, made that fact irresistibly clear in the postwar American West. As it came to maturity there, its structure was revealed to be one of a small power elite reigning over a large, anonymous, dependent population. That elite had both a public and a private face, the double-sided face of the modern capitalist state. It ruled in the West, as it did elsewhere, through an oligopolistic hold on capital and on expertise, but here it had the special advantage of water scarcity to justify its rule, to enhance its authority, to give it the imprimatur of necessity.

If history teaches us anything unequivocally about empires, it is that sooner or later they begin to falter. The illusions on which they are constructed eventually begin to lose their hold over the minds of people. The promises they have made are simply too grand to be delivered. Contradictions begin to mount, legitimacy to crack and flake away. The unanticipated social and ecological consequences of empire become increasingly unmanageable, just as they always have, and Leviathan starts to wobble, clutching more and more frantically at panaceas. All of those patterns began to appear in the western water empire at the very moment it neared its final triumph over a recalcitrant nature.

For all its seeming motion toward some grander destiny, nature is mainly a set of cycles, a tireless repetition of old ideas. A trickle in the highlands becomes a broad watery highway coursing through lower alluvial valleys, past dense ambitious cities, and then the river disappears, at least for a while, though beginning somewhere else as a trickle once again. History is a kind of river too, returning over and over to beginnings, completing cycles, if one stands and watches long enough. How long is hard to be precise about; the time required to complete the cycle of empire cannot be predicted with any confidence. But nothing is more certain in the modern West than that the next stage after empire will be decline.

"TOTAL USE FOR GREATER WEALTH"

Whatever its geography, its ethnic complexion, its degree of affluence or impoverishment, the colony's complaint is poignantly the same everywhere: that its fate is not in its own hands, that its wealth is being drained away to a distant metropolis, that it is made poorer so that others can be rich. The familiar remedy for the complaint among colonies of every sort is economic liberation, securing the freedom to make their own decisions and control their own destinies. For every colony which genuinely attains that liberation, several others fail. Hard as that freedom has been to achieve, however, it has not been so hard as another kind of liberation —freeing the colonists' minds to imagine fundamental alternatives to the old power relationship. The colony, in its pursuit of freedom, dreams of empire. It will throw off its chains by forging new ones, fastening them either on its own people or on its neighbors or, it may be, on the metropolis. So the eighteenth-century American colonies successfully struggled to be emancipated from the mother country and then proceeded to replicate the very institutions and drives they had despised as corrupt and exploitative. The ways of power are more easily learned and aped and improved upon than they are transcended or put aside.

No colony ever exhibited that fact more forcefully than the American West in its long, fierce quest to get out from under and on top. The expatriate Bernard DeVoto, looking again at his old home region on a visit in the summer of 1946, reassessing the region he had once called "the plundered province," saw that in pain and outrage, saw the West beginning to be caught in the coils of its own liberation. By that year the region was emerging at last from its long colonial status, he believed, thanks mainly to the New Deal and the water investments (like the Central Valley Project) it had made in the region. Those efforts at redistribution of national wealth had not been received by westerners with much grace, demanding as they did more and more of them, "demanding," wrote DeVoto, "further government help in taking advantage of them, furiously denouncing the government for paternalism, and trying to avoid all regulation." But for all the churlishness with which they were gathered in, the federal investments had "begun to make possible what had not been possible before"—an expanded resource base for the region that could raise it from its colonial dependency. All of that went down in Benny DeVoto's column as success, a thumping,

rousing, emphatic success, for he wanted to see the region realize its dream of "adult economic development and local ownership and control." What he did not like to see, what had driven him away from the West originally, was the region's slavish adherence to the imperial mentality, to what he had once termed the "desire of growth and domination." The West, he understood even in his enthusiasm for dam building, "does not want to be liberated from the system of exploitation that it has always violently resented. It only wants to buy into it, cumulative preference stock if possible."[1]

DeVoto went back to Massachusetts disillusioned and contentious, worried mainly about what western stockmen, lumber companies, and other public-land raiders were fixing to do to the West. What he did not mention was what the water-hustlers out there were lining up to do. In the next two decades or so they would lay their hands on virtually every river and tributary in the region, obliterating entire watersheds in a rage for "comprehensive, multipurpose water development." They would insist, with a sincere, breathless urgency, a frantic, intense will to believe in which was mixed the crassest self-interest and patriotic promotion, that without more and more water, death itself was stalking the land. Their anxious need to get more water, to expand their manipulation of nature, was so intense it became a kind of totalitarian impulse—a drive to capture and hold on to every single drop that fell on the West, allowing nothing to elude their tight control or stand as a challenge to their supremacy. And in their anxiety, most of it self-induced and contrived, in their unquenchable thirst for control, they would make their final push to empire.

Nowhere was the postwar mania for water engineering more pronounced than on the southern plains. Here a generation of leaders that had gone through the double trauma of depression and dust storms in the thirties, that had been looking poverty in the face for a long time, came into office advocating a program of dams, canals, and wells as their states' salvation. Perhaps no part of the West was more insecure than this one, and none more ready to place public faith in technological formulas to overcome that insecurity. They were quick also to generalize their formulas to the rest of the globe, especially the underdeveloped countries of Asia, Latin America, and Africa, where water control, they believed, would be needed, as it was at home, to save the world for democracy. Not only were droughts and dust bowls and hunger threatening humanity abroad as they were on the American plains, but there were also communists infiltrating all those places, undermining the foundations of prosperity and progress. Massive dams on the Mekong and Indus, counterparts to those on the Brazos and Platte, would drown all the enemies at once. Senator Lyndon Johnson, clawing his

way out of the obscurity of backcountry Texas, expressed that enlarging, generalizing anxiety when he wrote that "water management is . . . a decisive tool in our mighty struggle for national security and world peace." So did his colleague Robert Kerr, oilman and former governor of Oklahoma who, as the head of the Senate's Select Committee on National Water Resources, argued that river development was part of "a greater conflict," the international struggle of free peoples against godless Marxists. Whoever controlled water controlled the world's destiny.

> Can a pagan Communist nation [he asked], by enslaving and regimenting its people, make more efficient use of soil and water resources than the most advanced and enlightened nation in the world? Can ruthless atheists mobilize and harness their treasures of God-given wealth to defeat and stifle freedom-loving peoples everywhere?[2]

The answer, of course, was no—that is, it would be if Congress appropriated the money for the Kerr Plan, which would bring the Red, the White, and the Arkansas rivers under strict management, providing irrigation for the plains farmer and making Tulsa an international seaport. Thus did local ambition and global ideological conflict, a fear of deprivation and of the loss of control, all fuse and run together toward the single potent symbol of a dam.

As an exemplar of the southern plains water craze, the Texas professor Walter Prescott Webb was one of the more ironic figures. Two decades earlier he had been the man who had awakened the West to its colonial subservience and who had urged it to seek its own unique destiny in its arid condition. But by the 1950s it was clear that what he had in mind was not acceptance of and adaptation to but technological mastery over that ecology. A bigger and better industrial order than the one in the East should be created, this one to be founded on water control, making the West supreme and unassailable. In the midst of the 1953 drought, recalling earlier days when he had watched cattle dying of thirst and when his family had had to dip their water from a single scum-covered pond, he urged Texans to support Lyndon Johnson's grandiose program of federal river development. A canal, he explained, could be dug two hundred feet wide and hundreds of miles long, diverting surplus flow from the state's eastern rivers to the drier west, all the way from the Sabine to the upper Rio Grande. Such a scheme would bring "a complete revolution" to the state, he promised. It would ensure the "future growth of population, industry, and agriculture," would avert "a social and economic stagnation if not disaster," and by the

end of the century would bring as much as $8.5 billion to the Gulf Coast. There was nothing uniquely western in Webb's dream of the future. Essentially it amounted to a vision of replication of the East, where Texans would earnestly make the fullest use of their limited water in the pursuit of money and industrial giantism. In that process, he hoped, they would be able to drain power away from the old imperial centers to the rising new one.[3]

Few Westerners were as candid about their sectional rivalry as Webb, nor could they risk being so if they wanted the East's cooperation. Throughout the region, from its plains and mountains to its far coast, from the 1940s onward was heard the more politic claim that completing the West's hydraulic regime was important because it would secure for the entire country an enhanced international power. Give us more water, the promise went out year after year, help us build up the region, and we will put America in command of the earth, will keep it in that position against all threats. From the western slope of Colorado came a warning from Congressman Wayne Aspinall that without a stepped-up reclamation effort the nation would not be able to meet "increasingly severe challenges from abroad," either the Soviet bloc or capitalist competitors. A University of Arizona economist pointed out that the "creation of additional wealth-producing properties" by watering arid places had created "a new empire" in the West, and that without that empire "America would not be the world-dominating America we know at the midpoint of this twentieth century." And from the halls of the Bureau of Reclamation came a supporting chorus, insisting that the size of its budget, all lavished on the West, was a measure of national resolve. Bureau Commissioner Michael Straus threw down the challenge, "Why not survive," implying that anyone who questioned the reclamation program was in favor of American cultural suicide. The Bureau's director of project planning, J. W. Dixon, lauded the water engineer in the West as "a tool for world peace." And the burly, squareheaded, cigar-chomping Floyd Dominy, son of Nebraska homesteaders, commissioner of reclamation and perhaps the most influential agency head in the postwar era, tirelessly asserted that "achieving national goals for a stronger and more prosperous America" was what was at stake in the western plains and deserts. In all these minds, the dream of domination was powerfully compelling despite its loose and rigorless logic: the West is America, money is peace, control is freedom, survival is domination.[4]

Westerners could count not only on the Bureau for support in their grand designs. There were also such influential eastern opinion-makers as Henry Luce, a strident, unblushing ideologue through the fifties for the American Empire and Pax Americana. His *Time* magazine trumpeted the West as "the endless frontier" made possible by advanced water technology. "Irrigation

experts," the Luce establishment announced, "are now convinced that the rapidly growing U.S. can expand almost indefinitely within its present boundaries." Across the Rockies lay 50 million undeveloped acres waiting to be "watered into life," holding the promise of an agricultural productivity equal to that of France or Germany. *Time* noted they were capable of feeding 75 million people. Then there was the still untapped Mississippi, which could be pumped uphill to the high dry country, and the Columbia, which could be sent down south to the hot deserts—feats capable, the magazine promised, of inspiring "engineering ecstasy." And poised, eager, itching to lay hold on those possibilities, were the professional water managers, men who readily confessed with a grin to an awestruck reporter, "We enjoy pushing rivers around." Apparently enough Americans in every region took such brassy journalism to heart, enjoyed watching the river-pushers go to work, and were willing to pay something for the privilege. Federal money for western water development rose from $33 million in 1939 to $230 million in 1949 and stayed on that higher plateau thereafter.[5]

With popular enthusiasm stirred up by men like Henry Luce, with generous postwar appropriations from Congress, and with a dithery, ecstatic army of river improvers at its service, the West set itself the target of achieving nothing less than total control, total management, total power, or as the Bureau's own slogan, emblazoned on the covers of reports and project summaries and public relations material, put it, "total use for greater wealth." The war against European fascism and Asian militarism was over, a war waged for "unconditional surrender." Another war, the Cold War, pitting two superpowers armed with nuclear weapons against each other, had begun. And still a third war was now under way in earnest, this one to be waged against the western American landscape of scarcity, and it too would not stop short of total victory.

It drips endlessly from the roof of North America, from the cordillera of the Rockies, down from its eaves and gables and ridges, its mossy slates and piney shingles, running this way and that, running whichever way offers the least resistance. Put a barrel where it drips, and a second next to that one, and so on until the yard is full of barrels. Call part of that dripping the Rio Grande and give the barrels names too: Road Canyon, Sanchez, La Jara, Abiquiu, El Vado, Jemez, Elephant Butte, Caballo, Two Rivers, McMillan, Red Bluff, Amistad, and Falcon. Skip north across the plains with more barrels, putting them down right and left: Conchas, Possum Kingdom, Texhoma, Stillhouse Hollow, Fort Gibson, Cheny, John Martin, Kanopolis, Waconda, McConaughty, Pathfinder, Seminoe, Buffalo Bill, Glendo, Oahe, Sakakawea, Fort Peck, Yellowtail, Canyon Ferry,

Tiber. Barrel after barrel, each with a colorful name but all looking alike, quickly becoming an industry in their manufacture, with industrial sameness in their idea and use. The big ones must all be made to federal specifications and paid for by federal funding, but a thousand little private kegs and rusty pots can be deployed too. Run to the other side of the roof and put down more of them. Jackson, Blackfoot, American Falls, Dworshak, Cascade, Deadwood, Franklin Roosevelt, Potholes, McNary, Flaming Gorge, Blue Mesa, Navajo, San Carlos, Lake Powell, Lake Mead, Havasu, Laguna. Everywhere barrels filling in the spring, barrels emptying out again in the dry season. Plink, plink, save, save. It would have been a crime simply to stand by and watch it drip and run away. Waste not, want not. So the rooftop of the Rockies, in a matter of thirty or so frantic years, was ringed about with the means to capture and hoard all the falling, dripping mountain waters.

In the northern latitudes of the western United States, the two great challenges of the postwar period were the Missouri and the Columbia, along with their major branches. Neither river had been truly harnessed before World War Two, mainly because they were too much of a handful for the available money and technology and because the returns were too marginal to justify the effort anyway. So 150 years after Lewis and Clark had poled their way up its banks, the Missouri, longest river in the West, remained a treacherous, unpredictable force. Wide and shallow and filled with sandbars in the low season, a dark brown boiling of energy in spring floods, year after year it took lives and property and gave little back in profit. In its lower reaches were vulnerable floodplain settlements like Kansas City and Omaha that would have been happy simply to be protected from the river, though they would take wealth too. Upstream in Nebraska, the Dakotas, and eastern Montana were thousands of farmers who, like the southern plainsmen, had tasted a lot of blowing dust in the dirty thirties and now demanded some help in the form of irrigation from the river to stay in business. Both groups were prepared to accept some new, outside, central authority if it could tame the Missouri and deliver them from tribulation.[6]

The first agency to take on the Missouri was the Army Corps of Engineers as part of its mission to defend America against floods and improve inland navigation. For a long time that work had meant pulling snags out of the lower river, throwing up levees, and dredging deeper channels so that steamboats and barges could be safe. In 1933 Congress directed a somewhat reluctant Corps to undertake a new venture, the construction of a massive earthen dam, four miles wide, at Fort Peck in the Montana shortgrass country. This dam was to stabilize downstream navigation and store meltwater, but in 1942 and 1943 devastating floods gave more ambitious

heads in the Corps an opportunity to enlarge that role. To the forefront came Colonel Lewis Pick, a shrewd, ambitious bureaucrat-soldier, who in a terse, brief report proposed the complete dismantling of the natural river. Twenty-two dams were projected, the largest of them, Garrison in North Dakota, to be constructed on a site earlier rejected by the Corps as unsafe. Together they would cost the nation $661 million, would require the evacuation of 20,000 people (including a large Indian population from their reservations), and would cover a considerable amount of farmland with reservoirs. All this to realize what the colonel casually assumed to be self-evident benefits, not worth specifying in detail. "I mean," said Pick, "to control the water of the Missouri River."[7]

Meanwhile the Bureau of Reclamation was moving with matching fervor from an opposite direction, from headwaters and upstream reclamation possibilities toward the Corps's downriver domain. Out of their Billings office in 1944 came a proposal, drawn up by a lower functionary, W. Glenn Sloan, to construct ninety new reservoirs on the river system which would furnish irrigation water for 4.7 million acres of dry land, doubling the basin's existing reclaimed total and extending the Bureau's reach into the Dakota dust bowl. The cost was estimated at $1.3 billion, only a small part of it to be paid by farmers. If adopted independently, the plan might seriously interfere with the Corps's work, for one agency wanted to spread the river over fields while the other insisted on letting it flow in deep, steady currents in order to float commercial traffic. For two days at the Stevens Hotel in Omaha the rivals Pick and Sloan met to thrash out a compromise and save a role for both their bureaucracies. Their solution was a "Pick-Sloan" scheme in which "all the engineering features of both plans were agreed upon." Though nothing more than a paste-together job, their new, combined blueprint was a happy *modus vivendi* for each group. Together, in a cooperative spirit of river-pushing, they promised to construct an ornate hydraulic regime on the Missouri with a combined storage capacity of 83 million acre-feet, enough to give the shippers all the water they wanted and still allow irrigation diversions from Garrison and Oahe dams to open farm production east of the hundredth meridian to compensate for lands elsewhere lost in the scheme. If at points their program seemed somewhat self-defeating and irrational, a vicious circle of cost chasing cost, well, compromises can be like that. The river and the public treasury could wash over all the problems. Despite a lack of specifics on how the benefits compared with the costs involved, despite the Hoover Commission's conclusion in 1949 that Pick-Sloan was "in no sense an integrated development plan," Congress bought it. The basin subsequently fell under complex,

multiheaded federal regulation, and the grand Missouri became a series of deadwater lakes.[8]

Over on the other side of the Rocky Mountain rooftop, in the Pacific Northwest, the Army Corps of Engineers and Bureau of Reclamation were again competing, this time for the chance to manage the Columbia. Here, however, they had to deal with a river that was more a wild, cold gush than a dripping. But otherwise there were marked similarities. As in the Great Plains, water development in the Northwest subsection had lagged behind the more southerly parts of the region. The state of Washington, for example, had in 1939 only one-fifth as much irrigated acreage as California, and most of it was confined to the narrow Yakima valley—yet the mightiest river in the West looped through its territory.[9] By the forties, that retarded condition began to change quickly, as one in every four federal water dollars came to be spent in the state. And where there was an influx of money there was also the occasion for bureaucratic squabbling, for a new alignment of authority, for unbounded expectations.

The Columbia was for a long while exclusively the Army's river. Getting ocean vessels as far upstream as possible, over its many rapids, was the chief idea, and that was Army work. The Rivers and Harbors Act of 1927 gave the agency an expanded mandate to survey and build a chain of dams on the river, which it was hoped would provide smooth sailing deep into the interior. The first of those dams was Bonneville, begun in 1933 and topped off in 1938, a multipurpose structure designed to generate electricity as well as navigation. The American people heard about its virtues mainly through Woody Guthrie, who was hired to write and sing songs in praise of Bonneville. They were nasal and folksy and full of downhome spunk. "Your power is turning our darkness to dawn," one of the more familiar of them went, "roll on, Columbia, roll on." The songs were, in their way, rather more impressive than the dam itself, and the Army soon looked farther upstream to the Grand Coulee site, where there was more reason for excitement.

The main stem of the Columbia charges down from the Canadian Rockies into the United States, now running north, now south, then west, then south again, struggling to find its way through the Cascades, finally turning westward to the sea. In the Pleistocene a massive block of ice forced the river up and out of its twisty canyons, compelling it to carve a new path for itself—the Grand Coulee, a detour fifty miles long and as much as a thousand feet deep—until it could regain its established course. When the ice melted, the river reverted to the old way, leaving the Coulee a dry, abandoned trench. Falling away from that ancient, disused gash in the earth

was an immense stretch of eminently arable land, sagebrushy and cloudless, a land standing in a rain shadow, but a land that might, so local boosters believed, be transformed into an "inland empire" of agriculture, the Great Columbia Plain.[10]

A local newspaper editor, Rufus Woods of the Wenatchee *Daily World*, publicized in 1918 the notion of building a dam where the ice block had been in order to force the Columbia once more into the Coulee and, this time, to make it pay. He got nowhere with the idea. More prosaic minds had decided that the most practical strategy was to divert the Pend Oreille River somewhere east in Idaho and bring its water via a gravity canal downhill to the plain. The state hired General George Goethals, commander of the Panama Canal excavation, to advise it on the matter, and he too recommended the Pend Oreille alternative. That more than likely would have been the choice, had it not been for Idaho's determination to keep its water at home. In 1931 the Army engineers, impatient with interstate quarreling between Washington and Idaho, with the lack of resolution, threw their considerable prestige behind the Woods notion. So too did the Bureau of Reclamation, now rushing into the scene with New Deal backing. So also did President Franklin Roosevelt, who came out in 1934 to see the prospects for himself and, in the spirit of the old reclamation movement, pledged this to the gathered throngs:

> You have acreage capable of supporting a much larger population than you now have. And we believe that by proceeding with these great projects it will not only develop the well-being of the far West and the Coast, but will also give an opportunity to many individuals and many families back in the older, settled parts of the nation to come out here and distribute some of the burdens which fall on them more heavily than fall on the West. . . . You shall have the opportunity of still going West.

Senator Richard Neuberger of Oregon echoed that assurance when he predicted that a dam at Grand Coulee would make rural homes for "people in the slums and tenements of the East and the dust-bowl of the Middle-West," homes where they might "settle and cultivate a great chunk of fertile soil almost a continent removed" from their poverty. Now with humanitarianism and welfare-state largesse on its side, joined to the demands from local button-busting merchants and agriculturists, the dam soon materialized, reaching completion in 1941.[11]

Neuberger touted Grand Coulee Dam as "the biggest thing on earth," a

boast that took in a lot of territory—the Pacific Ocean, Mount Everest, Antarctica, and the like. As human contrivances go, it was indeed elephantine, a concrete plug standing in the midst of nowhere, 550 feet high and 4,200 feet long, with fully three times the mass of Hoover Dam. An artificial lake backed up behind it for 150 miles, all the way to Canada. And inside, down in the cool depths of the structure, a pack of dynamos hummed endlessly, capable of adding 50 percent to the nation's existing hydroelectric capacity, dynamos that would soon be furnishing enough energy to lift a portion of the river into the Coulee for irrigation and still have enough left over to make the Northwest the major postwar producer of military and commercial jet airplanes, a new center for the atomic bomb industry (at nearby Hanford, Washington), and the most important supplier of aluminum. Finally, there was water to provide 1,029,000 acres with irrigation, enough water to make 17,150 new farms. And that would be only the beginning, for already both the Bureau and the Army were drawing up their separate lists of future dams along the river, 142 of them from the Bureau alone, strung out along tributaries all the way to Wyoming, supplying water to 238 projects, benefitting over 5 million acres, and so the numbers went on and on. To bring all of the glittering statistics to reality, the two agencies would once more have to put their rivalries aside and share a river system with each other, share the credit for virtuosity in domination.[12]

The Columbia Basin Project, authorized in 1944 to become the main recipient of Grand Coulee water, was one of the Bureau of Reclamation's own enterprises, and the largest and most carefully planned agricultural settlement it had ever attempted. In contrast to the Great Central Valley of California, this one was explicitly to be a program in the redistribution of wealth. Virtually all of the project area was in private hands, as was also the case in California, but on the Columbia, the federal authorities were dealing with scattered, disorganized, often marginal and hardluck wheat growers and ranchers, not the likes of Joseph DiGiorgio and the Associated Farmers. Thus the Bureau could announce, without much fear of resistance, that in exchange for the cheap water it would furnish—electricity consumers would pick up 90 percent of the dam and project costs—existing owners would have to follow the Bureau's rules. They would be allowed to keep a maximum of 160 acres per farm. They must sell excess land to the government at prewater prices, eschewing speculation and windfall profits. The government, in turn, would find new buyers for it, usually in 40-, 60-, and 80-acre farm sizes. Teams of federal planners would come into the country and, in the spirit of Elwood Mead, lay out new town settlements in the project, new farm-management models, and new transportation facilities. "We were planning *for* a group about whom we knew very little," one

of them, Marion Clawson, admitted at the time, "and were not planning *with* them." It was a serious flaw in his view, but because the majority of the settlers had not yet arrived, because the Bureau's experts had to prepare the ground for them to occupy, what else, he wondered, could be done? The great advantage for the planners in that situation, of course, was that they were free to make the project, in the words of Bureau official William Warne, "not Utopian, but as near the ideal American farming community as can be."[13]

Dust-bowlers and tenement dwellers were, it must said, only a small fraction of the intended beneficiaries of the remade Columbia River, not important enough in themselves to justify the effort and expense, particularly in light of the parallel development going on to the east of the Rockies, which aimed at keeping many of them at home. No, the principal goal in the Northwest was something else, something not so very different from what it was in the southern latitudes, in California, Arizona, and Texas: to repeat from the Bureau's own mouth, total use for greater wealth. According to that agency, "we have not yet produced enough . . . to sustain a desirable and reasonable standard of living, even if goods were equitably distributed; and . . . there is no limit to the human appetite for the products of industry."[14] By that thinking the overriding goal of western water development was simple and unambiguous—the goal of making more—and yet it was an elusive goal, impossible to define or achieve, for what was "desirable" and "reasonable" was confessed at the outset to be an idea without shape or limit or the means of satisfaction.

The third of the great streams running from the roof of the Rockies was the Colorado, and in the postwar era it too came in for "total use." So total, in fact, that by the early 1960s it no longer reached the sea. Much of its annual flow had come to be lost in reservoirs, soaking away into porous sandstone or evaporating into the air. Some of it passed by a tunnel under Rocky Mountain National Park into the Platte River basin for irrigation. The largest portion was diverted into California, into its agriculture and urban settlements, through the All-American Canal and through the California Aqueduct, which sucked up water from behind Parker Dam and carried it to the Metropolitan Water District on the coast. More commitments would follow, but those were sufficient to reduce the lowest reaches of the river to a mere drainage ditch, lined and edged, carrying only runoff and local floods now and then. Down in the delta the Colorado completely dried up and disappeared.

The death of the Colorado River began with Hoover Dam but was completed by a new round of demands coming from parties that had gotten nothing out of the Boulder Canyon Project Act and were now, by the 1940s,

ready to be dealt into the game. The first claimant was Mexico, and that country threatened to make a great deal of noise in international circles unless the Americans guaranteed it a large, steady supply. Granted, Mexico contributed little precipitation to the river—virtually none, in fact—but then neither did California. Furthermore, the Mexican farmers had been drawing from the river for a long time too, and they were often poor, struggling folk meriting some help. The problem was to decide how much was Mexico's fair share and who should be obliged to give it. In 1944 a treaty between the two nations was signed, granting a minimum of 1.5 million acre-feet a year to the Mexicans, secured and delivered by the American reclamation investment. Californians, the most vociferous critics of the treaty, condemned it as "a first mortgage" on the river, as unfair competition in dry years for their heavy users, as an imposed modification of the western water-law principle of prior appropriation—and they were right. But the neighboring states, eager to get their own claims satisfied and some development under way, supported the State Department's treaty, and for a while the matter was settled.[15]

After Mexico got its share secured, the upper-basin states began lining up with buckets and barrels. By the Compact of 1922, those states (Wyoming, Colorado, Utah, and New Mexico) were reserved the rights to 7.5 million acre-feet, *after* they had made sure the lower-basin states (Arizona, Nevada, and California) got an equal amount. In truth, there would not be that much left over; more like 6.6 million acre-feet was all they could realistically expect in normal years. In a 1948 compact the upper-basin states agreed to divide whatever there was by the following formula, based on each state's contribution to the river: Colorado, 51.75 percent; Utah, 23 percent; Wyoming, 14 percent; and New Mexico, 11.25 percent; with 50,000 acre-feet set aside each year for northern Arizona. And then they went to work on Congress and the Bureau of Reclamation to build them a few dams and canals. First they would get a giant reservoir at Echo Park on the Green River, flooding Dinosaur National Monument, in order to be ensure enough water for the south. That would open irrigation development galore, up and down the western slope.[16]

For the men who wanted to flood Dinosaur, men like Senator Arthur Watkins of Utah, Bureau Commissioners Michael Straus and, later, Wilbur Bexheimer, and Secretary of the Interior Douglas McKay, an artificial lake would brighten up the dull, drab (and unvisited) canyons, would make good use of a wilderness containing nothing more valuable than a few old reptilian bones and scraggly pifions. Another group, however, with different values, suddenly appeared to battle the reclamationists, vowing to stop the Echo Park dam. They included Bernard DeVoto, who in a letter to Senator

John F. Kennedy declared, "The entire concept of reclamation needs a thorough overhauling."[17] There was also the writer Wallace Stegner, who depicted the virtues of an unflooded wild monument in *This Is Dinosaur,* along with David Brower of the Sierra Club, perhaps the most effective leader of the opposition, Howard Zahniser of the Wilderness Society, Arthur Carhart, a Denver conservationist, the New York publisher Alfred Knopf, and thousands of others in the West and East, all of them remembering with some bitterness that not three decades earlier they had lost a similar battle when San Francisco took over Hetch Hetchy Valley in Yosemite National Park for its water supply. This time they were determined to win, and win they did. The Echo Park dam proposal was scratched in March 1956, and Secretary McKay, stung by the defeat, resigned from the Eisenhower cabinet. Some other way would have to be found to get the upper Colorado harnessed.[18]

In the place of Echo Park, the Colorado River Storage Project Act of 1956 authorized a tremendous structure at Glen Canyon, just south of the Arizona-Utah border. To save Echo, Brower and the others supported a dam at this new site, much to their later regret, for it would drown some of the most spectacular canyons in the West. In its Lake Powell, named after explorer John Wesley Powell, Glen Canyon Dam would hold back two years' flow of Colorado water—as much as Hoover, its downstream mate. More than that, it would be what the Bureau called a "cash register," a generator of electrical power that would pay for all the other upper-basin features. There was to be Navajo Dam, dedicated in 1962, followed by Flaming Gorge in 1964, Blue Mesa and Curecanti on the Gunnison, the Central Utah Project, Seedskadee, San Juan–Chama, Paonia, and others. Glen Canyon Dam itself was completed in 1963. It was a plain chalk-white arch 710 feet high, wedged tightly between dark red stone walls, imposing in its clean, pure utilitarianism, impressive for its bulk if not grace; and running nonstop down in its turbine chamber was a cash register, counting up for tourists the dollars constantly being earned by the sale of electricity.[19]

And finally among the claimants seeking the death of the Colorado there was Arizona, a poor stepchild, left to the last and unhappy with its plight. What could be done for Arizona? Not much until it gave in to the federalization of the Colorado and ratified the 1922 compact, which, under pressure from the Mexican treaty, it got around to doing in 1944. Having done that, Arizona, rallying around the leadership of its aging but persistent United States Senator Carl Hayden, immediately began agitating for a federal program to bring the river into its dry interior. The water, it was said, was desperately needed, for Phoenix and Tucson were beginning a population

explosion that in the postwar decades would take them to metropolitan status. Competing against them for local supplies were the irrigators of the Salt and Gila valleys, using 95 percent of the water and still coming up short. In 1940, the state pumped 1.5 million acre-feet from its ancient underground deposits dating from as far back as the Ice Age. In 1953, it pumped 4.8 million acre-feet. Unable to agree on state legislation to control that unrestrained pumping, Arizonans looked off to the Colorado for their salvation. Repeatedly, from 1947 on, Hayden got the Senate to approve a billion-dollar Central Arizona Project under the auspices of the Bureau of Reclamation, only to have the California delegation in the House of Representatives stop it, claiming as they did that there was not enough river left for any large new diversions. Indeed there was not, for California was by then using 5.2 million acre-feet, not the 4.4 suggested as a fair share by Congress in the Boulder Canyon Project Act. Arizona, more angered and impatient with its big thirsty neighbor than ever, filed suit in 1952 to settle once and for all its rights and those of California. "The subsequent trial," writes Norris Hundley, "proved to be among the most complicated and hotly debated in Supreme Court history."[20] When it was settled in 1964, after fifty lawyers and a court-appointed special master had worked on it, Arizona emerged smiling and triumphant. It could lay claim, the court agreed, to a full 2.8 million acre-feet of the Colorado, plus the full flow of its own tributaries—though Arizona had to give a million of its allotment to several Indian tribes, which had suffered even more than white Arizonans had as mere stepchildren of the river.

With the competing claims settled, Congress was now ready to pass the last major water-development legislation for the Southwest, the Colorado River Basin Project Act of 1968, featuring the Central Arizona Project and a handful of little gifts tacked on for its friends and supporters. The CAP would begin on the eastern shore of Lake Havasu, created by Parker Dam, where a pump would slurp 1.2 million acre-feet a year up through a pipe and tunnel, through the Buckskin Mountains, into the Granite Reef Aqueduct. That great concrete channel would transport the water eastward across the state, 307 miles in all, first to Orme Dam northeast of Phoenix, then on south in the Tucson Aqueduct, through and over and past more pumps, mountains, deserts, Indian lands, suburban sprawl, until there was nothing left in the ditch. The first water began running in 1985. Total cost of the CAP, mounting higher and higher as the years went on, was in the billions of dollars, a sum that exceeded, so a couple of the state university economists admitted, the direct benefits from the project. Thankfully all of it was federal money or it would not have been there to spend. The energy bill was staggering too. Originally the plan had been to run the pumps on

hydroelectricity generated by two more Colorado River dams, one at Marble and the other at Bridge Canyon, the latter creating a reservoir that would bury a portion of the Grand Canyon National Park.[21] Once more the environmentalists buckled down to battle to save a last piece of the natural river, and once more—for the second time in the century—they were victorious. Once more, however, they lost something as well, for the energy to make the CAP go would be derived instead from coal strip-mined on Hopi sacred lands at Black Mesa in northern Arizona and burned in the Navajo Generating Station near Page, polluting the crystalline desert air with ash and poison gas.[22]

The Central Arizona Project was authorized exactly one hundred years after Powell led his small party down the unknown Colorado and exactly fifty years after the Boulder Canyon Project was passed. In the span of that century, even more so of that second half-century, the southwestern desert had been replaced over much of its extent by an astonishing urban and agribusiness complex, while the Colorado itself had been transmogrified into an industrial artifact, an almost perfectly realized expression of the new imperial West. What those northern rivers, the Missouri and Columbia, were still struggling toward, the Colorado had become—a part of nature that had died and been reborn as money.

For scale of engineering, for wealth produced, the American West had become by the 1980s the greatest hydraulic society ever built in history. It had far eclipsed not only its modern rivals but also its ancient ones, Mesopotamia, Egypt, Mohenjo-Daro, China, and the rest. It had made rivers run uphill, made them push themselves up by their own energy, and celebrated the achievement in brilliant neon colors playing over casinos, corporate offices, shopping malls, over all its new-age oases. It had turned an austere wilderness into sparkling serpentine seas where fleets of motorized houseboats circled under hot cloudless skies, where water skiers turned playfully in and out of once desolate, forbidding chasms. Then it had taken that same water and raised cotton with it, filled city pools with it, thrown it in the air with fountains and let it blow away. It had made its rivers over to produce art, learning, medicine, war, vulgarity, laughter, stinginess, and generosity. All this it had done with unmatched zeal, and most of it with the aid of the East.

To appreciate the awesome magnitude of this new hydraulic civilization, one had to start with its improbable farms, the foundations of its urban, industrial life, and they were legion and lush. The Census of Agriculture reported in 1978 that there were 45,433,535 irrigated acres in the seventeen western states: one-tenth of the world's total. California was still the

leader, with 8.6 million acres; but Texas had surged into second place, with 7 million, followed by Nebraska with 5.7 million and by Idaho and Colorado with 3.5 million each. The market sales from those lands amounted to one-fourth of the nation's annual total, or $26 billion (Florida, the only eastern state with substantial irrigation, contributed a small part of that figure), roughly the value of the sum of American farm exports. Taken by counties, all but one of the top ten agricultural producers were in the irrigated West, and eight were in California alone. Of the leading 100 counties in farm-product sales, California counted 21, Texas 13. Such figures, revealing as they were of the geographical shift in agricultural preeminence, only hinted at the political brawn of these western farmers, who were in most cases gathered around their ditches and water-management needs into muscular organizations.[23]

The irrigated West, it must be added, was not yet a single coordinated monolith, for it included thousands of farmers who remained on their own, as independent entrepreneurs, continuing to pump their water from aquifers with private equipment, as well as remnant small-scale, local water cooperatives. But far and away the major force in agricultural water supply, preempting the field with its capital and expertise, drawing western ranchers and growers into a regionwide network unapproached for cohesion elsewhere, was the Bureau of Reclamation. In its seventy-fifth anniversary report, the Bureau proudly listed its accomplishments: 9.1 million acres irrigated on 146,000 farms; 322 storage reservoirs constructed, 345 diversion dams, 14,490 miles of canals, 34,990 miles of laterals, 930 miles of pipelines, 218 miles of tunnels, 15,530 miles of drains, 174 pumping plants; 49 power plants marketing more than 50 billion kilowatt-hours a year over 16,240 miles of transmission lines. It had invested nearly $7 billion for irrigation purposes alone. Most of the electricity went to the cities, and the Bureau also furnished water for 16 million municipal and industrial consumers. "Builder of the West" was the way the agency was described by one of its longtime employees, and what he might have added, but did not, was that in no other major American region had a single federal agency devoted itself so single-mindedly to so narrowly regional a mission as this one, to the responsibility, as the same writer put it, of "marshalling resources to sustain the growth of the West."[24]

In rationalizing this work, from the time of Francis Newlands on, the claim had been drummed in repeatedly that western agricultural investment benefitted every American, wherever he or she lived. For example, Congressman Aspinall, the consummate water politician to whom was due the greatest credit for the size of postwar water budgets, argued that federal reclamation made children "bigger, stronger, more alert, and healthier than

their parents were" by filling them up with irrigated oranges and vegetables. What's more, the farmers out there pumped money back into the national economy. By his figures, the North Platte Valley Project, to take a single case, had cost the government $22.5 million, but each year of late it had paid back $16 million in taxes and ordered as many as 20,000 boxcars of merchandise from all over the country, thereby stimulating "American business and prosperity." The Bureau too was an old hand at trotting out the justificatory data, pointing out in 1977 that eleven of its projects had, during their existence, surpassed $1 billion each in gross crop value (led by the Central Valley, Imperial Valley, Minidoka-Palisades in Idaho, Yakima, Colorado–Big Thompson, Salt River, and the relatively new Columbia Basin)—over $4 billion worth of crops grown that year from federal water, enough to feed 32 million people.[25] The figures were all true, and the economic benefits indeed substantial, as these sincere, devoted zealots believed. What was missing from their accounting, however, was any acknowledgment that the success of the West was, to a sizable extent, the failure of the East. Those boxcars of tractors and radios would, in the absence of the reclamation program, largely have gone to places like Tennessee and Ohio, especially if the government had put that $7 billion of reclamation money into helping poorer farmers there improve their skills and productivity.

Few of the crops in the West had to be grown there exclusively. Most could have been more cheaply raised in humid environments, and they would have been, had been, are raised there yet. The most common crop on federally watered farms, the Bureau itself reported, was forage to feed cows—not people—constituting 37 percent of all acres in production. Another 25 percent of reclaimed lands grew the staple cereals, mainly corn, wheat, and barley, none of them unique to the West. The southerner's traditional crop of cotton appeared on one in ten Bureau acres. Only 17 percent of Bureau-aided lands were devoted to vegetables, fruits, and nuts, and the percentage in winter-season lettuce or in citrus fruit, filling out and diversifying the American diet, was a minuscule portion of that. Clearly the West was in extensive, direct, subsidized competition with the East. The consequence of that fact, a pair of resource economists commented, was that "increased production on reclamation-served land has increased USDA payments [paid out since the New Deal, paradoxically, to reduce surpluses], stimulated regional production shifts, and reduced the incomes of nonreclamation farmers." Bureau projects, they calculated, had forced out of use at least 5 to 18 million farm acres in the East. Though there had been a net gain in national production, it had been achieved by sending thousands of rural men and women into bankruptcy, forcing them to drift to the cities

looking for work, for few of them were able or willing to take up a new farm in the West.[26]

Here, then, were the outstanding achievements of the western hydraulic society—its triumphs over nature, its bright green wealth sprouting out of what had once been a dry, cracked landscape—and some of its costs entailed elsewhere. And at home, in the West, what was the structure of power associated with those triumphs? Had the region in fact become a model democracy, as forecast by a succession of promoters? Was it a society in which power and profit were broadly diffused—was it, after all, a people's Eden? Or was it instead, more or less as the earlier hydraulic societies had been, a hierarchical system of power, of unequal life-chances, of some humans dominating others? Were there concentrated, centralized forms of authority there, and did the individual and the small community stand before them in futility and impotence?

A number of observers have examined the question of power in the postwar West and its relationship to water, and virtually all of them have agreed that there has been an immense ballooning of the state, which is to say, the federal government and its bureaucratic apparatus, in the region. It would be hard to maintain otherwise—like trying to refute the setting of the sun. However, the observers have disagreed over the effects of that state apparatus on private power, over its implications for community freedom and autonomy, over its relation to festering social inequities. And, disagreeing over those matters, they have been at odds when it comes to suggesting how and by whom water should be apportioned in the future or how a genuinely democratic West would deal with its rivers.

One set of observers, and they are among the most listened-to critics of the modern hydraulic society, are the free-market advocates. What they have perceived emerging in the West is a big bruiser of a state that has shouldered private enterprise out of the water-development business, poured capital into projects that cannot meet the tests of market rationality, and played favorites when it comes to doling out the resource. The West by their account begins to look like a throwback to mercantilist England in the days before Adam Smith and laissez-faire enlightenment. Representative of this group of critics is the disillusioned New Dealer and *Newsweek* columnist Raymond Moley, who in the mid-1950s delivered a scathing attack on western reclamation, calling it a "paternalistic rainbow" and the Bureau behind it a "Napoleonic" institution in its overweening ambition. Money was being taken from the American public in the form of taxes, he charged, and redistributed according to the social values of powerful bureaucrats, and those bureaucrats favored western farmers over eastern farmers, over

urban dwellers, and over industrialists who wanted water too. Three economists—Jack Hirschleifer, James DeHaven, and Jerome Milliman—made the same case a few years later when they accused the Bureau of suffering from a "monument syndrome," of building immense, costly works that were simply not good business investments. Supplying water, they complained, seems persistently to evolve into a "natural monopoly" in which prices and benefits bear little relation to costs and both freedom and reason are sacrificed. They proposed "a decentralization of authority" in making decisions about water and stated: "The cause of human liberty is best served by a minimum of government compulsion and, if compulsion is necessary, local and decentralized authority is more acceptable than dictation from a remote centralized source of power."[27] The same argument would appear in one form or another over the succeeding decades. The West, it goes, is excessively dominated, insofar as water is concerned, by the federal government, and that government is surrounded by a pack of sycophants. In the eyes of the more extreme market theorists, the region is saddled with a bureaucratic despotism not so very different from that Karl Wittfogel found in the ancient world. Only the restoration of a free, private market in water supply, investment, and pricing would bring this monster tumbling down.

A contrary critique, so dissimilar that one might well wonder whether it can possibly have been provoked by the same West, has come from another group, who might be called the "public-interest liberals." They have found the region to be a fragmented, chaotic structure of power that is incapable of working for, incapable even of perceiving, the common good: a shabby little house of private desires. In one of its rooms, the Bureau of Reclamation squabbles endlessly with the Army Corps of Engineers over who will dam what, while in an adjacent room a knot of congressmen in Stetsons and string ties are elbowing one another aside at the federal trough, diving for pieces of pork; roaming about the floor everywhere are local farmers with their hands out, their pockets open, their voices demanding and lustful. The great failing of the region from this view is that there has been too little effective central power and too weak a sense of collective purpose in the conquest of water. Rivers can never be exploited for total yield, for maximum efficiency, this critique goes, until some new superior source of authority is located that can take a broad view and do the job in a coordinated fashion. As Charles McKinley wrote in his critical study of the Columbia River schemes, "these waters are a part of a great single force which demands unified human manipulation if it is to be used to best advantage." He would have set up a National River Development and Management Administration in the Department of the Interior and under its aegis nurtured a series of river-basin commissions resembling the Tennessee Valley

Authority, beholden to no local oligarchies or old, entrenched bureaucracies.[28] Similar proposals for one or more TVA-like superagencies have been made repeatedly and for every major western stream, always with the confidence that centralization of power is not the road to serfdom, as the market ideologues fear, but a way to achieve the national welfare.

In this same vein, the writings of political scientists Theodore Lowi and Grant McConnell have been especially influential. For them, the West, particularly in its irrigated agricultural development, exemplifies a pervasive problem in American life: the capture of government power by narrow interest groups and, consequently, the subversion of democracy. Lowi, in a complex argument that cannot be done justice to here, refers to an "iron triangle" in water development that has as its three corners a handful of well-placed western congressmen, the Bureau, and organized agribusiness, together forming a closed network of power that eludes scrutiny and check. "Power goes up," he argues, "but in the form of personal plunder rather than public choice."[29] Similarly, McConnell holds that real clout in the West rests with small, cohesive private groups that have made the federal bureaucracy their servant, reduced it to an amiable, docile giant stumbling after its little master. Americans are readily fooled by this arrangement, McConnell warns. Fearing some great despotic central state that could hold life-and-death sway over their lives, they have naively trusted in the notion of "local control," all unaware that power in such a decentralized society has not been done away with but has become more firmly seated than ever, with no possibilities for challenge at the grassroots. Failing to realize the genuine threat to democracy that exists in that situation—the opportunities it opens, for instance, for rich California farmers to grab cheap water for themselves at taxpayers' expense—they have no defense. Only a strong, transcendent federal government, McConnell believes, in which a full diversity of interests are represented, can look out for the public interest.[30]

In the face of two such contradictory sets of analyses of the West, of the market men who see decisive power gathering ominously in the hands of the state and of the public-interest liberals who think it is still in the tight grasp of private elites, the cry naturally goes out: Who is right? To some extent, the answer must be that both are. The problems of the American West resemble one of those funny little pictures that, held one way, show a face with a scraggly tuft of hair on top and a bushy beard underneath, and held another way, show a very different face with a wild bush on top and a goatee. The power that has accumulated with the domination of western rivers has two faces also, one private and the other public, depending on which way one turns the picture. The most nearly adequate term for describing the composite is "capitalist state." As indicated in an earlier

chapter, this will not do finally as a full or adequate description of the West, will not capture all its peculiarities of history and ecology, but it comes closer than either of the accounts above to suggesting the complex but unified structure of power there.

The theory of the capitalist state, it will be remembered, denies that power in modern societies is democratically diffused, competitive, or pluralistic. It also denies that the immense bureaucratic apparatus of today is a benign force, or even a neutral one standing ready to do the bidding of whatever organized group can get into office, the good as well as the bad folks. Instead, the state has become a Leviathan in whose shadow ordinary men and women live. This large, hovering creature is not all-powerful, for the contemporary world is too complex, too diverse, too full of struggling, contending parties for any entity to rule unchallenged. Moreover, it is restrained by the purpose on which it has fattened. Depart from that purpose and Leviathan will sicken and die. In the main, that purpose is to promote the economic culture of capitalism, the core ethos of which is the rational, calculating, unlimited accumulation of private wealth. The state has come to be the single most important agency for the preservation of that culture. In the work of preserving, it finds at once the end of its being and the means to enhance its own prospects. As conservator, the state exercises military power abroad, facilitates commerce at home, educates the young, encourages investment, safeguards profit, absorbs the social and environmental costs of capitalism, and regulates the chaos of the marketplace. Above all, the state has the responsibility, not alone but finally, whenever lesser agencies fail, of dominating nature. Only through such mastery can resources be made available in infinite quantities and can the process of private accumulation continue.

The Moleys, Lowis, and McConnells see only a limited aspect of this picture, and that is where they go wrong. All of them, however, are right to a point. As the market purists accurately complain, freedom of enterprise tends to shrivel in the shadow of the modern state, but not because that shadow is thrown by a hostile form of power. Capitalism is, after all, aimed primarily at the acquiring of individual wealth; free markets are only one of its strategies for doing that, and one that has historically been quickly discarded when others, the contrived market of the state in particular, have become available. The public-interest liberals are likewise perspicacious about several details. In the capitalist state, private good does in fact become identified with the general welfare. However, removing power from local elites to some national center does not change that identification but only enlarges it, making power more concentrated than ever, more difficult to escape or overturn.

But it is not only those observers discussed above who have been unable to turn the picture around and around to get all its faces in view. The Marxists, too, have had their lapses of perception. Though they have written almost nothing on the American West specifically, they have been among the most clear-minded generally about the capitalist state and its mission. They have seen its coherence, its logic, its connections, better than almost any one else around. Too quickly, however, they have assumed that the state is merely a tool of a single elite group who own the means of production—that it is, in other words, first and last a coercive instrument of a well-defined ruling class. That kind of mechanical analysis reduces the endless conundrum of historical cause and effect to a pat formula. Is the entire culture of capitalism along with its protective, conserving state the invention of a particular economic class, the bourgeoisie? Or rather has the rise and hegemony of the bourgeoisie been an inevitable outcome of that culture? Has the class been called into existence, thrust into a position of leadership, by the culture's values and beliefs, shared more or less spontaneously by a wide spectrum of the population, as well as by its evolving relationship with nature through technology? The latter way of thinking, though admittedly messier, seems finally to be the more satisfactory, for it rightly emphasizes that a culture is not simply the invention of a handful of people at the top, something that they alone create and impose on everyone else, but that a culture, including that of capitalism, grows amorphously, anonymously, out of particular historical circumstances, out of particular environments, and in that process of growing sets up its own distinguishing structure of power.

The American West is an ecological variant on the modern world-circling culture of capitalism: a pattern of culture and society that has branched off, diversified somewhat from the parent that sent it out to find a new home for itself. It was created by the movement of that capitalist culture into an arid environment, into a land where scarcity of the vital resource of water was the prevailing environmental reality. Where there was an abundance of natural wealth lying about, waiting to be easily gathered up and made use of, capitalism as a culture and as a social order got along without much centralization of its energies. But when it encountered the raw edge of scarcity (it can create scarcity through depletion, of course, as well as come into it) that culture began to shift about. It found itself saying and accepting things it would not have accepted before. It felt the need to fabricate, or invite in, powerful organizations, above all the state, to help carry out its drives. In the West, the single most important function of that state has been, in the words of Roy Huffman, "to provide a constantly expanding resource base upon which private enterprise can build."[31] Making abun-

dant what was scarce, putting an elusive, stingy nature within private reach where before it was unattainable: this has been the fundamental, underlying ecological role of the capitalist state, and in the West, this has been its role to a degree unmatched anywhere else in America.

The naked accumulation of wealth has, for most people, never been a wholly agreeable idea or an adequate explanation of life. Consequently, it has needed dressing up from time to time in more lofty ideals, more noble, transcendent rhetoric, even in actual garb. As Ralph Miliband shows, one of the most appealing wardrobes has been that of nationalism. For a long time now, the capitalist state has resorted to nationalistic appeals to furnish disguises for the self-enriching behavior it seeks to protect. Nationalism or patriotism has also served to muffle internal protest and dissent. "For the good of the nation"—by that appeal men and women are persuaded to go quietly along with their state apparatus and its projects, subordinating themselves, as Miliband puts it, to "a larger, more comprehensive concern which unites in a supreme allegiance rich and poor, the comfortable and the deprived, the givers of orders and their recipients."[32] There are other garments in the wardrobe besides nationalism. The grand cause of the domination of nature is one of them, perhaps the one most often brought out and worn, though it may be called by other names like "progress." Another garment used to cover the embarrassment of unconcealed self-seeking—and a capacious, well-handled one it has been in the United States—is regional pride, regional ambition. Nowhere is this more so than in the American West, where talk of making an empire, of conquering the desert, of overtaking the East, has served to distract attention from the less attractive realities of hierarchy, power elites, and the insatiability of an acquisitive culture. Finally, put the water-controlling men into a costume of oversized belt buckles, narrow-heeled boots, and big white hats, and their disguise is complete. They have fully appropriated the heroic, freedom-loving cowboy past of the West to justify their modern acquisitiveness.

Here then are the mature lineaments of the newfangled hydraulic society which, by the 1980s, had taken form in the trans-Mississippi landscape, up and down the plains, over the Rocky Mountain rooftop, across the desert basins to the coast. Not radically different in its cultural imperatives from the rest of America, or from France or Japan for that matter, it presented nonetheless a few distinctive features. On its environmental base of aridity, it had erected a closely integrated system of power that included both the state and private capitalist enterprise. Neither could survive in the harsh land without the other. Working together, however, the vision of total use could be dreamed and realized: the management of every river, every

obscure remote creek, for the sake of greater wealth, for the sake of America and a greater West, for the sake of domination.

ACCUMULATION AND LEGITIMATION

Holding an empire together is a more difficult task than creating one. With success come new threats from within and without, requiring a level of vigilance that would have been inconceivable at some more primitive stage of development. In the postwar western water regime, those threats took two forms. First, there was a swelling of social criticism that the empire could not answer. Dissension over the grand project of river domination arose as its human results became difficult to reconcile with some of its original promises. That dissension, as it grew more bitter and unresolved, left in its wake a dark deposit of disillusionment, a loss of faith. The entire project began, for many, to seem morally bankrupt. Second, with all the engineering triumphs came a set of adverse ecological consequences, and they began to plague the river-pushers, defying their expertise and endangering their magnificent artifice. The first of those threats to the empire, the decline of its moral legitimacy, was the outcome of a hard-fought, impassioned controversy, lasting more than three decades, over the 160-acre limit in the national reclamation law. The fate of the limit was finally settled by Congress in 1982—but not before a fatal crack had appeared in the traditional, broad-based political alliance for arid-land reclamation.

Ironically, the threat of a lost legitimacy came precisely and inevitably through the very success of the water empire. All along in its rise to power it had been marked by latent contradictions, and those contradictions, deriving chiefly from the capitalist state mode of environmental exploitation, had always carried the potential for self-destruction. Most treacherous of them was the contradiction in purpose: the state had in the West the dual role of promoting the accumulation of private wealth through the increase of available water while maintaining social harmony in its distribution.[1] Promoting accumulation was always the more essential job, for time and instrumental reason had proved it to be the most efficacious strategy for generating economic growth, bringing in revenues, and keeping the bu-

reaucracy employed. It was also what the Bureau of Reclamation did best, and as the years passed, it became more narrowly focused. As some individuals got richer, they clearly came to deserve, by the rules of the Bureau's work, the fullest attention. Which is another way of saying that the accumulative function by its nature tolerated, even produced, economic inequalities. On the other hand, many of those citizens who, for one reason or another, failed to keep pace with the elite were sooner or later likely to resent their situation and feel that the state was not performing its distributive job in good conscience. They could readily accept the idea that the state apparatus ought to help individuals acquire more water, more capital, and more income—but accept only to the extent they themselves were assured that such help was fairly distributed to all. The controlling American definition of justice, as many have observed, has been one of open opportunities and plenty of them. Restrict those opportunities to a privileged handful, smaller and smaller in number, and in many people's eyes the state and its efforts began to appear less legitimate, less supportable.

Everywhere modern capitalist culture faces such a contradiction, and faces, if it cannot resolve the tension, its own death. So at least Jürgen Habermas, the German social philosopher and heir of the Frankfurt School, has argued. What he calls *Steuerungsprobleme*, or unresolved steering problems, abound in this culture and its various societies, engendering from country to country a sense of crisis that so far no state has quite been able to relieve. Apathy, alienation, a decline in mass loyalty toward institutions and traditions, a growing sense of a world gone irrational: these are some of the symptoms of the general legitimacy crisis. Can the state steer away from the rock of elite accumulation and back toward popular support? Can it revive the heroic collective spirit that once animated the drive to conquer nature? If not, a crash is coming, Habermas warns, and some new culture, some new economy, with new social arrangements and modes of production, will emerge from the wreckage.[2]

The American West, running for so long on an ascending curve of optimism, came at last to be drawn into that same general malaise. So abrupt was the reversal in mood that it left a lot of westerners bewildered and angry, determined to insist on the old clichés more stridently than ever. They began to sense but not really understand that former symbols of success like Hoover Dam no longer stirred the same old enthusiasm nationwide. Nor did Henry Luce's ebullient vision of an "endless frontier" for reclamation raise its former fervor. Too many critical questions faced the empire. But western leaders and state apparatchiks proved unable, as we

will see, to respond creatively to the crisis, and so at last undermined their project of river domination.

Steering a successful course for reclamation had always required the wholehearted support of agrarian democrats. More than any other group, it was they who gave the effort its moral legitimacy. They earnestly believed and worked to convince the public that irrigating the West was the way to open up opportunities for millions of poor Americans and to keep faith with the ideals of men like Thomas Jefferson. In the postwar period, that role of legitimation belonged preeminently to the University of California economist Paul Taylor. He would never have described his part that way. On the contrary, he would have said he was a gadfly, an outsider, an outraged man fighting against the power elite, denying them legitimacy. And he was all that too: for forty years he had struggled against them to save the 160-acre limit in the reclamation law. But so long as he was successful in his struggle, and for a while he was that, Taylor added an unintended credibility to the over-all program. For he sincerely felt that the idea of water domination was a noble one, if it could be kept joined to the idea of distributive justice. That was exactly what the cause of reclamation legitimacy needed: someone to fight tirelessly for its tradition. The empire also needed to let a man like Taylor win a little. That did not happen, and that was why it irretrievably weakened its case.

Taylor first learned about the reclamation program, including the provision on acreage limitation, at the feet of Walter Packard in the early forties.[3] He was then a professor at Berkeley, had been since 1922, and would stay there till his retirement and beyond. Born in 1895 in Iowa, he had studied at the University of Wisconsin with John R. Commons before coming West for graduate work. His first scholarly commitment was to labor policy, especially regarding Mexican farm workers in California. In 1939, he and his photographer wife, Dorothea Lange, collaborated on an eloquent essay, *American Exodus,* depicting the plight of the Okie migrants. Once he had heard from Packard about the acreage limit, however, he had the driving motive of his mature years: to bring about the breakup of the large agribusiness interests in California and put land in the hands of as many people as possible. A democratic West, he began to insist in a spate of articles and congressional testimony, would require the prevention of land and water monopoly and the proliferation of the small family farmstead.

Originally the acreage limit on federal water projects, as has been discussed, had been set at 160 acres per family. That was a maximum, a ceiling, not a suggested optimum. Far less land than that, it was generally

acknowledged, would be adequate to support a family wherever irrigation was available. Consequently, farms in the West ought to be smaller than those elsewhere, smaller than the quarter-section norm that had guided earlier, humid-land settlement. Families, the law went on, must reside in the "neighborhood" of their land—must be real farmers, that is, not speculators or landlords living in some distant city. By midcentury, however, the law had been significantly altered by Bureau "interpretation." The residency requirement was completely ignored (under the unconvincing claim that Congress had omitted it in the 1926 Omnibus Adjustment Act).[4] The 160-acre allotment had been extended to every adult member of a farm household, and it could be held in as many separate irrigation districts as one liked. Exemptions had been granted to a lengthening string of projects all over the West, though not, despite the best efforts of Sheridan Downey and Alfred Elliott, to the Central Valley of California. Luckily, Michael Straus's "technical compliance" formula allowed large landowners there to sell their excess land to friends, relatives, employees, anyone who would let them go on using it. And the Bureau everywhere allowed the unlimited leasing of land, so that a single operator could farm five or ten or fifteen thousand acres with ridiculously cheap public water. Still, for all the bureaucratic loosening, there remained a specified limit on the books and enough show of enforcement to rile the bigger accumulators. It was Paul Taylor's intention to hold fast to that limit, or some near facsimile of it, and to toughen the Bureau's adherence to it.[5]

He had his work cut out for him. During the first term of the Eisenhower presidency, Secretary of the Interior Douglas McKay, formerly an Oregon automobile dealer, now a powerfully placed official determined to remove all federal roadblocks to private enterprise, came up with a method to get around the acreage law. He offered to accept a lump-sum payment of $14 million for the Army-built dam at Pine Flat on California's Kings River (it had cost $40 million—the rest would be charged off to flood control), allowing excess owners along the river and in the old Tulare Lake basin to buy their way out of conformity. Fifty-two of the owners held among them 196,466 excess acres, and they were delighted with the McKay bargain; it was exactly what they had sought since prevailing upon the Army (instead of the Bureau) to do the work.[6] Unfortunately for them, McKay's successor, Fred Seaton, felt compelled to take that offer back as a possible violation of the reclamation law, and not until 1982 would they get their way. Meanwhile, Congressman Clair Engle of California introduced a more successful evasive strategy, the so-called Engle formula, which allowed exemption through payment of interest charges, set at very low rates, on federal

water projects. This was enacted in the Small Reclamation Projects Act of 1956.[7] Still another assault on the limit came through the courts, when an excess owner in the Ivanhoe Irrigation District (Tulare County again) sued to stop the district from accepting the limit in its Bureau of Reclamation contracts. The California Supreme Court agreed with him, declaring in *Ivanhoe Irrigation District* v. *All Parties* (1957) that the acreage provision violated state law, which must take precedence in water matters. The limit was "unlawful discrimination" against the well-to-do, the court complained, a piece of "class legislation." The following year, the United States Supreme Court unanimously struck down that decision, thereby asserting not only the validity of the limit itself but the primacy of federal authority as well.[8] In all these skirmishes, Paul Taylor was at the forefront, advising and consulting with liberal senatorial allies Paul Douglas and Wayne Morse, bristling tall and angry at hearings, his keen eyes searching out any bureaucrat who would dare to empty sacred words of their meaning. He was a strong, determined hawk of a man whom little farmers could use around the barnyard for defense.

The case against the acreage limit was what it had always been. Critics contended that in the old days it had been a nice theory of dividing up the public domain, but that it now interfered with the higher principle of accumulation. In the words of the chief counsel for the Imperial Irrigation District, "it completely offsets a man's right to work, to live, and to acquire property." That refrain ran through the 1958 hearings convened by Senator Clinton Anderson of New Mexico, who was among those seeking repeal, or at least relief. The witnesses he called in those hearings included a North Dakota farmer who resented "this business of putting ceilings over him." "America has been known and admired the world over as a land of unlimited opportunity," he went on, but "acreage ceilings set at the turn of the century certainly limit the opportunity of progressive irrigation farmers." Senator Frank Barrett of Wyoming, whose bill would have applied the Engle formula to all federally reclaimed lands, stuck in his view that it was not morally right to deprive a man of his property and give it to another. And Floyd Dominy, then the Bureau's associate commissioner, confessed that he was at heart an accumulator too. He owned 380 acres as a gentleman farmer in Virginia and was "not yet convinced that is sufficient." Dominy went on:

> I think we must cut through the fog in this [hearings] room that has come from many well-intentioned people as to the sacredness of the 160-acre limit. I want to defend it, yes,

> as to its principle and as to its policy. But I think that it needs to be adjusted to the existing circumstances in any given area.[9]

With Chairman Anderson and other western politicians, Dominy lavishly praised the principle of redistributing reclamation benefits widely. Such assertions were the established method of holding on to broad funding support. It was merely the application, the substance, of that principle he and the others found objectionable. For them, the problem was to devise some subtle, unobtrusive way of maintaining the husk of agrarian idealism without preserving its kernel of meaning. For Paul Taylor, the challenge was not letting them get away with it.

Note that though the party of accumulators was scattered over the West, California was still by far the main and loudest source of noncompliers, with recalcitrants in the neighboring states looking on to see which way the federal wind blew out there. In the next round of the limit controversy, after those generally unsuccessful trials in the fifties to get the limit removed completely, the contest would move to California altogether. Once more, its Central Valley would become a violent battleground, though this time words and lawyers—not pick handles and thugs—would be used, for this was to be a battle fought, for the most part, with professors and congressmen, not with poor alien workers. The controversy now focused on the desolate western side of the San Joaquin River, the Westlands district still lying high and dry and vulnerable. With no other water than what they could pump from deep down in the ground, with water tables falling rapidly, there was a fierce local clamoring for government aid. Controversy was also gathering around the latest hydraulic feat in the West, and one of the most impressive: the State Water Project of California, which was sold to legislators by agribusinessmen to rid them of the fearsome federal rule-makers.

The State Water Project began in the early 1940s when powerful valley agricultural interests, backed up by merchant groups and the state engineer, made a pass at buying out the feds. When they discovered there was not enough money, or will, to take over the entire Central Valley Project, they turned instead to rivalry. They would jolly well do their own plumbing from this point on. They would not let the Bureau of Reclamation add the Feather River, plunging off the Sierra into the Sacramento basin, to its cap, but would claim it for the state. A dam on the river at Oroville, built to world-class scale, plus diversion of northern coastal waters southward would yield enough water to fill a new canal, the California Aqueduct, which would push up from the delta along the western wall of the valley and,

reviving an old fancy, leap over the Tehachapi Mountains. That was the main idea, simple and megalomaniacal. But in their master blueprint of 1957, the planners went on to speak airily of 376 new reservoirs in all and of total capital expenditures of $11.8 billion—not bad for a single state going it alone. If carried out, the plan would be larger and more costly than the entire federal reclamation program to date. The need for it, state officials said, was desperate. Los Angeles, suppurating endlessly over the southern desert, must have that kind of investment or it would die. Even more to the point, there were land interests along the aqueduct route who needed it, who were aching with thirst, who had to have an irrigation system they could reliably control. This one, it was understood, would have no acreage limitation attached.[10]

After a lot of disputation and delay, a new governor, Edmund "Pat" Brown, took the plan firmly in hand in 1959 and coaxed it through the legislature. His special aide in the campaign was a former Bureau lawyer, Ralph Brody, a smooth man destined for wealth and notoriety. One year later, the proposition went before the California public in a referendum. Now, however, only the first phase was laid out for scrutiny and the cost presented for approval was a mere $1.75 billion. Even at that, a number of independent economists said the project was a boondoggle, returning, by one estimate, barely fifty cents on the dollar. Other critics wanted water development left to the federal bureaucracy, who had the means to go after the big supplies farther north, the Columbia in particular.[11] The opposition almost prevailed, but four days before the election the Metropolitan Water District of southern California signed a contract with the state for 1.5 million acre-feet, and the southern voters now swung over to support the plan. The project passed by 170,000 votes out of almost 6 million cast. Only sixteen out of forty-four counties, and all but one of them was in the southland, gave it a majority.[12] Late in 1971, the first water crossed the mountains.

City people paid the largest part of the bill for the State Water Project, though in some cases they used none of the water. Land developers and agribusiness, on the other hand, took the largest profit. The Metropolitan Water District directors, who ostensibly represented urban consumers, could hardly have been unaware of that outcome. Perhaps because nearly half of those directors were real-estate developers or big landholders, they were not manifestly bothered. In the Great Valley, the leading beneficiaries were a few horny-handed plowmen toiling in Kern and Kings counties: Chevron USA (owner of 37,793 acres in the SWP service area), Tejon Ranch (part of the Los Angeles *Times* holdings, owner of 35,897 acres), Getty Oil (35,384), Shell Oil (31,995), McCarthy Joint Venture A (a part-

nership including Prudential Insurance, 25,105), Blackwell, Tenneco, and Southern Pacific. They got their water at discount and used it, not to salvage a fading economy as promised, but to put in a quarter of a million new acres of cotton, olives, pistachios, almonds, and wheat.[13]

That the *un*-motive of the State Water Project, however overlaid it became with later justifications, was to circumvent the federal acreage limit was well understood by Paul Taylor and his associates. Their attention, though, was riveted elsewhere, on the Bureau of Reclamation and its latest round of maneuvers in the valley. Not one to be shut out of any field of budding enterprise, the Bureau was now hurrying its own schemes along to fetch more water and find more customers in the California interior. Already it had spent more money on the valley than on any other single project. Yet still there were lands unredeemed. There was, for instance, west of Fresno above the low-lying sloughs, an undeveloped flattish area the size of Rhode Island. In 1952, landowners there formed the Westlands Water District, which eventually would cover more than 600,000 acres, replacing Imperial as the largest district in the nation.[14] Directly thereafter, the Bureau began looking into the prospects of hooking up a faucet for them. The most feasible solution appeared to be a dam on San Luis Creek coming out of the Diablo Range—precisely where the State Water Project engineers also wanted to build. Handsomely, they agreed to share the facility, and San Luis Dam was budgeted by Congress in 1960. Water taken from its reservoir for federal use would carry the acreage-limit proviso; water for state use would not. The trickiness of distinguishing one water molecule from another did not trouble President John F. Kennedy, who was present to preside over the ground-breaking ceremony, quipping to the thousands sitting on folding chairs, "It's a pleasure to me to come and help blow up this valley in the name of progress." When completed in 1968, San Luis Dam was one of the half-dozen largest structures of its kind ever made, worthy enough, exclaimed Interior Secretary Stewart Udall, to bear a sign reading "Man was here!"[15] What kind of man, what kind of progress, had yet to be discovered.

Long before the Bureau and its know-how came to the rescue, Westlands had been the private fiefdom of a few exceptionally big owners. Though by cross-valley standards they earned a skimpy per acre return from the land, they were hardly poor, for they counted among their numbers the likes of Southern Pacific Railroad, Boston Ranch, Southlake Farms, Bangor Punta, and Standard Oil. You needed many acres there, it was said, to eke out a bare, marginal corporate living, many more to be really comfortable. Federal water, however, was supposed to change all that: farms would be broken into much smaller units, it was promised, new settlers would flock

in by the thousands, crop yields would shoot out of sight, the economy would boom, money would blossom along every ditch. In fact, only the last of those promises turned out to be true. After the project was finished, most of the same growers were hiring the same men to ride the same tractors around the same fields. There was no new settlement and little genuine or practical opportunity for the landless—but there was indeed a great gob of money rolling in at last. Why that was the outcome is a revealing study in bureaucratic handling of the reclamation law.

By a strict interpretation of the law, the Bureau was obliged to sign contracts before any construction could begin, and the contracts had to commit landowners to sell their excess lands within ten years of receiving water and at preproject prices to prevent windfall profiteering. Commissioner Dominy saw his duty differently. He would build first, get contracts later. Eventually, under public pressure, they were indeed signed, all under the watchful eye of Ralph Brody, formerly of the governor's office and before that of the Bureau, now counsel for Westlands and the highest paid official in California. By 1976, Brody could boast that 350,000 acres in the district were under contract and of that sum 109,000 excess acres had been disposed of to 928 individuals. All in all, it was "an outstanding record of compliance."[16] Not so, said a group of U.S. senators who came out in 1975 and again in 1976 to see for themselves what had been wrought. The Bureau had no idea, charged the senators, what a family farmer was, how many of them were originally in the district, how many had been added. It had accepted sale prices that were too high, and worse yet, had not made sure that the land really went on the market. Senator Gaylord Nelson reported:

> I have witnessed few hearings in my career that have been more moving than those held in Fresno when literally hundreds of would-be family farmers appeared just to be represented by one California family farmer—a man who told their story of repeated efforts to buy reclamation land sold as excess, only to be told that it was not available in small parcels for family sized farms. These people were experienced family farmers with credit available to them from private sources. All they were asking was what the law promised.[17]

Who, then, was getting the land, if in fact it was being sold as Brody claimed, and how were they doing it?

The would-be farmers who had been excluded from buying formed the

National Land for People organization under the leadership of George Ballis, a sharp, crusty ex–labor journalist. Their investigation uncovered that, despite strenuous denials, project-aided lands were being reorganized into ever more intricate corporate holdings, with the investors typically residing in such farm neighborhoods as San Francisco, the Caribbean, Japan, and Mexico. For instance, Russell Giffen, once described as the largest farmer of irrigated land in the United States, had sold out to a hand-picked circle of cronies and "partnerships," many of them giving the same last name and the same address, which also happened to be the office of one John Bonadelle, a Fresno land speculator. All in the family, as it were. Bonadelle soon after pleaded guilty to a fraud conspiracy charge, but the Westlands shell game went on, confusing the most alert observer with its deft movements, its successive sales and resales, its shuffling of names on the door. Combined with unrestrained leasing, the game was played as a way to prevent any change whatever in the personnel or scale of farm operation. "It is like a club atmosphere," said a representative of the National Farmers Union who had personally tracked down one of the purchasers, the so-called Jubil Farms, to its New York office. "If you are a member of the club, you have access." Under this Bureau-style watchdogging of the reclamation law, there were simply no 160-acre (and precious few 320-acre) farming operations to be found in Westlands.[18]

That men and women would carry on so intricate, so demanding, even at times so flagrantly criminal a shell game as this one may require explanation. The reason, at least the indisputable part of it, had to do with the accumulative urge. Turning on a faucet for Westlands cost the American taxpayer more than $3 billion dollars. (This figure includes construction and interest charges, calculated at 6.75 percent over forty years.) The water came to growers at a measly $7.50 an acre-foot, well below the price charged on the nearby State Water Project lands—a figure so low that they were actually paying off only the yearly operation and maintenance costs. Pumping water uphill from San Luis Dam was done with cheap electricity supplied by the Bureau. The total subsidy, according to economists Philip LeVeen and George Goldman, was a whopping $2,200 per acre. Figure it out: an investor who got one of those interlocking quarter-sections received a gift from the public of $352,000.[19] In exchange, the public got more cotton, sugar beets, and tomatoes—more of them, yes, but not enough to justify their huge capital investment. It was ridiculously expensive food and fiber.

Why the Bureau or Congress would underwrite such extravagant welfare for a rich elite should by now not require any explanation. What none of the parties involved quite expected was the hullabaloo, the demands for

investigation, raised over the Westlands project. People wanting an opportunity to farm, resenting their government's indifference toward them and now more effectively organized than ever, were not going to accept this outcome in silence. In 1976, National Land for People filed suit against the Department of the Interior to prevent any further approval of excess-land sales in the district. One year later, Secretary Cecil Andrus, acting under a court injunction, suspended sales approvals not only there but throughout the West, pending a general review of the reclamation law and the adoption of new rules for its enforcement.[20] And Paul Taylor up in Berkeley thought maybe the tide was turning at last, bringing in a people's program of water control.

"All around him were oaths, moans, bellowed complaints, the brief tableaux of upright wincing men, hoes dangling, their hands on the small of their backs, who were going on under the same torment." That is the world of the washed-up prizefighter Billy Tully in Leonard Gardner's novel *Fat City*.[21] It is the California agricultural worker's world, populated by winos toting along their bottles in paper bags, by street derelicts trying to pick up a little change, by old experienced hands knowing no other life, a few of them white, many more of them black, Filipino, and Mexican, in every case seasonal workers who get ninety cents an hour to thin tomatoes or top onions and who spend much of it evenings in Central Valley bars. In the postwar period, they were still around, as they had been since the nineteenth century, and they were no closer to escaping that hard lot than before, no nearer to owning their own farms or receiving public-funded water for them. The entire federal and state investment in irrigation expansion had not been made for them, did not improve their condition. It had been for the accumulative class, who were overwhelmingly white, Anglo men already owning property.[22] Even the hundreds of aspiring farmers who showed up before Gaylord Nelson wanting to buy a piece of the Westlands were well removed from the ranks of seasonal laborers. Granted, with the right kind of reclamation program it was at least conceivable that some of the Billy Tullys along with the Sanchezes and the Villanuevas of the fields could become small-time owners, bending and sweating for themselves. But that had not been the program pursued, though it had always been the promise held forth. The result was a glaring gap between the claim of wide redistribution and the bleak reality of a permanent underclass who did the brute work in western reclamation. Legitimacy slipped down into the gap and could not be pulled out.

The elaboration of irrigated agriculture, as demonstrated earlier, required a rural proletariat. For a long while Asian immigrants made up that

proletariat, then Mexicans and Okies. When the Okies moved out of farm work during World War Two and into coastal defense industries, the growers fell back once more on Mexican nationals to serve. A presidential executive order in 1942 allowed them to recruit workers across the border (the so-called *braceros*, or strong-armed ones) on temporary work permits. The policy was extended in 1951, as Public Law 78, a further example of the state's promotion of the water empire. Growers claimed, in agitating for the law, that they could not find enough domestic hands to get their crops in. "We tried to bring labor from the Southern states," explained J. Earl Coke, a prominent California agricultural leader, "and the colored people just can't bend over that far."[23] In the peak year of 1959, California imported 136,012 Mexicans, and Texas used 205,959. Put more accurately, it was a tightly organized group of 50,000 growers in five key western states, assembled, for instance, as the Imperial Valley Farmers Association, who employed virtually all the *braceros*. Stories of laborers being herded north (packed like cattle into rickety old trucks by unscrupulous, exploiting contractors), of squalid housing conditions, and of starvation wages led to the termination of the import program in 1964. Still open were the possibilities of applying for permanent alien resident status—becoming a "green card" worker—or of crawling illegally under the fence at the international border.[24]

Then began, with that grudging restriction of the labor pool, a fierce race along the western ditches between the forces of unionization and of mechanization. Americans of Hispanic ancestry, the largest remaining source of workers, undertook to organize themselves, as they had tried to do in the 1920s and 1930s, into agricultural unions. Marching under the flag of the National Farm Workers Union, which bore a black Aztec eagle on a red-and-white field, and led by a cotton picker from Arizona, César Chavez, they tasted real success for the first time. In 1965, they announced a work stoppage against the grape farms of the Delano, California area. In the next year, they went on strike in the vineyards of two of the state's biggest growers, Schenley (who became the first to recognize the union) and DiGiorgio (who fought them bitterly). Those actions were followed in 1968 by a national boycott against the table-grape industry. Despite the open hostility of Governor Ronald Reagan and the entire agribusiness establishment, the NFWU persisted, winning through the seventies a series of victories in contracts, minimum-wage guarantees, and state-supervised elections.[25]

And then they began to lose. With every success, growers had an added incentive to invest in the new farming machines appearing on the scene. The weird, ingenious, and expensive technology was designed, for the most part, at public-funded universities and aided the accumulators by lowering

their labor costs. One harvester clattered along the cotton rows, stripping the bolls and blowing them into wheeled bins that carted them to the gins. Another ripped grapes from their vines. Still others grabbed walnut trees by their trunks and shook the crop down. With increasing frequency it was machines that dug potatoes and beets and carrots and dumped them onto conveyor belts. By 1966, there were 460 machines in California fields alone harvesting tomatoes, and farmers were bringing in millions of tons of a new "square", thick-skinned variety of the fruit, specially created to withstand mechanical handling. "The machine won't strike," noted the chairman of an engineering department at the University of California at Davis, where much of the inventing went on; "it will work when [the growers] want it to work."[26] His words hinted of the vision that had animated the empire from the beginning—of extending its technological control as far as possible, to the total domination of the earth. If one could make water run uphill for hundreds of miles, one could do more, much more. One could turn over the whole job of irrigated cropping to genetics, to electronics, to robotics, doing away with the need for almost all field labor, completing man's triumph over the desert. No more stooping in the hot sun, no more threats to strike, no more workers, no more work.

From its very beginning, the federal reclamation bureaucracy had studiously ignored this rural proletariat toiling on its assisted lands. All of its promises of creating new farms and farmers in the West were proffered, however vaguely, to some set of noble husbandmen or yearning city people elsewhere, usually a good deal farther off. And there was another community in the West who were ignored, closed out, not regarded as the stuff from which accumulators and imperialists are made: the Indians. Outside of a few of its judges, the government did not acknowledge that the Indians might need or want water too. Yet three out of four Indians living on reservations in the United States were located in the West, and because they had for so long been disregarded, the tribes found themselves by the postwar years in a parlous situation. Reservation lands had been taken from them and sold to white irrigators or flooded behind dams. Their groundwater had been pumped away to adjacent interests. The Paiute of Nevada watched their Pyramid Lake, once an abundant fishery for cutthroat trout and cui-ui, recede lower and lower, as farmers upstream on the Newlands Irrigation Project diverted the Truckee River to raise cattle feed. The Bureau of Reclamation consigned other flows, like the Yellowstone River in Montana, to invading coal companies, despite the protests of the Crow, Cheyenne, Arapaho, and Shoshone. Some Indians wanted to secure water for their own industrial schemes, while others had the laying out of large-scale irrigation farms in mind—or merely the retaining of a right to future

development. But everywhere they were standing at the tail end of a long, long ditch.[27]

The Indians pinned their hopes for a fairer distribution on some principles enunciated in a Supreme Court case back in 1908, *Winters* v. *United States*. The case was over who was entitled to the Milk River of Montana: a white settler named Henry Winters and his neighbors, who were drawing off the river to their fields, or, downstream from them, the Gros Ventre on their Fort Belknap reservation. The Court concluded that the Indians had priority of claim, had in fact a special, unique right to water based on their treaty with the American government. When they came to terms with their conquerors, the tribe reserved enough water for all their future needs. Whether that right had ever been claimed or not was immaterial; the water must be there waiting for the Indians whenever they decided to use it. The white man's laws of appropriation, which gave a water right to whoever first put a river to use, could not affect those reserved native rights. Furthermore, the English tradition of riparian rights, granted to any and all streamside dwellers, could not prevail against the Indian priority. The Winters doctrine was potentially a bombshell that could blow the entire structure of western water rights, and the hydraulic society resting on it, to ruins. One Indian sympathizer, William Veeder of the Department of Justice, maintained that the Winters decision gave the tribes an unlimited claim on their watersheds, on all the streams "which rise upon, traverse or border upon Indian reservations," and that white users there, no matter how old their own claims, must now buy the right to divert or must give way. Others hotly denied so sweeping a claim.[28] A fundamental moral issue was at stake, a question of justice. Did the fact that a people had arrived in a country first give them an eternal and superior hold on its natural resources? Or did a higher right belong to the man or woman who first saw the economic promise in a resource, who first put it to use and made a profit from it? Neither the courts nor Congress managed to settle the issue. Indeed, they left it in total confusion. No one could say, would say, where or how far the Winters doctrine applied. And in that state of ambiguity the white appropriators had an uneasy but clear edge: they were already in possession.[29]

The predicament of the farm workers in the western hydraulic order was radically unlike that of the Indians. But there were some similarities. In the first place, neither group had been cut in on the benefits from water development. Now, in their new militancy, both groups could seriously embarrass the region nationally and internationally. They could testify that technological prowess and private accumulative success were not the only outcomes worth noting. There was also poverty, despair, and discrimination

in the West. The instrumental reason by which the empire functioned had long ignored those darker truths, for they were about matters of morality, justice, ultimate intrinsic values, and the instrumentalists, whether public or private men, were not skilled or interested in such matters. Another parallel was that neither the field workers nor the Indians could expect much from the traditional reclamation law, regardless of how vigorously it was enforced. In particular, the acreage limit was not meaningful if one had the land, as the Indians did, but needed water or if one did not have the funds, as workers did not, to buy excess lands that came on the market. The theory of justice embodied in the limit, taken alone, was too narrow to produce a genuinely egalitarian society in the region. Moreover, it could conceivably work against these poorest, excluded groups by adding to the number of white farmers competing against the Indians' reservations or pushing for mechanization of the laborers' jobs. Finally, for both groups the danger in the controversy over the 160-acre law was that it could preempt the broader moral debate over water and its distribution, reducing to a formula, and an old-fashioned Jeffersonian agrarian formula at that, the more complex issues they wanted addressed.

By the decade of the 1970s, then, the water empire was ringed about, more than at any other time in its rise to power, by loud, angry, protesting voices. Among them were the voices of Indians and field workers. There was also a vitriolic newcomer down in Imperial Valley, Dr. Ben Yellen, fighting with broadsides and lawsuits to get the acreage limitation and residency clause enforced.[30] There was George Ballis and National Land for People agitating for the same thing in the Westlands district and across the region. Even the growers, those securely on the side of empire, were not altogether happy. They resented any semblance of federal control, especially over their acquisitive ambitions, and demanded the removal of all acreage limits whatsoever. What all of the voices were wrangling over was the legitimacy of the empire itself and how that legitimacy would be defined—what cultural values, traditions, and standards of judgment would predominate.

In August 1977 the Bureau of Reclamation, obeying the court injunction to review acreage enforcement, issued a new set of rules interpreting and applying the 1902 law. Any single individual (or any corporation) would still be limited to 160 acres, as the law said, though a family could own up to 640 acres. Through additional leasing, the operational limits could be expanded to 480 acres per person, or 960 acres per family. The time allowed for disposal of excess lands would be lowered from ten to five years, and the federal government would set up a lottery to sell lands that owners could not sell among their family, neighbors, or employees. And no owner

or lessee of federally watered lands would be allowed to live more than fifty miles from them—a requirement that would be "phased in so that no undue hardship would occur." Would the enforcement of those rules make much of a difference across the West? In most places, the answer was no. Only 2 percent of all reclamation landowners had more than 320 acres; the average size of ownership units was a piddling 70 acres. A mere 0.8 percent of the units exceeded 640 acres, the family standard (though they owned 16.8 percent of irrigable acres). But there were a few places over which the rules would roll like an earthquake, shaking and knocking about the social order, and those places happened to be precisely where the Bureau had lavished its best efforts, notably the Central Valley of California. Under the proposed methods of calculating, Californians would own almost a million acres of excess lands, or 89.3 percent of the total in the seventeen-state Bureau service area. New Mexico, Texas, Nebraska, and Montana would add enough to account, with California, for 96 percent of acreage excess. In those states, the Bureau was admitting at last that there "was a very high degree of inequality" in the distribution of benefits for which it was partly responsible, and that a new, serious round of enforcement could rectify that inequality. Something like a thousand new farms could be created, the government ventured, most of them to be found in the Westlands district. That was, after all, not many farms, not enough to erase most of the lines of class and hierarchy, but it was enough to seem wildly, dangerously revolutionary to a grower named Standard Oil or J. G. Boswell, Inc., and thus it was enough to doom the new rules.[31]

The Interior Department officials dutifully took their proposed rules into western towns and cities where they hoped to hear the grassroots reaction. What they mainly heard, and it came from a choleric brigade who could not claim to represent the large, unaffected, complacent majority of reclamation farmers, was that enforcement would be catastrophic. An even smaller knot of dissidents appeared at hearings to say that the rules did not go far enough, that far stricter ceilings on family ownership and on leasing—say, a maximum of 320 acres on all operations of every kind—would make many more opportunities for new farms than the Interior scheme, but their voices were shouted down in the general organized clamor set up by the rural elite. Among those taking the elite's side was liberal Governor Jerry Brown of California, who sent his state director of food and agriculture, Richard Rominger, to protest that the 160-acre limit was "unrealistic." He had support from men like the Westlands Water District manager and the spokesman from the Pacific Legal Foundation, who charged that Interior was trying to force "a social change by attempting to create an 'agrarian' form of agriculture." The foundation subsequently got the courts to issue

an injunction against the rules until an environmental-impact statement was prepared.[32] While that was in process, western congressmen and senators rushed off to Washington with a slew of proposals in their attaché cases to bury the proposed rules and amend the 1902 law.

By 1979, it was clear that the only bill that had much chance of passage was the Reclamation Reform Act, Senate Bill 14, proposed by Frank Church of Idaho to give "relief to real family farmers." It would repeal all residency requirements, make 1,280 acres the absolute maximum for operations, leased or owned or a combination thereof, but expand that limit where climate or altitude put farmers at a competitive disadvantage. Church would also free any district from those limits once it had paid out its forty-year contract with the Bureau. Hearings on the bill were held in Washington in March 1979. After drawn-out statements from state secretaries of agriculture, from the well-heeled Farm/Water Alliance, the National Cotton Council, and so forth, after twenty-three witnesses in all testified in favor of liberalizing or abolishing the old law, when the hour was late and the senators were eager to go home, George Ballis of National Land for People was allowed to come forth and speak alone in opposition. Some months later the full Senate considered the Church bill and voted in favor of it, 47 to 23. No action was taken by the House of Representatives, however, leaving the issue moot.[33]

With the new Interior rules still hanging threateningly in the air, with a string of failures to get the law rewritten by Congress, the western elite was frustrated and worried that they would again fail to get reform as they had in the 1940s and 1950s. Then, the inauguration of Ronald Reagan as President in January 1981, a man who as California's governor had sharply condemned the general idea of an acreage limit, along with the seating of a strongly conservative, Republican-controlled Senate, brightened their prospects considerably.[34] Once more a rush of new bills appeared in Capitol Hill committees. Senator James McClure of Idaho, with support from Armstrong of Colorado and DeConcini of Arizona, sponsored S. 1867, which would set the limit at a munificent 2,080 acres owned and leased. For a while it was the Senate's favored child. This time, however, the bill that was destined to succeed where all others had failed was one slipped into the House hopper by Morris Udall of Arizona. H.R. 5539 would abolish residency requirements completely. The western reclamation farmer could live in Taiwan or Palm Springs if he liked, plowing and watering at long distance. Udall's bill would set the combined ceiling for a family at 960 acres, or its equivalent in areas of lesser productivity, but at 320 acres for a corporation. It would let the Secretary of the Interior decide how long (up to a period of five years) an owner had to dispose of his excess lands. No

lottery was required to see that the excluded, the outsider, got a chance at the sale. The bill would allow unlimited leasing above 960 acres, so long as the lessee reimbursed in full the interest paid out by the government on the reclamation funds it borrowed. And it would exempt all Army Corps of Engineers projects from any acreage limit. On 6 May 1982, the House voted in favor of the Udall bill (228 ayes, 117 nays). In July of that year the senators agreed to shelve their own McClure bill and put Udall's in its place. The vote was 49 in favor of that move, with only 13 opposed. Thus, the Reclamation Reform Act of 1982 became law. After eight decades of dispute, loose attention, and the persistent hopes of social reformers the old 160-acre homestead principle was dumped for a new standard, one six times larger than its predecessor. For those growers whom George Ballis called the "biggies," those men who were huge in ambition but mighty few in number, constituting less than 2 percent of the reclamation owners, the way was now open to unlimited aggrandizing. Without embarrassment or danger they could openly set up truly massive operations, if they paid "full cost." What was meant by paying "full cost" turned out to be not so very onerous either: getting an interest rate, through long-term government borrowing, that was about half the going market figure, paying something like 6 or 8 percent above the water rates charged the smaller operators, with all those subsidies from urban water and electricity consumers left pleasantly intact. The power structure of the hydraulic empire was not altogether satisfied with the outcome—it wanted more liberality than it got. But, on balance, it was happy, for it was safe at last from the tattered hordes of wild-eyed agrarians, farm workers, revolutionaries, populists, and redistributionists.[35]

During these years of turmoil from the mid-1970s to 1982, much was said about the principles, the moral values, that should henceforth govern the development and use of water in the West. Little that was said was new or profoundly thought out, but what was said was strongly, passionately, and thanks to the changed political climate of the Reagan era, unabashedly urged. The debates in Congress produced especially revealing articulations of the region's public values on the matter. Judging by the frequency of their iteration, the most compelling of those principles were the following:

1. The proper role of the state should be to promote the private accumulation of wealth, not seek its dispersal into as many hands as possible; it should be to reward the successful, not the failures.
2. The laws of the marketplace are reason exemplified,

and they should be allowed to dictate what size of farm operation is most desirable, what will work best, what will be viewed as efficient.

3. The hydraulic apparatus of the West, an imposing technological triumph, should not be flawed and compromised by an antiquated agrarian ideal that belongs to the horse-and-buggy days.

Although evidence could be rustled together in support of any of the three principles, they were all more in the way of preachments than demonstrable or logical truths. Defenders of the 1902 law flailed away at them with their own statistics and preachments, but finally they could not prevail—could not crack the imperial ideology.

By the first of the principles, the federal government was to be regarded as a welcome partner in developing western water when it confined its mission to the domination of nature and left private enterprise alone. When it acted, that is, in Senator Malcolm Wallop of Wyoming's words, as "a public-investment-making entity," and in the words of his senior colleague, as "an engine of economic growth." Then, so the reasoning went, no matter how large its budget or how far-flung its tentacles, no matter how subtle or powerful its influence, no matter how deeply dependent on it westerners had become, government was not yet become that dreaded monster Bureaucracy. It was not yet an overarching authority repressing and restraining the rights of individuals. When the state took to redistributing land and water, on the other hand, the West would become, in the rumbling phrases of McClure of Idaho, a "centrally controlled, rigidly enforced egalitarian society in which excellence is not virtue and liberty no prize." In the 1979 hearings, Orrin Hatch, a prominent member of the New Right, denounced this "continuing process of bureaucratic domination" that the acreage limit imposed on his constituents in Utah (Bureau figures showed that only 0.1 percent of irrigable acres there were excess). On the same occasion John Puchen, director of California Westside Farmers, demanded to know, "Who is the Government of the United States to say that because you want to be a farmer, your income should be limited to a subsistence level?" And Bernice Wolf of California Women in Agriculture echoed many senatorial sentiments when she said, "We must preserve the sacred right of property owners to do as they wish with their property." Big government, then, was not *ipso facto* incompatible with the western way of thinking, only government, whatever its size, that attempted to mess about with the single sacred right of accumulation. The region's elite were attacking a government that said, as Wallop put it, "You're going to be frozen in place."[86]

The second principle had less visceral appeal than that of defending the raw accumulative passion, but it had the great advantage of seeming to be more scientific, more disinterested, even more humanitarian: A large body of technical literature could be brought to its defense, all of it demonstrating, so it was said, that a mere 160 acres was irrational and inefficient by the standards of contemporary marketplace agriculture. Among such studies frequently cited were those by California farm economists Gerald Dean, Harold Carter, and Warren Johnston. In their view, the economies of scale in irrigated farming all began well above the quarter-section farm unit level: at 600 to 640 acres for most of the crops they studied. Modern machinery, their studies and a few others suggested, had made the old nineteenth-century standard in farm size completely outmoded. Rigidly imposing that standard today would raise the cost of food and, as some went on to claim, threaten the hungry of the world with starvation. However simplistic, that argument provided grist for the empire's mills. Not mentioned were the other implications in the studies. Once achieved, those economies of scale typically did not go on and on upward but reached a plateau where they leveled off, or even declined, as they encountered some inefficiencies associated with overblown size. Yet no one in the agribusiness world or the United States Senate suggested that a *lid* be placed on western farm size right where those diseconomies began to show up. Taking off every lid possible was the great and only desideratum, for it was accumulation, not efficiency, that was their real, leading motive.[37]

The identification of an optimum scale in agriculture mainly reflected, of course, the cost and design of the machinery currently being invented and deployed on farms, as well as the desire of every operator to own his own full panoply of such equipment rather than to share with his neighbors; the growing dependence on a battery of chemicals; and the ability or inability to get a contract with some giant food processor. Any such optimum was best understood, not as a "law," specifying what had to be, but rather as a description of what was, of what had been devised, of what had been sought. In the agricultural engineering schools, efficiency had been persistently defined as whatever was most profitable for big operators. Therefore, the search for a so-called scientific definition of ideal scale was something of a self-fulfilling prophecy. Believe that big is better and you will work to make it so.[38]

Those who wanted to hold on to the old 160-acre acreage limit, or at least on to some lower ceiling than the one pushed by Udall or McClure, had their own studies to cite, casting the entire matter of scale and profitability into some confusion. For example, a study by two agricultural economists at Washington State University demonstrated that a 160-acre farm in the

Columbia basin could earn a family $15,590 in after-tax income, a 320-acre farm, $27,360, sums they described as respectively "quite adequate" and "quite generous" by national standards. Corroboration came from the Bureau of Reclamation's environmental-impact statement on its proposed rules, which determined that in the vast majority of irrigation districts a 160-acre farm could produce as much as or more income than the national farm average of $10,037. Quadrupling that size, as the Bureau proposed to allow for families, would have made it possible for a western farmer with subsidized water to make far more money than his counterpart in the East: as much, it was calculated, as $101,480 in net operator income in the Westlands Water District, $124,600 in Imperial Valley.[39]

The third principle may have been the most subtly persuasive of all, though it was more of an oblique presence than a well-articulated argument. The 160-acre standard, argued senators, congressmen, editorialists, and farm groups, came from another century, when dams were simply piles of brush or stones placed across a stream, when a plow or a mule-drawn fresno was sufficient to scratch out a ditch. In the shadow of a San Luis Dam or the Central Arizona Project, it seemed a hopeless anachronism. Moreover, the standard came from another, fading region. For farmers back East so small a farm and the income it provided might be all right, but not for farmers in the West, where men lived by larger expectations. Enforcing an old, outmoded social ideal of small farming in that big land of big engineering triumphs was a gross incongruity. It would create a region of "serfs" and "peasants," warned western leaders.[40] Never mind for the moment that those serfs, according to the economic studies, were making on average as much as or more than those in any other region of the world. The point was that they were men who had a spectacular hydraulic achievement to live up to and therefore could not be confined to the ambitions of lesser men elsewhere. That general, diffuse feeling of incompatibility between traditional, eastern social ideals and modern, western technological miracles was independent of any personal, self-interested acquisitiveness or any loyalty to the most accumulative class. It was unsentimental, commonsensical thinking, an honest acknowledgment that if the West had ever really wanted to establish in its valleys a more decentralized, agrarian life, where a large portion of its people would live directly on the land and make their own decisions locally, it would never have pursued the water system it got. Now it was time, westerners were insisting, that the society be conformed to its infrastructure.

Whatever the validity of these ways of thinking, they carried the day. A long-standing agrarian tradition and its powerful mystique were abandoned in 1982. For almost a century, it had been attached—granted, as rhetoric

more than reality—to the western reclamation program. Now at last that program was revealed to be unequivocally an imperial one, aimed at the massing of wealth and power, using the concentrated force of the capitalist state to further that work. The next question was whether, without the cover of the agrarian tradition, such a program could still hold on to its legitimacy among Americans, even among westerners. Would they continue to finance it, as they had always done, once they had an unambiguous view of what it was after?

"The great barbecue is over," announced Senator Daniel Moynihan of New York during consideration of the McClure bill. While the taxpayers in his own home city were forced to spend over a billion dollars of their own money to improve their water supply, westerners were still asking for more federal aid. They were asking, he acknowledged, but they were not going to get it. Not a single major water-authorization bill, he pointed out, had been passed by Congress in the decade after 1972. The Corps of Engineers was without work, and the Bureau was merely finishing up old projects. The national majority that had once supported those authorizations had now disintegrated. Moynihan recounted how the governor of Arizona, flying with him in a helicopter over the Colorado River reservoirs, had joked that the water was destined for "the swimming pools of my more affluent constituents." Moynihan was incensed by such profligacy, such flagrant abuse of New York charity. What he was saying should have been taken as a warning to the western bloc in Congress that the legitimacy of their program was hanging in the balance. They did not pay him any attention, however, and ignored similar warning signals from Senators Proxmire of Wisconsin, Metzenbaum of Ohio, and Lugar of Indiana. All indicated that the Midwest, like the East, was not likely to go on financing the water empire in years to come. Nor did they heed one of their own, Congressman Jim Weaver of Oregon, who denounced the Udall bill as "the product of a well-financed campaign of a small but very wealthy group of agribusiness interests, multimillionaires and corporations. It is a bald-faced antifamily farm package of direct subsidies to the richest of America's agribusiness interests." Outside the West, and even here and there within it, the legitimacy of the program was slipping away.[41]

The irony of the situation was that, in making their case for reforming the acreage limit, the western elite had forged a tool that now could be turned against them with devastating effectiveness. They had claimed to want to live and grow by the principles of the marketplace. Very well, let them pay market prices for their water. If the West was not interested in

opening new homestead opportunities for the disadvantaged, then the old justification for furnishing cheap irrigation was gone. Two Colorado State University economists, David Seckler and Robert A. Young, wrote in 1978, "We find there is no compelling rationale for anything like the amount of subsidies now being provided under federal water programs."[42] That was an old conclusion, now spreading rapidly through both professional and lay circles, and the 1982 legislation could only confirm it. In fact, the new law reflected that thinking to some degree when it spoke of "full cost" pricing for larger operations and when it required districts to agree to annual renegotiations of contracts and prices if they wanted to enjoy the new acreage liberality. Since it had been taken over by the state, reclamation had never been asked to meet the familiar market tests: Would this expenditure bring the highest possible return? Would the benefits be greater than the costs? Would private capital have undertaken this or that project? Would the water go to those willing to pay the most for it? Now, suddenly, caught in the backlash of their own reasoning, the western ideologists might have to face those tests at last.

If the empire had now to meet, and meet rigorously, the pure marketplace tests of economic success, then there might be significant shifts ahead in its structure of power. Agriculture might eventually have to give way, might be forced to migrate back eastward where its costs were lower, its western water going to a new set of customers—the industrialists, the mining and energy companies, the desert megalopolises. Moreover, under strict marketplace accounting, no new projects might be undertaken for quite some time. There might be too many other demands on capital, pressing demands from all over the world, competing against the water developers. Their dream of total use, total domination of the western landscape, might then never be fully realized. That was a distinct possibility lurking in the triumph of 1982. In winning its long battle to lift the lid on accumulation, the empire might have lost the means to finance its continuing war on the desert. And lost too its ability to command the moral capital of the nation.

For a man like Paul Taylor, however, a man who had given so much of his life to defending the agrarian tradition in the reclamation law, that sudden, unforeseen vulnerability of an empire overreaching itself was not apparent in the summer of 1982. Now eighty-seven years old, he shuffled down the corridors of Barrows Hall on the Berkeley campus where he had his office, dressed in a plaid shirt and a blue nylon padded jacket, walking slowly and gingerly with a cane in one hand. Once in his office he sat among the scholarly debris of a lifetime, sorting out his papers for the archivists. His eyesight was weakening, his sagging eyelids held in place by tape. On

his desk lay an appeal from Morris Udall for a campaign contribution, and for a moment it brought the fire back into those eyes. "Should I send him money?" he asked—send money to a man who at that moment was gutting the law Taylor had worked so hard, so long, to hold on to? He had before him too the beginnings of an article for a law journal, arguing that the Metropolitan Water District had been violating the Warren Act of 1911 by selling its Colorado supplies to excess-land owners. On that and other matters he answered questions with a slow, thoughtful precision. His mind was alert and tenacious while the body gave way. Yet that alertness was tinged with melancholy, for he knew that he had failed in what he had set out to achieve. He understood and must accept that the West, or at least the elite West, had rejected a future he had wanted to see for it, a future where small farmers of many races could live harmoniously and comfortably in that dry land, with a powerful benevolent state building for them, looking out for their welfare, bringing them water. Now that was a vision that had been put aside, once and for all. It was a quaint notion left to the historians. "Well," was all Taylor could say at the end, glancing at the floor, then out the window toward the Sather Tower, "it was a good fight."

LEVIATHAN AILING

In the winter of 1975, the Bureau of Reclamation began filling the reservoir behind one of its newest dams, Teton in southeastern Idaho, at the base of the glorious mountains of the same name. There had been no end of headaches in its construction. Incredibly, the dirt-and-rock dam had been sited on one of the most active earthquake zones in the country, and the canyon walls around it were cracked and fragile, leaking water like a corroded bathtub. Scientists at the U.S. Geological Survey had questioned the wisdom of putting a structure in so treacherous a place. Economists had worried about the cost overruns. Environmentalists criticized the destruction of seventeen miles of canyon wildlife habitat. The Bureau answered by pouring more grout into the cracks. Within six months after its completion Teton Dam sprang a leak, then another. On the fifth of June 1976, its entire north end collapsed, and 80 billion gallons of water came thundering downstream, taking everything in its path: eleven people, 13,000 head of cattle, many ranchers' homes, a billion tons of topsoil, and no small part of the pride and esteem of the river controllers.[1]

A tragedy like Teton Dam could give no one satisfaction, but it could usefully suggest that the hydraulic society had a misplaced, dangerous confidence in its mastery, through concrete, steel, and earth, over nature. The best designs of the best engineers (though Teton was hardly that) could fail, not only all at once, with thunderous impact as in Idaho, but slowly too, wearing out, falling into disrepair, becoming impossible to salvage. Steel penstocks and headgates must someday rust and collapse. Concrete, so permanent-seeming in its youth, must turn soft and crumble. Heavy banks of earth, thrown up to trap a flood, must eventually, under the most favorable circumstances, erode away. After all, nothing nature could throw in the way of even so small a river as the Teton—whether blocks of lava, andesite, sandstone, granite, or gneiss, no matter how many thousands of feet thick and miles and miles across—could contain it forever; how much less likely was it that the human contrivances of the water empire could permanently withstand the force of flowing water. The message of the Teton disaster was that the days of the empire were numbered, on stream after stream, river after river. It was a signal of impending mortality, of human imperfection, of transient, elusive command. The end might not come soon, might come when it did with a whimper more than a bang, but it would come.

Teton was not the first big American dam to collapse. There was the Johnstown, Pennsylvania, disaster of 1889, which had brought John Wesley Powell to a ringing defense, despite the more than two thousand casualties. There was the St. Francis Dam catastrophe of 1928, some forty miles north of Los Angeles, which drowned more than four hundred persons and destroyed the career of the formidable William Mulholland of the Los Angeles Water and Power Department. There was the Walnut Creek washout in Arizona, Austin Dam in Texas—and how many nameless others? In 1965, Fontenelle Dam in Wyoming began leaking and had to be drained, and Navajo in New Mexico narrowly averted a similar fate; while in 1981, a large section of the Westlands irrigation facility, San Luis Dam, slid off into the water, threatening not drownings but drought from diminished reservoir capacity. And there were a few more potential disasters looming in the future: Auburn and San Fernando dams in California and Wolf Creek in Colorado had all been built in unstable seismic zones like Teton's. One study in the aftermath of the Idaho collapse argued that America's dams were ten thousand times more likely to cause a major disaster than all of the nuclear power plants. Even if the federal government could learn to put safety ahead of pork-barrel politics and guarantee its own structures, there remained the grim fact that twenty-four out of twenty-five dams around

the country were in private hands, and those were often loose, bungling hands.[2]

More serious for the empire's future than any botched design or isolated disaster were the inevitable problems associated with the aging of the hydraulic system. Yet those problems were seldom confronted. In proposing dams and canals the practice had never been to include the costs of decommissioning or replacing them, for the designers had always assumed that their works were made to last, if not forever, then for a very, very long time. In 1985 Hoover Dam would be a half-century old, and no one really knew what its life-span was. Each day sediment backed up behind it, reducing its capacity, foreshadowing its end. Would it last a full century? Two? The answer would depend in part on the durability of its materials, exposed year after year to a hard climate yet expected to withstand the unrelenting pressures of a mammoth lake, and upon the vagaries of land-use management in its basin, for too much grazing or deforestation upstream could accelerate erosion and add to the sediment. Pointed warnings came from the bad experiences of other countries, for example, from Pakistan's much touted Tarbela Dam, whose life expectancy the designers had overestimated by a factor of three or four.[3] One thing was certain over the long term: whatever their span of service, the Hoovers and Grand Coulees of the West must some day hold back not water but a vast sludge drying in the sun. Eventually engineers would be forced to look for new sites, and they were not going to find any, for the good ones had already been taken, used, and rendered useless.

The failures associated with aging and carelessness of design were part of a larger environmental vulnerability that the water lords began to encounter in the postwar period. They had to contend, in ways their predecessors had never contemplated, with the limits imposed by nature, limits to what humans can do in the pursuit of domination. Hydraulic technology held out for a long time the illusion that it could bring natural forces under absolute, tight, efficient control, but in truth it multiplied the ways it could work its own demise. Each new project, grander than the last, demanded increasingly intricate supervision, greater managerial sophistication—greater, it sometimes seemed, than people could summon. There was more to go wrong, and it did go wrong, on a scale commensurate with the technology involved. In addition to the problems with the apparatus itself, three sets of environmental vulnerabilities appeared: a water-quantity problem, a decline in water quality under ever more intensive use, and a potentially irreversible degradation of the pristine ecological communities of the West. These were not mere casual or minor nuisances. They were

deep systemic problems, growing out of the very program of large-scale, intensifying water control, associated with it wherever it had been pursued in history, and quite possibly without remedy. In that case, they might also prove to be fatal.

The old Incas used to say, "The frog does not drink up the pond in which he lives." They did not know the frogs or the ponds of the American West. Into that dry region had migrated the thirstiest frogs on the planet, and by the 1970s they were in fact drinking up their supplies at an alarming rate. Thousands of potholes, sloughs, and entire lakes from North Dakota to southern California had by that date been drained completely dry. Major rivers like the Colorado, the upper Rio Grande, the Arkansas, the Red, and the Platte were totally consumed or nearly so; even the copious Columbia was flowing uncommonly low at times. Despite more than a century of herculean efforts to make more water available, the thirst was still there, and it was a thirst that grew larger and more diverse with time. These frogs needed not only a little water on their tongues, in the way of all flesh, but a lot of water on their lawns, in their coal-slurry pipelines, in their manufacturing plants, and above all on their farms. They simply could not be satisfied. Scarcity for them was not merely an objective condition of nature but the product of, the rationale for, the force behind, their culture. Wherever they perceived scarcity they would drive themselves to create abundance. When and where there was abundance they would make scarcity anew. In that unceasing escalation of want they constantly ran the risk of consuming the very last drop, of becoming frogs with no ponds left.

Here were the dimensions of western thirst in the mature stage of empire. In its 1975 Westwide study of eleven states, omitting the plains tier, the Bureau of Reclamation determined that water withdrawals for all uses amounted to 136,778,000 acre-feet a year, or 45 trillion gallons. Of that sum, irrigation alone accounted for 100,717,000 acre-feet, or 74 percent. Some of that water made its way back into streams, but most of it did not. California's was the worst case in this respect: three out of every four gallons it used were considered "consumed"—that is, made unavailable for further use because of evaporation or seepage into the ground. California also made the largest withdrawals (39 million acre-feet), followed by Idaho (26 million), and Oregon (11 million). These figures must be put, of course, against the total runoff available, some 427 million acre-feet in all. That might seem like a plentitude of water, four times the quantity consumed, leaving no cause for alarm. And then one remembered where that runoff occurred and how difficult it would be to reach what was still untapped. Two

states, Washington and Oregon, and their coastal ranges in particular, contributed 183 million acre-feet alone to the runoff, and that water was a far and expensive way off from most of the thirst.[4]

Americans of all regions had habitually been, as though it were their birthright, big water users, profligate users even, but westerners had become the biggest by far. In 1900, the total amount of water used across the country for all purposes was 40 billion gallons a day; by 1975, the amount was 393 billion gallons, ten times more, though the population had only tripled in size. By that later date Americans were indisputably the thirstiest people on earth, withdrawing three times as much as the world average, a considerably higher rate than in other industrial societies and enough to make an African villager, carrying a water pot home on her head, stagger in unbelief. Beyond the hundredth meridian, per capita rates of withdrawal and consumption much exceeded even those extravagant American levels. The national average withdrawal from all sources was 1,600 gallons per person per day. In Idaho it was, thanks to irrigation, 21,000 gallons. It was equally striking that not only farmers but urban westerners too, in their direct use about the house and yard, drank great draughts of water. The national average for direct personal use was 90 gallons a day, but in Tucson, it was 140 gallons, in Denver, 230, and in Sacramento, 280.[5] This was letting water slop from the cup, run freely down the chin, thoughtlessly spill on the ground, making the world stare in amazement. By 1980, resource experts were predicting a planetwide water crisis that could be a greater threat to human life than the energy shortages of the seventies. If that was to be the future, Americans would be much troubled to adjust and struggle through—and Americans in the West, drinking, bathing, guzzling, swimming, mining, watering with a loose freedom in the face of strict limits, would be the most troubled of all.

Survival, to be sure, is an elastic idea, and a crisis of survival means different things to different people. For a Punjabi farmer the lack of water might mean a nightmare of crop failure and famine, but in the modern West the immediate, foreseeable threat was not so dire. It was a threat to an established standard of living, to a margin of wastefulness, and to a future of unrestrained economic growth. That last may have been the most culturally serious. As Theodore Schad, director of the National Commission on Natural Resources, saw the problem, "Some method must be found to meet the demands in order to prevent stagnation of the economy of the West due to lack of water in the twenty-first century."[6] But even though they were less desperate than some in the world, the prospects for the West could be fearful all the same. Where would the future supplies come from to satisfy those expanding demands? Therein lay the region's challenge, a more

compelling one in the late postwar period than ever before, and the acceptable, practical answers were getting harder and harder to come by.

The ground itself had always held the largest promise of water. Subsurface deposits often require little social organization to exploit, though it was a long while before people realized that and even longer before they could begin to tap them. Even the starkest desert could offer, down in its depths, a reservoir for the thirsty. Through the permeable aquifers, the water crept seaward, sometimes moving no faster than a mile per century, rising to the surface now and then in artesian wells, springs, and oases. Hydrologists calculated that there was thirty-seven times more water underground than there was on the surface, some of it billions of years old, some of it last winter's snow. A serious difficulty was that the larger portion of the underground supply lay more than a half-mile down, too deep to retrieve. Most of the rest became available only with the invention of powerful centrifugal pumps using electricity or fossil fuels. A second difficulty was that underground water was replenished at a far slower rate than the pumps could take it out. Hence, falling water tables, "cones of depression" around active wells, land subsidence; and increasingly intrusive government regulation were everywhere the outcome.[7] That pattern of expansion and overpumping, as discussed earlier, was what led farmers and urbanites alike in central Arizona and California to demand that distant rivers be brought to their doorsteps.

A similar plight came to the Great Plains in the postwar period, stirring up a similar demand. Underlying what had once been unbroken grasslands, so sparsely watered on the surface, was the paradox of the largest freshwater aquifer in the world, the Ogallala, containing 2 to 3 billion acre-feet, more water than the Mississippi had carried to the Gulf in two hundred years. The Ogallala extended from the southernmost parts of Texas northward into Nebraska. In the aftermath of the dust-bowl years, farmers around Lubbock and Plainview discovered it and with its aid raised a series of phenomenal harvests of cotton and corn. A boost to the plains farmers' efforts came in 1949 when Frank Zybach of Strasbourg, Colorado, invented the ingenious center-pivot irrigation system: a row of sprinklers mounted on a wheeled frame that rotated in a great circle around a well. The system could ride over sandy hillocks, requiring no land leveling or ditchdigging, throwing water over a field like light rain falling from the sky. By 1979, there were more than 15,000 of these units in use in Nebraska alone, and they had transformed the plains landscape from a giant checkerboard to rows and rows of bright green checkers. They had also opened up fragile lands to cropping, encouraged farmers to cut down their shelterbelts (rows of trees planted along the edges of fields to diminish the wind), and in-

creased the incidence of wind erosion. And they were rapidly depleting the Ogallala. By the late seventies, farmers were mining the aquifer at ten times its recharge rate, taking out an amount over the rate of replenishment equivalent to the entire Colorado River flow. Consequently, the underground water table quickly began to recede, six inches a year in some places, six feet in others. At those rates of fall, the Ogallala would be altogether depleted within thirty to forty years, by the first or second decade of the next century—and then there would have to be a devastating retrenchment in plains agriculture and the society it supported.[8]

Clearly, the cheapest way to bring supply and demand into balance was by reducing demand. That meant a program of conservation, and in every part of the West much could be done. There were thousands of miles of ditches that could be lined with concrete to prevent seepage, and there were hundreds of thousands of farmers who might be persuaded (and quickly would have been if their water were not so cheap) to pour less on their crops. However, the region was good at going after every possible molecule but exceedingly careless about putting what was captured to use. Conservation had always had about it an air of restraint, self or other, and the expansionary, accumulative culture was in its marrow opposed to restraint. Far more acceptable were the technological panaceas that had substituted for conservation—and there were still a few of them to grow ecstatic about. One group of wizards proposed towing Arctic icebergs or collapsible bladders filled with Columbia water down to the California coast. The Bureau of Reclamation undertook, in its ballyhooed Project Skywater, to make more snow fall on the Rockies by cloud seeding, thereby augmenting the spring runoff. Several other experts suggested that atomic bombs could be set off underground, fracturing rocks and enlarging the carrying capacity of aquifers. Still others wanted nuclear power plants to take the salt out of the ocean and pipe the water inland. None of those panaceas ever quite materialized. All were too costly, it seemed, or presented complicated dangers that could not be escaped.[9]

That left, as always, the traditional remedy of interbasin transfers. Find a river so far left alone and push it out of its course, push it wherever there was thirst. But in the mature days of the empire that once-popular remedy was encountering resistance from the public will and pocketbook. For example, anticipating the depletion of the Ogallala, state and federal water planners looked hopefully toward the Missouri and Mississippi, even the Great Lakes, as replacement sources, but the residents along those waters eastward were not eager to let them go. Even if they could be persuaded, the cost would be sizable: many billions of dollars, money that the western farmers could not scratch together on their own, money that other taxpayers

were not eager to provide. In 1969, the voters of Texas vetoed a state water plan to pump the Mississippi River across the state to the High Plains. That left them, like their northern neighbors, with no foreseeable options but to wait for the decline. Farther west, the Columbia was still the established favorite to be everybody's savior, but here too there was a sudden resistance against any interbasin transfers. Senator Henry Jackson of Washington, working to protect his constituents from their fellow westerners, got included in the Colorado Basin Project Act of 1968, as the price of his consent to it, a moratorium on studies to bring any outside water (the Columbia was what he particularly had in mind) into the Southwest. Whether his death in 1983 would make possible the resumption of such studies and the eventual diversion of Northwest waters to the southern latitudes remained to be seen.[10] Meanwhile, as the Columbia became more closely guarded, an even more spectacular transfer, the North American Water and Power Alliance, was being debated.

NAWAPA: the water scheme to beat all schemes, or end them. If empires are at bottom feats of imagination as much as of strength or greed; then this was the western water empire's finest hour, for never had imagination conceived anything like it in the way of river manipulation. Its audacity was breathtaking. The plan came to the public in 1964 from the Ralph Parsons engineering firm in Pasadena, California, an outfit where several former Bureau of Reclamation engineers had assembled to make money consulting and designing resource projects for countries around the world. These Parsons people thought in terms of entire continents. Far to the north in Alaska, they realized, could be found almost half of the United States' fresh-water supply, stored in lakes and glaciers, flowing down the Tanana, the Susitna, and the Yukon to the Bering Sea. There also were the Canadian rivers—the Churchill, the Blackstone, the Slave, the Coppermine, the Peace, the Mackenzie—spending themselves uselessly in the Arctic Ocean or Hudson Bay. Could they made to serve the new race of pharaohs raising their pyramids in the south? Assuredly yes, if the nerve was there, along with something like $100–200 billion (the estimates varied) to pay for the apparatus. According to the plan, an array of reservoirs, tunnels, and pumping stations would divert the northern surplus into the nine-hundred-mile depression known as the Rocky Mountain Trench that runs the length of British Columbia. From the upper end of this deep trough a canal would angle southeastward across the Prairie Provinces to Lake Superior and the Mississippi, making inland barge navigation possible from the Alaska wilderness to Montreal and New Orleans. At the southern end of the Trench, electricity generated by the project would send water off into the Columbia basin, relaxing jealousies there, and into the high border country of Idaho

and Montana. From that latter point, the plumbing would branch in two directions, toward the east slope of the Rockies, the depleting plains lands, and toward the southwestern deserts, crossing the Snake valley, the Bonneville Flats, on and on to golden prosperity. Even Mexico, at the very end of the system, would get enough water to irrigate eight times more land than the Egyptians were reclaiming from their new Aswan High Dam. Surely men who could dream such dreams and carry them out need never fear privation, stagnation, or the closing in of restraint. They could engorge the very oceans, they could cut up the polar ice pack into cubes for their drinks, could, if they desired, master anything in their view. NAWAPA was, simply put, "feasible," and it had about it the irresistible logic of an imperial history.[11]

In the awed hush that followed the unveiling of the Parsons scheme, western leaders lined up to embrace it, though with dignified caution, as though they feared giving way too easily to their own enthusiasm. Senator Frank Moss, for instance, who had served as chairman of the Subcommittee on Irrigation and Reclamation and on the Senate Select Committee on National Water Resources, gave it his careful endorsement. It was, he wrote with an air of studied understatement, an "encouraging" proposal because it suggested that "if we are wise, and if we apply the technical knowledge we have to the problem, the whole of the North American continent can be assured of an adequate supply of good water for as long as we want to live here."[12] But alas for those seeking encouragement, the scheme proved to be at once too premature—for there were still other, more accessible streams to be mastered—and too late, for gathering across the country was the beginnings of a mood of rejection. Wallace Stegner was a prophet of that mood when he wrote in 1965 that the plan would be "a boondoggle visible from Mars."[13] What would be the ecological consequences of so grandiose a transfer, a new generation began to ask? Would the diversion cause the polar cap to melt, elevating the level of the seas around the planet, submerging coastal cities? Would the gargantuan reservoirs to be constructed trigger a series of devastating earthquakes, releasing massive floods? Could the nation afford so huge an expense? And then there was the matter of agency: who was available to carry out the project, and who could be entrusted with the power it entailed? It would take the combined managerial authority of three sovereign nations, or of some centralized, supernational force, and the American-based Bureau of Reclamation was not likely to be handed that role. Who then? Unresolved, those imponderables generated doubt, then opposition, then apathy. Thus, though the NAWAPA project had started off brightly toward realization, as so many others before it had done, in the twenty years following its publication it

slipped slowly from public consciousness, fading away as dreams do when they have gone too far to be credible.

By the early 1980s, the empire had reached a plateau of water development and did not know how to climb on up from there. Its existing supplies, its prospects for growth, were running out, yet no new possibilities offered themselves convincingly to a scrutinizing, distrusting people. Once before when the water developers had reached a plateau and were milling about in frustration, the federal government had thrown them down a rope. Now there was no superior agency standing ready to pull the West another notch upward, no one in a position to furnish the necessary capital and expertise, no one powerful enough to overcome all the regional and international political differences, no one able to command a continent.

The second set of environmental vulnerabilities had to do with deteriorating water quality. Reclamation, it began to be clear, was capable of taking good water and making it bad. Indeed, at some advanced point in its intensification, it could hardly do otherwise. Water quality, of course, was a problem that concerned more than the West. In fact, for a long time it seemed to be more of an eastern malady, the result of too many people flushing their body wastes and toxic chemicals into waterways and, more seriously yet, into aquifers, polluting them for the indeterminate future. Eventually, as its population and industry swelled, those problems became the West's too. In addition, the region had a few water-spoilers that were all its own: the corruption draining from densely packed, dreary cattle feedlots and their mountains of manure, as well as that from a hundred million tons of radioactive uranium tailings left lying about on the banks of the Colorado River. Then there were those threats to water quality from irrigated agriculture, perhaps the most discouraging of all because they were the bitter fruit of some very proud achievements.

The warm, moist environments created by reclamation, as noted elsewhere, have in land after land offered ideal breeding grounds for a host of pests, some of them pathogens preying on humans, others of them insects, fungi, and nematodes that damage crops. This predicament appeared in the West early on, and farmers there quickly became avid technicians of pest control. In 1872, California citrus groves were besieged by an imported scale insect that fed on the trees' sap. That threat was defeated by biological control methods—the clever introduction of an Australian lady beetle that attacked the scale insects. Later, however, irrigation farmers turned almost exclusively to a series of deadly chemicals. They were among the first and most heavy users of DDT in the post–World War Two years. From 1962 to 1974, pesticide use nationally doubled, then doubled again in the next

eight years. In that escalation, the West set the pace. California was consistently the leading user among the states, spending in 1978 the sum of $1 billion a year on chemical pesticides (insecticides, rodenticides, herbicides, fungicides) and their application, about one-fifth the American total. Some of those poisons were the chlorinated hydrocarbons, such as DDT—until it was banned for use in the United States in 1972—heptachlor, aldrin, dieldrin, chlordane, and endrin. Others were the organic phosphates, including parathion, malathion, DBCP, EDB, benzine, hexachloride, and toxaphene. They were sprayed on codling moths in the apple orchards of the Yakima valley, on pink bollworms infesting cotton in Arizona and Imperial, on aphids crawling on cantaloupes near Rocky Ford, Colorado, on spider mites raging through San Joaquin alfalfa fields. Each application, it soon was apparent, made necessary another and stronger dose, as the pests quickly developed genetic resistance or as the poisons killed off useful, nontarget species that had kept the pests in some kind of check. Western farmers, with sizable and profitable investments in their system of irrigated agriculture to protect, found they could not live without the expensive pesticides. But neither could they live with them.[14]

Rachel Carson, in her book *Silent Spring,* told the story of the Tule and Upper Klamath Lake area of Oregon, where DDT from surrounding reclamation lands drained into wildlife refuges, killing herons, pelicans, grebes, and gulls.[15] That was in 1960. Subsequently, water contamination by pesticides and its lethal effects on the food chains in nature became a familiar tale. Consumers began to worry about dangerous residues on the fruits and vegetables they ate, with good reason, for virtually all Americans were carrying detectable amounts of the poisons in their fatty tissues, and those residues were linked to ailments ranging from liver and blood disease to, possibly, cancer. Western farm workers had to live with some of the most serious consequences: it was they who were hired to do the actual spraying and dusting of cauliflower, peaches, lettuce, strawberries, and other crops. Reentering the sprayed field even as late as a month afterward, they would suffer from blisters, inflamed skin, and reddened eyes. Nor was that the worst of it. Between 1950 and 1961, more than 3,000 farm workers were poisoned in California by pesticides and other farm chemicals, and of that number 22 adults and 63 children died. A biophysicist at the University of California reported that "the severity of pesticide-related illnesses to farmworkers is probably greater than that attributed to all occupational causes in any other type of work in California."[16] This was a consequence of the water empire that no one in earlier stages had had any premonition of, that no one more recently involved in it had intended, yet one that nobody knew quite how to shake off. The unintended costs in lives and

money were high and tragic, but without those pesticides, even when used in a more restrained and integrated program of pest management, the irrigation economy might very well collapse.

The degradation of the precious water on which the West depended had further ominous aspects. A regimen of intensive cropping must soon deplete the soil, necessitating the application of chemical fertilizer. The fertilizer in turn, under continual artificial watering, must leach into the groundwater or streams, contaminating drinking sources. Nitrates in the fertilizer, where sufficiently concentrated in an aquifer, could produce methemoglobinemia, or "blue-baby syndrome," a condition of inadequate oxygenation of the blood, and such concentrations were indeed found and found frequently in places like the irrigated Platte River valley.[17] And then there was the oldest and most endemic form of water decline associated with all hydraulic societies: salinization, the poisoning of water and soil alike by salt buildup.

Salt is a generic term covering not only the familiar sodium chloride in the kitchen shaker but also a range of chemical compounds that are reactions between bases and acids. These include calcium carbonate (chalk), zinc sulfate, barium chloride, sodium bicarbonate, various phosphates, nitrates, and hydrates. Typically they have a whitish or grayish color, and their structures are crystalline. They readily dissolve in water, making it "hard," or alkaline, leaving in teakettles and pipes a scaly deposit. Clustered heavily around the roots of plants, salts interfere with moisture take-up, causing stress, diminished productivity, and even death.[18] Fortunately for living things, the salts, though originally scattered through the earth, have been diminished in the upper soil layers by the steady rainfall of billions of years and have washed into the sea, allowing vegetation to flourish. Everywhere, that is, except in the arid lands. There the salts remain abundant and omnipresent. A desert torrent, violent but soon over, may bring them to the surface, leaving them behind as a glittering crust, or they may collect in stagnant pools. Whichever, the climate there is too dry to greatly diminish them. Desert plants therefore must be highly salt-tolerant to thrive.

What nature has taken geological eons to achieve, the leaching of salts from the root zone of plants, the irrigator undertakes to do in a matter of decades. Covering the arid soil with artificial rain, two or three feet deep over each acre in a year's time, has several effects on the salts. First, the water table may rise, bringing with it dissolved salts, until it intrudes into the root zone, saturating the ground with dangerously saline water just where the farmer's crops are trying to grow. The only remedy then, other than decreasing the irrigation, is to lay down an expensive network of drains, which will remove the salt, but only by pouring it in concentrated

form into streams and rivers. Another effect, and a more obvious one to the casual passer-by, is for the salt to come to the surface and, as the water evaporates in the dry air, to be left behind there—an acceleration of a natural process. Then the irrigator must use more, not less, water to flush away the white crusting, washing it off downstream for someone else to deal with. The use and reuse of that water makes it more and more saline, until the last man on the last ditch might as well be dipping from the ocean. This is a discouraging predicament coming from the attempt to transform, overnight as it were, a desert environment into a humid one. What seems at first to be an easy, and miraculous, achievement turns out to be a Sisyphean labor.

Salinization, the process of concentrating what had been diffused, became in the postwar years a worldwide environmental disaster. Agricultural expansion into dry, marginal lands led to salt buildup, led to man-made wastelands, led to impoverishment and hunger in country after country. Pakistan at one point was losing 60,000 acres of fertile cropland a year to salinization, and Peru had 10 percent of its agricultural area similarly degraded. In the Helmud Valley of Afghanistan, in the Punjab and Indus valleys of the Indian subcontinent, in northern Mexico, in the Euphrates and Tigris basin of Syria and Iraq, salinity was a severe problem dogging the developers' plans.[19] Gradually it became clear that the same problem had damaged early irrigation civilizations, perhaps had even destroyed them. An American traveler to Iraq in the late 1940s, Frank Eaton, saw from his train window miles and miles of salt lying white on the surface, shining in the night like snow. It was the insidious force, he argued, that had brought ancient desert societies to their destruction. "Compared to the magnitude of this slow-moving event," he added, "our dust bowl was but a passing incident." Some years later, two archaeologists, Thorkild Jacobsen and Robert Adams, supported that historical hypothesis, arguing as they did that "growing soil salinity played an important part in the breakup of Sumerian civilization." So long as there had been "a powerful and highly centralized state," they went on, a state that could keep strong vigilance over the side-effects of irrigation, Sumer thrived; but the eventual weakening of that state, its distraction and failure to command obedience, allowed the problems of salt and silt to pile up to the point of hopelessness.[20] The lesson drawn by these observers for modern irrigators was that salinization was a trouble that might be managed, but only by furthering the concentrating, power-accreting tendencies of the hydraulic society.

In the American West, too, salinization became a more and more serious ailment, producing loud cries that the federal government step in and save the irrigators. Especially in the most intensively developed parts of the

water empire, the Colorado basin and the southern half of the Great Central Valley, conditions reminiscent of Pakistan or Sumer could be found. It took, nonetheless, an international confrontation to make the situation there dramatic and compelling. Late in 1961, the government of Mexico made a formal protest to Washington that its agreement with this country over the Colorado River was being violated. In the treaty of 1944 Mexico had been guaranteed, so it claimed, not only 1.5 million acre-feet of water a year, but water of good quality, suitable for irrigation. Instead, it was receiving highly saline water. The protest riveted attention on the mounting environmental crisis along the Colorado, one never mentioned in all the authorizations for more dams and aqueducts. In 1962, the State Department established an advisory Committee of Fourteen (made up of two representatives from each of the seven basin states) to prepare recommendations on how to respond to Mexico. Mainly, they proposed to let Washington handle it, and while it was doing that, to give the western Americans some aid too. Ten years later, President Richard Nixon agreed with President Echeverria of Mexico to work toward a permanent solution, and Herbert Brownell was named to head a task force on the matter. Minute 242, which fixed a limit on the salt content of the water delivered across the border, was signed in 1973.[21]

The cause of Mexico's ire lay, of course, in heavy river use north of the border, but nothing in the Minute directly addressed that. The river itself, as noted earlier, was drying up. During the fifties, the flow at the international boundary averaged 4.24 million acre-feet a year; in the sixties, it fell to 1.52. This drop meant that there was less fresh current to dilute the polluted water seeping back from agricultural users. The Bureau of Reclamation made the situation worse in 1952 when it completed a new irrigation project, Wellton-Mohawk, using Colorado water on some 60,000 acres east of Yuma, Arizona. Soon the project was producing cotton and citrus crops valued at over $1,000 an acre. It was also soaking a great deal of water into those crops—more than five times as much, one report claimed, as the Israelis, employing an advanced, economizing system of drip irrigation, were using on similar crops in Israel. An impermeable substratum under the project lands kept the irrigation water from draining downward, so farmers had to find other methods to get rid of it. Their solution was to drain the used water, and now it was very salty water, back into the Colorado—and out of their concern. Immediately thereafter Mexico found its supplies jumping to a salinity level of 1,500 parts per million (ppm), double the norm. Did the Bureau then (or the State Department or basin users) propose to shut down this project and clean up the Colorado? They did not. Instead, the federal government built, at public expense, a bypass channel that

would void the saline excretions farther south, where they would not pollute Mexico's fields. And it undertook to construct, again with public monies, a desalting plant, costing $178 million, to reduce the salt level in the Wellton-Mohawk backflow. That plant was authorized in the Colorado River Basin Salinity Control Act of 1974.[22]

In the case of Wellton-Mohawk, the salinity threat had an easily defined local source, but that was not usually so. The degradation of water and land had in most instances no clear single perpetrator. Scientists speak of "salt loading," the dissolving of salts into the drainage, and "salt concentrating," the loss of diluting water from a solution through evaporation. Both these phenomena are spread widely around, and controlling them is as hard as keeping dust out of the air. American irrigators in the Colorado basin came to that frustrating realization as, in the wake of the Mexican wrangle, they themselves had to contend with the problem. With the onward march of their empire, the river became a bit saltier each year. Before any diverters had appeared, the Colorado at Lees Ferry, its halfway point, was carrying a salt load of 5.1 million tons a year, or about 250 ppm. That was nature's own leachings from shale formations, mineral springs, and salt domes upcountry. By 1972 that natural level had been raised by human activities to 606 ppm. One study showed that Grand Valley farmers in western Colorado were alone adding 8 tons of salt to the river from each acre they farmed, while in Uncompaghre Valley the pickup was 6.7 tons. Those were areas that had been continuously irrigated since the latter decades of the nineteenth century—yet the salt was still there, still washing out, in quantity. Two engineers for the Colorado River Board of California estimated that by the year 2000, the current at Lees Ferry would be 800 ppm saline. Downstream the condition worsened. The water at Imperial Dam near the border read 785 ppm on average from 1941 to 1969, then 850 ppm from 1963 to 1967, and was predicted to reach 1,340 ppm by the end of the century.[23]

The economic implications for the growers of Imperial Valley were grim, for they, with the Mexicans, were the last to drink. Lying low as they did —below sea level, in fact—growers there had been forced from the time of first settlement to spend hugely on a system of drainage. By the early seventies, they had put out more than $66 million on tile drains and canal linings, discharging the runoff into the sump of the Salton Sea. But once the water coming through the headgates began to deteriorate, the growers were in a new and more serious sort of trouble. They must then shift to salt-tolerant crops, and with them they would earn less cash, be able to hire fewer workers, be strapped to maintain their hydraulic apparatus. Or they must consume more water—if they could get it—to rinse away the poison-

ous deposits, and that would mean needing more fertilizers, pesticides, and pump energy too. A single point increase in ppm, said the Bureau of Reclamation, cost those irrigators $108,400, directly and indirectly, and that amount would leap, by the year 2000, to $240,000.[24]

Anticipating these calamities, the Colorado River Board of California, with support from Governor Reagan, called in 1970 for federal assistance to the agribusiness valley. They wanted fresh water brought in from their state's northern coastal rivers. They wanted someone to find a cheap way to take the salt out of the Pacific Ocean, with the resulting brine to be injected safely out of the way in deep geological formations. They wanted weather modification to get more snowfall and runoff. They demanded control of salinization at its sources in the upper Colorado basin. Some of those demands were delivered by the Colorado River Basin Salinity Control Act of 1974. It instructed the Bureau, in addition to building the desalting plant, to spend $125 million on containing the salt dribbling out of the Crystal Geyser in Utah, the Las Vegas Wash, and other natural sources up north. Here once again were structural or engineering solutions, aimed at controlling nature, not man. What was needed, in the opinion of critics, was a forthright facing of the main issue, an overextended reclamation program that was neither economically rational nor ecologically sustainable. Until that was done, salinization would continue to be a stalking danger.[25]

In the San Joaquin Valley, grappling with the salt threat was quite as ineffectual. By 1981, there were 400,000 acres affected there by high (or "perched") brackish water tables, located mainly in Kern, Kings, and Fresno counties. To salvage those farms and their owners, as they had been salvaged so many times before, the government set about to dig a master drain, the cost to be partly repaid by the irrigators. The drain was to draw off the saline water and dump it three hundred miles away near San Francisco. Without the drain, one reporter wrote, "more than 1 million acres in the San Joaquin could undergo desertification during the next 100 years."[26] Saving those lands was not, however, to be the end of the problem. There was also the question who or what would be sacrificed in that salvation. One hint of an answer came late in 1983. Scientists at the Kesterson National Wildlife Refuge, lying below the Westlands, discovered a pathetic cohort of fledglings in their nests: coots, stilts, grebes, and ducks born with stumps for feet, missing eyes and beaks, dying soon after birth, reminiscent of the human thalidomide deformities of a previous decade. The birds were the victims of selenium compounds and other salts leaching from nearby irrigated fields. The drain, when completed, might save the refuge and its waterfowl, along with the growers, but only to pour the same poison into the environment elsewhere. Congressman George Miller, repre-

senting Californians living where the drain would vent, vowed to stop it, calling it "nothing short of a dagger pointed at the heart of San Francisco Bay and the delta."[27]

Could the lowering specter of salinization ever really be exorcised from the western water empire? Some of its engineers and agriculturists had no doubt that it could be, that it was a temporary nuisance which a little time and expense could banish. Others were much less confident. Throughout history, wherever irrigation has been carried on intensively, they pointed out, salinization has come in its wake, like dust following the wind. It is the way of empires to believe they will be forever impregnable, that they will give the law to nature, not vice versa, that their power and expertise will conquer all. But from the vantage of 1983, that confidence was falling apart.

Salinity, sedimentation, pesticide contamination, diminishing hopes of replenishment, the dangers of aging, collapsing dams: all these were the hydraulic society's worsening headaches. But there was another peril, altogether different in kind from these and even less manageable because it had to do with faith, not technique. A sense of irreparable loss began to settle about the water empire by the late twentieth century, a remembrance of things past. Once, men and women recollected, the West had been a land of canyons leading on to canyons where tamarisk and cottonwoods rustled in a slight breeze blowing up at twilight, a region of broad flatlands where sandhill cranes alighted during their migrations to spear at frogs and crayfish. Deer came out in that lost time to browse in the bottomlands, finding shelter there in winter, encountering, it might be, a mountain lion lying hungrily in wait. Then was a time too of wrens singing a bright, bubbling melody that echoed from the canyon walls, of swallows wheeling and dipping over a stream for mayflies. In the spring run, salmon came fighting their way upstream from the ocean, seeking their birthing place. Beaver chewed down aspen logs, dragging them into midstream for a dam, a lodge, a home for their kits. And everywhere the water purled on, free and uninhibited, racing and slackening, curling back on itself, rippling over hidden rocks, meandering under empty skies, a thing always alive, voracious, unpredictable and full of mystery. Not all of that older time had been lost, but most of it had, and there were many who were not pleased to see it go. Good riddance, had always been the response of the water manipulators; let nature give way to a greater, man-made West. Only the sentimental, the misguided, would mourn that loss or criticize the gain. Leave the elegies to poets, therefore, and get on with constructing the future. What the proponents of empire did not anticipate was that there would come a day

when such advice would be rejected. Nor did they appreciate that the nostalgia they scorned might turn out to be more than a silliness. It might transform itself into a profoundly subversive force, one that could bring an empire low. Nostalgia for what has been lost might lead people to the discovery of new, radically disturbing moral principles, in this case the idea that pristine nature in the West has its own intrinsic value, one that humans ought to understand and learn to respect. In that event, to save what remained of that lost natural world from the imperialists, the instrumentalists, the accumulators, could appear to be a struggle worth making. Conceivably, too, nostalgia might serve as a basis for imagining an alternative future society quite different from the reigning imperial order.

By the 1970s, impassioned friends of the western river past could be found, to the consternation of the empire, in all parts of the region and across the country, sorting out their loyalties, moving from private elegies to the politics of preservation. In one dramatic instance, a young man named Mark Dubois chained himself to a rock in the middle of California's Stanislaus River, protesting the flooding of its wildness behind New Melones Dam.[28] Others challenged the reclamation men armed with chainsaws who were cutting out along thousands of streamside acres the so-called phreatophytes—the trees and other plants that grew along the waterways, pumping moisture through transpiration into the air, wasting what should have gone to a farmer.[29] Other nay-sayers canvassed to save estuaries like San Francisco Bay from poisoning and from eutrophication through diminished inflow.[30] Or to rescue Mono Lake and its rookeries, even its brine shrimp, from Los Angeles's increasing megalopolitan thirst.[31] Still others, in the tradition of Mary Austin and John Van Dyke, went out to fight for a remnant of desert, a place that might have been unredeemed and gaunt but was made more precious than ever by its rarity. The instances of such conflict multiplied in the newspapers, engendering after a while a kind of glazed boredom in readers. So many court appeals, so much repetitious testimony, so familiar the main story, so unending the details. But it would be a mistake to let that feeling of familiarity obscure the historical novelty of what was happening. Never before had a great water-dominating civilization encountered so informed, relentless, determined, and successful an internal opposition. Not Egypt, not the China of the Han dynasty, not the Aztecs or the Sumerians. It was as though the American water empire had created, against its will, a dissidence precisely commensurate with its unparalleled technological success. And now it found itself embattled, losing, unable to hold on to its credibility. It was caught in a dialectic that Karl Marx had never predicted, one pitting not merely rival classes pursuing their competing self-interest but rival ways of valuing nature.[32]

The most sensational success of the emergent party of protest came in 1977 when they managed to persuade a new President, Jimmy Carter of Georgia, to veto a slew of environmentally damaging and economically questionable water projects, nine of them in the West, up for reauthorization. Those projects included Fruitland Mesa in Colorado, which would spend $70 million to benefit fifty-six farmers; the Garrison Diversion in North and South Dakota, which would destroy prairie wetlands wholesale and send salty irrigation return flows into Canada; and the Central Arizona and Central Utah projects. Nothing like that presidential veto had ever happened before to the region, not in seventy-five years of extracting money from the public treasury, and its leaders and elite reacted with shocked, spluttering wrath. Shortly, they succeeded in getting the veto overridden. But in their triumph over a clumsy, uncertain President Carter, the empire leaders might have seen that their success was written on the water, dissolving before their eyes. Those would be the last projects authorized by Congress—for how long no one could yet say, perhaps a short while, perhaps forever. As Senator Moynihan pointed out, not one new project had made it through Congress after 1972. Even when westerner Ronald Reagan, a darling of the empire, defeated Carter in 1980 and moved into the White House, that situation would not change. Much would be proposed in the way of new schemes—$10 billion worth, in fact—but as late as 1985 none of them had managed to run the gauntlet.[33]

The party of preservation and protest, however, had more success in stopping the expansion of the hydraulic society than it had in dismantling it. In 1983 the apparatus was still in place, still pumping the rivers dry, as was the capitalist state that oversaw its operation. Millions of acres of farmland remained in subsidized, profitable production, though besieged by difficulties, and millions of city dwellers had moved into the region to keep the empire busy and in control. Nonetheless, something important had changed, to what effect it remained to be seen. Now, as at no other point in its history, the water-control apparatus (including its managers and its chief profiteers) was coming to be seen, not as a crowning, self-justifying achievement of a world-beating people, but as a necessary evil. The domination of nature had been achieved, and it would not be easy to undo, perhaps could not be. But at the same time domination was no longer a language that westerners or other Americans spoke with much enthusiasm. Somewhere an old river god might be listening to such talk and might exact a retribution.

Fracking, Oil, and the Environment

THE BAKKEN GOES BOOM

OIL AND THE CHANGING GEOGRAPHIES OF WESTERN NORTH DAKOTA

Introduction

The Changing Geographies of Western North Dakota

Kyle Conway and William Caraher

This book is about the human side of the oil boom in the Bakken formation in western North Dakota. We began work on it in 2013, when a barrel of crude oil sold for a little more than $90. At that time, economic optimism was the order of the day. People were asking, would the boom last twenty, forty, or sixty years? Harold Hamm, the billionaire CEO of Continental Resources, went so far as to tell the Williston Basin Petroleum Conference, "I still think we will reach 2 million barrels a day [by 2020]. I don't think that's over the top, folks" (quoted in Burnes 2014).

Now, as we write this introduction at the end of 2015, that same barrel sells for less than $40. What we did not know—what we could not know—when we began was that the Organization of the Petroleum Exporting Countries (OPEC) would refuse to cut production in the face of dropping oil prices, in an apparent attempt to make oil production from shale, such as in the Bakken, too expensive to continue (Murtagh 2015; Olson and Ailworth 2015). In retrospect, the estimates of a forty- or sixty-year boom seem naive: by all appearances, we were at the boom's peak. In December 2014, there were 174 rigs drilling in the oil patch; a year later, there are 65. There are also five thousand fewer jobs, and monthly in-state income on oil royalties has dropped from $128 million to $69 million (Donovan 2015). Inadvertently, it seems, we captured an important moment, when the bust people dreaded (but thought would never happen) was just on the horizon.

Our purpose in putting this book together was to give voice to as wide a range of people as we could. We were both professors at the University of North Dakota, so we sought out other scholars. We researched the boom, so we sought out our collaborators. We taught about the Bakken, so we sought out students. But we also read the news, went to art galleries, and read poetry, so we also sought out journalists, artists and museum

curators, and poets. The boom was one of the most interesting things we had ever seen, and there were more ways to know it than through the cold rationality we privileged in our scholarship. Journalists, artists, and poets could reveal things we would not otherwise see, experiences or emotions that academic prose could not capture, but art or poetry could. As much as drilling for oil in the Bakken produced an economic and demographic boom, it also was an intellectual and cultural moment for North Dakota, and our book tries to capture that.

Our approach was propitious, if the controversies around hydraulic fracturing (or simply "fracking") are any indication. In the time since we began soliciting submissions, a wide range of books have been published, each more polemical than the last. In one, an environmentalist asks what happens when she inherits mineral rights in North Dakota and has to choose between her ideals and financial security (Peters 2014). In another, a conservative media darling calls out environmentalists for what he sees as their duplicity and willful ignorance of the human rights abuses inflicted by governments of oil-rich countries on their own citizens (Levant 2014). In yet another, an investigative reporter tells the story of an Alberta woman's fight for justice from the oil industry (and her own government) after fracking poisons her water supply (Nikiforuk 2015).

In this back-and-forth, it is clear that the pro- and anti-fracking groups are talking past each other. This is where our book does something different. By and large, contributors sidestep the controversies about fracking and focus instead on the social impact of the boom. There is much to learn here: whether we support or oppose fracking, it has had a significant impact on people's lives. For people living in the Bakken region, life has changed, and we want to understand how. What impact did the boom have on longtime residents? On newcomers? On women? On Native Americans? How did it reshape the healthcare infrastructure? Housing? The media? These are the questions we asked our contributors to answer.

Scholars and journalists shared insight that they gained from their particular perch. But artists and poets did something more: as they talked about how the boom has reshaped North Dakotans' sense of self—how North Dakotans see themselves and imagine their future—they evoked something akin to emotional truth. For that reason, we have devoted considerable space in this book to their work. Because art has the potential to affect viewers at a gut level, we included, among other things, a catalogue from an exhibit about the Bakken at the Plains Art Museum in Fargo. We also included comments left by members of the public.

We also decided to open this book with a prologue in the form of a prose poem. Language is an imperfect tool. It serves us relatively well

when we describe technical aspects of a situation, but in other cases it falls short. We know this most acutely when we experience powerful emotions such as joy or grief and words fail us. In the Bakken, for instance, it is relatively easy to describe the monetary or environmental costs of an oil boom, but it is much harder to find words for the ache we feel when our home no longer looks the same. But in poetry, language comes closest to breaking free of its bounds. When poet Heidi Czerwiec writes, "Given enough time, a sea can become a desert; given enough time, even a desert has value," she presents us with an image not unlike the art in the catalogue. In the dried up sea, we see our own fall from plenitude to emptiness. But the loss is paradoxical, in that it brings a new type of value. Her image brings the contradictions that undergird our experience into view. Even if we cannot put them into words, we can see them and feel them.

So what do we learn from all of this? What do scholars, journalists, artists, and poets reveal about the human side of North Dakota's oil boom? Resources are stretched thin, and to compensate, people have had to rethink the social and physical networks that link them to others. As a result, the geographies of western North Dakota—the ways people understand their relationship to space and place—have changed. Part of this change is material, such as the demographic shift from the eastern part of the state to the western part. A decade ago, nearly a third of the state's residents, those in Grand Forks and Fargo, lived in the narrow strip between Interstate 29 and the Red River. In other words, almost one out of three people lived within five miles of Minnesota. No longer is that the case, as towns such as Williston, Watford City, and Dickinson have doubled or tripled in size, creating unmet needs in social services, law enforcement, healthcare, housing, and other forms of infrastructure.

Part of this change is psychological, too. The stories people tell to make sense of their place in their community or the world have changed. They understand their relationships with their neighbors differently. Some longtime residents and newcomers view each other with a suspicion that grows out of a disparity in wealth and access to resources. Others look for what they share in common.

One result of these changing physical and mental geographies is that many people have had to make do with less, especially those who were already in vulnerable positions. Rents have gone up, but the stock of quality housing has gone down. Travel takes longer and is more dangerous, and unfamiliar people congregate in once familiar places. Even as the boom has subsided, social networks remain stretched for longtime residents, who face new disparities of wealth and ongoing political challenges, and for newcomers, who have left families in faraway homes in search of work. In short, there are more cracks to slip through.

But there is also resilience and creativity. Longtime residents have found ways to extend hospitality to newcomers. Artists have found ways to reimagine their place—which is to say, our place—in a landscape punctuated by oil rigs and tanker trucks. We cannot understand the challenges posed by the boom without considering the creativity it has brought about, nor the creativity without the challenges. One tugs constantly on the other.

To close, let us consider an interesting potential symmetry. In 2013, the bust was on the horizon, but we could not yet make it out. We must not forget that booms and busts are cyclical. Perhaps the next boom is on the horizon now, but as with the bust, we will see it most clearly in retrospect. As Karin Becker writes in her chapter, change has reached a plateau. North Dakota in 2015 is not the same as North Dakota in 2005. People talk of a "new normal." The state has reversed its longstanding trend of outmigration, and the population is up almost 20 percent compared to a decade ago. The median age is younger, and jobs pay better: even Wal-Mart has to pay $17 an hour to its employees in Williston, where the average annual salary is still more than $75,000 (Donovan 2015).

The changes North Dakota has undergone are real, and we owe it to ourselves to ask how they have shaped us. We would do well to listen to everyone—citizens, public figures, artists, poets, and even scholars. This book is not the final word on the Bakken oil boom, but we hope readers will find in it something useful, a starting point for understanding how the boom has affected us and who it is we have come to be.

Prologue

Excerpts from:
Sweet/Crude: A Bakken Boom Cycle*

Heidi Czerwiec

I.

From Teddy Roosevelt's cabin in western North Dakota, as far as the eye could see was sea: the Cannonball Sea, last of the North American interior, brimming with paleobiology, swimming with lithe dinosaurs. Later, Lake Agassiz (the *–siz* sounds like *sea*), named for the Swiss geologist who read books of stone in the old epic mode, who posited the immense glacial lake, greater than all Great Lakes collected, fed by the end of the last Ice Age. Later still, geologists tell us all that life went underground: carbon-rich shale trapped beneath aquifer-rich sandstone trapped beneath nutrient-rich soil. And buffalo grass: a species whose fine roots lace to dense sod seven feet deep.

What lies beneath you?

(This is all connected.)

Labeled the Great American Desert on old maps of hostile horizons, the Plains become a place that settlers bypass on their way out West seeking the auguries of timbers, pilgrims bristling with hoop-iron and axles. Until a blacksmith named John Deere invents steel plow blades that can break through sod to soil beneath. Until the Homestead Act claims "rain follows the plow." Until settlers staking their claims realize the previous claim is buffalo shit, but learn to tap the aquifers, to siphon off for farming. Until Henry Bakken, a farmer in western North Dakota, taps oil until no more seeps out. Until a U.S. Geological Survey estimates the shale holds 7.4 billion barrels. Until they learn to frack.

Given enough time, a sea can become a desert; given enough time, even a desert has value.

---

* Excerpted from Heidi Czerwiec, *Sweet/Crude: A Bakken Boom Cyle*. Farifax, VA: Gazing Grain Press. 2016.

II.

Given enough time, an inland sea can become a desert; given enough time, even a desert has value. The Fertile Crescent has been called the cradle of civilization, of incunabular vocabulary, inventing the alphabet so I can tell you these things. Inventing the wheel, literally. Inventing agriculture by irrigation, diverting two rivers to preserve a land alluvially lush. Lavish: a king deviates the Euphrates to water cascading terraces of fruited trees for the pleasure of a favored concubine longing for the meadows of her Persian mountains. Crescent, the sweet kisses she lavishes on his brow.

Today, the gardens are legendary. Today, less than a tenth of the crescent's fertility remains, almost completely dried up, scrub marking the ancient shore, its gardens gone underground, its only liquid sweet crude. Double-edged sword that continues to support and yet thwart civilization, its foreign hungers and wars. Its land increasing in demand, increasingly wasted, unstable – some in ways we've been implicated, participated. I fill my car even as I listen to NPR, my fool deity, my black idolatry. Men's covenants are brittle.

Don't blame us, the oil companies say. It's the Taliban's fault, they claim, as people in the streets raise signs that read *No Blood for Oil*.

III.

No blood for oil implies distance, implies foreign. But this is here, this is North Dakota (trademark: Legendary!), one of the worst states for workplace safety. Blame the Wild West culture of risk. Blame an influx of green employees with no industry experience, disordered recruits afoul outcountry. Blame fatigue from long shifts – 12-hour days for 2 weeks straight, mud effigies jagged with blood among the dull clank, the blackened pools of grease – work that goes on regardless of weather. (Don't blame us, the oil companies say, it's the contractors' fault. Don't mention drug use: word is, they skimp on testing to fill out their crews.) Nearly all state fatalities investigated by OSHA occur in the Bakken: two-thirds are pulled into pumpjacks or set afire. (An employee was changing valves when a tank ruptured, soaking the employee in oil; he burst into flame and died as a result of his injuries.) One-third killed in falls or "struck by" hazards. (An employee was hit by a set of power tongs on a rig and died as a result of his injuries.) The death rate in North Dakota is 18 times higher industry-wide. (Word is, it's bad luck to wear another man's hardhat; word is, you have better odds of winning the lottery than getting a visit from a regulatory industry; word is, the payoff is up to $300,000.) None of this includes the near-daily occurrence of truckers sliding off slick highways glassy and treacherous, the force of 40-ton tankers colliding with cars on the back roads of North Dakota: flyover, but not foreign.

IV.

North Dakota is a foreign country. Alien. A flyover state, even from space. When we show our foreign friend a photo of a satellite flyover, he's astonished. At nightfall, light clusters on the frozen prairie, phantom city emerged from among the ghost towns. A blooming midnight meridian. Stars in a lake of blackness, a constellation of ignited eyes. The natural gas that emerges alongside the oil costs more to capture than flare. The foreign companies that drill here burn money, a billion a year in flames and fines. A Little Kuwait on the Prairie whose dread watchfires smelter under the dark more brightly than Minneapolis. More broadly than Chicago. In winter, truckers cluster for warmth beneath the flares, which fling their flapping rags of fire six yards into space, toward the stars and satellites and passing planes.

Foreigner, flyover passenger, when you peer out your window, what do you see? What lies beneath you?

Chapter 1

The Paradox of Plenty: Blessings and Curses in the Oil Patch

Karin L. Becker

The press has descended on the oil patch, centering on Williston as the new ground zero for America's energy renaissance. Whether it be by sound, like NPR audio podcasts, by sight, like the countless documentaries circulating on Youtube, or by print, as national, regional, and local media outlets cover North Dakota's oil boom, the Bakken boom is receiving lavish attention. Just within the last year, writers from *Harper's*, *National Geographic*, *The Atlantic*, *New York Times*, *Washington Post*, and *Huffington Post* have devoted boots-on-the ground journalists and lengthy spreads to cover the oil boom. The oil boom has garnered national and international publicity and put North Dakota in the limelight. With the spotlight cast on the oil patch, the question that journalists are trying to answer is whether the oil boom is a blessing or a curse.

Much publicity has been given to the economic benefit of the oil boom. Equally, time, energy, and resources have been dedicated to documenting the social, health, and environmental impacts the oil boom has caused on this frontier region and the rural communities. While reporters and policy makers are busy making their T-bar lists and tallying the positive outcomes against the negative ones, what is missing from this conversation is the long-casting vision. While an oil boom is not unique to North Dakota, nor unprecedented (this is the third one to occur in six decades), media accounts neglect to talk about similar communities that have endured boom and bust cycles. Therefore, there is critical need to look at how boomtown communities are impacted both positively and negatively over time. Many current conversations attend to documenting the pressing problems stemming from the frantic race of oil companies to get there first and start drilling and are exacerbated by the needs caused by the influx of people. However, more efforts need to be made to better understand the phenomena of boom and bust communities.

To help explore the question of whether the oil boom is a blessing or a curse, this chapter will review the research compiled from communities that have experienced similar booms and then apply those findings to circumstances in western North Dakota. While these historic case studies provide insight into the current oil boom phenomena, much remains unknown in terms of final outcomes. While oil industry experts and geologists estimate there is enough oil to sustain the oil boom anywhere between three to seven decades to come, the answer may not be apparent until after the boom. Determining outcomes of the boom is important, both for economic and community impacts, but the evidence needed to answer the question is not yet available. In the meantime, while the oil boom continues to play out, a revised question is needed—one that accounts for the concept of time. For when the question is asked, pre-boom, peak-boom or post-boom, may determine its answer.

Boomtown Phenomena

North Dakota is situated atop the Bakken Formation, the largest contiguous oil deposit in the lower forty-eight states, with the U.S. Geological Survey estimating there are 7.4 billion barrels of recoverable oil resting below its surface (Rucker and Volcovici 2013). Oil produced in North Dakota helped the U.S. become the world's leading oil producer and has ushered in a geopolitical shift and economic prosperity in North Dakota (Krogstad 2014). Yet this is not North Dakota's first oil boom. As a result of new fracking technology that has changed the ways in which oil is extracted, this oil boom has made the largest footprint and is predicted to last the longest.

Longtime residents of western North Dakota are familiar with the boom and bust oil cycles, but this one feels distinctly unique. The first major exploration in the Bakken occurred in Tioga, N.D. in 1951 when Amerada Corporation struck oil in a farmer's field (MacPherson 2008). According to Debbie Iverson, wife of Clarence Iverson on whose farm oil was first discovered over sixty years ago, this current oil boom has had a greater impact on the community. "I've seen boom and bust times, but this boom is the biggest and longest and has the most infrastructure" (personal communication, October 1, 2012).

Reviewing the literature with an eye for themes emerging from boomtown communities reveals pervasive concerns surrounding rapid expansion and decline, and heavy demands on community services and infrastructure (Camasso and Wilkinson 1990). Specifically, three themes emerge concerning community impacts: social disruption due to rapid population influx, loss of identity, and uncertainty and anxiety. These

themes will be explored and then applied to the oil boom in western North Dakota.

Looking at oil boom community impacts in midwestern states, Little (1977) claims the most distinguishable characteristic of boomtowns is an accelerated population growth. Stemming from community impact studies conducted in the late 1970s and early 1980s on governmental regulated extraction projects carried out in rural areas of the western United States, a "boomtown model" was developed to measure social impacts (Gramling and Brabant 1986). Gramling and Brabant (1986) recognized common characteristics when large, complex extraction projects were constructed near small, rural, isolated, homogenous, agricultural-based economies. Specifically, the type and lifespan of the projects necessitated certain labor demands that the local community could not supply. The shortage of workers led to a large in-migration of workers, followed by an out-migration once the project was completed. The rapid population growth and ensuing decline were responsible for both the positive and negative economic, infrastructural, fiscal, and sociocultural impacts on the local community (Gramling and Brabant 1986).

When a community is suddenly faced with a swelling population, economic problems associated with the influx are readily apparent. "There is very little delay between the onset of the new population and the economic costs of providing community services for these new residents" (Little 1977, 404). Small, rural communities are particularly ill-prepared to absorb population growth. There are many ways to define rural according to population density (having less than one hundred persons per square mile) and location (having fewer than 2,500 inhabitants and being located outside of an urban area) (U.S. Census Bureau, n.d.). According to the Health Resources and Services Administration, all five counties within the oil patch region of North Dakota (Dunn, McKenzie, Mountrail, Stark and Williams) are listed as rural counties.

According to Little (1977), rapid population growth leads to a breakdown in municipal services, planning lags behind need, and control of the community rests with forces outside the immediate environment. Communities can usually absorb a population growth rate of 5 percent with a breaking point threshold at 15 percent. As communities approach the 10 percent growth rate, institutional malfunctioning and community fragmentation begin (Little 1977).

Social Disruption

The oil patch region of North Dakota, which consists of counties in the far northwest corner, has experienced astronomical population growth.

Williams County, where Williston is located, has witnessed a 32.1 percent population change in just three years, from 2010–13 (U.S. Census 2014). Williston is braced to expand from 12,000 to an estimated 90,000 within 15 years (Chiaramonte 2013). Similarly, neighboring McKenzie County to the south and Mountrail County to the east have experienced a 46.4 percent and 22.2 percent population change respectively in the same time period (US Census 2014). According to the Williams County Comprehensive Plan 2035 planning report, these counties are anticipating a continued population growth for the next twenty-five years.

Population growth is a new trend as North Dakota's population for the past one hundred years has remained stagnant. Fearful of the shrinking trend that has caused some small, rural towns to become ghost towns, at first residents welcomed the expansion the oil industry brought. Some communities which were close to dying are now flourishing. Schools are no longer consolidating, but growing. The demographics are changing as well. It is predominantly young, single men between 20 and 35 years of age who are moving in compared to the majority of the existing residential population who are between 45 and 59 years of age (U.S. Census 2014).

As a result of the population increase, communities are experiencing severe growing pains. Increases in traffic, accidents, dust, litter, and stress have been reported by residents living in oil-impacted counties (Becker and Hall 2012–13; Becker and Hall 2013; Hall and Becker 2012–13). A recent study examining community health need assessment data from oil patch communities reveals that the most pressing community health needs are a health care workforce shortage, excessive drinking rates, traffic safety, and a lack of affordable housing (Becker 2014). What is significant about these results is that they are expressed and prioritized by community members living in the oil patch. Community members report they no longer know their own community; it is not the same town they grew up in and they no longer feel safe to go outside for walks (personal communication, January 6, 2013).

Crime, domestic violence, prostitution, depression, isolation, and unmet mental health needs have also been reported to have increased since the oil boom (Becker 2014). Some attribute the increase to a numbers game: the more people you have in a given area, the more conflict will arise. Others point to the cramped living quarters where a family of five may be living in a single-wide trailer that is positioned six feet away from the next trailer. In the initial rush of the oil boom, some trailer parks lacked electricity and running water. Further, long hours of monotonous work are blamed for increasing substance abuse. Living as an outsider in a small town away from family members can bring feelings of isolation and

marginalization which are often soothed by alcohol. While not readily noticed or addressed as economic factors, social factors are important corollaries affecting communities as a result of the population boom.

Kennedy and Mehra (1985) indicate the major social disruption resulting from rapid social change. Their research focuses on communities in western Canada that have undergone similar significant economic and social change with an oil boom. They conclude that instability in population size and composition, as well as shifting economic conditions, wreaks havoc on a community's social climate. Seydlitz and a group of researchers (1993) have studied the impacts of oil and gas extraction on communities in the gulf region, and their research has demonstrated that higher levels of rapid changes in development are associated with higher homicide and suicide rates, especially in communities that are involved in resource extraction. Moreover, their research shows increased strain on local infrastructure and increases in poverty during the height of mineral extraction (Seydlitz et al. 1995).

Demand for high paying oilfield jobs has put a squeeze on local businesses in the oil patch. Employers are experiencing turnover as employees quit their jobs or careers for more lucrative oil field employment. Hospitals are losing their custodial and administrative staff as well as certified nurse assistants. Emergency medical services are strained immensely. For hospitals serving the oil patch, call volume has increased three to four times with the recent influx. Tioga Medical Center CEO Randall Peterson states, "In 2007 we would see 600 patients in the ER per year. In 2012, we anticipate seeing over 2,000. That means in a five-year period, Tioga's emergency room visits have more than tripled" (McChesney 2012).

Recruitment efforts are stymied because of the housing shortage. Tioga Mayor Nathan Germundson says "there is literally no place to sleep" (Holeywell 2011, section 5). Residents are sleeping in churches or in their vehicles. To alleviate the housing crisis, oil companies are providing housing, in the form of mobile homes, for oilfield and construction workers. Called man camps, since they are primarily occupied by men, these camps are tightly run with rules including residents cannot drink alcohol, smoke, host guests, or have pets on the premises (Klimasinska 2013). A tour the author took in the fall of 2013 of Tioga Lodge, a man camp run by Target Logistics located on the outskirts of Tioga, revealed a sprawling compound consisting of rows and rows of trailers, each with pickup trucks parked outside, entirely enclosed by a metal fence. The camp housed approximately 1,200 people, about the same size of Tioga, and has led some to call the influx of workers a "man rush" (Krogstad 2014). During my tour, dust was kicked up on the dirt roads and my tour

guide said his favorite pastime of hunting was scratched as the dust and noise pushed the wildlife out.

For the rural residents who elect to live in a small town, the growth comes with a price. "Every system you take advantage of is taxed," says Upper Missouri District Health nurse Janine Oyloe (personal communication, January 13, 2013). The systems she is referring to are roads, traffic lights, repair shops, retail items and medical services. Although new fees have been drafted for the camps to support fire and ambulance services, the increase in call activity is heavily straining the local communities, both in terms of personnel and finances. For many small towns, the oil boom has "come to embody the danger of growing too big too fast, cluttering formerly idyllic vistas, straining utilities, overburdening emergency services and aggravating relatively novel problems like traffic jams, long lines and higher crime" (Sulzberger 2011, section 2).

Identity Fragmentation

Freudenberg (1984) claims the problem of hasty social change produces two viewpoints. One view suggests that rapid social change loosens traditional systems and as a result, greater economic and social opportunities appear. Individuals experience positive effects and opportunities for growth. It is important to point out that age is an important variable; younger people are more apt to benefit from rapid social change (Freudenberg 1984).

The alternative viewpoint posits that rapid growth creates substantial disruption for local residents. This is the dominant view from the body of literature surrounding boomtowns and rapid social growth. Communities, especially small, rural ones, thrive upon creating a web of continuing relationships. This process is a slow one, developed over time where the emphasis is on coming together, sharing resources, and experiencing a sense of belonging to the community. With increasing mobility and population migration, the psychological sense of community fades. The perception of community as a stable and secure place of one's long term home becomes a source of change and fear; negative consequences ensue as individuals are less securely embedded in a family, a workplace, a neighborhood, or community (Pilisuk et al. 1996).

The hurried pace of the oil boom leaves little time for planned growth. City planners in the small rural towns of western North Dakota are overwhelmed with the population influx as the towns are growing too big, too fast, overburdening housing, utilities, and emergency services. Although city planners and local leaders across the western prairie placed an indefinite moratorium on man camp developments in 2011 and gathered

at a conference to discuss regional infrastructure needs, the fact remains that the boom is booming too quickly (Donovan 2012). Even though this growth has anchored oil patch communities' viability, the population surge has happened so quickly it has strained local services and resources. With the increase of traffic and rail accidents, the dangerous nature of the work, and the demanding twelve- to fourteen-hour shifts, oil and gas industry professionals are admonishing caution. Even high profile proponents of the boom, like Robert Harms, Chairman of North Dakota's Republican party, are calling for a slower, more "moderated approach" (Breiner 2014, section 1).

Moreover, rural communities typically have antiquated or seriously strained public facilities prior to the additional stress created by the new industry. The primary method of information dissemination in small towns is word of mouth and face-to-face interactions (Solomon et al. 1981). These communication methods favor local, insider knowledge and can make communicating to newcomers difficult. A central repository of information is lacking and often websites are not updated. The lack of a viable communication network tends to make newcomers feel excluded from the community. Alternately, longtime residents may view newcomers as uninterested and detached from the local community. These perceived differences can result in weakening relationships between economic, social, environmental, and political dimensions of community involvement, agency, and political mobilization (Brown and Schafft 2011).

The combined forces of increased population, change in demographics, and economic and infrastructure development can erode a community's identity. Brown and Schafft (2011) claim one of the principle foundations of rural communities is the role of locally oriented social interaction where community members share common interests. However, differences in values and commitment to the local community vary between newcomers and longtime residents. Gramling and Freudenburg (1990) attest to the external origins of large-scale industrial projects where the magnitude of exterior boom/bust forces may be so great that they overwhelm the local community. For example, a new workforce may view the local community as only a temporary situation; therefore, motivation for community involvement may be low. The temporary trailers in the man camps situated on the outskirts of town reinforce the workforce as outsider status. The distribution of news and promotion of local events that occur casually at convenience stores and cafés keep newcomers uninformed. Consistent with Freudenberg's (1984) analysis of boomtowns in western Colorado, this lack of identity with and lack of trust in their community has a destabilizing effect on residents, leaving them with feelings of alienation and normlessness. Yet in the midst of the merge between

newcomers and longtime residents, new structures of identity and community are emerging and worthy of study.

Uncertainty and Anxiety

Another major theme identified in the research on boomtowns is uncertainty (Brown and Schafft 2011). Although North Dakota has the nation's best economy, tops the country's jobless rate, and has an education system rich with dollars flowing into it, community members are quick to ask "for how long" (Bureau of Labor Statistics 2013)? While it is clear the oil boom has a strong economic impact to local, state and national economies, it is unclear how sustainable this growth is.

According to the U.S. Energy Information Administration (2014), North Dakota is now the second leading oil producing state, behind only Texas in nationwide output. Oil production has generated an economic boom in the state and a domestic energy spike for the nation. Oil output in North Dakota broke a million barrels per day for the first time in history (Petroleum Supply Monthly 2015). The Bakken oil field has close to 10,000 wells, with each one generating on average $24 million in net profit, and many more in the works as the boom transitions from the discovery phase into the production phase (O'Donoghue 2014). For every dollar the industry earns, the state takes 11.5 cents, which totaled more than $2 billion as of October 2012 and supports more than $1 trillion in total value added to the economy, or 7.3 percent of U.S. GDP (North Dakota Energy Forum 2014). However, forecasts for future oil production are marked with tremendous uncertainty. The Energy Information Administration anticipates oil production to continue to rise until about 2020 and then to plateau for a few years, before starting a gradual decline (Casselman 2014). A newfound dependence upon the mining of non-renewable resources such as oil makes communities apprehensive about sustaining the economic base and infrastructure once the extractive activity is completed. Residents that lived through previous booms are quick to point out the results of the bust cycles — the vacant buildings that remain from previous booms when growth happened too soon, too fast and was not sustained.

With North Dakotans already having two boom and bust cycles under their belts, there is an attitude of wariness that pervades. Haunted by the memories of vacant hotels and empty lots, boomtowns turning into ghost towns over night with the fall of oil prices in the 1980s, North Dakotans are careful not to repeat history by adding to the "too much, too fast" recipe (Robinson 1959). Business owners and elected officials are proceeding prudently with development, sure that the bust is imminent.

While no one can predict when the fall may happen, it is certain that a bust is inevitable. As recently as 2009, the Federal Reserve Bank reported the pulse of the Bakken boom was weak; economists were forecasting dismal oil projects, causing oil companies to continue with caution, cutting down drilling and downsizing staff. "Their anxiety is reflected in a slowdown of business and consumer spending, less demand for bank loans and falling rents for apartments" (Davies 2009, 2).

In hindsight, we know the opposite of this happened. Rents are higher in Williston than in Manhattan, indicative of the demand for housing and workers due to the boom exploding (Grandstrand 2014). Yet it is the idea of the bust being ever-present on the horizon that clouds the vision. The scathing memory of previous busts and the cyclical nature that a boom also includes a bust creates an atmosphere of apprehension. At any moment, all of the growth, the influx of people and the economic gain could come crashing to an end. Combined with the extent of social disruption experienced from the in-migration of workers and the amount of change to the rural communities, the ever-present worry of the end exacerbates residents' feelings of anxiety.

Another uncertainty expressed by community members living in the oil patch is the unknown environmental effects of the oil boom (Becker and Hall 2013). Fracking is controversial for many reasons including its spread of natural gas drilling and for the wastewater its produces (Prud'homme 2014). The chemical makeup of this briny wastewater is toxic—it's eight times saltier than seawater and is laced with carcinogenic chemicals and heavy metals that can be radioactive, kill vegetation, destroy farmland, and contaminate drinking water (Dawson 2015). A three million gallon spill of wastewater from a North Dakota pipeline near Williston that occurred in January 2015 has the capacity to wipe out aquatic life in streams and wetlands and sterilize farmland (Valentine 2015). Although the brine is supposed to be injected thousands of feet underground into disposal wells, spills by tanker trucks and ruptured pipelines are common (Kusnetz 2012; Dawson 2015), with 74 saltwater spills in 2013 alone (Valentine 2015).

In addition to wastewater spills, oil patch residents are concerned about oil spills and railroad hazards due to the increase in rail traffic (Becker & Hall, 2012-13). The Tesoro Logistics pipeline that spilled more than 20,000 barrels of crude oil in a wheat field in Tioga in the fall of 2013 highlighted the environmental threat the oil boom poses (Atkin 2014). An oil train's explosive derailment in Quebec that killed forty-seven people in June 2013 drew attention to the need for rail safety (George-Cosh 2014). In December 2013, a freight train carrying crude oil that collided with another train, shooting black fireballs up more than

one hundred feet, prompted the evacuation the town of Casselton in December, and reinforced the danger of the boom and drew attention to the need for rail safety. With the Bakken pumping out more oil and relying on trains to transport it, railroads are being heavily utilized but not readily maintained. As North Dakota Representative Kevin Cramer said, "Booms happen first and then the infrastructure catches up" (Potter 2014, section 3). Of the 1.2 million gallons of oil spilled in the U.S. in 2013, all but 10,000 came from the oil fields in western North Dakota (Potter 2014). More than one thousand accidental releases of oil, drilling wastewater, or other fluids have been documented in 2011 alone, with many more lethal releases going unreported (Kusnetz 2012).

Furthermore, the process of hydraulic fracking forces the sought after crude oil to come out of the earth, but also pushes out natural gas which, if not processed, is flared or burned off (Quick and Breennan 2014). Pipelines which could capture the natural gas are at capacity, resulting in burning nearly a third of the natural gas produced in the region and consequently generating thousands of flares—enough to light up the prairie night sky (Quick and Breennan 2014). Flaring raises the atmospheric levels of carbon dioxide and has contributed to the U.S. moving from fourteenth up to fifth place on the list of gas-flaring nations (Brown 2013). Because many companies offer incentives for low injury rates, many of the environmental impacts are unreported or underreported. What remains to be determined are the environmental risks and negative health factors associated with living in an oil boom environment. The lack of reporting combined with the aggressive pace of drilling creates an atmosphere of suspicion and mistrust.

Timing is Everything

Consistent with boomtown phenomena, North Dakotans living in the oil patch are affected by social disruption due to rapid population influx, loss of identity, and uncertainty and anxiety. However, these impacts do not necessarily determine that the oil boom is a more of a curse than a blessing. Trying to measure the benefits against the detriments of the oil boom leads researchers to conclude they are a "paradox of plenty" (Karl 2004). Proponents of oil-led development highlight the augmented economic growth and job creation, increased government revenues to offset poverty, technological advancements, improvements in infrastructure, and growth of related industries. However, the experience of almost all oil-exporting countries to date illustrates few of these benefits. Overwhelmingly, the consequences of oil-led development tend to be negative, including slower than expected growth, barriers to economic

diversification, poor social welfare indicators, and high levels of poverty, inequality, and unemployment (Karl 2004).

However, it is important to point out that much of this research has been conducted at the peak of extraction. What this list of consequnces does not convey is that these needs are observed during the height of the boom when communities are at the breaking point and social services are in crisis mode. While the intensity and severity of needs are not doubted, a long-term look at how past oil booms have fared may help to answer the blessing-versus-curse question, allowing communities to prioritize the most pressing concerns and better plan for the growing needs. What is needed is research collected on the extent of social disruption at five, ten, and twenty years after the boom cycle.

A longitudinal study of community change conducted by Brown (2005) using Delta, Utah, as a case study to examine pre- and post-boomtown phenomena reveals that time has the potential to heal wounds. Looking at measures of community satisfaction such as likelihood to move, willingness to borrow from neighbors, and number of friends in the community, Brown's research shows that the dimension of wellbeing was enhanced ten years after the boom. Indeed, throughout the twenty-four year history, periods reporting the lowest levels of community satisfaction and the greatest likelihood of residents moving over the twenty-four-year reporting history occurred at times of substantial population growth. This study has significant implications for oil patch communities in western North Dakota. As some experts say the oil boom is currently at its peak, it is understandable that community erosion and feelings of dissatisfaction are strong. Brown's study concludes that time can heal many of the social interactional wounds caused by the rapid growth; having a hearty attachment to one's place through "thick and thin" can help residents adjust to disruptions (Brown 2005, 19).

Smith, Krannich, and Hunter (2001) agree that social disruption occurs in several dimensions of wellbeing such as social integration of newcomers and community change, but their research contends the effects are not permanent. Among four boomtown communities studied for social disruption in western states, none continued to show declines in overall community satisfaction. In fact, where boomtown disruption was evident, it was followed by a sharp rebound in social wellbeing. Fifteen years down the road, the communities that had experienced the strongest boom effects reported greater wellbeing. Moreover, age may have a more profound impact on community satisfaction. In examining attitudinal differences between residents of a boomtown and of surrounding stable communities, no difference existed for adults although adolescents exhibited less satisfaction and greater alienation in post-boomtown

communities (Freudenburg 1984). Given the aging population of most rural areas, this finding holds promise for cooperative outcomes.

Blessing or Curse

Before we can answer if the oil boom in western North Dakota is more of a blessing or a curse, we need to be patient and allow for a longitudinal perspective to unfold. The drama of the oil boom will continue to play out as time moves forward. Once the boom has subsided and in the years following its decline, the answer to the aforementioned question will become clearer. Perhaps the benefits have not yet been realized but will emerge over time. Perhaps the question needs to be reframed so that it allows for a both/and response instead of an either/or solution.

In the meantime, residents of the oil patch can help foster a capacity for flexibility where they can simultaneously remember and forget the oil boom. The cyclical nature of booms and busts necessitate that residents learn from the oil boom to avoid repeating mistakes, but there is also a need for residents to choose to let go of their fears and anxieties in order to move forward. This boom is distinctively different than past booms and experts predict it is here to stay.

Given the amount of change and displacement community members are experiencing, it is natural for a certain amount of resistance to be expected. Their small communities are becoming unrecognizable to them, and the quickly changing environs are cause for fear. Yet the propensity for patience about the social disruption experienced at the peak times and the ability to focus on long-term planning may help alleviate the feelings of uncertainty. An attitude of openness to change may help longtime residents accept the changes that are occurring. There are many positive outcomes stemming from the oil boom, although in the immediacy of the day-to-day changing environment, the inundation of new faces, the amount of change in traffic and daily routines, especially for rural communities, the positives may be hidden.

The ability to loosen one's grip on the tightly held memory of how things used to be before the boom may encourage healing and usher in an elasticity that allows for some change, some shifting in the ideation of what their community looks like, feels like, and is comprised of. Although not denying the impact of the social change, nor attributing the disruption to hype or heresy, a future vision where the shape of community is not yet drawn may be the cushion needed to rethink boundaries and priorities and allow the time needed to determine if the oil boom is a blessing or a curse. While much has been written and there is much to be learned from boomtowns across the U.S., whether they come in the

form of coal mines or oil rigs, looking at boomtown phenomena on a long-term scale may help lessen the community erosion and allow for an invitation to be extended to new residents to help shape the face of the oil patch and steer the conversation to long-term planning.

Chapter 5

Revisited Frontiers: The Bakken, the Plains, Potential Futures, and Real Pasts

Sebastian Braun

> *Thousands of emigrants, as our magazines have told us again and again, are thronging annually to the great plains of the Northwest, where wheat-farming has offered the home-seeker great financial opportunities. All Americans rejoice that these thousands of home-seekers are able to establish themselves financially. On the other hand, residents of the East, the South, or the Pacific Coast, who love a pleasing diversity of hill and dale, grove and meadow, lake and river, cannot but regret that millions of their fellows are doomed to live on the monotonous Western plain, and to gaze daily on a view which includes no hill, no valley, no grove of trees, no water, nothing but earth and wheat.*
>
> Wallace Craig (1908)

During the Bakken oil boom beginning in 2008, people from all over the United States would once again flock to North Dakota, lured by economic possibilities. In this boom, however, images of monotonous doom have had no place. In the curious historical frame of post-terror insecurities and anger, of rising, if reluctant, acknowledgment that climate change has real consequences, of post-Iraq realizations that it might not be possible to truly control oil abroad, and of living through an economic depression that wiped away jobs (yet left wealth intact), messages about the Bakken have been very clear. The oil boom, while a temporary inconvenience, has helped North Dakota stay out of economic trouble, has brought a population increase, has revitalized the state, and has put the state on the map. North Dakota became the poster child for the American dream after having languished in national amnesia, or worse, as the poster child for lonely abandonment, for decades. The message came (and comes) from official and unofficial state channels, was (and is, although with more question marks) picked up by the media, as well as by educational institutions. The Bakken is exciting, it is a chance to start

over, it is a new chapter for the state, and all of this is made possible by new technology: hydraulic fracturing and horizontal drilling. Here, I will not try to evaluate the claims made about economic, ecological, or social impact. I will not attempt to dissect and deconstruct political statements. I will not critique well counts, tax agreements, pipelines, flaring practices, or roads. All of these issues need to be addressed. However, in this text, I will simply put the Bakken into its context as a resource extraction boom. Booms—and busts, which people often forget in the excitement of a developing boom—are nothing new, and so, it would seem, a state undergoing a resource boom would be able to learn a lot from the experiences of past booms—and busts.

Resource booms are nothing new to North Dakota. In fact, the response of many communities in the Bakken region to the developing boom in its early years was guided by the experiences with the last oil boom, in the early 1980s, which ended in a bust very quickly. Not sure whether this new boom would last, experienced residents decided to adopt a wait-and-see attitude. Instead of risking investments into infrastructure that might lead to financial troubles again, perhaps the boom would blow over, and once the workers and their machines were gone, the communities could emerge more or less intact. This attitude, of course, shaped the response by the state, which placed considerable emphasis on the long-term nature of the boom (preferring not to speak of a boom, instead predicting that these developments would increase the population in communities three-fold, for the long term). Local challenges became regional opportunities, and this new boom was nothing like the earlier one. Hence, historical models would only be misleading. A new society was being built, with new technology, opening new opportunities. In fact, even if the events would not benefit the communities they were going to directly affect, they would at least provide security—energy security—to the rest of the nation. The potential futures projected onto graphs and into newspapers, onto whiteboards and screens, and most importantly into dreams and over frustrations, were millennial and sometimes bordering on the messianic.

The history of the United States, is, of course, permeated with the idea of building new societies, a shining city on the hill, the new Jerusalem—communities that would not be linked to historical precedent. Of this mythical American project, and the stories that accompany it, Ziauddin Sardar and Merryl Wyn Davies (2002, 207–8) have written that the "most hateful of all acts of 'knowledgable ignorance' is the failure to examine history and to acknowledge that deeds done to others in the name of virtue have actually done great harm." Working, teaching, and writing as an anthropologist in a department of American Indian Studies,

and thus entering into dialogue with those kinds of deeds every day, I have to agree. The world is complex, history is complex, motivations for action are complex. Nobody asks that any action taken cannot hurt anybody. But the painting of a new canvas, no matter how grand, virtuous, or well-meaning, is never isolated from history, nor disconnected from people in communities.

Frontiers

The Bakken boom, far from being something terribly new, is in fact simply a revisitation of the "frontier" to the northern plains, a region that has seen different waves of frontier booms based on natural resource extraction for centuries. Thinking about frontiers in terms of settlement or demographics is to use the wrong category. In a superficial reading of Fredrick Jackson Turner ([1920] 1996) or the Buffalo Commons prediction (Popper and Popper 1987), demographic change might appear to be the factor determining whether frontiers open or close. However, although population changes might be one of the consequences of booms and busts, it is not population density that defines a frontier. What makes a frontier is, most often, a resource boom. Turner ([1920] 1996, 147) actually did connect the frontier to the industrialization of a landscape: "The transcontinental railroad, the bonanza farm, the steam plow, harvester, and thresher, the 'league-long furrow,' and the vast cattle ranches, all suggested spacious combination and systematization of industry." Frontiers do rearrange landscapes, as Fredric Jameson (1998) has pointed out, and it is not simply the physical landscape that is altered: legal, cultural, social, political, and spiritual landscapes are affected as well (Braun 2008, 210–14). Resource frontiers do not simply extract resources and then disappear without a trace. They extract resources and leave a fundamentally changed environment. On the northern plains, the resources have taken diverse forms: in no particular order, fur, gold, water, hides, land, uranium, buffalo bones, coal, and, for quite a while now, oil.

Oil was first sought and found in Montana in the early twentieth century. Between 1915 and 1920, several oil and gas wells became operational in east-central Montana between Lewistown, Billings, and Miles City (Rowe 1920). The discovery of the Cat Creek field in 1920 began a boom that lasted several years. Investors in one company saw a 9,500 percent return on investments over seven years. The boom, however, did not last. No new major fields were discovered, and the onset of the great depression in the late 1920s busted the developments. World War II meant a renewed interest in exploration, which was prolonged into the 1950s (Darrow 1956). In North Dakota, too, oil exploration started in the

1910s, expanded in the early 1920s, and was revived and focused after the war (Thom 1952). While a North Dakota well produced a single pint of oil in 1950, the first commercial well in the Williston Basin was drilled in Manitoba in 1951, followed that same year by wells in North Dakota and Montana (Fox and Matiniuk 1992; Laird 1962). The following boom lasted into the early 1960s, but then production decreased into the 1970s. New discoveries together with the OPEC crisis then led to a renewed oil boom into the early 1980s (Anderson et al. 1982), when it went bust. This was the last oil boom before the current Bakken boom, which started in earnest around 2009. It is this last boom, and the experiences that longtime residents made at that time, that informed at least the initial reactions to the contemporary Bakken boom.

As in most places, frontiers in North America have been waves of expansion and retraction of state control, of procedural landscapes (Braun 2013). States, however, let private companies or individuals interested in resources take the lead and limit their presence to licensing, permitting, and, if necessary, the enforcement of policies, laws, and territorial control. This is an old pattern of European colonial expansion, seen in the *repartimiento* and *encomienda* system of the Spanish conquest (e.g., Service 1951; Pastore 1997), and then its proto-capitalist English, Dutch, and French system of trading companies (MacLeod 1967), and its American descendants of free market governance. As one author points out, "The conquest and colonisation of America, therefore, was a joint venture between the Spanish state and private entrepreneurs" (Pastore 1997, 333). The same is true for most other European colonial efforts, as well as for the United States. On the northern plains, the first encounters with this developing global capitalist market system that brought wealth and power, unknown risks, and ultimately dependency, occurred during the early fur trade, when both British and French companies explored the region, established posts and trade relationships, and began a boom cycle. Native peoples in the region thus have experiences with proto-industrial and industrial extraction economies within a global context that stretch back at least three hundred years (Ray 1998). Different resources created booms and frontiers in different regions in North America. They all, however, demanded adaptations, commodified and stripped the resources, and created dependencies that could be exploited when the booms busted (e.g., Milloy 1988; Braund 1993; Gallay 2002). Frontiers were primarily an economic enterprise. They did not establish total political control at once, nor were they one-sided, as "colonialism was seldom if ever imposed but instead built through interactions" (DuVal 2006, 47). Frontiers, however, returned, often in waves, dependent on the need for new resources (see Braun 2013). While this pattern is observable all around the

globe, the northern plains provide a great example of it, and the current Bakken oil boom is but one historical manifestation.

Most booms and frontiers do not originate from the discovery of new resources (unless the value of that resource is, at the time, very high), but from a change in economic value of a known resource. The fur trade was not driven by the existence of fur-bearing animals, but by the fashion demands in Europe. The buffalo hide boom was driven by the new value for hides once they could be industrially processed. The buffalo bones boom was driven by the demand for fertilizer. Energy booms are similarly driven by specific demands. Once the demand or the value falls (which is not always the same thing, as natural resources are extracted in a global context), that particular resource boom goes bust. If the value stays the same, however, the boom goes on for as long as the resource lasts. Particular frontiers thus move over landscapes, and the local boom economies are always dependent on global economic values outside their control. Nobody should understand that better than those who have to estimate property values. "The oil economy can be fickle," as one banker in North Dakota put it (Ustinova and Louis 2013). In the Marcellus Shale gas boom, the more conservative banks are calculating mortgage risks based on the assumption that the boom disappears. Others only value 20 percent of royalty income in their appraisals (Scarborough 2012). Community reactions to the Bakken oil boom at least initially took a similar approach. Communities did not want to invest in new infrastructure if the boom would not last as happened in the 1980s, and as a result communities would become insolvent after the bust. After a while, however, the influx of people and wealth can no longer be ignored because it disrupts and paralyzes life as people knew it.

Studies of social impacts of natural resource extraction on local communities were developed in Canada, Australia, and Alaska, mostly in the 1970s, and mostly in the context of indigenous communities affected by mining, oil extraction, or pipeline construction. The most significant of these studies, and in many ways the model, was the Berger inquiry into the Mackenzie River valley pipeline in the Yukon Territory (Young 1995, 184–88). The report, titled "Northern Frontier, Northern Homeland," demonstrates that frontiers are not wilderness areas becoming settled, but the territories of people making their homes there (Nuttall 2010, 62–70; see also Watkins 1977). In some situations, because of treaties, sovereign status, special legal status, or other considerations, it is important that in many cases, it is indigenous peoples that are affected by resource frontiers. However, implications are the same whether locals are indigenous or not. Frontiers exist as *frontiers* for outsiders, on the same land that is *home* to locals. The imposition of frontiers, then, already showcases that

they are an expression of power: the power to transform homes into a frontier. It is by reclassifying and transforming a landscape into a frontier (supposedly free for the taking) that the resources also are transformed from owned to exploitable. The Berger report resulted in a ten year moratorium to clarify land title and prepare for social impacts, but these kinds of setbacks to industry are extremely rare, and only come about through thoughtful governments intent on using power benignly.

Interests and Discourse

Mineral resource and oil or gas booms might be the most visible, and perhaps most infamous, resource booms today. However, they are obviously not the only natural resource booms; probably the most common are land booms. Whatever the desired resource is, these booms and associated frontiers show structural similarities, both in their local manifestations and in their general existence. Historically, one of the primary similarities was that booms and frontiers were temporary, at least in expectation. Once the resource—furs, gold, oil, land—was exhausted, the area no longer held any interest. This was even true for the seemingly most permanent resource: land. As long as the intent is simply to extract value from the land—that is, as long as land is seen as an alienable or alienated commodity, not a place or a home—there is no incentive to expend resources on further investments once the easy returns are gone. Historically, this can be seen with the example of agricultural frontiers in the United States.

The plains, David Danbom (2006, 146, 148) has concluded, were settled as a "postindustrial commercial frontier," and have remained "largely colonial, exporting raw commodities and importing capital and manufactures." Looking at this agricultural frontier as an industrial frontier indeed shows the similarities to other booms, such as the Bakken. Geoff Cunfer (2005, 219) describes the necessity of the constantly moving agricultural frontier in the United States based on soil depletion, "a farm system that mined soil nutrients." Once a particular frontier had run its course, and land as a natural resource had been depleted, a new frontier was opened—"there were the farther free lands to which the ruined pioneer could turn" (Turner [1920] 1996, 148). When there were no more "free lands" suited for agriculture, however, the frontier was transformed. "Rather than adopt one or more of the ancient strategies, farmers (and the industrial nation behind them) created a new option. They appropriated abundant, cheap fossil-fuel energy to import enormous amounts of synthetically manufactured nitrogen onto their fields" (Cunfer 2005, 219). Ultimately, the land frontier and the fossil fuel frontiers are directly

linked. This history, however, leaves out several aspects of frontiers and booms, most importantly the legal implications and the global consequences of resource frontiers.

Governments of expanding states are always interested in advancing frontiers, as discussed in part because their frontiers appropriate the homes of others. However, they are not necessarily interested, at least not in the modern, capitalist state, in pouring resources into these frontiers. Just as they are for businesses, frontiers are extractive for governments, too. In the United States, this has historically resulted in government disposing of newly acquired territories to private individuals—"the distribution of the public domain," as one author called it (Klose 1964, 98–104). After all, the "free land," and other "free" resources were only "free" for the taking because the state directly or indirectly imposed and enforced the fact. The political dynamics at work can be seen on the plains in the subsidized, land-grant railroads, beginning with the Pacific Railroad Act of 1862.[1] On a global stage, the quest for fertilizer before the advent of synthetic nitrogen led to the opening of new frontiers with the Guano Islands Act of 1856, which enabled the appropriation of any "island, rock, or key" with guano deposits, for the sole purpose of allowing the commercial extraction of that resource. After the resource was depleted, the United States was in no way obligated to keep the territory (or any responsibilities for it) (Foster 2000, 150–151).[2]

Resource booms do not exist, and never have come into existence, as a function of an essential need for more resources. Such an interpretation leaves out the political, social, cultural, legal, and environmental contexts of booms. It could be argued that the growth-imperative of modern capitalist economies has to lead to constant expansion into territories of cheap resources and labor. However, just like the expansion of the Inca and Aztec empires was not a function of religion, and religion did not have the purpose to serve as a legitimization of expansion (Conrad and Demarest 1984, 191–209), so, too, can we not interpret economics from a functionalist perspective only. The establishment of resource frontiers is a social, cultural, and political choice. It is embedded in other discourses, and partially dependent on them, but it is a voluntary activity. The nature of resource frontiers, too, is dependent on cultural choices. Mississippian buffer zones, for example, were used for resource extraction, but they

[1] I have argued elsewhere that 1862 marked the beginning of the true colonization of the plains. In conjunction with the Pacific Railroad Act, the Morrill Act and the Homesteading Act prepared this. See Braun (2009).

[2] See also 2011 U.S. Code, Title 48—Territories and Insular Possessions, Chapter 8—Guano Islands (§§1411–19).

looked very different from other frontiers. Their depletion probably led to societal collapse (Anderson 1990, 205–6). This might be true for all resource frontiers, but a global economy can exploit more alternative niches and therefore can hide the collapse longer. While the goal for a buffer zone was to be sustainable, the goal for extractive resource frontiers, especially booms, is not to be sustainable, but to provide as much economic profit as possible. We have to be careful not to infuse local peoples with ecological wisdom (Krech 1999), but the decision to leave intact resources that could be extracted is possible, an available choice.[3]

What resources are extracted, how, and how a frontier should look, then, are choices that are up for debate. However, because resource extraction in boom frontiers is in the interest of the state or of corporations, and because the legality and legitimacy of frontiers are often tenuous at best, an open debate might not be in the best interest of powerful stakeholders. Instead, most frontiers are enshrined in a hegemonic discourse. As mentioned, in the Bakken, and in other oil and gas booms in the early twenty-first century, this discourse is dominated by the idea that these booms save the state and the people. The urgency to extract resources as fast as possible in order to jumpstart the national and regional economy, to provide energy security, and to provide jobs thus merges with the old ideas of the frontier as the bringer or guarantor of American wellbeing and identity. These booms are also positioned in a context in which the "focus of government policy [has] shifted to making the world a more hospitable place for American business." This is nothing new, as in reality, "the heads of US-based corporations" were always the frontiersmen (Byers 2005). The myth of the American frontier is anchored in the lone, individual hero (Sardar and Davies 2002), but in reality, frontiers were controlled (and financed) by private and state capital, from railroad barons to ranch empires, from government agencies to multinational corporations. Local people often experience booms and frontiers as chaotic and uncontrollable, but this might more be a consequence of not being privy to the planning decisions.

The discourse in the Bakken has been stressing that corporations might move somewhere else if the state is not lenient in regulating them. State regulators and legislators have been especially wary of environmental regulations that might slow the rate of development, warning of EPA regulations on hydraulic fracturing (Donovan 2011), just as they have warned against EPA regulations on coal power plant emissions (Nowatzki 2014). This discourse is nationally organized, for example

[3] For example, in the Ecuadorian Amazon; for a general argument on this see Grober (2012).

through groups like the American Legislative Exchange Council (Goldenberg 2014; Yeatman 2013). "Decades worth of oil, natural gas, coal and uranium are once again within reach—along with many thousands of jobs and trillions of dollars in government revenues," wrote one author; yet, "almost as quickly as technologies and discoveries are announced, national environmentalist groups, local activists, bureaucrats, courts and politicians proclaim their opposition, based on potential to speculative risks to air quality, groundwater, endangered species or Earth's climate, or on resistance to energy projects and facilities in their back yards" (Driessen 2010, 3). The discourse is so pervasive that in my own research on boom impacts, I have learned of and met faculty at regional institutions and employees at federal agencies reluctant to engage in any research or data sharing activities that might be seen as directed against the interests of industry. This includes basic research on air and water quality, or the sharing of public satellite images. One of the best examples of this discourse came in the summer 2012, when I attended the *Energy Impact Solutions Conference* at Minot State University. John Hurlimann, the presenter on "Statewide Community Resilience for North Dakota" and working for Dickinson State University, was talking about the dangers of terrorism for the Bakken boom, in a passage that merits quoting in full:

> I know, people look at me like I'm crazy when I talk about terrorists, and we are becoming more of a terrorist target in this country, right now, uh, for a couple reasons. We have two groups that don't want to see a lot of things going on here. One are the environmentalists, and, trust me, you read the blogs, and I mean they would just as soon close down the coal and everything else we have. The EPA is a good example of that, uhm … and, sorry, Senator Conrad's office, but, uhm … they passed a rule last year that said any power plant that uses coal will be fined unless it changes to a new biodegradable fuel. The problem was, this fuel has not been invented yet. But their argument was that they're gonna fine people anyway because that was an encouragement for them to invent the fuel. So, I mean, that's what we're dealing with sometimes with these people.[4]

Maybe because this was North Dakota, nobody raised an eyebrow at this equation of a federal agency with terrorism because the agency is trying to

[4] The quote in full is transcribed from the DVD of the conference presentations *Energy Impact Solutions Conference*, Tuesday, August 14, 2012. In possession of author.

regulate the energy industry. The example showcases how hegemonic the discourse of the resource extraction frontier as an economic enterprise in the interest of the state has become. To put this into historical context, the land boom that populated the plains in the late nineteenth century was in part fueled by a discourse of rain-making through "pluviculture" and other schemes, a discourse that "was understandably popular in a land where dreams were much more pleasant than realities" (Danbom 2006, 145).

Realities

In reality, booms are never only pleasant, not the current oil boom, nor the fur trade, nor uranium mining, nor gold rushes, nor the land boom in the nineteenth century. Less than 20 percent of homesteaders on the plains stayed on the plots they settled first. They found that the environments did not adhere to the dreams of pluviculture. However, "such a constrained environment is not likely to be accompanied by limited expectations by people from modern industrial cultures" (Bennett 1996, 261). People who believe in the hegemony of technological and industrial solutions did not and do not expect to have their dreams shattered by local realities. In essence, that is why booms occur: there is a disconnect between the lived realities of local people and the dreams of strangers, who flock to boom regions. Because booms are temporary phenomena, and because capital can be controlled globally, frontier realities of local people also often do not match those of outsiders.

In addition, booms create status divisions. Oil and gas booms, for example, create divisions between those who own mineral rights and earn royalties and those who do not, yet have to live with all the disturbances that are necessary to create their neighbors' new wealth (Hudson and Braun 2013). Simona Perry (2012) describes the impacts by hegemonic discourse, wealth differentiation, and the influx of strangers on communities in the Marcellus Shale as "collective trauma." Her description of local realities under boom conditions are very similar to community impacts in other resource frontier situations. Accounts of the Marcellus fracking boom show how the initial local enthusiasm—fueled by dreams of poverty relief, national recognition, and patriotism—disappeared when it became clear to some in these communities that this development had divided communities and sometimes families, had the potential to create great environmental harm, and would ultimately mostly benefit outsiders (McGraw 2011; Wilber 2012). While in the abstract, booms have a positive economic impact on an international, national, regional, and local

level, the impact on local people cannot be captured by general statistics or numbers alone.

Only in very abstract terms can economic growth be used to define development because it is mostly meaningless for people in communities. As has become increasingly evident, economic recovery has been disconnected from employment opportunities, for example. In other words, "the 'trickle-down effect' rarely takes place; growth does not necessarily lead to enhanced standards of living. As societies in the affluent North demonstrate, the increased use of highly sophisticated technology or a fast-growing GNP does not necessarily eradicate poverty, illiteracy or homelessness, although it may well alter the ways these ills are experienced" (Gardner and Lewis 1996, 7). In the case of resource booms like the Bakken, it is easily arguable that homelessness increases and education is disincentivized. Like other booms, the Bakken has in part led to the deterritorialization of locals, who either cannot afford to pay hugely inflationary rents or have their subsistence activities disrupted by mineral rights owners. The lure of quick money is, at least from anecdotal evidence, also leading large numbers of young people to forgo higher education.

The majority of local residents in the Bakken, in my experience, still look at the extraction of natural resources as a positive development. Many have come to see the boom in a different light, though, and question whether extraction has to be hurried, or whether it can be carefully thought through, well-regulated, and supervised. The issue for them is not whether or not extraction should take place. "The key issue is," as Young (1995, 183) pointed out for mining in Australia, "aboriginal [or local] control over deciding where [extraction] can take place and how its benefits will flow through to the community." The loss of local control, "the most serious consequence of 'development'" (Bennett 1996, 347), along with alienation from the earth and from one another have long been recognized as two conditions of capitalism (Foster 2000). They flow as necessities out of the prioritization of economic capital and growth, the simplification of context for the sake of efficiency (Dussel 1998, 13). In frontier situations, this can mean the exclusion of local concerns, as the preexisting local is denied under the assumptions of wilderness; in boom situations, the local is denied under the assumption of overarching economic or political interests.

While some authors may argue for at least the potential of a "sustainable boom" (Parlow 2011), I see that idea as an oxymoron. But even if booms were "sustainable" (what exactly would that mean[5]—and is it

[5] See Grober (2012, 17–21) and Boff (1997, 128–29).

not in the definition of "boom" that it will go bust?), they contribute to new inequalities. I have argued that "the proper goal for a contextualized economy is not only materially healthy communities but also spiritually, ecologically, and physically healthy communities" (Braun 2008, 177). In 1869, the naturalist Alfred Russel Wallace wrote that we "should now clearly recognize the fact, that the wealth and knowledge and culture of the few do not constitute civilization, and do not of themselves advance us towards the 'perfect social state'" (Wallace 2000, 457). Poverty, power, and sovereignty are evident factors in the hydraulic fracturing booms of the early twenty-first century. Poor communities need income and jobs, and they do not have the luxury of asking whether they agree with how these are generated, or whether the mode of production will destroy their communities in a few generations' time (Braun 2008). In other words, they do not have, or feel they do not have, the privilege of sovereignty, a good that has increasingly become a luxury of "the few." This can, for example, be seen by an analysis of decision making processes during another energy boom opportunity in North Dakota, the coal-gasification boom of the early 1970s in Mercer County (Tauxe 1993, 138–44). Energy development can be beneficial to local communities. In order for that to happen, however, they need to regain control, which sets up a built in conflict over sovereignty between local and outside interests.

The way these conflicts have been fought may perhaps best be seen by the experience of Native communities, who have been embroiled in struggles over sovereignty for a long time (Ambler 1990). Energy and other resource booms have affected indigenous communities for centuries, and several, especially Fort Peck and Fort Berthold, have been in the center of different oil booms on the northern plains. It is an expression of the ways in which power inequalities are mustered in the interests of the state and industry when local people express feelings of being treated "like Indians" when they feel disappropriated by governments (Tauxe 1993, 145; Wagoner 2002). Patricia Limerick has pointed to western ranchers' self-perception as victims in the wake of the sagebrush rebellion, and Lamm and McCarthy also identified themselves with "the New Indians," refusing to "be herded to the new reservations" (Limerick 1987, 47, 157). In the spring of 2014, militia members from all over the United States participated in a successful armed standoff against the Bureau of Land Management in Nevada, which was trying to enforce grazing fees on public lands against a rancher. These events underscore how much frustration government power still creates (e.g., Eowyndbh 2014). They also recall, however, the long fight by Western Shoshones Mary and Carrie Dann against the BLM and other agencies who do not accept the Treaty of Ruby Valley (Luebben 2002), and faintly echo other ongoing

fights against treaty violations. Perhaps more interesting than the effort to paint oneself as a victim (and write the "old Indians off the page"? [Braun 2007, 199]) is that Lamm and McCarthy (1982, 5) start their book with a "nightmare" scenario of energy politics, a hypothetical blockade of Middle Eastern oil:

> The federal government takes immediate action, mandating massive energy exploration and recovery in the American West. State and local laws are overridden as energy profits proliferate across the land. The western states are not consulted. They are ignored. Their rights are abrogated, their sovereignty destroyed. Energy combines, unleashed by the government, invade the West … Boomtowns mushroom across the West's rural face, disfiguring the land. Cedar breaks crumble to strip miners, waters fill with toxic waste, mountain valleys fall to tractor roads, and evening sunsets blaze through polluted air. Ways of life change forever … New cities, plagued by crime and violence and nonexistent social and economic services, cannot deal with the change.

Apart from the cedars and the mountains, the scenario seems almost prophetic when compared to the local perception of the Bakken boom, and many other energy booms in the early twenty-first century—except that the government has given the driver's seat to industry, in part under the pressure of political leaders who want to see "energy profits proliferate across the land."

In the last decade of the twentieth century, some authors thought that the western United States had been deindustrialized, that "the federal government succeeded in transforming the colonial economy of the West into a pacesetting technologically advanced economy" (Nash 1999, 145). Others, however, warned that there had been no real structural change. "The form of capital remaking the hinterland may be different, the ensuing pace of change may be more immediate, and the remapping of regional landscapes may be on a much greater scale, but in terms of external influences on local conditions, little has changed. Events in the West today differ only in scope and magnitude from the events of 1893, when decisions made in transatlantic boardrooms brought immediate chaos and suffering to the tiniest of industrial communities in the western outback" (Robbins 1994, 194). Lamm and McCarthy (1982, 5–6), too, saw western history as a continuity of dependence: "In time, the energy rush dies. The boomers disappear. Left behind is a wasteland, its skeletal boomtowns and cratered-out landscape a graphic reminder of days past.

Western people, pawns in an ugly and endless war, regroup and rebuild. And their cyclical history begins again."

The Real Resource: Water

A cyclical nature is not only a marker of settler history on the plains, and of boom-bust economies, but also of the plains ecosystem, especially in regards to drought cycles (Clark et al. 2002). Yet, in early 2012, the predominant water-related metaphor for the Bakken boom did not mention drought. Instead, people were framing the boom as a potential tsunami. This might have been a response to the 2011 tsunami that had devastated the Japanese coast, yet it made perfect sense. The image of an unstoppable wave crashing into and over peaceful communities and leaving nothing but destruction in its wake captured the fears of locals, both Indian and non-Indian. On the Fort Berthold reservation, however, I heard another metaphor, too. Several people used the historic flooding of the Missouri River as an image to describe their fear for their communities. Lake Sakakawea had destroyed communities, livelihoods, and the nation's economy fifty years earlier, leading to lasting dependency (Parker 2011). Those events thus capture, on one hand, the fears of destruction at the hand of outside forces. For others, they are the reason why the tribe needs to invest in and profit from the boom: it presents the chance to finally rebuild something akin to what was lost.

Beyond these metaphors, however, lies a greater truth. All the booms and frontiers on the plains have one thing in common: water is the key resource. Whether it is furs, electricity, gold, uranium, land, or oil that is extracted, the ultimate resource for all activities has always been water. Water is also at the heart of the Bakken boom, and of fracking booms in general. This has two reasons: hydraulic fracturing uses a lot of water, and it produces a lot of wastewater. In 1890, John Wesley Powell pointed out the centrality of water as a resource for the arid lands of the west. He went a step farther, however, and problematized another aspect of water as a critical resource, namely commodification and regulation: "The land itself is valueless without the water. If a company owns that water, unless protected by local, national, or State law in some manner the farmer becomes the servant of the company" (Powell 1890, 252). Even in semi-arid lands, like the plains, interdependent natural resources "are often set in a hair-trigger equilibrium which is quickly upset by uncontrolled use" (Leopold 1991, 112–13). Aquifers across the United States and globally have been depleted by agriculture and industrial usage and population increases (Konikow 2013; Wada et al. 2010).

According to a brief survey of data from FracFocus.org, a typical fracking well in the Bakken needs about two million gallons of water to complete. In southern Mountrail County, the range of water used lies between 700,000 and 30,000,000 gallons of water; at the beginning of June 2014, there were 1,055 wells listed for the county.[6] In October 2013, 809 had been listed. This means that the fracking industry used at least 400 million gallons of water in one county during these nine months. Initial water usage for fracking a well is extended by maintenance usage, which amounts to about 600 gallons a day per well (Kiger 2013). In 2012, the estimated water usage by the oil industry in the state came to 5.5 billion gallons (Dalrymple 2013). In 2010, estimates for total usage needs in 2025 ranged from 4.5 billion gallons to 9.1 billion gallons per year and came to the conclusion that "the only plentiful and dependable supply of water for the oil industry in western North Dakota, at projected rates of extraction, is the Missouri River system" (Schuh 2010, 43–47). Perhaps in part because of the Missouri, water use for fracking is not perceived to create a hugely competitive situation in North Dakota, in contrast to drought-hit regions with fracking booms, such as Texas (Freyman and Salmon 2013). North Dakota also has a more effective regulatory system in place. Anyone with a legal interest in land can apply for a water use permit; these permits are then examined by the State Water Commission. The oil industry has given rise to many water permits being used for "water depots," where the industry buys the water needed for its operations (Schuh 2010; Western Organization of Resource Councils 2013). The system exemplifies the frontier as a place where public resources are commodified for the profit of individuals and corporations. However, permits limit the quantity of water to be extracted.

Because the future of the oil boom in North Dakota hinges on the availability of water from Lake Sakakawea, the state, which is supporting the industry, and the federal government, which is trying to regulate the water usage in the Missouri River watershed overall, have come into conflict. The Corps of Engineers has been playing with the idea of asking for a "storage fee" for water from the lake, a notion that the state is rejecting out of hand, as it claims the water for itself. If the water belongs to the state, water permits could be given for a nominal fee, and the industry would have cheap access to the critical resource it depends on. In 2012, the Corps signed a first water agreement, for 1.6 billion gallons. In 2010, it had applications for easements for about 11 billion gallons, although the amount requested might not be the amount of water that is either needed or would be removed (US Army Corps of Engineers 2010;

[6] Data retrieved from FracFocus.org on June 2, 2014.

Springer 2013). The fact that this conflict mirrors frontier water disputes of the nineteenth century, and that water is the actual key resource in the Bakken is also illuminated by the response from the Mandan, Hidatsa and Arikara Nation on Fort Berthold. In 2012, the Three Affiliated Tribes passed a resolution against water agreements by the Corps, noting that the "Corps' proposal to sell or allow the taking of water from Lake Sakakawea for use in the oil and gas industry will undermine the Tribes' current plans to market and sell water to the oil and gas industry and thereby raise needed revenue" (Tribal Business Council of the Three Affiliated Tribes 2012). New communal water delivery systems in northwest North Dakota are also counting on industrial sales of water to finance the infrastructure. Even if there is enough water, competition between water providers to raise revenues for communities is becoming a new economic and sociopolitical reality.

Water usage is only one part of the role water plays in hydraulic fracturing frontiers; however, the other part is the generation and disposal of wastewater. Water is mixed with chemicals before it is injected into wells to frack them. That water, as well as additional water, comes back up the well, and in contrast to water that is used for agriculture or ethanol or coal plants, this water cannot be allowed to reenter the water cycle. The only way to legally dispose of it in the Bakken and in most other oil and gas shale plays, is to inject it deep into the ground. The illegal way to dispose of it is to simply let it drip out of tank trucks while driving along the road. However, in North Dakota, as in other states, the Department of Health "considers oilfield-produced saltwater (brine) to be an effective substitute for commercial dust and ice control products." As such, brine can be spread on dirt roads in winter and summer. The NDDoH notes that "wastes are exempt from waste management rules and are not considered a waste when it is: '(2) Used or reused as effective substitutes for commercial products'" (North Dakota Department of Health n.d.). Brine as a waste product is injected in one of over 30,000 Class II disposal wells in the United States. In early 2013, North Dakota was injecting over 19 million gallons of produced water brine into the "Dakota Formation" per day, or over 7 billion gallons a year (Davisson and Luther 2013).[7]

Deep injection wells are designed to be safeguarding drinking water and aquifers, but the regulations are often based on unproven assumptions (Lustgarten 2012). A study hypothesizing that fracking itself can change the properties of the shale in which it occurs, which could then lead to the permeability of assumed stable geological formations, enabling waste

[7] For a discussion of the inconsistencies in nomenclature of formations, see Thamke and Craigg (1997, 12–13).

to travel into other layers, including aquifers, was heavily criticized, in part by a consulting firm (Myers 2012; Saiers and Barth 2012; Cohen and Andrews 2013). However, other studies have postulated that some of the assumed impermeable geological layers might have natural fractures, and that brine has contaminated groundwater (Warner et al. 2012). It seems that deep injection is relatively safe for now, as long as the injection wells are constructed and maintained well. The volume of waste injected, the lack of known data, potential seismic activity caused by injection, and communication between fracked wells, all raise the potential for contamination of ground water over the long term. Recent research by a consulting company rejecting the permeability of layers comes to the conclusion that "where upward flow occurs, both permeability and flow rates are low, and therefore, timescales for transport are long" (Flewelling and Sharma 2013; Flewelling et al. 2013). Thus, if problems occur, they might become noticeable after the industry has left the region.

Most contamination issues exist from improper handling, storage, and well construction. The potential for contamination of drinking water in shallow aquifers on the northern plains is demonstrated on Fort Peck, where brine has contaminated drinking water and the Poplar River since the 1970s. To reduce the threat to groundwater serving three thousand people in the Poplar area, remediation systems were established (Thamke and Craigg 1997; Thamke and Smith 2014). Potential water contamination and other health risks, such as air pollution (McKenzie et al. 2012), have led to calls for the inclusion of a comprehensive public health approach to discussions on hydraulic fracturing development (Mackie et al. 2013). It is, of course, the presence of such planning discussions that mark the absence of a frontier, or a boom. Comprehensive planning and regulations mark not necessarily an economic bust, but the fact that the state is changing its interests from securing resources for individuals and corporations to a public safety enforcement.

Conclusions

Industrial booms are nothing new to the global or national landscapes, nor are they new to the northern plains. Recurrent waves of frontiers, each one extracting resources a little more difficult to get at, have swept the region. As all frontiers, each visitation has disrupted those tied to place, and shifted economic and political power to those not related to the region and those who disentangle themselves from such ties. "Today's disintegration of rural life," wrote Osha Gray Davidson (1990, 159), "the breakup of families, small-town organizations, and whole communities—fits the pattern established by colonial powers throughout the Third World." There

is a connection between inequality, dependence, poverty, and frontier resource extraction: the first three create a society where "civic culture" is more likely absent (Duncan 1999), and that enables the establishment of a frontier economy. Frontiers are economic and political patterns that take advantage of and create more inequality. They persist until one of two things happens: either the resources are depleted and capital leaves, or some beneficiaries successfully (re-)build a civic culture. In the first case, local communities are left with depleted resources and nothing to show for it. In the second case, the frontier transforms into a stable, regulated economic and political environment. This transformation, however, also needs to accomplish a successful economic diversification, or the stability will be a delusion. Brian Black (2000, 187) describes the dreams for such a transformation for the region around Petrolia, where "delusions of permanence had been based on a finite resource; it was a lesson about the nature of the oil industry." That lesson has been learned by planners in North Dakota as they attempt to attract families, to build infrastructure and subdivisions, and to advertise the Williston Basin as a sustainable boom. The underlying dependence on a finite resource, however, raises the specter of yet another bust.

Facing the spectacular end of the land boom on the plains in the years after the Dust Bowl, the Great Plains Committee came to the conclusion that hubris and ignorance about geographic, climatic, and environmental conditions had been mainly to blame. Although "an inherent characteristic of pioneering settlement," the assumption that "Nature is something to take advantage of and to exploit" was obviously a mistake. Since natural resources are actually not inexhaustible, the report advocated for conservation instead of temporary economic profiteering. It also, however, pointed out that "under pioneering conditions … if anyone acquired some portion of the free natural resources and turned it into productive use, he was … rendering a service to the entire society"; yet, in hindsight, "only too frequently what appears to be of immediate good to the individual in the long run is not good for the people of the region, and even for the individual" (Great Plains Committee 1947, 63–64). Local control cannot mean handing that control to economic interests that are often not tied to local communities. Local sovereignty over resources needs longterm wisdom and regulations, and outside control needs insight and deference to local needs and wants. Neither is given in frontier situations. In 1924, Aldo Leopold advocated that "uncontrolled use of one local resource may menace the economic system of whole regions. Therefore, to protect the public interest, certain resources must remain in public ownership, and ultimately the use of all resources will have to be put under public regulation, regardless of ownership" (Leopold 1991, 113).

This advice, namely to keep decisions about natural resources outside the influence of economic interests, would end frontiers and regulate booms.

The crux is, of course, as it has been ever since the American settlement of the West, what "public interest" means. For Leopold and others, it was the defense of the community and the environment upon which the community rests against corporate interests and those wanting to exploit "free" resources. This is still the interpretation of communities, for example, that have passed no fracking ordinances in order to safeguard their water. It is hard to reconcile such a notion with contemporary practices of states, however. Providing free resources to individuals and corporations so they can profit from them hardly protects the public interest, unless, of course, the public interest is identical with corporate interests. This is, of course, what lobbying groups such as the American Legislative Exchange Council postulate.

The public interest in natural resource has been interpreted in the interests of the state since the 1930s at least. In the case of water, the Tennessee Valley Authority and the Pick-Sloan dams on the upper Missouri are testimony to that. Energy extraction—with or without fracking—as a national interest follows the same trajectory. However, there is a difference between a resource being appropriated by the state and a state giving free reign over a resource to corporations. The latter, which creates the frontier extraction model, may fall into the current trend for states to clear the way for business interests. I have to admit, however, that this leaves me deeply suspicious. Imagine watching a movie in which the sheriff tells John Wayne or Gregory Peck that they cannot help poor ranchers fight for their right to water because the rich water barons need to make more money off them.

Boosterism has always accompanied frontiers, just as it does in the Bakken today. Yet boosterism works only by abstracting specific positive elements of booms from their contexts, and then claiming they stand for the whole. "Pluviculture" never worked in context; the rain does not follow the plow, even if at times, it might rain after somebody plows. Neither is it true that "the lesson of history is that in free societies individuals produce more energy than they consume" (Bradly and Fulmer 2004). The first law of thermodynamics has something to say about that. Neither is it true that "'non-renewable' energy sources have become more abundant" (Desrochers 2005)—we have just happened to find more, like in the Bakken. But ultimately, no amount of boosterism can realistically deny that the Bakken needs to be analyzed in the appropriate, historical and contemporary, global context of energy, environment, and politics.

Chapter 9

Doctors Wanted: How the Bakken Changed North Dakota Health Care Delivery

Jessica Sobolik

We often hear through the news media that a physician shortage is occurring in the United States (Association of American Medical Colleges 2014a). Headlines warn that the number of doctors needed to treat aging baby boomers is insufficient. Furthermore, many physicians are approaching retirement. However, in rural states like North Dakota, distribution of health care is a larger problem (UND School of Medicine and Health Sciences 2012, vii). The state's relatively small population (700,000) is spread out over a large geographic area, and there are not enough physicians to adequately serve everyone. Thus, people who live in rural areas often travel more than one hundred miles to receive specialized health care.

During the latest oil boom in western North Dakota, the growing population has strained the state's health care system even further. The new challenge is twofold: not just a sharp increase in population in general, but a change in demographics that were not prevalent in North Dakota since the 1930s (U.S. Census Bureau 2014). Young men doing dangerous work, often requiring visits to the emergency room (Eligon 2013), have in many cases brought young families to the state. Hospitals are scrambling to provide the services that this new demographic requires, among other challenges. This chapter will explore North Dakota's current health care system network, the state's demographic changes, the challenges the network is facing, and solutions that may result in better health care for all.

North Dakota's Health Care Network

North Dakota's health care network includes six tertiary hospitals, or the Big Six: Altru Health System in Grand Forks, Essentia Health in Fargo, Sanford Health in Bismarck and Fargo, St. Alexius Medical Center in Bismarck, and Trinity Health in Minot (UND School of Medicine and

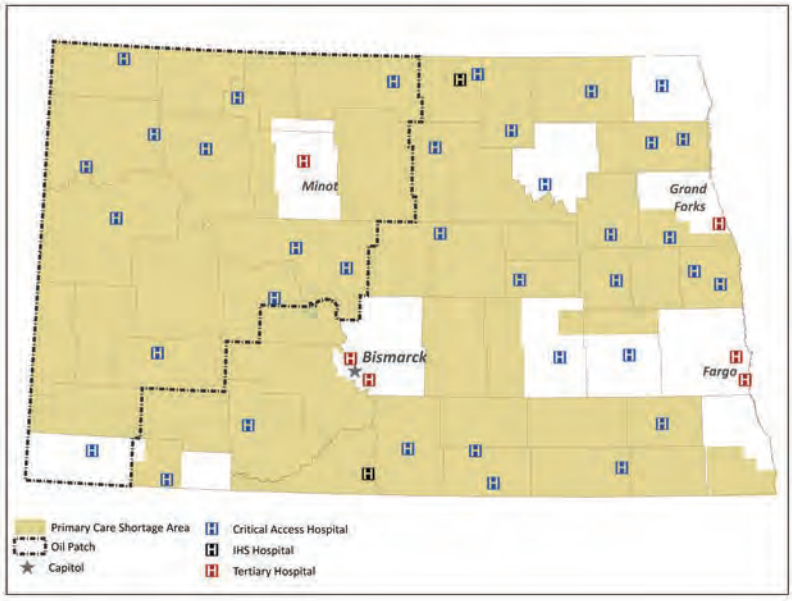

Figure 1. North Dakota's hospital system network (source: UND School of Medicine and Health Sciences 2012, 66).

Health Sciences 2012, 66). Tertiary hospitals offer specialized medical care involving complex procedures and treatments by medical specialists (as opposed to primary or secondary care). The Big Six are located in the four largest cities in the state. In other words, if you were to divide the general rectangle shape of North Dakota into four quarters, each city would serve a quarter (see Figure 1).

The state also has thirty-six critical access hospitals (CAHs, pronounced "caws"). CAHs serve rural areas of the state and must meet federal guidelines such as no more than twenty-five short-term care beds, an average length of stay for patients of ninety-six hours or less, and a location with thirty-five miles of another hospital (not necessarily a tertiary hospital). In addition to various clinics and the tertiary hospitals, CAHs form a network of health care across the state. This does not include the state's three psychiatric hospitals (Fargo, Jamestown, and Grand Forks), two long-term acute care hospitals (Fargo and Mandan), two Indian Health Service hospitals (Ft. Yates and Belcourt), and one rehabilitation hospital (Grand Forks) (North Dakota Department of Health 2014a). Physicians from the Big Six often travel to the CAHs one or two days per week or month to provide specialized care for those who might not be able to travel to the Big Six.

In addition to tertiary hospital Trinity Health in Minot, twelve CAHs are located within the Bakken oil patch: Community Memorial Hospital, Turtle Lake; Garrison Memorial Hospital, Dickinson; Kenmare Community Hospital, Kenmare; Mercy Medical Center, Williston; McKenzie County Hospital, Watford City; Mountrail County Medical Center Hospital, Stanley; Sakakawea Medical Center, Hazen; Southwest Medical Clinic, Bowman; St. Andrew's Health Center, Bottineau; St. Joseph's Hospital, Dickinson; St. Luke's Hospital, Crosby; and Tioga Medical Center, Tioga (UND School of Medicine and Health Sciences 2012, 66). CAHs more centrally located in the Bakken oil field, such as Mercy Medical Center in Williston, are more affected than those on the outskirts, such as Sakakawea Medical Center in Hazen. A closer look at the challenges faced by individual centers later in this chapter may better illustrate how each facility is being affected differently by the oil boom making it difficult to come up with a blanket solution that would fix all health care delivery problems across the state.

Population Changes

Several population and demographic changes have occurred in North Dakota since the Bakken oil boom began, which greatly affect health care delivery. Because many changes have occurred after the U.S. Census in

2010, it is difficult to pinpoint exact population and demographic statistics for the western part of the state today. Still, the U.S. Census Bureau, the authority for demographic statistics, makes projections between census years. Those projections are used in this chapter.

Overall, the state's population tallied 672,591 in 2010 (U.S. Census Bureau 2014). Since then, the U.S. Census Bureau has projected a 4.3 percent increase in population in 2012 and a 7.6 percent increase in 2013 for a record total of 723,393. The previous record of 680,845 was tallied in 1930, right before the Great Depression derailed the state's burgeoning agricultural industry (UND School of Medicine and Health Sciences 2012, 10). In general, the state's population is increasing rapidly, three times more than the national rate (U.S. Census Bureau 2014).

Demographically, North Dakota is the second-oldest state in the nation behind Rhode Island in the percentage of its population over eighty-five-years-old (defined as "elderly") (UND School of Medicine and Health Sciences 2012, 5). Based on 2012 Census Bureau population projections, people over age sixty-five made up 14.4 percent of the state's population (U.S. Census Bureau 2014). Older populations use more health care workforce resources than younger populations requiring more ambulatory services and more family physician visits (UND School of Medicine and Health Sciences 2012, 5).

However, 22.1 percent of the state's projected 2012 population (701,345) consists of children under age 18 (U.S. Census Bureau 2014). Children and their mothers require physicians of different specialties, primarily pediatrics and obstetrics/gynecology. As far as gender goes, according to 2012 projections, the state's population is still split roughly 50/50, although more men are working in the oil fields.

North Dakota counties that saw the largest population increase from 2000 to 2010 were primarily in the western part of the state: Burleigh (Bismarck), Mountrail (Stanley), Williams (Williston), McKenzie (Watford City), Morton (Mandan), Stark (Dickinson), and Ward (Minot) (UND School of Medicine and Health Sciences 2012, 11). Burleigh, Mountrail, Williams and McKenzie counties increased their populations by more than 10 percent.

Generally speaking, the population in western North Dakota will continue to grow and demographics will continue to change as oil production in the area increases. In order for hospitals to provide adequate health care to the growing population, they must understand the area's changing demographics.

Physician Specialties

Primary care physicians are most in demand in North Dakota and across the nation, followed by general surgeons. Various health care entities categorize primary care specialties differently; this chapter uses the most generally accepted definition of primary care as family medicine (basic health care), internal medicine (prevention, diagnosis, and treatment of adult diseases) and pediatrics (development, care, and diseases of babies and children). There are 550 primary care physicians practicing in North Dakota (UND School of Medicine and Health Sciences 2012, 52). Fifty-nine percent of them specialize in family medicine, 28 percent are internists, and 13 percent are pediatricians. Primary care physicians do not earn as much compensation as other specialists (Association of American Medical Colleges 2014b), a fact that likely has some effect on workforce shortages in western North Dakota.

Aside from primary care, physicians can specialize in a number of areas. More popular specialties include: anesthesiology, dermatology, emergency medicine, neurology/psychiatry, obstetrics/gynecology, ophthalmology, otolaryngology, pathology, radiology, surgery (orthopedic, plastic, thoracic), and urology (American Board of Medical Specialties 2014). One can also subspecialize in a particular specialty. For example, cardiology is a subspecialty of internal medicine.

Specialists in North Dakota are more often found at the tertiary hospitals where patients requiring those specialties are expected to go (see Figure 2). However, recognizing that sometimes patients are unable to travel long distances, some specialists travel to the CAHs on a limited basis.

Workforce Needs

In 2011–13, CAHs responded to a survey that helped form individual community health needs assessments compiled by the Center for Rural Health at the UND School of Medicine and Health Sciences. Of the twelve CAHs in Bakken oil country, all identified "health care workforce shortage" as one of their significant health needs (Center for Rural Health 2014). Less than one-third of all CAHs *did not* identify this need, indicating a statewide challenge as opposed to a Bakken challenge. Assuming all CAHs were already facing this challenge, the oil boom only made the issue worse.

It is important to note that not all twelve western North Dakota CAHs feel affected by the Bakken oil boom. "We are impacted, but not nearly to the degree that those in the center of the activity are," said Darrold

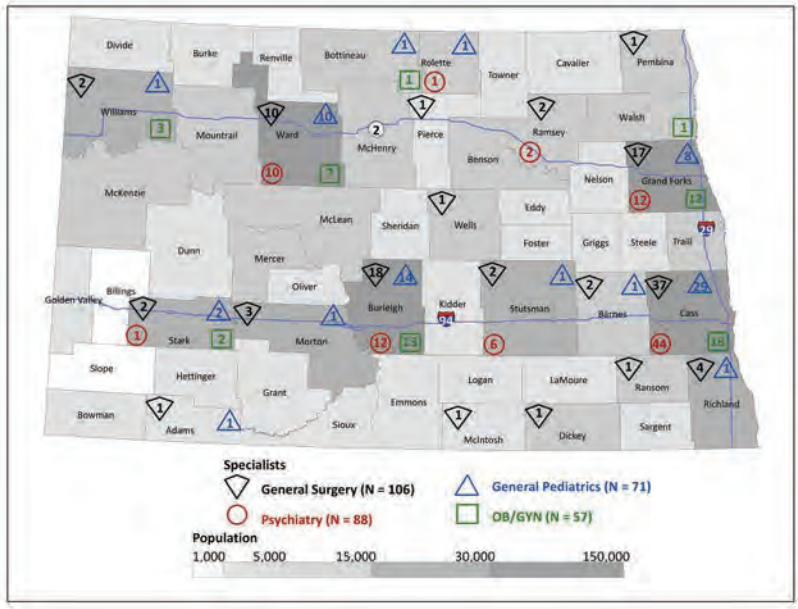

Figure 2. Location of specialty physicians in North Dakota (source: UND School of Medicine and Health Sciences 2012, 55).

Bertsch, CEO of Sakakawea Medical Center in Hazen, in an email to this author. However, facility administrators are still hoping to restart obstetric services and add specialized pediatric services (Hall 2012, 52–53). The number of young families is increasing in western North Dakota, and patients living in Hazen, for example, currently travel seventy miles to Bismarck to receive those services.

Southwest Medical Clinic in Bowman was one of few facilities that did not indicate oil field challenges at all in its community health needs assessment. In fact, it predicted a slight decrease in total population between 2000 and 2017 (Eide Bailly 2013, 10).

Clearly, not every CAH has the same needs when it comes to specialties. Some have more of a need for family medicine physicians. Others agree that pediatricians and obstetricians/gynecologists are needed (Jackson, current volume). But almost all CAHs in the Bakken have indicated workforce challenges tied to the oil industry, even at St. Andrew's Health Center in Bottineau in the far northeast corner of the Bakken oil patch. In its community health needs assessment, the facility's community members and health care providers acknowledged a growing population and a similar increase in emergency room visits (Hall and Becker 2012, 33). In addition to the specialists mentioned above, health care providers in the area also expressed interest in expanded radiology services (e.g., ultrasound and MRI) (Hall and Becker 2012, 40).

As cited in his facility's community health needs assessment, Tioga Medical Center CEO Randall Pederson also reported a growing number of emergency room visits. "In 2007, we would see 600 patients in ER per year," he said. "In 2012, we anticipate seeing over 2,000. So in a five-year period, we have more than tripled our emergency room visits" (Becker and Hall 2013, 58). The assessment also indicated an interest in adding surgeons (general and orthopedic) (Becker and Hall 2013, 60).

For this chapter, administrators at the twelve CAHs were interviewed in order to identify challenges being faced since the community health needs assessments were completed. Out of the twelve, four administrators completed the interview questions, one responded briefly in general, two declined participation due to other commitments, and five were unreachable. The following is a closer look at four specific facilities, their communities and their physician needs, along with a brief indication of how the facilities plan to fill those needs (e.g., recruitment agencies).

Spotlight on Williston

Williston has been identified as the center of oil boom activity (Rocco 2013). In its community health needs assessment, respondents addressed

the demographic changes taking place in the community. "Lifelong residents are bitter about the influx of residents due to the oil boom and they feel their needs are not being met," one said. Others mentioned that elderly residents were moving away because of the increase in the cost of living (e.g., housing, food) (Hall and Becker 2013b, 43).

In an email to this chapter's author, Mercy Medical Center CEO Matt Grimshaw confirmed the demographic challenges facing his facility in Williston. "The most significant change in our region, apart from the increase in population, has been the changing demographics," he said. "Williston is getting younger faster than any city in America, and because of that, the kind of services needed here have changed dramatically. Demand for the many services needed by younger people have increased 100 percent in the past four years (ER, obstetrics, pediatrics), while other services have only increased slightly (inpatient surgery, intensive care)."

Grimshaw confirmed that his facility was facing a physician shortage before the oil boom began. He estimates the current shortage in Williston is approximately six full-time primary care physicians, and he projects that shortage to increase to more than twenty providers over the next five years. Specialties currently needed include emergency medicine, orthopedics, general surgery and oncology. Future needs include cardiology, urology, and critical care. Mercy Medical Center is actively recruiting to fill open positions with physicians who are a good fit with the facility's existing team and who are "fully committed to providing the highest quality of care possible," according to Grimshaw. The facility utilizes online recruiting resources and multiple recruiting firms. In the meantime, the facility brings specialists in from multiple neighboring facilities. These specialists focus on cardiology, neurology, neurosurgery, and oncology.

Spotlight on Garrison

Garrison is located between Minot and Bismarck on the eastern border of the Bakken oil patch. According to its community health needs assessment, St. Alexius Garrison Memorial Hospital has seen an increase in acute and emergency room visits because of the oil boom (Howe Enterprises LLC 2013, 5). In an email to this author, hospital administrator Tod Graeber confirmed that the oil boom has greatly stressed his facility's emergency medicine department, similar to St. Andrew's Health Center in Bottineau and Tioga Medical Center. "Our emergency department has seen increases of 25 to 30 percent in volume in the past five years," he said.

He also mentioned the challenge of collecting payments from patients after services were provided. "There are a lot more transient patients," he said. "These patients are often hard to track down to find an address to send a bill to. There are a lot of good-paying jobs, but often a lot of these workers do not have health insurance."

In the community health needs assessment, Garrison community members and health care professionals indicated the number one reason patients seek health care services in other towns is because of a lack of specialists (Howe Enterprises LLC 2013, 47–48). According to Graeber, the hospital only provides primary care and emergency care, for which he feels the facility is adequately staffed. The hospital used to provide specialty services via visiting physicians one or two days per month. However, since western North Dakota's population has grown, Graeber said the hospital has lost access to some of its visiting specialists who are being called elsewhere. These included urologists, podiatrists, neurologists, and psychologists. Graeber is hoping to restore some of these services in the future. The facility posts its job openings on its website, on related industry websites, and in relevant professional publications.

Spotlight on Kenmare

Located 50 miles northwest of Minot, Trinity Kenmare Hospital is located on the eastern edge of the Bakken oil patch. Still, the community has felt significantly affected by a growing population according to its community health needs assessment. Young single males make up most of the influx, and their chosen profession in the oil fields is requiring more emergency services (Trinity Kenmare Community Hospital 2013, 4).

In an email to this author, hospital administrator Shawn Smothers said her facility only has one physician who rotates with a family nurse practitioner every other week. She would like to hire another family medicine physician, but the hospital cannot afford one. Instead, it is considering hiring a midlevel provider—a family nurse practitioner—to cover clinic hours, as well as the emergency room and overnight shifts. Smothers also pointed out that it has been difficult to keep adequate hospital staff on the payroll. Either they are leaving for higher paying jobs in the oil fields, or they have spouses making enough money in the oil fields making a second income unnecessary.

Outside of primary care, the hospital does not have any specialists except a podiatrist who visits the facility once a month and a physician who covers the emergency room up to ten days a month. Smothers did not feel additional specialists were needed, although community members have expressed interest in having more access to an oncologist (Center

for Rural Health 2013, 10). The hospital utilizes recruitment agencies to fill job openings.

Spotlight on Watford City

Watford City, like Williston, is more centrally located in the Bakken oil field. Forty-five miles southeast of Williston, McKenzie County Healthcare System has a greater need for emergency medicine, just like in Tioga and Garrison. According to CEO Dan Kelly in an email to this author, the county's hospital was seeing fewer than one hundred emergency room patients per month in 2007. Today, that number exceeds five hundred per month. "In addition, we're seeing more trauma patients," he said. Further, according to the hospital's community health needs assessment, there are not enough outpatient clinic doctors to see patients in a timely manner, so patients are using the emergency room as a walk-in clinic (Hall and Becker 2013a, 60).

In particular, Kelly does not feel his facility has the need for a full-time pediatrician or obstetrician/gynecologist just yet, but as the population increases, he acknowledges that will change. However, he would like to recruit one more family or internal medicine physician. Currently, the ratio of McKenzie County residents to primary care physicians is five times the state average and six times the national average (Hall and Becker 2013a, 60). On the other hand, community members indicated a need for more "birthing services/obstetrics" and pediatric services in the community health needs assessment (Hall and Becker 2013a, 44). So while some community members desire these specialties, there are still not enough patients to justify bringing these full-time specialists on board. In addition, cardiologists, pediatricians, and orthopedic surgeons operate separate specialty clinics in the area.

Solutions

This chapter has identified a number of challenges facing health care facilities in western North Dakota today. In summary, there has been a swift increase in population, changing patient demographics, a shortage of specialists and physician recruitment. Particularly CAHs are seeing a greater need for pediatricians, obstetricians/gynecologists, and emergency medicine providers.

In light of this information, solutions are being identified and action plans are being formed across the state. CAHs are drafting their implementation strategies based on the community health needs assessments. Also, the UND School of Medicine and Health Sciences has developed the

Health Care Workforce Initiative, which aims to reduce disease burden, increase retention of graduates, increase student class sizes and improve the health care delivery system overall (UND School of Medicine and Health Sciences 2012, 108–10). According to its purpose statement, the School of Medicine and Health Sciences, the only medical school in the state, is responsible for educating future physicians and other health professionals and enhancing the quality of life for all North Dakotans (UND School of Medicine and Health Sciences 2013).

By reducing disease burden, or encouraging disease prevention, fewer people would get sick and therefore require fewer health care services. Specific to the Bakken oil fields, for example, educating workers about preventing sexually transmitted infections could reduce the number of future health care visits. Public health officials already provide these educational services to physicians (North Dakota Department of Health 2014b). The UND School of Medicine and Health Sciences created a Master of Public Health program in 2012 to educate more public health officials (UND School of Medicine and Health Sciences 2012).

Retaining graduates is perhaps the most challenging goal, but also one of vital importance. All medical school graduates are required to complete residency training, which lasts three to seven years depending on the specialty (Association of American Medical Colleges 2014c, 11). Yet most residencies are located outside the state, and statistics indicate that medical students are more likely to practice in the state where he or she completed residency training (UND School of Medicine 2012, 104). In-state residency programs include family medicine, internal medicine, psychiatry, and surgery. Discussions are underway to resurrect the state's obstetrics/gynecology residency program. Furthermore, the North Dakota Legislature approved funding for a RuralMed Program, which defrays tuition costs if the graduate agrees to practice family medicine in a rural area of the state for five years (UND School of Medicine 2012, 109).

Increasing student class sizes would increase the likelihood of more graduates choosing to practice in North Dakota. Therefore, the state legislature approved funding to allow the School to increase its class sizes starting in summer 2012 (UND School of Medicine 2012, 109–10). Using medical students as an example, the first expanded class would graduate in 2016 and finish residency training no earlier than 2019.

Improving the health care delivery system would encourage the tertiary hospitals to work cooperatively with the CAHs across the state to ensure that all areas of the state receive quality health care.

To get a better idea of how long it takes to produce certain specialists, it may be helpful to look at the latest graduating class of medical students

at the UND School of Medicine and Health Sciences. Out of a class of sixty-four students graduating in May 2014, nine plan to go into family medicine, four are going into obstetrics/gynecology, five are going into emergency medicine, and four are going into pediatrics (UND School of Medicine and Health Sciences 2014). The rest have chosen other specialties. Comparing these numbers to the needs identified in Williston and elsewhere (e.g., Mercy Medical Center needing six primary care providers), this year's class cannot fill current shortfalls, so physicians must be brought in from out of state or outside the United States. Midlevel providers (e.g., nurse practitioners, physician assistants) could also help fill the gaps. No matter what solutions or action plans are identified as the best, it is certain that inaction would only make the physician shortage worse and the health care delivery system in western North Dakota more strained.

Summary

In conclusion, the delivery of health care via CAHs across North Dakota was already strained before the latest Bakken oil boom occurred. Now, CAHs are lacking the appropriate workforce to provide the necessary health care for their communities. In general, the specialists most needed or desired are pediatricians, obstetricians/gynecologists and especially emergency medicine providers. However, just because community members desire additional services or providers, it may not warrant actual hiring of those providers.

Each community has been impacted differently. By taking a closer look at four specific CAHs and their communities (Williston, Garrison, Kenmare, and Watford City), it is evident that each facility must develop unique strategies to follow in the near future.

By identifying the changing North Dakota demographics and the parallel needs of the state's CAHs, the UND School of Medicine and Health Sciences and other health care partners can then develop the most effective ways to improve health care delivery statewide, which is especially challenging when the state's population increases so quickly. As history has shown, North Dakota's health care network will work together to ensure that everyone is entitled and has access to high-quality health care.

Chapter 14

"Cowboy Logic": Lessons from Norway

Ryan M. Taylor

I published these pieces in the *Dickinson Press* after I had been invited by one of the editors to write about my fellowship with the Bush Foundation. I had gone to Norway as a Bush Fellow to study their policies and see what could be learned from a country with a long history as a major oil exporter.

I wrote in a style that was personal and practiced due to my part-time vocation as a columnist for agricultural newspapers across the western U.S. and Canada since 1994. My long-running Cowboy Logic column has always dealt with living on a ranch, being part of a tight-knit rural community, and raising a young family in the midst of it all. When I wrote these pieces about the topic of oil development and a handful of global lessons, I kept my same Cowboy Logic voice. I figured the readership of the *Dickinson Press* in western North Dakota would understand and appreciate that. Plus, it allowed me to be myself. My voice is my Cowboy Logic voice.

There is generally a lot of support for oil development in North Dakota, including western North Dakota where the brunt of the impacts are felt—the good, the bad and the ugly. The jobs and the economic development (the good) is something North Dakota has been looking to find for years. The deterioration and the critical shortage of infrastructure (the bad)—roads, highways, housing, emergency services, law enforcement, schools, you name it—seem to be challenges continually faced a day late and dollar short. Then there's the large-scale wasteful flaring of natural gas, the saltwater brine and oil spills onto productive agricultural lands, the diminished feeling of safety in once secure communities, and the surge in traffic fatalities (the ugly). One of the problems in our public discourse, though, seems to be that any mention of the bad or the ugly will bring accusations that you don't appreciate the good, or it'll get you labeled "anti-oil."

As a public figure, I've faced my share of accusations when it comes to the booming oil and gas sector of North Dakota. Having served in the state senate for ten years from 2002 to 2012, I pushed the green (yes) or red (no) button at my desk thousands of times on thousands of legislative bills and issues. I support the harvesting of energy in North Dakota, but I've never been willing to give away our one time harvest or step back from our responsibility to be good stewards of the land and water while we do it.

I remember voting against a tax break for oil companies in the 2009 legislative session. It looked to me like a giveaway; it was pitched as an "incentive." I figured the incentive to drill for oil in North Dakota hinged squarely on the quality of the resource, the world market price for oil, and the technology available to go get it. So I voted no on the oil tax reduction and in my 2010 reelection for the district senate seat, opponents ran radio ads across the state, well beyond my district borders (foreseeing that I would probably be a statewide candidate in the future) that said I was "against the Bakken."

I laughed at the ludicrous spin they were making—that voting against a tax giveaway to oil companies made someone against the Bakken. As a Republican ranching friend and supporter of mine from McKenzie County chuckled and said, "Gosh, Ryan, I didn't think anyone could be against a geological formation!" For the record, I'm not against any of our geological formations or tapping energy from them. I do believe we need to work very hard to do it in a way that respects our land and water, and the communities and people in the middle of the development. And yes, that means maintaining a reasonable oil extraction tax rate to provide the needed investments in those communities and having something to show for the future when this one-time harvest is complete.

In politics today, there seems to be little respect for the idea of middle ground or thoughtful compromise, unfortunately. When I ran for governor of North Dakota in 2012, and later, for state agriculture commissioner, oil development was a fundamental topic of the debate about North Dakota's future and our legacy as a people and an agrarian culture. And, while I won my senate election in 2010 handily in spite of the "against the Bakken" radio ads, that narrative of false choices was continued by my opponents in my two statewide races both of which proved unsuccessful at the ballot box. The attacks were amusing, though. When the Brighter Future Fund (and you can imagine whose bright future they were worried about funding) took to the radio airwaves in my race for ag commissioner to say that I had admitted to being a "tree hugger" in one of my Cowboy Logic columns (gasp), I had to laugh, because I knew the column they were referencing.

The exact words in my July 20, 2009, column were, "Even though I'm a child of the generally treeless plains, I'm a tree lover. I reckon you could call me a tree hugger, although being a Scandinavian Midwesterner with well-managed emotions makes me an unlikely hugger of anything. As with people, I'd be more likely to give a tree a firm handshake or a hearty pat on the back, but not a hug." There you have it. I went on to write about the grove of ponderosa pines my father planted in one of our pastures, and how I built my house next to those trees after they grew so nice and tall. I don't know that I've hugged them—the pine needles are kind of bristly, you know. I have stood on the south side of them when a brisk north wind is blowing in January and felt quite content, however.

I failed to find much derision in Norway for people who appreciate the outdoors and who are willing to advocate for the environmental side of the equation when there are potentially harmful tradeoffs with industry. On the contrary, there is a common Norwegian term, *friluftsliv*, meaning, "the open air life," an ingrained, cultural Norwegian appreciation of the outdoors and outdoor recreation. Understanding the Norwegian *friluftsliv* makes it easy to see the cultural basis of their fourth commandment in the 1971 "Ten Oil Commandments" for Norwegian oil and gas development. It lifted up protection of nature and the environment as a guiding value from the very beginning of their off shore oil and gas extraction activities.

Norway is not perfect—no country is—but it does have policies and experiences that we can learn from. My experience as a policy maker in the state senate and as a candidate for statewide office tells me there is room for improvement in the way North Dakota manages and finds its way through this oil boom. As a Bush Fellow, I believe I have identified some of those possible improvements on the other side of the Atlantic. And as a fourth generation cattle rancher and agrarian who holds our prairie in very high esteem, I believe many of us know what we should be doing and where we must improve. Maybe some Cowboy Logic will help remind us what that is.

Across the Pond: Looking for Lessons in the Old Country

Towner. N.D. — It was 1910, 103 years ago, when a grandfather I never knew packed up all that he had, bought a ticket to America on a ship called the Lusitania and left his home, never to return.

He died long before I was born and that's why I never knew him. And I never really had the opportunity to travel back across the pond, as they say, to get to know his homeland. But this fall, I got to make the trip, and

by seeing his country I think I learned a little about both him and his home.

The home he left in Norway was a mountainous valley called Hallingdal, and the place he came to in North Dakota was a significantly less mountainous valley along the Mouse River. The ship that Syvert came over on would become famous five years after his journey in a sinking that would eventually bring the U.S. into World War I, but when he was on board, it was just another long, hard trip to Ellis Island to add his name to a long list of immigrants seeking a life less hard in America.

His trip took weeks just to get to New York, mine took about 12 hours of flying time on three jet planes to get all the way to North Dakota. Syvert never got to see his family again. When I was in Norway, if I wanted to see my family, I simply found a wireless internet connection for my iPad and dialed them up on Skype.

I didn't get to Hallingdal on this trip, but I saw a lot of Norway, and I saw a lot of beautiful country. It's a place that has always been beautiful, but, in 1910, Syvert knew you couldn't eat scenery, so, along with what would be 900,000 of his countrymen and women over a 100 year period they struck out for places with more land and opportunity.

I was in Norway to study the lessons of their policies and practices in the area of oil extraction as part of a Bush Foundation Fellowship that I was awarded. In an interesting turn of fate, the country that was so poor that one third of their citizens had to leave its shores less than 100 years ago is now one of the world's wealthiest, with vast pools oil and gas beneath the waters of the seas they've sailed since the time of the Vikings.

Syvert left a poor country that became a wealthy country with oil. He moved to North Dakota which had more space and opportunity, but was still a hard place to survive, especially through the years of the Depression as a small farmer caring for a family of seven children along with his wife. And now that state is becoming wealthy with oil. The place he left has handled the prosperity pretty well, committed to the geological windfall being a long term benefit to its people for generations to come.

The Norwegians are the same people who ate sheep's head, "smalahove," because they didn't waste anything. Know that, and it's easy to understand that one of the first hard rules they laid out when they started granting permission for companies to drill for oil in their sea was that there would be no unnecessary flaring of natural gas.

It's like eating the sheep's head. They weren't going to light a match to perfectly good natural gas and put it up in smoke. They waited for the pipelines and the plants, they found uses and markets for it or they reinjected it, pressurized the wells and got more oil. No waste.

I learned a lot in the short time I was back in Norway. And even though it was my first time, it felt more like a homecoming than a maiden voyage. I wasn't just a North Dakota cowboy roaming Norway.

I was the grandson of Syvert from Hallingdal, the great grandson of Hans and Ragnhild from Gudbrandsdal. And I ate the gamalost and the lutefisk, and, if it's put in front of me, I'll raise a skol of aquavit and try some smalahove as I listen to their lessons on prudent petroleum management for the long haul.

Hard Work and a Good Rest

Towner, N.D. — Around the world, work is work. Some work is harder, some places definitely have better working conditions, but in the end it's all a trade of time and toil for money, or something else of value.

I grew up knowing full well the old saying, "an honest day's work for an honest day's pay," and it's western companion, "you have to ride for the brand." I knew a lot of people who lived by them. When I went to work in the animal health business years ago my regional manager stood up, said those two things and said that's what he expected of us. I knew I was in the right region and that I had the right manager.

I've had a lot of friends and neighbors go to work in the oil patch, and I know they put in an honest day's work for an honest day's pay, and they rode for the brand because the company logo was on their coveralls, their chore gloves, and their baseball caps! And I'm pretty certain it was hard work. Several of them worked a few years and decided to come back and ranch instead of roughneck. Ranching's no walk in the park so if raising cattle is more tempting than the oil rig, it must be demanding.

They may not have made a lifelong career on the oil rig, but they took the money they made to buy some cows, pick up some land or pay cash for a more modern feeding tractor to make life a little easier on the ranch. Others have made a career out of it, and are working their way up the ladder from worm to driller to who knows what.

When I was in Norway visiting with people in their oil industry the subject of careers in oil came up, of course. I distinctly remember a drilling supervisor tell me that no one looked down on the oil rig jobs, he said there was no such term as 'oil field trash', "these are respected careers," he said, "Lifelong careers that allow people to be with their families."

A lot has changed in oil field jobs, everywhere I think, and that has changed the once held stereotype. Most people can probably remember the bumper sticker from oil booms past, "Don't tell my mother I'm working in the oil patch, she thinks I'm a piano player in a brothel (actually it didn't say brothel, I'm just trying to find a term acceptable for

print in a widely circulated paper)." At any rate, the message on the sticker was that 'mother' would put oil patch work below other, shall we say, less respected jobs.

In Norway, the oil is all off shore, so when you go to work on a platform, you are out to sea and on the job for two weeks. The biggest point of pride for the drilling supervisor I talked to was the Norwegian mandate of "two weeks on, four weeks off" for their workers. That, he believed, helped make the careers respectable, sought after, and most important to him and his workers, family friendly.

A parent or spouse might be out to sea for two weeks, but they come back and have a whole month to be a full time parent and a partner before they have to leave again. The supervisor believed that work schedule helped change the status of oil platform work in Norway to one of career and not just cash.

I'm certain the pay was excellent, as it is in much of the industry. I didn't ask anyone the exact pay scale. I still have a hard time doing that because it strikes me as similar to asking a rancher how many cows he has, or how big a place they have. Anyone in the cow business knows those questions are taboo. It'd be like asking someone to show their W2 form and lay out all their personal finances.

Every policy has pros and cons. The supervisor saw a lot of pros to the two on, four off, schedule for family. I'm guessing family holds a high place in Norway because they're also the country with 36 to 46 weeks of mandated, paid parental leave for new mothers or fathers.

I suppose a drawback could be having to recruit more workers to accommodate the job needs during the longer time off, especially in Norway, a country with low unemployment and a short supply of workers similar to North Dakota. However, the policy could make the work that much more attractive across a bigger geographical area and give them more candidates for the work.

The supervisor said his workers can live "wherever they want," and fly in from all parts of Norway, or Europe for that matter. It probably reduces the housing crunch somewhat for the communities closest to oil activity and the heightened demand that increase rents and prices beyond reach.

Whether this is a policy that fits places other than Norway is hard to say. But like everything we learn when we go abroad or talk to others, we discover there's more than one way of accomplishing an honest day's work.

Leadership, Learning and Adaptive Challenges:
Lessons Taught, Experiences Studied

Towner, N.D. — When I was awarded a Bush Fellowship from the Bush Foundation of St. Paul, Minn., the most common question asked, hands down, was if it came from the family of George W. Bush and George H.W. Bush. And, if so, why on earth would they award one to me?

First off, no, the Bush Foundation was established by 3M company executive Archibald Bush, and his wife Edyth, in 1953. And here's a piece of trivia for you. The 3M company which now makes us think of "Post-it" notes and Scotch brand tape, was originally known as Minnesota Mining & Manufacturing (get it? 3M) and started as a mining company that moved into the production of sandpaper.

The fellowship's stated goal in its leadership category is "To support and develop more leaders who are better equipped and better networked to effectively lead change." They mention things like being a "catalyst for courageous leadership" and they "support efforts to expose proven and emerging leaders to new ideas and new people."

The fellowship has certainly done that for me. Most recently, it allowed me to go to Harvard University for a week to participate in a course called "21st Century Leadership: Chaos, Conflict and Courage." Sounds applicable to western North Dakota, especially on the days when the chaos seems to outpace the courageous leadership.

I'd have never guessed I'd have a chance to sit in a classroom at Harvard, in a group of 66 people coming from more than 25 nations around the world. As one of my personal heroes, Will Rogers, said, "A man learns by two things. One is reading. The other is association with smarter people." I got to do both at Harvard.

Some of my readings were in "Leadership on the Line," a book who's author happened to be one of the smart people I got to associate with at Harvard. I guess you'd call that a Will Rogers double.

One of the concepts in the book is the work of differentiating between technical and adaptive challenges. Technical challenges can usually be fixed with a tool or technology. Go get the hammer or the microchip. Adaptive challenges require a change of mindset, require courageous leadership. The hammer won't work, and neither will the newest whiz bang fix.

It brought to mind another lesson from my fellowship when I was in Norway, learning about their oil production practices and policies. I was visiting with a production supervisor for one of their major oil companies. As it goes, whenever a person talks about off shore drilling, the BP oil spill, or the Macondo spill, as some call it, in the Gulf of Mexico in 2010,

came up. It resulted in the death of 11 workers and spilled 206 million gallons of oil into the gulf.

We talked about possible technical solutions—blow out preventers, remote triggers, protocols, casings and such. I'm no expert in any of this but I asked him about one piece of blow out technology that I remembered hearing about—one that Norway had mandated since the early 1980's that was still not required in the United States in 2010.

He conceded that it may have helped, but that he thought there was more to the tragedy than mere missing technology. He then drew the distinction for me between technical challenges/solutions, and adaptive challenges/leadership, in his own understated Norwegian way.

He said that his company had a platform operating in the Gulf of Mexico quite close to the Macondo well of BP's. They had lots of trouble too, he said, pressures and disruptions and difficulties with their well. It was a hard go.

But, he said, "we are Norwegians and in our culture sometimes we just back off, and take it easy, and slow down," spoken with his open hands in front of him signaling a backing off. And I had to remind myself that the Norwegians have held that mentality and have still harvested 37 billion barrels of oil and gas (in oil equivalents) off their own shores. Taking it easy did not mean standing idle.

I've thought about that conversation many times. The difference between a continued search for a technical fix in hardware or software, and the seemingly simple, but courageous, adaptive leadership that could have possibly prevented a 206 million gallon oil spill by backing off from the go-go mentality and just "taking it easy." Adaptive leadership could have saved lives, billions and billions of dollars of financial loss and untold environmental challenges and clean-up costs.

And I begin to connect the dots from that visit over a cup of strong coffee in a Norwegian break room to the discussions in a classroom at Harvard University to my place in this fast rising oil state that seems to be searching for courageous leadership in the midst of chaos.

Dance with the One Who Brought You
But Everyone Else is Welcome to Waltz Too

Towner, N.D. —When I came out of NDSU in 1992, the parchment in the nice black folder that the university president handed me said bachelor's degree in agricultural economics. I got a second degree (nearly a two for one in the days when you didn't pay per credit) at the same time that said bachelor's in mass communications.

So I was one of those 'right brain/left brain' anomalies, someone who was good at math and liked economics, but could also write a story, or even draw a picture or recite a poem if need be. But, even though both sides of my brain work, I still shoot my rifle right handed, rope calves right handed and the only time I ever wrote with my left hand was the 12 weeks of healing when I broke my right wrist back in seventh grade basketball. I can spin a Will Rogers-style flat loop with my right or left hand thanks to that wrist-induced period of ambidextrousness.

Anyway, back to ag economics. By training, I'm one of those guys. I can plot supply and demand on the two axis of a graph and identify the intersecting price. I could have taken up ag banking or aspired to corporate management after college graduation, but my Dad had been diagnosed with Parkinson's Disease, the family ranch needed me, and, honestly, I felt I needed to be with my family and back on the ranch as we began to fight Dad's battle together.

But I've always followed economics, and kept economics and business on my reading list. I even had the Wall Street Journal delivered to my mailbox three and half miles from the ranch every day for a year after college. I won it as part of an academic scholarship. The paper was always a day late, but that seemed timely enough in the days before the internet.

Now, after 22 years of post-college cattle ranching, 10 years serving in our state senate, a campaign for governor and a new campaign to be the state's agriculture commissioner, I find myself reading about the economics of agriculture and oil, which, today, are the two main economic movers in North Dakota.

One economic principle that kept popping up in my reading was one called the "Dutch Disease." Not Dutch Elm Disease, that's a nasty one that took out some nice trees in a pasture just north of my house, but just Dutch Disease. It's the identified relationship between an increase in an area's exploitation of natural resources and a correlating decline in that area's agriculture and industry. The term was coined in a magazine, "The Economist," in their description of the decline of the manufacturing sector in the Netherlands after they discovered a large natural gas field in the North Sea.

Now stick with me while I try to nutshell the theory without getting too eggheaded. There's a non-tradable sector and two tradable sectors. Non-tradable is service, tradable is the booming (natural resource) sector and the non-booming (agriculture or manufacturing) sector. Eventually the booming sector increases the demand for labor and so does the service sector in order to meet the needs of the booming sector, the non-booming sector pays higher local prices for both services and labor to the detriment of their business, and deals with shortages from the increased

boom and booming service demand. It sounds familiar, even with the economic jargon.

My brother-in-law is flying in his farming help from South Africa because no local labor is available. It's not an inexpensive venture. Across North Dakota, railroads have increased rail rates and local elevators can hardly get grain cars on the tracks laden with oil tankers to get the grain to market. It forced shutdowns and slowdowns of the state's mill and elevator in Grand Forks and sugar beet plants in the Red River Valley. A long standing livestock sale barn in Minot was scrapped to make room for boom sector infrastructure. These are economic symptoms of the Dutch Disease. History shows it has caused the diminishment of pre-boom manufacturing and agriculture in other countries.

Ways to treat the disease, according to lessons from others, include investments in education and infrastructure for the non-booming sector of agriculture. Some countries have outright supports for the non-booming sector. Many nations have large savings funds to hold the taxes and revenues collected from the booming sector to insulate their economy for future generations and protect them from overheating the economy to the detriment of their historical agricultural and manufacturing sectors. Norway's $800 billion sovereign wealth fund is one I got to study to some extent in my Bush Foundation Fellowship.

It's interesting economics, worth reading about in the Economist or the Wall Street Journal when it comes to a dusty mailbox three and a half miles from a remote ranch. Better yet, worth discussing by policy makers who, first, realize the symptoms, and, second, believe that both agriculture and oil, as well as tourism, technology and manufacturing, are worth having as contributors to the North Dakota economy.

It's nice to have a new dance partner (oil), but remember the old adage that also instructs us to dance with the one who brought us (agriculture).

People and Oil, and Stories

Towner, N.D. — I grew up in a community, and in a family, with a strong appreciation for stories and the storytelling culture. It may be a cowboy trait that gives birth to cowboy poetry and music and the gatherings at brandings where a lot of folks who'd rather take a beating than step in front of a microphone entertain others with tremendous storytelling talent.

My father was one of those soft spoken cowboys who was full of good stories. One of my favorites was about a colt he raised on the ranch that was a year or two old when he was drafted into the army in WWII and went to fight and serve in the South Pacific. By the time he came home

from the war years later that colt was plenty big, a big one to geld and a big one to break.

He got him broke and a nearby rancher named Morris decided he wanted to own that big gelding. He asked Dad how much he wanted for the horse and Dad told him $75, a decent sum in the late 1940's. Morris dug a check out of his pocket that was written to him for $1,200.

He asked Dad if he could cash that check so he could buy that horse. Dad looked at him and said, "Hell, if I could cash a $1,200 check, I wouldn't be selling the horse!"

That's an honest piece of cowboy logic about buyers and sellers, and ranch finance.

Stories of Norway and oil

I thought about the stories that make up a places economic history when I was in Norway on my Bush Fellowship to study that country's successful practices and policies in oil development.

They have many. There's the story of the geologist in the early stages of analysis who completely discounted the possibility of their being any oil off Norway's shore beneath the sea. He confidently claimed he would drink all the oil that anyone would bring up from the Norwegian Continental Shelf. Lucky for him, 37 billion barrels of oil and gas (in oil equivalents) later, no one held him to it.

A famous letter in the Oil Museum in Stavanger, Norway, is that from Phillips Petroleum in 1962 requesting an exclusive license to explore and develop the Norwegian Continental Shelf. History records the offer to have been $160,000 per month for that exclusive right. Wisely, the government and leaders declined the offer, and they now have some $800 billion in a sovereign wealth fund belonging to all Norwegians derived solely from oil taxes and revenues.*

As another story goes, a fellow Scandinavian country had a similarly low offer for exclusivity at a point in their history. Their chief negotiator, under the influence of a fair bit of alcohol, accepted the offer, and, so, that country has realized a lot less benefit from their petroleum in comparison to Norway. I don't mention the country by name because I was only told the Norwegian version of the story by a friend over a shotglass of aquavit and I can't cite any academic sources for it!

Drawing lines between nations under the sea, spawned another story directly related to the offshore oil field called Ekofisk that I was fortunate

* These figures date to 2013, today the Norwegian sovereign wealth fund is $882 billion.

enough to visit, thanks to the hospitality of Conoco Phillips and their helicopter, on my trip to Norway.

By negotiating a starting point beyond their physical shoreline for the demarcation of the boundary with the United Kingdom that put British oil on one side and Norwegian oil on the other, Norway found itself just inside the line for its first major productive oil field, Ekofisk, a field that continues to produce superbly today as technology and recovery methods advance and evolve. I'm guessing the Norwegian negotiator was both shrewd, and sober, when he struck that deal.

North Dakota's Storied History

When the story of North Dakota's oil history is written, it will revolve around some often repeated stories as well, I'm sure. The story of the Iverson well near Tioga that started it all is sure to be among them. I have a copy of a Life magazine from Aug. 13, 1951, with a story headlined "Wheatland Oil Boom," complete with photos of the "Wildcat Headquarters" at Bismarck's Grand Pacific Hotel and of an oilman bargaining with a North Dakota farmer sitting on the seat of his tractor.

Individual farms and ranches will likely have stories of regret when their mineral rights were sold outright to get them through a hard time. Others will have stories of gladness of mineral rights leased and royalties retained to benefit generations forward.

Will the stories of North Dakota's policymakers who were in charge during this boom be stories of wise negotiating and policy-setting on behalf of the all its people, and their children and grandchildren? Or will it be a story told with eyes downcast of missed opportunities and a windfall sold short?

By studying, and sharing, the stories of Norway, afforded to me by the Bush Foundation and their fellowship awarded to me, I hope we'll write stories with happy endings, complete with a little pragmatic, Norwegian cowboy logic.

Chapter 17

Photographing the Bakken

Kyle Cassidy

> *The first thing which I recommend is to burn the wagons we have got, so that we may be free to march wherever the army needs, and not, practically, make our baggage train our general. And, next, we should throw our tents into the bonfire also: for these again are only a trouble to carry, and do not contribute one grain of good either for fighting or getting provisions. Further, let us get rid of all superfluous baggage, save only what we require for the sake of war, or meat and drink, so that as many of us as possible may be under arms, and as few as possible doing porterage. I need not remind you that, in case of defeat, the owners' goods are not their own; but if we master our foes, we will make them our baggage bearers.*
>
> Xenophon, Anabasis

The fog froze on the trees last night.

As it crept slowly through Tioga, crystal by crystal fog collided with trees, with the occasional building, with blades of grass, with fences and came to rest, and other crystals nestled next to them, and in the morning the world looked like a faerie palace, everything was white, encased in half an inch of frozen fog (Figure 1).

It's cold here in the western part of North Dakota. The coldest temperature ever recorded in the Bakken was in February of 1936 where, in the sleepy town of Parshall, population 1,929, part of the Fort Berthold Indian Reservation, just a few miles from where we are right now, the mercury fell to sixty-degrees below zero.

And there are winds here too. After these winds caused the great dustbowl of 1934 by blasting the topsoil into the air, killing everything and driving vast numbers of people west form the planes into California, New Mexico, and Washington looking for work in the greatest migration this country has ever known, the federal government planted shelter belts of trees to keep it from happening again – they grow in inexplicable rows

Figure 1. Capital Lodge near Tioga, ND.
Photo by Kyle Cassidy.

across the landscape. But in the 1970s and 80s as family farms began to become consolidated by large agro business, the shelter belts began to be cut down because they were obstacles for farm equipment that had to spend precious time navigating around them, so the winds are returning. These winds take the cold air and hurl it across the prairie. And it's not just the extreme cold, but the persistence. Once the temperature falls, it stays that way. On average, January temperatures move only between -2 and 15 with an average temperature of 7. In January of 2014 the temperature in Williston dipped into the negative double digits nine out of thirty-one days. The number of days with below freezing temperatures vacillates between 180 and 201 days out of the year.

On top of the persistence is the isolation; Toronto and Winnipeg all have climates similar to the Bakken, but they were designed and built as cities. There are things to do. In western North Dakota, in the winter, there's one thing to do: get oil out of the ground. The infrastructure exists for this and precious little else.

Apart from a constant drone of trucks which come, even in the early morning, at a rate of four or five a minute, and a slowly flapping American flag, the only thing moving in this Tioga Type II man camp is Clint Breeze, a 37-year-old over-land truck driver from Southern Idaho who moved here a year and a half ago to take a job hauling water and fracking fluid (Figure 2).

> "I moved my family out here 8 months ago," he says, "and it just wasn't working so I'm moving them back home today. It's nice to have the family together, but not a good place for them, nothing for them to really do." Clint's wife and three children spent days in a trailer provided by his employer while Clint worked regular shifts of 12 hours on, 12 hours off, 28 days in a row. The cold and the isolation got to them. Eight months was all they could take. Clint, like many workers in the oil patch is making money hand over fist, it's just a question of how long he can hold out.

So much of surviving here is in the preparation. Lewis and Clark arrived in North Dakota in October of 1804 and stayed for an entire miserable winter, erecting a high walled fort, meeting Sacagawea, and preparing for their demise by copying down all of the notes they'd made so far to send back to Saint Louis as soon as the thaw came.

Towards the end of April, Lewis climbed a bluff in present day Williston and observed "a most delightful view of the country, the whole of which except the valley formed by the Missouri is void of timber or underbrush, exposing the first glance of the spectacular, immense herds

Figure 2. Clint Breeze in his trailer near Tioga, ND.
Photo by Kyle Cassidy.

of buffalo, elk, deer, & antelopes feeding in one common and boundless pasture."

There are still elk and deer, though the buffalo seem to all be behind fences, raised as cattle ("too dry" remarks one local) there are still lots of other animals around. Pheasants, for one thing, seem to exist like pests, dotting nearly every field and continually darting in front of cars. As I'm dragging my suitcase into the SUV outside of the Roosevelt Inn in Watford City a truck blasts its horn three times and a mule deer bounds up into the parking lot, rushing past me before I can get my camera to my eye and loping off, looking for some place to call its own in what has become a residential patch on a hilltop.

Settled a hundred years after Lewis and Clark left, the town of Tioga occupies less than one and a half square miles. Its population quadrupled in the 1950s when oil was first discovered in Williston and at its largest, in the 1960s, slightly more than 2000 people lived there. It's big enough now to maintain a high school and a newspaper. Tioga means "peaceful valley" though there's not really one to be seen. It looks like a pool table.

Twenty two miles southwest of Tioga is the smaller town of Wheelock. Wheelock's population was at its height in the 1930s when there were more than a hundred people living there—by the 1990s that had dwindled to twenty-three. Now on its third wave of occupation, a smattering of houses and permanent structures are augmented by a series of RV's and trailers (Figure 3).

It's like the Salton Sea in its remoteness and the people who populate it; it sports a self-proclaimed mayor and a motorcycle club and every year hosts a legendary fourth of July party. Wheelock busted but it never boomed, from its founding in 1892 the number of inhabitants has hovered around 100, dipping to 23 or so at its low point in the 1990's but now mobile homes are springing up adding somewhat to the population. The town disincorporated in 1994. "The dogs outnumber the people here," says Samantha who lives in a small green house by the eastern edge of the town with her two daughters (Figure 4).

* * *

When scientists go to a place it is to find truth. When artists go to a place, I think, it is to find beauty. When artists and scientists work together they have the potential to produce that, rarest of all things: something which is both useful and beautiful.

North Dakota is a beautiful place—and a place filled with beauty—these are two different things. Everything that you see is abut the poetry of the intersection of people and landscape—from that mule deer in the motel parking lot to the very act of oil coming out of the ground which is

Figure 3. Truck, house and trailers. Wheelock, ND.
Photo by Kyle Cassidy.

Figure 4. Samantha and her two daughters outside their home. Wheelock, ND. Photo by Kyle Cassidy.

an amazing feat of chemistry, engineering, management and desperation —to the questions of providing for the people who do these things. These are thoughts on a grand scale: What makes a *town*? What's the difference between a *house* and a *home*? What do *people* need to stay *human*? What is *work*? And what can an employer expect from an employee?

This is a place filled with beautiful and terrible stories, with people who are happy and people who are living at the very edges of what a person will do to care for their family. Here, often, are the ends of stories that begin "I had no other choice...." and they're complicated—it can be a difficult place to raise a family, the working hours are long, but the money can be extremely good. People with engineering skills, the people who find the oil and drive the drill bits to their destination through miles of rock can make money at astounding rates, but for unskilled laborers the stories are often grim.

These are all the stories you have to work with; all influenced by the grand and empty landscape, by the cold, and by the isolation and by a nation hungry for oil.

Working with scientists also ties all your art to a very specific set of data points. You can't make a photograph and wonder five years later "whatever became of that group of houses?" because the scientists have tagged the GPS coordinates of every corner of each house in your photo and you can go back forty-five years later and find the sewage lines in the same place. Your art, you realize, is itself just a data point in a greater collection of *truth*. But if you're doing your job right, your data points are fuzzy, you tell the stories that are happy and sad at the same time, your work is hard to quantify, but it makes people pause while looking at the *data*, that in the truth of science, they might, for a moment, glimpse a greater, but impossible to grasp, truth about humanity.

About the Contributors

Carenlee Barkdull, PhD, LCSW, is associate professor and chair of the Department of Social Work at the University of North Dakota. Dr. Barkdull has numerous years of experience in the public and nonprofit sectors encompassing policy advocacy, administration, and community practice. Her involvement with the North Dakota Man Camp Project has led to a keen interest in the effects of extractive industries on vulnerable populations and the human service sector, especially child welfare and child and family wellbeing.

Karin L. Becker received her PhD in communication from the University of North Dakota. With a focus in health communication, her research explores provider-patient communication preferences among individuals with chronic pain and addresses the utility of computer-mediated communication as a mechanism to provide support for marginalized populations. While working as a researcher at the Center for Rural Health at the University of North Dakota School of Medicine and Health Sciences, she conducted community health needs assessments on critical access hospitals and facilitated strategic implementation planning sessions with hospitals located in the oil patch. She has over fifteen years of teaching experience and currently teaches in the School of Entrepreneurship at UND. Originally from Durango, CO, she is an avid hiker and landscape photographer but currently, her lens is focused on her son and daughter.

Nikki Berg Burin is an assistant professor of history and women and gender studies at the University of North Dakota. She received her PhD in history from the University of Minnesota in 2007. Nikki is working on a book project that puts the history of prostitution and sex trafficking in North Dakota in conversation with the commercial sexual exploitation of

women and children in the state today. Nikki also serves on the Advisory Committee for FUSE (North Dakota's anti-sex trafficking coalition).

Sebastian Braun is associate professor of anthropology and director of American Indian Studies at Iowa State University. He earned a lic. phil.I in ethnology, history, and philosophy from University of Basel and a PhD in anthropology from Indiana University. He is the author of *Buffalo Inc. American Indians and Economic Development* and editor of *Transforming Ethnohistories. Narrative, Meaning, and Community*. Among other publications, Braun has written the chapter on the United States for *The Indigenous World*, the yearbook of the International Work Group for Indigenous Affairs (IWGIA) since 2005. His interests lie in the intersections of ecology, economics, and politics.

William Caraher is an associate professor in history at the University of North Dakota. His took his PhD at Ohio State University in ancient history. He has directed archaeological project in Cyprus and worked extensively in Greece. He is the co-director of the North Dakota Man Camp Project with Bret Weber and the co-author of *Pyla*-Koutsopetria *I: Archaeological Survey of An Ancient Coastal Town* with R. Scott Moore and David K. Pettegrew.

Angela Cary is a proud North Dakotan and third-year graduate student at the University of North Dakota in Grand Forks. She will complete her master of arts degree in communication in 2016. This is Cary's second degree from UND—she also earned her BA in advertising and visual arts from the university in 1990. Cary's professional background is in television production. She spent seventeen years writing and producing commercials and promotional videos before making the decision to return to graduate school. She hopes to continue working as a communication instructor following her graduation from UND.

Kyle Cassidy is the author of the #1 bestselling art book *Armed America: Portraits of Gun Owners in Their Homes*, as well as 2012's *War Paint: Tattoo Culture & the Armed Forces*. He has published viral photo essays of Librarians, Occupy Wall Street protesters, Science Fiction authors and, in 2015, the scientists behind the New Horizons mission to Pluto. Find him online at kylecassidy.com as @kylecassidy on Twitter.

Kyle Conway taught at the University of North Dakota for six and a half years before joining the Department of Communication at the University of Ottawa in January 2015. He studies the ways people talk across

cultural or linguistic borders, and he asks whether and how they negotiate a common vocabulary. His books include *Everyone Says No: Public Service Broadcasting and the Failure of Translation* (2011), *Beyond the Border: Tensions Across the Forty-ninth Parallel in the Great Plains and Prairies* (coedited with Timothy Pasch, 2013) and Little Mosque on the Prairie *and the Paradoxes of Cultural Translation* (forthcoming).

Dr. **Simon Donato** is best known as the host of the Esquire Network's adventure sports television show *Boundless*. He is the founder of Adventure Science, a volunteer-based organization formed in 2008, which pairs scientists with adventure athletes and has since conducted over fifteen global projects exploring everything from archaeological ruins in Oman, to searching for missing people in New Mexico, to conducting exercise physiology projects on ultra-distance runners in the Canadian Rocky Mountains. When he's not racing or exploring, he spends his days running Stoked Oats, his gluten-free oatmeal company. He holds a PhD in Geology and lives in Canmore, Alberta.

Rebecca A. Dunham is the curator of collections and exhibitions at the Nora Eccles Harrison Museum of Art at Utah State University in Logan. Dunham specializes in modern and contemporary art, particularly works on paper and ceramic arts. Previously, she worked at Plains Art Museum, the Museum of Fine Arts in Houston, and two university-affiliated museums. She earned a BA in art history from the University of North Carolina at Chapel Hill, an MA in art history from the University of Florida, and completed PhD studies in art history and classical archaeology at the University of Missouri.

Julia C. Geigle, MSW, LGSW, has practiced in the areas of school social work and crisis stabilization, assessment, and counseling services for individuals with chemical and mental health issues. She obtained both her master's and bachelor of social work degrees from the University of North Dakota. Her thesis addressed the social impacts of western North Dakota's early twenty-first century oil boom.

John Holmgren received his Bachelor of Arts from Central Washington University in 2004, and in 2007 received his Master of Fine Arts in photography from the University of Minnesota in Minneapolis, Minnesota. In 2010 he accepted a position at Franklin & Marshall College in Lancaster, Pennsylvania. He has exhibited his work nationally and internationally and has been awarded many grants and awards.

Heather Jackson (MA, MPH) is from North Dakota. Now she resides in New England and works as a birth doula, case manager of pregnant and parenting teens, and early childhood education data collector. She is co-editor of *Feminist Parenting*, an anthology published by Demeter Press (demeterpress.org). Her writing has also been published on thepushback.org, hipmama.com, girl-mom.com, muthamgazine.com, and in many books and zines. She is also the single mother of a teenager, and she rides bike, goes to the beach, and plays guitar.

Ann Reed is a cultural anthropologist and adjunct assistant professor in the Department of World Languages and Cultures at Iowa State University. Her research interests have focused on the interface of political economy and culture, both in North Dakota and in Ghana. Since the 1990s, she has carried out long-term field research in Ghana on the construction of diaspora African identity, heritage tourism, globalization, and political economy. Her most notable publication to date is *Pilgrimage Tourism of Diaspora Africans to Ghana* (2014), but she has also published in *Museum Anthropology* and contributed book chapters for edited volumes on tourism, heritage, and diaspora from Palgrave MacMillan, Ashgate, Blackwell, and Routledge. She teaches courses in African and African American studies, anthropology, and international studies.

Andrew Reinhard publishes the work of the American Numismatic Society and previously served as publisher for the American School of Classical Studies at Athens. Educated at the University of Missouri-Columbia and the University of Evansville, he has excavated in Greece, Italy, Kansas, New Mexico, and Illinois. Andrew most recently led a team of "Punk Archaeologists" as they dug the now infamous "Atari Burial Ground" in Alamogordo, New Mexico, uncovering thousands of games while being filmed for a documentary. Reinhard now studies the intersection of archaeology and video games.

Dr. **Richard Rothaus** holds a BA from The Florida State University, an MA from Vanderbilt University and a PhD from The Ohio State University. Rothaus has pursued historical and archaeological research in North America, the Mediterranean, the Middle East, Asia, and Central America. Rothaus has been involved with Adventure Science since the beginning, and has traveled the world with some of his colleagues on the Badlands adventure. Rothaus is currently the Interim Vice Chancellor of Academic and Student Affairs for the North Dakota University System and a research assistant at the Center for Heritage Renewal at North Dakota

State University. Rothaus lives in Bismarck with his wife and youngest son; his older sons live in Minnesota and Washington.

Jessica Sobolik is director of alumni and community relations for the University of North Dakota School of Medicine and Health Sciences, which aims to educate physicians and other health professionals and to enhance the quality of life in North Dakota. She earned a Bachelor of Arts degree in Communication from UND and is currently pursuing a Master of Arts degree in the same field. She lives in Minto, ND, with her husband Ryan and two children, Josie and Luke.

Melissa Rae Stewart is a public relations professional and savvy entrepreneur, working in the endurance sport and outdoor industries. Founder of Sufferfest Media and Digitainment Group, as well as sports agent and publicist to various professional athletes, Melissa is a recognized and respected expert in the field of public relations. She has provided communications programming and support for various scientific expeditions throughout the globe.

Laura Tally is a 2014 graduate of Saint Catherine University with a B.S. in communication studies. Through the capstone class Global Search for Justice: Women and Work with economist Dr. Shika, she examined the intersection of domestic violence and the Bakken oil boom. The opportunity to educate her classmates and professors on this topic evolved into a commitment to share the stories of domestic violence survivors and service providers with dignity, relevance, and in a language both scholars and policy makers can use to effect change. She currently lives in rural Stevensville, Montana, and volunteers with SAFE in the Bitterroot.

Ryan Taylor is a fourth generation cattle rancher from Towner, ND. A graduate of North Dakota State University, Taylor wrote his "Cowboy Logic" column for twenty-one years for multiple agricultural newspapers and had them published in three separate books. Taylor was elected to the North Dakota Senate three times, serving from 2002 to 2012; was elected by his peers to be senate minority leader; and was the Democratic NPL candidate for governor in 2012. In 2013, he was named a leadership fellow of the Bush Foundation, St. Paul, MN. In August, 2015, he was appointed by the President to serve as state director for USDA Rural Development, making critical investments in the infrastructure of the state's rural communities. With his wife, Nikki, they are raising their three young children.

Bret A. Weber, PhD, LCSW, is an associate professor in the Department of Social Work at the University of North Dakota. His terminal degree is in U.S. History with emphases on twentieth century social policy and environmental history. As a member of the Grand Forks City Council, and as codirector of the North Dakota Man Camp Project (including service on the boards of the local Housing Authority and Community Land Trust), he focuses on social justice issues related to housing, and the social, physical, and economic environment.

Dr. Joshua E. Young is an assistant professor of communication studies at St. Gregory's University and a recent PhD graduate of the communication and public discourse program at the University of North Dakota. Young's research focuses on the way that rhetoric and public discourse create the relationships between and within communities. For instance, he has published work on budget struggles between university administration and other education stakeholders and presented work at the Smithsonian Institute on the contemporary relationship between non-Natives and American Indians in the context of powwow.

Hydraulically fractured

Unconventional gas and anthropology

Kim de Rijke
The author is a postdoctoral research fellow at the University of Queensland (UQ) in Australia. He has undertaken fieldwork in Alaska and Australia on notions of wilderness, a dam dispute, and native title rights to land and water. His current research project, funded by the UQ School of Social Science, involves coal seam gas disputes in the Australian states of Queensland and New South Wales. His email address is k.derijke@uq.edu.au.

Hydraulic fracturing, commonly referred to as 'fracking', is a controversial technique for recovering oil and gas from underground rock layers that has been available since the mid-20th century, but has not been commercially viable until this last decade. In conjunction with other technological advances such as horizontal drilling, fracking has helped to significantly increase unconventional gas production, initially and especially in the United States, but increasingly also in other countries around the world. In the context of global climate change, this technology has been heralded for its potential to provide a much cheaper and cleaner-burning energy source than coal and oil.

However, the operation of this technology is accompanied by major environmental issues ranging from its potential to cause environmental pollution to triggering seismic events. The governments of industrialized countries have so far been ill-equipped to provide the stricter regulation that these sophisticated techniques are said to require, and their adoption – especially in countries with weaker regulatory regimes – could pose a particular threat to human populations. These factors make this technology particularly controversial today.

In this paper, I begin by setting out some of the main aspects of global energy predictions, unconventional gas, and fracking. This provides context for discussion of disputes, anthropological research projects, and the limited published literature on the subject. Drawing on my ongoing research in the gas fields of Australia, in the third section of this paper I describe the conflicts surrounding the extraction of gas from coal seams in southern Queensland. This case material is presented thematically to illustrate the diversity of anthropological perspectives in the literature and the research currently underway.

Unconventional gas and global energy

The World Energy Outlook released by the International Energy Agency (IEA) in November 2012 includes a factsheet which opens with a pertinent warning that 'taking all new developments and policies into account, the world is still failing to put the global energy system onto a more sustainable path' (IEA 2012a: 1). This warning, a reference to both the environmental and social consequences of current energy production modes, is particularly salient in the light of projected demand. Disregarding for the moment the difficulty of making accurate predictions under changing conditions, from 2012 to 2035 global energy demand is projected to increase by over one third.

So-called 'unconventional' gas production is set to account for nearly half the growth in global gas production to 2035 (IEA 2012a), with the share of unconventional gas potentially rising from 14 per cent in 2010 to 32 per cent in 2035 (see Fig. 1). These predictions give an indication of potential magnitude, but appear not to take into account a variety of factors affecting the economics of production, including high gas well depletion rates and associated cost increases, concerns about climate change and continued reliance on hydrocarbons, and increasing community opposition to technologies such as fracking.[1]

Unconventional gas is gas previously considered difficult to extract profitably. It is contained in deep underground shale formations, coal beds (referred to as coal seams in Australia), or in geological formations that are particularly impermeable (so-called 'tight' gas). Significant reserves of unconventional gas have been found around the world in regions both sparsely and densely populated. In Australia, most coal seam gas fields are located on the populated eastern seaboard, in agricultural rural hinterlands relatively close to rural and urban centres.

Across the United States, Europe and Australia, diverse protest groups are emerging which take issue with the environmental consequences of the increased use of fracking in unconventional gas extraction. Despite local idiosyncrasies they share concerns about issues such as the industrialization of rural landscapes, food production, multinational corporate enterprise and community disempowerment, the potential for subterranean and surface water pollution, and future human and environmental health generally.

Although its safety has been questioned for some time (e.g. see Sumi 2005), an important impetus for the emergence of various protest groups was Josh Fox's 2010 Oscar-nominated activist documentary *Gasland*, filmed in the unconventional gas fields of the United States, which caused consternation around the world with its threatening images of pollution and combustible tap water.

Unconventional gas and fracking

Compared to conventional gas, unconventional gas extraction requires a greater density of wells (one or more per square kilometre) and thus much more infrastructure, including well pads, pipelines, compressor stations, processing plants, roads, and water treatment facilities. The scale of such operations has caused concern about its environmental impacts, including major changes to the landscape (see front cover image).

When gas flow needs to be increased, fracking is used to 'stimulate' the underground layers in which the gas is trapped. Small fractures are created by pumping fracking fluid (a combination of 98 per cent water, proppants – silica sand or manufactured granules which keep the fractures open – and numerous chemicals) into the shale or coal seam under enormous pressure. New drilling techniques allow these fractures to be created along horizontal lines, increasing the amount of obtainable gas per well (see Fig. 4).

Every fracked well may require up to 20 million litres of fresh water, 4,000 tons of proppants, and up to 200,000 litres of chemicals (IEA 2012a: 27; IEA 2012b: 33). In Australia, the Queensland state government intervened to ban the use of carcinogenic chemical compounds such as benzene, in fracking. Methane, the main component of natural gas, is a volatile and more potent greenhouse gas than carbon dioxide, and leakage may thus undermine the proponents' view of methane as a clean and transitional source of energy in the future. However, enticed by energy independence and security, many thousands of wells have

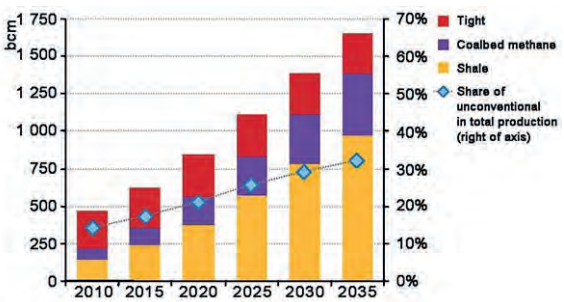

Fig. 1. *Projected unconventional gas production increases (IEA 2012b: 82).*

GREENSEFA / CC BY 2.0

Fig. 2. *Green Members of the European Parliament (MEPs) and anti-fracking activists pose with fracking-flavoured water outside European Parliament.*

been drilled in the United States thus far, and approximately 40,000 wells are planned in the Australian state of Queensland over the next few decades.

Much of the fracking fluid remains underground (50 to 80 per cent in shale operations), and may pollute poorly understood underground water resources. The fluids which flow back to the surface are also considered hazardous, including highly saline water and harmful compounds naturally occurring underground. Coal seams do not require the same level of stimulation as shale, but the coal seams must be dewatered to depressurize them and allow gas flow. In Australia, vast amounts of the resulting 'produced' water must be treated before release into the environment or re-injection into underground reservoirs. As a result of the controversies surrounding fracking, France has banned it, as did the state of Vermont in the United States, while many other places have seen the introduction of (temporary) moratoria on the use of fracking techniques until a variety of scientific risk studies are completed.

In summary, if the predicted increase in unconventional gas production eventuates, it is set to change global energy and attendant geopolitical relations. Increased conversion into LNG (Liquid Natural Gas) allows shipping of gas around the world, thus intensifying concerns where it is extracted and transported on a large scale. The required infrastructure needed to support unconventional gas extraction results in profound changes in the local landscape. Widespread public concern about the impacts of this industry have emerged, particularly with regard to fracking, surface and subterranean water, air pollution and a host of other environmental, social and health issues. In many regions, unconventional gas has been brought into production despite a poor understanding of its various potential impacts.

Research today

Energy has been of interest to the social sciences for a long time (e.g. Cottrell 1955; White 1943). However, interest in natural gas specifically has been awakened more recently as part of a portfolio of interests in the individual types of energy (e.g. Behrends et al. 2011 on oil) and in energy more broadly (e.g. Nader 2010; Spreng et al. 2012; Strauss et al. 2013).

Melosi (2010: 58) found that energy transitions historically 'are not simply exercises in swapping fuels and changing technologies, but disruptive events with the potential to remake societies in fundamental ways'. The challenge of research is to combine insights into the global and historical processes of energy production, consumption and distribution with the specific characteristics of the resource, its related technologies and the societies in which they are introduced.

A number of scholars are contributing to research on discursive framing and the political economy of fracking, which will usefully add to the broader anthropological literature on energy and 'energopolitics' (see e.g. Boyer 2011; Rogers 2011 for brief commentary). The volume by Strauss et al. (2013) *Cultures of energy: Power, practices, technologies* includes contributions on the ethnography and cultural understandings of energy, and its meaning, transformation and contest. One contribution by Elizabeth Cartwright considers the concept of eco-risk in the context of fracking. She considers risk at the intersection of 'particularly lived understanding' (drawing on Reno's [2011] work on risk, knowledge and emplacement), 'technologies of visualization and quantification' and legal standards (2013: 204). The health implications of fracking are under-researched and, she argues, any such research should engage with the enormous complexity of 'multimorbidity' (2013: 205-6) – the poorly understood interplay of multiple factors with regard to health. Cartwright's call to address complex relationships while also attending to technologies of quantification and regulatory frameworks is pertinent to other aspects of unconventional gas research, including, for example, the impact of fracking on subterranean water reservoirs or social well-being.

Sociological survey studies were published in the 2011 *Journal of Rural Social Science* special issue on unconventional gas in the United States, including analyses of key themes and variables in community perceptions of, and engagements with, unconventional gas developments.

While anthropologists have yet to fully engage these new developments, the 2012 American Anthropological Association's (AAA) annual meeting in San Francisco included an environmental anthropology panel entitled 'Energy, environment, engagement: Anthropological encounters with hydraulic fracking' and involved presentations of current research projects underway on fracking in parts of Ohio, Pennsylvania, New York State, Wisconsin and Australia. Projects cover topics such as contested landscape imaginaries and human-environment relations (Anna Willow), health and fracking discourse in the gas fields (Anastasia Hudgins), responses to fracking by affected farming communities (Jeanne Simonelli, see also Perry 2012), materiality and symbolic politics (Kim de Rijke), and the political ecology of frac sand mining and commodity chains (Thomas Pearson).

Two collaborative efforts involve a stronger applied character: a participatory film project to engender community dialogue on place and fracking (Amanda Poole) and the development of open-source collaborative information systems ('digital humanities') to enhance the documentation, sharing and collective analysis of stories from the gas fields (Sara Wylie). To facilitate cooperation among anthropologists working in this contested space, AAA panel members also created the new listserv 'Extr-act-ed'.

So, while anthropological literature on unconventional gas and fracking may as yet be limited, with these research projects underway and against a background of increased interest in the social sciences generally, this situation will likely soon change. Hopefully, research on gas company representatives, drillers, investors and others directly involved in this system of energy production – studying 'up, down and sideways' as Nader (2013: 317) argued – will allow for a richer understanding of fracking and unconventional gas disputes. Promising fields of enquiry include analyses of place and landscape imaginaries, discursive frames, and political economy. Collaborative applied research projects with affected communities have

the potential to make significant contributions to public engagement and debate.

Coal seam gas: An Australian case

Below follows my research into conflicts surrounding unconventional gas in Australia as a case study to illustrate the points made above.

Politics

In Australia, extractive industries exert considerable political influence, as evidenced in a highly effective industry advertising campaign against a proposed new federal tax on 'resource super profits', which contributed to the 2010 resignation of the then Prime Minister Kevin Rudd (cf. Wanna 2010). Similarly, in the United States, we had previously seen shale extraction exempted from aspects of federal laws including the Safe Drinking Water Act, the Clean Water Act, the Clean Air Act, and the Emergency Planning and Community Right-to-Know Act. How, then, should we understand the role of government regulation? The Australian state of Queensland might serve as an example.

Over the past few years, in the context of substantial state government debt, comparatively limited technical and human resource capacity, and revolving doors through which talented public servants may depart for well-paid industry employment, the Queensland government embraced a coal seam gas adaptive management strategy. While flexibility of regulation may be appropriate in fast-changing circumstances, the practical outcome of this approach is a reactionary regime which facilitates unconventional gas extraction.

In fact, a recent media investigation has alleged that severe political pressure was put on Queensland public servants over the implementation of gas project assessments. Multi-billion dollar projects are said to have been approved within short time-frames despite complaints by public servants about insufficient project details and environmental impact concerns (*The Courier Mail* 2013). In the context of acknowledged impact uncertainty and absent key performance indicators, the regulator has taken a 'learning by doing' approach which allows problems to become apparent before amendments are made (c.f. Swayne 2012). This looks like a questionable strategy when dealing with volatile substances, disputes and radical transformations of the landscape.

Discourse

In May 2011, the then premier of Queensland heralded the arrival of a new 'gas age'. Many billions of foreign capital investments and many thousands of new jobs linked unconventional gas extraction to the 'future prosperity' of Queensland. Echoing the findings of Finewood & Stroup (2012) with regard to neoliberal discourse in Pennsylvania, economic development and prosperity – also of rural resource regions historically in decline – are pervasive tropes of discourses arguing in favour of natural gas, whether employed by industry, governments or the wider public. In Queensland, rural communities with limited economic opportunities are indeed experiencing significant increases in economic activity after the introduction of gas fields. Many landholders have agreed to developments on their land because these provide a welcome additional income stream.

Public discourse often portrays natural resources as forms of wealth, such as 'liquid gold' (irrigation water), 'black gold' (oil) or 'buried sunshine' (coal). In certain areas, waste water is offered to farmers as irrigation water after recycling in reverse-osmosis plants. The life-giving force of water features prominently among coal seam gas companies in Queensland: images dominated by the green colours of irrigated trees on company-owned plantations adorn websites and speak to industry claims of methane as a clean transitional source of energy, supportive of environmental integrity and productivity.

In contrast, opponents use tropes of death, disease, and invasion. Aerial images of dense gas fields depict a diseased landscape in which human health and environmental integrity are said to be utterly compromised. These claims are supported by reports from various gas fields where affected residents have reported skin rashes, nosebleeds and a raft of other health complaints. Additional activist themes relate to future soil quality and food production (see Fig. 7) and a sense of nationalism played out in an ambiguous activist symbolic politics. Undertones of xenophobic politics, for example, appear in relation to concerns about unconventional gas and foreign, particularly Chinese, industries. Imagery may include references to invasion and Akubra hats (which represent 'the food producing farmer' or colloquial 'little Aussie battler'), and future generations (see Figs 5-6).

The alignment of environmental activists and largely conservative farmers is particularly ambiguous because most commercial farming operations in or near the Queensland gas fields are best understood as agribusinesses. Agribusiness in the fertile black soil regions of the Darling Downs in southern Queensland, for example, is characterized by advanced technological production methods including GPS navigation of machinery, GM (genetically modified) crops, laser-levelled land, and, at least historically, substantial water use. More appropriately represented by the industrial 'hard hat' than the historical Akubra hat, these enterprises have themselves led to severe concerns about the environmental impact of certain farming practices on soil quality and underground aquifers, particularly the vast subterranean reservoir known as the Great Artesian Basin.

Rights

The symbolic acts revolving around the small Aussie battler also refer to concerns about rights. In Australia, the state owns the underground resources. Landowners with freehold title therefore cannot stop resource extraction. But they can lock their gates to frustrate company access. Established in 2010, The Lock the Gate Alliance has become the overarching anti-coal seam gas network in Australia. In less than three years it has developed international links and represents 167 smaller member groups with more localized activist agendas across the country.

Other Australian titles to land, such as Native Title, afford Aboriginal people the right to negotiate agreements with extractive industries, but this does not afford them the right to stop extraction should they wish to do so. This right is vested only in the state and federal governments. Local (municipal) governments too are to a large degree by-passed in decision-making, although they do face the local consequences. Lastly, similar to the situation in the US, companies negotiate individual agreements with landholders which might include confidentiality clauses that prevent public discussion about the terms of compensation and other arrangements.

The extraordinary expansion of the unconventional gas industry has thus led to questions about social power and the rights of individuals and local communities, the role of multinational corporations in politics and rural service provision, as well as related questions regarding fundamental processes of democracy, capitalist economies and social justice.

The material qualities of gas and fracking

In his work on oil, gas and corporate social technologies in Russia, Rogers (2012: 293) called on anthropologists to

1. The prediction, rather, is based on what the IEA calls 'the Golden Rules Case' in which gas industries appropriately address current concerns about environmental and social impacts (IEA 2012b: 9).

attend 'ethnographically to the ways in which particular qualities of these materials enter broader, and heavily politicized, fields of signification'. The material qualities of unconventional gas, fracking, and associated aspects such as pipelines, processing and export facilities, large machinery, industrial traffic and work camps are important if we are to understand current conflicts, including their discursive dimensions.

Methane is a volatile, highly flammable, odourless, and invisible substance which requires sophisticated technologies to contain (cf. Kaup 2008: 1736). In the process of extraction, methane is associated with other dangerous gases such as hydrogen sulphide (it is technically categorized as 'sour' gas where the proportion of hydrogen sulphide is significant and as 'sweet' gas where it is not).

Unless methane is mixed with hydrogen sulphide in the open air in sufficient concentration, in which case it can be smelled, humans can often only detect natural gas with technological devices (see Fig. 9). It generally produces no sound and cannot be felt unless transformed into a liquid; yet emissions of gaseous compounds associated with the extraction process are reported in gas fields in Queensland and America as accompanied by headaches and other physical reactions. During my fieldwork some affected residents reported severe anxiety about the possibility of ubiquitous but invisible substances in their day-to-day lives and environments. Others travelled the gas field region during recent floods to inspect for otherwise indiscernible bubbles that might indicate methane emissions.

Unconventional gas originates deep underground and is the product of organic decay. In that way it is the antithesis of oxygen, which is both a product and source of growth, and which methane requires in order to burn and release the energy we seek. Apart from places such as swamps and garbage dumps, subterranean natural gas is generally contained in, and by relatively stable underground geological formations.

To release unconventional gas, such stability must often be physically fractured, allowing gas to cross or diffuse those boundaries. Methane may leak from pipes and associated infrastructure, becoming what are called 'fugitive emissions'. It might 'migrate' through underground layers and contaminate aquifers or surface water, air and soils. In the process of coal seam gas extraction it must be separated from highly saline 'produced' water. It must then be compressed, chilled and converted into a liquid (LNG) to transport effectively.

These material qualities make unconventional gas an agent of change both underground and at the surface. These forms of change have a profound sensory dimension; visual, auditory, as well as olfactory. In combination with technological interventions like fracking, gas can become – in a classic Mary Douglas way – 'matter out of place'; its material qualities contribute to a sense of anxiety as it escapes above ground into the inhabited environment (cf. Jackson 2011). Such anxieties also explain the international outcry over images of dangerous material boundary crossings, including those of combustible tap water in *Gasland*.

Simultaneously, the technical capabilities to contain gas through pipes, compression, and industrial networks, also speak to cultural imaginaries of power and submission of the natural world, inspiring economic development, growth and wealth creation. Gas company websites, for example, include promotional images of complex and well maintained infrastructure. In Queensland public debates, the technological capacity to capture and develop a multi-billion dollar industry on a materially elusive substance is linked to human endurance and community perseverance in economically challenging times. Such discursive strategies draw on the material qualities of steel and complex technologies of containment, but obfuscate others, including those concerned with fracking, uncertainty and vulnerability.

Risk, knowledge and the politics of science

As implied above, and addressed specifically by Cartwright (2013), a significant part of the conflict over unconventional gas in Queensland revolves around risk, with concomitant discussions about the precautionary principle, the acceptability of impacts, and views of science as the pursuit of objective truths.

In conflicts such as these, however, the social dynamics of establishing trust, credibility, and measuring risk as part of lived experience are of the essence. Environmental activists, for example, often have an ambigious relationship with science as they negotiate, both internally and externally, the politics of esoteric expertise and 'lay' forms of knowledge based on daily embodied activity (c.f. Checker 2007; Delgado 2010; Satterfield 1997; Yearly 1996).

Public credibility of scientific knowledge may be compromised where industry funds university research programmes and specialized institutes directly. This raises ethical concerns that wealthy companies may unduly influence policy and the purview of research.

Generally, academic research into the contentious aspects of unconventional gas extraction, whether publicly funded or not, instantly becomes subject to criticism and debate far beyond the circles of academia. Digital fora bring together information from across the globe, whether on fracking, companies, politics, family stories or local blockades.

Conclusion

With energy demand rising, fossil fuel consumption is projected to increase in the coming decades. Calls for reductions in emissions in the light of climate change may not put a stop to this. Celebrated by proponents as a clean and transitional fuel, unconventional gas is envisaged to meet a significant part of this growing demand, despite high rates of well depletion and increasing cost. However, as we have seen, the unconventional gas industry has been the subject of intense conflicts around the world especially in relation to its controversial production technologies that have the potential to pollute the environment and profoundly transform landscapes.

Technologies may be invented or adjusted to help contain and mitigate the adverse effects of its deployment on the societies where it operates. Nevertheless, disputes about the potential social and environmental ramifications of this technology may not be fully contained, and anthropologists would do well to research this topic from a variety of perspectives, some of which I have touched upon above.

I have highlighted the material qualities of gas and fracking that inform the diverging attitudes and discursive frames surrounding its production and utility. Expansion of this industry is accompanied by key tropes of economic growth, investment and the promise of future prosperity. However, close relationship between governments and powerful multinational corporations brings to the fore questions about political influence and human rights.

Anthropology, with its commitment to understanding local individuals and groups in their holistic cultural contexts is well suited to contribute to these debates surrounding gas extraction and energy. Whether we seek to offer socio-cultural analyses as publicly funded academics, as social impact consultants for governments or industry, as journalists, or as activists aligned with protest movements, the unconventional gas boom presents important conundrums to attend to. ●

Edited by Brian John Hoskins, Imperial College London, London, United Kingdom, and approved January 30, 2015 (received for review November 16, 2014)

Before the Syrian uprising that began in 2011, the greater Fertile Crescent experienced the most severe drought in the instrumental record. For Syria, a country marked by poor governance and unsustainable agricultural and environmental policies, the drought had a catalytic effect, contributing to political unrest. We show that the recent decrease in Syrian precipitation is a combination of natural variability and a long-term drying trend, and the unusual severity of the observed drought is here shown to be highly unlikely without this trend. Precipitation changes in Syria are linked to rising mean sea-level pressure in the Eastern Mediterranean, which also shows a long-term trend. There has been also a long-term warming trend in the Eastern Mediterranean, adding to the drawdown of soil moisture. No natural cause is apparent for these trends, whereas the observed drying and warming are consistent with model studies of the response to increases in greenhouse gases. Furthermore, model studies show an increasingly drier and hotter future mean climate for the Eastern Mediterranean. Analyses of observations and model simulations indicate that a drought of the severity and duration of the recent Syrian drought, which is implicated in the current conflict, has become more than twice as likely as a consequence of human interference in the climate system.

drought | Syria | climate change | unrest | conflict

Beginning in the winter of 2006/2007, Syria and the greater Fertile Crescent (FC), where agriculture and animal herding began some 12,000 years ago (1), experienced the worst 3-year drought in the instrumental record (2). The drought exacerbated existing water and agricultural insecurity and caused massive agricultural failures and livestock mortality. The most significant consequence was the migration of as many as 1.5 million people from rural farming areas to the peripheries of urban centers (3, 4). Characterizing risk as the product of vulnerability and hazard severity, we first analyze Syria's vulnerability to drought and the social impacts of the recent drought leading to the onset of the Syrian civil war. We then use observations and climate models to assess how unusual the drought was within the observed record and the reasons it was so severe. We also show that climate models simulate a long-term drying trend for the region as a consequence of human-induced climate change. If correct, this has increased the severity and frequency of occurrence of extreme multiyear droughts such as the recent one. We also present evidence that the circulation anomalies associated with the recent drought are consistent with model projections of human-induced climate change and aridification in the region and are less consistent with patterns of natural variability.

Heightened Vulnerability and the Effects of the Drought

Government agricultural policy is prominent among the many factors that shaped Syria's vulnerability to drought. Despite growing water scarcity and frequent droughts, the government of President Hafez al-Assad (1971–2000) initiated policies to further increase agricultural production, including land redistribution and irrigation projects, quota systems, and subsidies for diesel fuel to garner the support of rural constituents (5–9). These policies endangered Syria's water security by exploiting limited land and water resources without regard for sustainability (10).

One critical consequence of these unsustainable policies is the decline of groundwater. Nearly all rainfall in the FC occurs during the 6-month winter season, November through April, and this rainfall exhibits large year-to-year variability (Figs. 1*A* and 2*A*). In Syria, the rain falls along the country's Mediterranean Sea coast and in the north and northeast, the primary agricultural region. Farmers depend strongly on year-to-year rainfall, as two thirds of the cultivated land in Syria is rain fed, but the remainder relies upon irrigation and groundwater (11). For those farms without access to irrigation canals linked to river tributaries, pumped groundwater supplies over half (60%) of all water used for irrigation purposes, and this groundwater has become increasingly limited as extraction has been greatly overexploited (4). The government attempted to stem the rate of groundwater depletion by enacting a law in 2005 requiring a license to dig wells, but the legislation was not enforced (6). Overuse of groundwater has been blamed for the recent drying of the Khabur River in Syria's northeast (6). The depletion of groundwater during the recent drought is clearly evident from remotely sensed data by the NASA Gravity Recovery and Climate Experiment (GRACE) Tellus project (Fig. 2*C*) (12).

The reduced supply of groundwater dramatically increased Syria's vulnerability to drought. When a severe drought began in 2006/2007, the agricultural system in the northeastern "breadbasket" region, which typically produced over two-thirds of the country's crop yields, collapsed (13). In 2003, before the drought's onset, agriculture accounted for 25% of Syrian gross domestic product. In 2008, after the driest winter in Syria's observed record, wheat production failed and the agricultural share fell to 17% (14). Small- and medium-scale farmers and herders

Significance

There is evidence that the 2007–2010 drought contributed to the conflict in Syria. It was the worst drought in the instrumental record, causing widespread crop failure and a mass migration of farming families to urban centers. Century-long observed trends in precipitation, temperature, and sea-level pressure, supported by climate model results, strongly suggest that anthropogenic forcing has increased the probability of severe and persistent droughts in this region, and made the occurrence of a 3-year drought as severe as that of 2007–2010 2 to 3 times more likely than by natural variability alone. We conclude that human influences on the climate system are implicated in the current Syrian conflict.

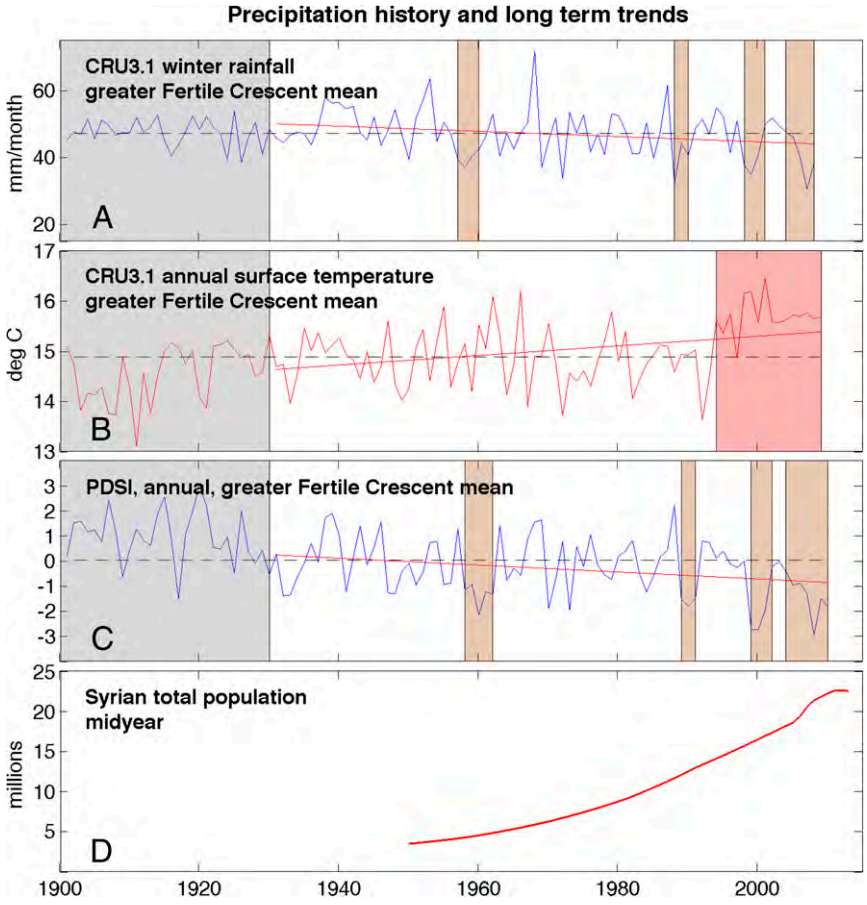

Fig. 1. (*A*) Six-month winter (November–April mean) Syria area mean precipitation, using CRU3.1 gridded data. (*B*) CRU annual near-surface temperature (red shading indicates recent persistence above the long-term normal). (*C*) Annual self-calibrating Palmer Drought Severity Index. (*D*) Syrian total midyear population. Based on the area mean of the FC as defined by the domain 30.5°N–41.5°N, 32.5°E–50.5°E (as shown in Fig. 2). Linear least-squares fits from 1931 to 2008 are shown in red, time means are shown as dashed lines, gray shading denotes low station density, and brown shading indicates multiyear (≥3) droughts.

suffered from zero or near-zero production, and nearly all of their livestock herds were lost (15). For the first time since self-sufficiency in wheat was declared in the mid-1990s, Syria was forced to import large quantities of wheat (13). The drought's devastating impact on vegetation is clearly evident in Moderate Resolution Imaging Spectroradiometer (MODIS) Normalized Difference Vegetative Index (NDVI) version 5 satellite imagery (Fig. 2*D*) (16). Atieh El Hindi, the director of the Syrian National Agricultural Policy Center, has stated that between 2007 and 2008, drought was a main factor in the unprecedented rise in Syrian food prices; in this single year, wheat, rice, and feed prices more than doubled (17, 18). By February of 2010, the price of livestock feed had increased by three fourths, and the drought nearly obliterated all herds (16, 19). There was a dramatic increase in nutrition-related diseases among children in the northeast provinces (20), and enrollment in schools dropped by as much as 80% as many families left the region (21). Bashar al-Assad, who succeeded his father in 2000, shifted to liberalizing the economy by cutting the fuel and food subsidies on which many Syrians had become dependent. These cuts continued despite the drought, further destabilizing the lives of those affected (22). Rural Syria's heavy year-to-year reliance on agricultural production left it unable to outlast a severe prolonged drought, and a mass migration of rural farming families to urban areas ensued.

Estimates of the number of people internally displaced by the drought are as high as 1.5 million (3, 4, 13). Most migrated to the peripheries of Syria's cities, already burdened by strong population growth (~2.5% per year) and the influx of an estimated 1.2–1.5 million Iraqi refugees between 2003 and 2007, many of whom arrived toward the tail end of this time frame at the beginning of the drought and remained in Syria (23). By 2010, internally displaced persons (IDPs) and Iraqi refugees made up roughly 20% of Syria's urban population. The total urban population of Syria in 2002 was 8.9 million but, by the end of 2010, had grown to 13.8 million, a more than 50% increase in only 8 years, a far greater rate than for the Syrian population as a whole (Fig. 1*D*) (24). The population shock to Syria's urban areas further increased the strain on its resources (11).

The rapidly growing urban peripheries of Syria, marked by illegal settlements, overcrowding, poor infrastructure, unemployment, and crime, were neglected by the Assad government and became the heart of the developing unrest (13). Thus, the migration in response to the severe and prolonged drought exacerbated a number of the factors often cited as contributing to the unrest, which include unemployment, corruption, and rampant inequality (23). The conflict literature supports the idea that rapid demographic change encourages instability (25–27). Whether it was a primary or substantial factor is impossible to know, but drought can lead to devastating consequences when coupled with preexisting acute vulnerability, caused by poor policies and unsustainable land use practices in Syria's case and perpetuated by the slow and ineffective response of the Assad regime (13). Fig. S1 presents a timeline summarizing the events that preceded the Syrian uprising.

(*D*) The difference in the Normalized Difference Vegetation Index (NDVI) between 2008 (annual) and the mean of the previous 7 years.

The Drought in Context

Having established Syria's vulnerability to droughts, we now examine the 2007–2010 drought itself. The severity and persistence of the drought can be seen in the area mean of FC rainfall according to the University of East Anglia Climatic Research Unit (UEA CRU) data (Fig. 1*A*) and in the two Global Historical Climatology Network (GHCN) stations located closest to Syria's northeastern agricultural region, Deir ez-Zor on the Euphrates River and Kamishli near the Turkish border (*Materials and Methods*). The 2007/2008 winter was easily the driest in the observed records. Multiyear drought episodes, here defined as three or more consecutive years of rainfall below the century-long normal, occurred periodically over the last 80 years (CRU), in the late 1950s, 1980s, and 1990s (Fig. 1*A*, brown shading). Although less severe, these droughts raise the question of why the effects of the recent drought were so much more dramatic. We offer three reasons: (*i*) the recent demand for available resources was disproportionately larger than in the 1950s; in addition to the recent emphasis on agricultural production, the total population of Syria (Fig. 1*D*) grew from 4 million in the 1950s to 22 million in recent years; (*ii*) the decline in the supply of groundwater has depleted the buffer against years with low rainfall; and (*iii*) the recent drought occurred shortly after the 1990s drought, which was also severe; Syria was far more vulnerable to a severe drought in the first decade of the 21st century than in the 1950s, and the FC never fully recovered from the late 1990s drought before collapsing again into severe drought. In fact, the region has been in moderate to severe drought from 1998 through 2009, with 7 of 11 years receiving rainfall below the 1901–2008 normal. It is notable that three of the four most severe multiyear droughts have occurred in the last 25 years, the period during which external anthropogenic forcing has seen its largest increase.

Regional Climate Variability and Trend

Agriculture in Syria depends not only on the precipitation that falls within Syria and on local groundwater but also on water from the Euphrates and Tigris rivers and their numerous tributaries. These rivers have long provided water to the region via precipitation in their headwaters in the mountains of eastern Turkey. Despite Turkey's control over the water flows of the Euphrates and Tigris through its upstream placements of dams, Syria and Turkey have cooperated in recent years, and Turkey increased water flow to Syria during the recent drought (28). It has been previously shown that natural winter-to-winter rainfall variability in western Turkey is due largely to the influence of the North Atlantic Oscillation (NAO) (29). For eastern Turkey and in Syria and the other FC countries, however, the NAO influence is weak or insignificant. This has allowed observational analyses to identify an externally forced winter drying trend over the latter half of the 20th century that is distinguishable from natural variability (30–32). Furthermore, global coupled climate models overwhelmingly agree that this region will become drier in the future as greenhouse gas concentrations rise (33), and a study using a high-resolution model able to resolve the complex orography of the region concluded that the FC, as such, is likely to disappear by the end of the 21st century as a result of anthropogenic climate change (34).

That the neighboring regions of southeast Turkey and northern Iraq also experienced recent drought, to a lesser extent, perhaps begs the question as to why the effects in Syria were so grave. Syria was far more vulnerable to drought, given its stronger dependence on year-to-year rainfall and declining groundwater for agriculture. Water scarcity in Syria has been far more severe than in Turkey or Iraq, with Syria's total annual water withdrawal as a percentage of internal renewable water resources reaching 160%, with Iraq at 80% and Turkey at around 20% in 2011 (35). Furthermore, Turkey's geographic diversity and investment in the southeast region's irrigation allowed it to better buffer the drought, whereas the populace in northwest Iraq is far less dependent on agriculture than their counterparts in northeast Syria (36, 37).

To address the question of whether the recent drought was made more severe by a contribution from long-term trends, we first determined the long-term change in winter rainfall. The FC as a whole has experienced a statistically significant ($P < 0.05$) winter rainfall reduction (13%) since 1931 (Fig. 1*A*). Observational uncertainty was large before 1930 due to sparseness of station data. Further examination of the linear trends present in the individual GHCN stations for the FC corroborate the drying trend, as 5 of 25 stations exhibited a statistically significant ($P < 0.1$) negative rainfall trend (Fig. 2*B*). The pattern of this trend (Fig. 2*B*) is similar to the climatological rainfall pattern (Fig. 2*A*), concentrated along the coast and in northeastern Syria. The long-term drying trend is closely mirrored by recent changes in satellite measurements of groundwater (measured in terms of liquid water equivalent) (Fig. 2*C*) and, to a lesser extent, by estimates of vegetation changes (Fig. 2*D*).

The annual surface temperature in the FC also increased significantly ($P < 0.01$) during the 20th century (Fig. 1*B*). The warming in this region since 1901 has outpaced the increase in global mean surface temperature, with much of this increase occurring over the last 20 years (all years from 1994 through 2009 were above the century-long mean) (Fig. 1*B*, red shading). The trend during the summer half year (1.2 degrees, Fig. S2) is also important, as this is the season of highest evaporation, and winter crops such as wheat are strongly dependent on reserves of soil moisture. Reductions in winter precipitation and increases in summer evaporation both reduce the excess of precipitation over evaporation that sustains soil moisture, groundwater and streamflow. The recent strong warming is concomitant with the three most recent severe multiyear droughts, together serving to strongly dry the region during winter and summer.

The century-long, statistically significant trends in both precipitation and temperature seen in Fig. 1 suggest anthropogenic influence and contributed to the severity of the recent drought. The FC area mean of the self-calibrating Palmer Drought Severity

Index (38), which combines precipitation and temperature as a proxy for cumulative soil moisture change, also exhibits a significant long-term trend (Fig. 1*C*). Although natural variability on timescales of centuries or longer cannot be entirely ruled out for this region, the long-term observed trends and the recent increase in the occurrence of multiyear droughts and in surface temperature is consistent with the time history of anthropogenic climate forcing. The case for this influence is supported by additional modeling and theoretical and observational evidence (see *Frequency of Multiyear Droughts*, *Mechanisms*, and *Supporting Information*).

Frequency of Multiyear Droughts

For Syria and for the greater FC, natural multiyear droughts—here defined as three or more consecutive years of rainfall below the long-term normal—occurred periodically during the 20th century (Fig. 1*A*). It is a generic property of a time series consisting of a natural oscillatory part and a downward trend that the minimum is most likely to occur toward the end of the time period when the negative influence of the trend is greatest and when the oscillation is also at a minimum. The century-long trends in precipitation and temperature, here implicated as evidence of anthropogenic influence, point toward them being key contributors to the recent severe drought. We therefore estimated the increased likelihood of an extreme 3-year drought such as the recent one due to anthropogenic trend.

We did this in two ways. First we separated the observed anthropogenic precipitation trend from the residual, presumably natural, variability by regressing the running 3-year mean of observed (CRU) 6-month winter precipitation onto the running 3-year mean of observed annual global atmospheric carbon dioxide (CO_2) mixing ratios from 1901–2008 (39, 40). The latter time series was used as an estimate of the monotonic but nonlinear change in total greenhouse gas forcing (*Materials and Methods*). After removing the CO_2 fit from the total observed winter precipitation timeseries (Fig. 3*A*), we constructed frequency distributions of the total and residual timeseries (Fig. 3*B*) and applied gamma fits to the distributions. The difference in the total and residual distributions is significant ($P < 0.06$), based on a Kolmogorov–Smirnoff test, and is due almost entirely to the difference in the means. Thresholds are shown at 10%, 5%, and 2% (in percent of the total sample size of 76 3-year means) in the dry tail for the timeseries (Fig. 3*A*) and for the distribution of the total (Fig. 3*B*). The result is that, when combined, natural variability and CO_2 forcing are 2 to 3 times more likely to produce the most severe 3-year droughts than natural variability alone. Residual, or natural, events exceeding the 10% threshold of the total occur less than half as often (3 versus 8, out of 76). For the residual alone, no values exceed the 5% threshold of the total.

The trend contribution would be quite similar if we simply calculated a linear time trend. There is no apparent natural explanation for the trend, supporting the attribution to anthropogenic greenhouse gases. Further support comes from model simulations. We used 16 Coupled Model Intercomparison Project phase five (CMIP5) models (*Materials and Methods* and Table S1) to construct similar distributions, providing a larger sample size than for the observed 3-year droughts. In this case, rather than removing the CO_2 forcing as in the observed case, we compare the historical and historicalNat runs. The former include all external forcings during the 20th century, including the change in greenhouse gas concentrations, whereas the latter include only the natural forcings (*Materials and Methods*). In this analysis, the models were normalized to the observed CRU mean and standard deviation (SD) (see Fig. S3 for model comparison before normalizing). The resulting distributions support the observed finding, as the driest 3-year events occur less than half as often under natural forcing (historicalNat runs) alone (Fig. 3*C*). The agreement between the model and observational analysis

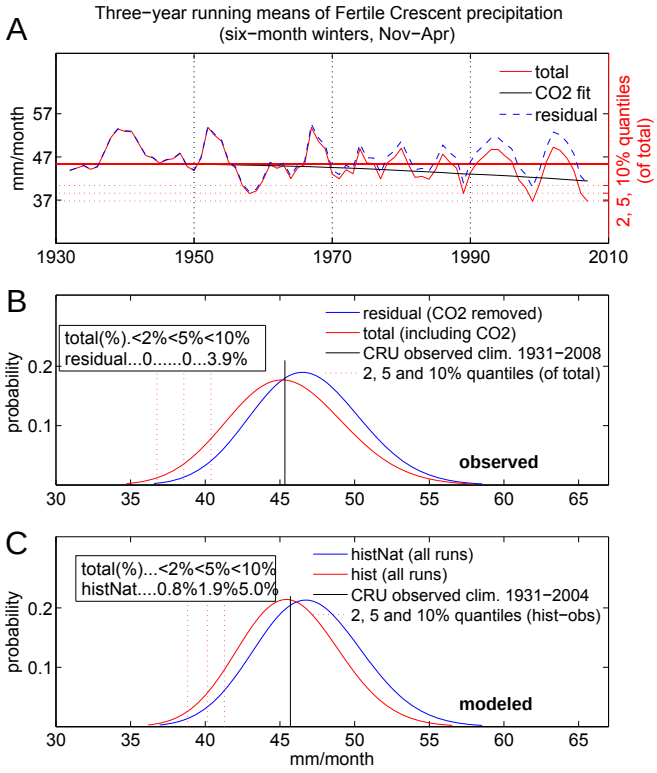

Fig. 3. (*A*) Timeseries of observed (CRU) 3-year running mean 6-month winter FC (area mean) precipitation: total (red), CO_2 fit from regression (black), and the residual or difference between these (dashed blue). Frequency distributions based on gamma fits of 3-year running mean 6-month winter FC (area mean) precipitation, for the (*B*) observed data (corresponding with above) and (*C*) CMIP5 model simulations, comparing historical and histNat runs. Quantile thresholds based on the total (in *B*) and historical (in *C*) are shown at 2%, 5%, and 10% (dotted lines). The tables indicate the percentage of actual (*B*) observed (sample size 76) and (*C*) model simulated (sample size 46 × 72 for histNat and 69 × 72 for historical) occurrences exceeding the respective thresholds.

results supports the attribution of the century-long negative trend in precipitation to the rise in anthropogenic greenhouse forcing and to the role of the latter in the devastating early 21st century Syrian drought.

Mechanisms

We examine the low-level (850 hPa) regional atmospheric circulation by comparing a composite of driest minus wettest winters (Fig. 4*B*) to the difference between the periods 1989–2008 and 1931–1950, representing the long-term change, or trend (Fig. 4*C*). Climatologically, the flow is from the west, bringing moist air (shading represents specific humidity) in from the Mediterranean Sea and allowing moisture convergence that sustains precipitation (Fig. 4*A*). In both the composite dry anomalies and the trend, the climatological westerly flow is weakened. In both cases, there is a positive geopotential height anomaly over the Mediterranean Sea (consistent with higher surface pressure) and an anomalous anticyclonic (clockwise) circulation (arrows). In the composite case, this anomaly extends over Turkey and beyond the eastern Black Sea, resulting in anomalous northeasterly flow over the FC, advecting dry air and generating anomalous moisture divergence. In the trend case, by contrast, the positive geopotential height anomaly does not extend over most of Turkey, and the flow anomaly is more northerly over most of the FC. This difference between the composite and trend anomalies can be seen in the specific humidity anomalies (Fig. 4 *B* and *C*,

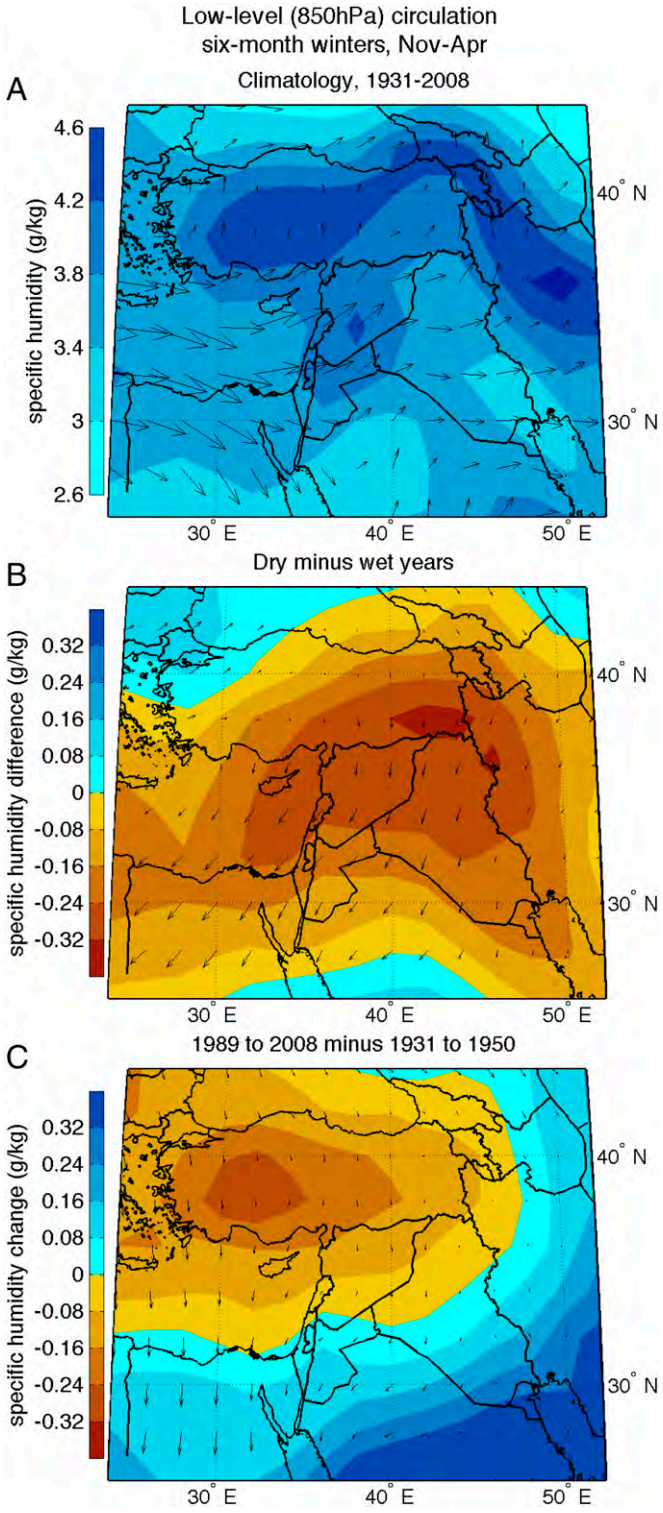

Fig. 4. The 6-month winter low-level (850 hPa) horizontal winds (arrows) and specific humidity (shading) for the period 1931–2008. Shown are the (*A*) climatology, (*B*) composite difference between driest and wettest years (those outside of ±1 SD) and (*C*) the change, or difference between the recent 20 years and the 20 years at the beginning of the period.

shading); in the composite, the center of the anomaly is located over the FC and southeastern Turkey and northern Syria, Iraq, and Iran, whereas in the trend case, it is centered over western Turkey. Thus, the trend in the circulation enhances drying in naturally occurring FC dry years by strengthening the northerly flow, dry air advection, and moisture divergence anomalies. In 2005–2008, the long-term trend combined with a dry phase of natural variability to produce the most severe drought in the instrumental record over the greater FC.

Summary

We have here pointed to a connected path running from human interference with climate to severe drought to agricultural collapse and mass human migration. This path runs through a landscape of vulnerability to drought that encompasses government policies promoting unsustainable agricultural practices, and the failure of the government to address the suffering of a displaced population. Our thesis that drought contributed to the conflict in Syria draws support from recent literature establishing a statistical link between climate and conflict (25–27). We believe that the technical challenges to this work (41) have been adequately answered (42, 43). A more fundamental objection (27) is that data-driven methods do not provide the causal narrative needed to anoint a "theory" of civil conflict, and the quantitative work on climate and conflict has thus far not adequately accounted for the effects of poor governance, poverty, and other sociopolitical factors. Our analysis of the conflict in Syria shows an impact of an extreme climate event in the context of government failure, exacerbated by the singular circumstance of the large influx of Iraqi refugees.

Multiyear droughts occur periodically in the FC due to natural causes, but it is unlikely that the recent drought would have been as extreme absent the century-long drying trend. We argued, with support from analyses of observations and climate model simulations, that the observed long-term trends in precipitation and temperature are a consequence of human interference with the climate system. The attribution to anthropogenic causes is also supported by climate theory and previous studies (see *Supporting Information*). Fortunately for this line of argument, this is a region where models compare reasonably well with 20th century observations in terms of simulation of the climatology of precipitation and its trend (44). The strong agreement between observations and climate model simulations in century-long trends in precipitation, temperature, and sea-level pressure (Fig. S4) adds confidence to the conclusion that in this region, the anthropogenic precipitation signal has already begun to emerge from the natural "noise" and that the recent drought had a significant anthropogenic component. It also implies that model future projections of continued drying for Syria and the FC are reliable.

An abundance of history books on the subject tell us that civil unrest can never be said to have a simple or unique cause. The Syrian conflict, now civil war, is no exception. Still, in a recent interview (45), a displaced Syrian farmer was asked if this was about the drought, and she replied, "Of course. The drought and unemployment were important in pushing people toward revolution. When the drought happened, we could handle it for two years, and then we said, 'It's enough.'" This recent drought was likely made worse by human-induced climate change, and such persistent, deep droughts are projected to become more commonplace in a warming world.

Materials and Methods

In this study, the winter and summer seasons are represented by the 6-month periods November through April and May through October, respectively. Timeseries of FC area means are here defined by the domain 30.5°N–41.5°N, 32.5°E–50.5°E (as shown in Fig. 2). Three datasets were used for observed precipitation: the UEACRU version 3.1 (46, 47) and Global Precipitation Climatology Centre v6 (48) gridded (0.5° by 0.5° horizontal resolution) precipitation data sets and the GHCN beta version 2 station precipitation data (49). CRU v3.1 was also used for observed surface temperature. We used 16 CMIP5 global climate models (Table S1) assessed in the Intergovernmental Panel on Climate Change Fifth Assessment Report. For the 20th century, we compare the "historical" using all forcings and "historicalNat" simulations including natural forcings only. To compare with 20th century observations,

we first linearly interpolated the models to the same 0.5° by 0.5° horizontal grid as the CRU observations. To determine the change due to trend, we applied linear least-squares fits, except in the case of the estimation of multiyear droughts, when regression onto global CO_2 mixing ratios was used. For the latter, this nonlinear detrending provided a more conservative estimate of the residual than linear detrending. We also examined the sensitivity of using global mean surface temperature rather than CO_2 and found almost no difference in the resulting residual. For analysis of the regional circulation, we used the Twentieth Century Reanalysis Project, with a horizontal resolution of 2° by 2° (50). For composites, dry and wet years are here defined as those outside of ±1 SD (based on the CRU 1931–2008 period).

ACKNOWLEDGMENTS. We thank Dr. Dipali Mukhopadhyay for her generous assistance and outstanding advice, as well as Yuma Shinohara for his assistance in creating Fig. S1. Thanks also go to Dr. Yotam Margalit and to Lina Eklund for feedback and advice, and to Dr. Tahsin Tonkaz for fieldwork support. We thank the Global Decadal Hydroclimate group at the Lamont–Doherty Earth Observatory and the Bulletin of Atomic Scientists for their support and funding. The authors were supported by the following grants: Office of Naval Research Award N00014-12-1-0911, National Oceanic and Atmospheric Administration Award NA10OAR4310137 (Global Decadal Hydroclimate Predictability, Variability and Change), and Department of Energy Award SC0005107. This is Lamont–Doherty Earth Observatory Contribution 7871.

Native American

GUESTS

WINONA LADUKE
longtime Native American activist and executive director of the group Honor the Earth.

While Democracy Now! was covering the Standing Rock standoff earlier this month, we spoke to Winona LaDuke, longtime Native American activist and executive director of the group Honor the Earth. She lives and works on the White Earth Reservation in northern Minnesota. She spent years successfully fighting the Sandpiper pipeline, a pipeline similar to Dakota Access. We met her right outside the Red Warrior Camp, where she has set up her tipi. Red Warrior is one of the encampments where thousands of Native Americans representing hundreds of tribes from across the U.S. and Canada are currently resisting the pipeline's construction.

TRANSCRIPT

This is a rush transcript. Copy may not be in its final form.

AMY GOODMAN: This is *Democracy Now!*, democracynow.org, *The War and Peace Report*. I'm Amy Goodman. While *Democracy Now!* was covering the standoff at Standing Rock earlier this month, on Labor Day weekend, we spoke to Winona LaDuke, longtime Native American activist, executive director of the group Honor the Earth. She lives and works on the White Earth Reservation in northern Minnesota. She spent years successfully fighting a pipeline similar to Dakota Access, the Sandpiper pipeline. We met her right outside the Red Warrior Camp, where she has set up her tipi. Red Warrior is one of the encampments where thousands of Native Americans, representing hundreds of tribes from across the U.S. and Canada, are currently resisting the pipeline's construction. Her tipi is painted with animals that are threatened by climate change. We began by asking Winona LaDuke why communities are now protesting the pipeline.

WINONA LADUKE: It's time to end the fossil fuel infrastructure. I mean, these people on this reservation, they don't have adequate infrastructure for their houses. They don't have adequate energy infrastructure. They don't have adequate highway infrastructure. And yet they're looking at a $3.9 billion pipeline that will not help them. It will only help oil companies. And so that's why we're here. You know, we're here to protect this land.

AMY GOODMAN: Explain what happened to the Sandpiper pipeline, the one that you protested, the one that you opposed.

WINONA LADUKE: What we opposed, yeah. So, for four years, the Enbridge company said that they absolutely needed a pipeline that would go from Clearbrook, Minnesota, to Superior, Wisconsin. That was the critical and only possible route. They proposed a brand-new route that would go through the heart of our best wild rice lakes and territory, skirting the reservations, but within our treaty territory. They did not consult with us, and they made some serious errors in their process. They underestimated what was going to happen there.

And so, for four years, we battled them in the Minnesota regulatory process, which is a process which is more advanced and slightly more functional than North Dakota's regulatory process, which, from what I can see, is largely nonexistent. And in that process, we attended every hearing. We intervened legally. We rode our horses against the current of the oil. We had ceremonies. And they cancelled the pipeline. That's what they did, after four years' very, very ardent opposition by Minnesota citizens, tribal governments, tribal people, you know, on that line.

And that pipeline, you know, big problem—we still have six pipelines in northern Minnesota to go to Superior, the furthest-inland port. But their new proposals are not going to happen there. Enbridge has said that they still want to continue with their proposals for line three. The first pipeline they want, they want to abandon. The beginning of a whole new set of problems in North America, the abandoning of 50-year-old pipelines, with no regulatory clarity as to who is responsible. And so we are opposing them on that, that they cannot abandon, and they cannot—they still cannot get a new route.

But when they announced that, you know, in my area, I could have said, "Hey, good luck, y'all. We beat it here. Good luck." You know? But, no, we said we're

going to follow them out here, too, because we believe that—you know, we could spend our lives fighting one pipeline after another after another, but someone needs to challenge the problem and say, "This is not the way to go, America. This is not the way to go for any of us." So, we came out here to support these people.

AMY GOODMAN: So talk about everyone who's out here.

WINONA LADUKE: There are a lot of people out here, you know? It's very funny, because I feel like I've been like the Standing Rock switchboard, the travel guide, for the past two weeks. You know, everybody hits me up on Facebook, calls me up: "Hey, LaDuke, I want to bring out this. I got some winter coats. You know, what should I do?" I was like, "Oh, my gosh!" You know?

So, a lot of people are coming here, united. You know, so what I know is out here is like—you know, I go walk in here, and I've seen people from the—you know, from Wounded Knee in 1973. I've seen people I worked with in opposing uranium mining in the Black Hills in the 1970s and '80s, you know, out here. I mean, I've been at this a while. You know, it's like Old Home Week out here. I've seen people from Oklahoma that opposed the Keystone XL pipeline, and Nebraska. And I've seen people from, you know, out in our territory that are opposing the pipelines here. The tribal chairman of Fond du Lac is here, and, you know, a whole host of Native and non-Native people. And there are a lot of people that just do not believe that this should happen anymore in this country, that are very willing to put themselves on the line, non-Indian people, you know, as well as tribal members, and they are here. And it is a beautiful place to defend.

AMY GOODMAN: For people who are watching in New York and Louisiana, in California and India, China and South Africa, why does this matter to them?

WINONA LADUKE: This matters because it's time to move on from fossil fuels. You know, this is the same battle that they have everywhere else. You know, each day or each week, there's some new leak, there's some new catastrophe in the fossil fuel industry, as well as the ongoing and growing catastrophe of climate change. The fact that there is no rain in Syria has directly to do with these fossil fuel companies. You know, all of the catastrophes that are happening elsewhere in the world has to do with the fact that North America is retooling its infrastructure and going after the dirtiest oil in the world—the tar sands oil and the oil out of North Dakota, the fracked oil—rather than—you know, they were

working with Venezuela's—it also has to do with crushing Venezuela, because Venezuela has the largest oil reserves in the world. And rather than do business with Venezuela, they were bound and determined to take oil from places that did not want to give it up, and create this filthy infrastructure. So, this carbon—this oil is very heavy in carbon and will add hundreds of millions of tons of CO2 to the environment, if these pipelines are allowed through. So, that is—you know, it affects everybody.

AMY GOODMAN: Now, some tribes are for the pipeline. Can you describe the division?

WINONA LADUKE: You know, I don't know that I would say some tribes are for it. I would say some interests in Indian country have been for the pipeline. I mean, historically, the Three Affiliated Tribes is an oil-producing tribe, but they came down here to support the opposition to the pipeline. They came down there. Their whole tribal council came down here a couple of days ago. You know, but the fact is, is that, you know, some tribes have been forced into production of fossil fuels. Eighty-five percent of the Navajo economy, for instance, is fossil fuel-based. About the same percentage of the Fort Berthold economy is fossil fuel-based.

So, you know, just to give a little historic picture: You come out here with your smallpox, and you wipe out 95 percent of the people, the Mandan, Hidatsa and Arikara people, in the early 1800s. They live along these villages, you know, just trying to hang in there. Then you come out here, and you flood their lands. And the agricultural crops that they produced are now owned by Monsanto and Syngenta as trademarked varieties that they created. Right? And then you're out here in North Dakota, and everybody in the country flies over North Dakota and looks down and says, "Well, that's North Dakota." Nobody comes out here. And so stuff continues out here for a hundred years, where these people are treated like third-class citizens, you know, where they have no running water in their houses, and they have oil companies coming out here. And you have high rates of abuse and violence against women and children, and it accelerates and increases in the oil fields, until you have an epidemic of drugs, which now hits this community. This community doesn't get any benefit from oil, but the meth and heroin that came out of those fields is here, you know? Because those dealers came up here, and then they saw these Indian people, and they said, "Well, we'll just go there." And so these reservations are full of it. You know? And then you say, you know, to that tribe up there, the BIA cuts some backyard deals and starts oil extraction. And so, then you—

AMY GOODMAN: The Bureau of Indian Affairs.

WINONA LADUKE: Bureau of Indian Affairs. And then you end up with oil—you end up with haves and have-nots in the oil fields. And you end up with a tribe that now has oil revenues that are coming in. And they look out there, frankly, and they say, "You know? Things haven't been going too well for us, so we're going to sign a few more of these leases, because, after all, you know, nothing has ever worked out well for us. And so, we're going to get a little bit of money." And that's how you get—you know, you force people into that, with a gun to their head, and then they end up destroying their land, you know, which is what is happening up there on that reservation. And they've had huge investigations into corruption at the leadership. But, you know, you force poor people. You force people into that situation, and that's a perfect storm.

AMY GOODMAN: You've talked and written about Native Americans having PTSD, post-traumatic stress syndrome.

WINONA LADUKE: Yeah, we have ongoing; I didn't finish it, I still have it. You know, you say "Enbridge," and I get this little like quirk, you know, and because the Indian wars are far from over out here. But, you know, what you get is intergenerational trauma, is what it is known as, historic trauma. And other people have it. But you have a genetic memory, and you look out there, and you see—every day you wake up, and you see that your land was flooded. And that big power line that runs through this land, that doesn't benefit you. You still have to—you know, everything that is out here was done at your expense, but you still have to pay for it. And every day you go out there, and some—you know, you got a roadblock, that the white people put up, coming into your reservation. And every day you go out there, and you look at your houses, and you see that you've got crumbling infrastructure, and nobody cares about it. And you've got a meth epidemic, and you've got the highest suicide rates in the country, but nobody pays attention. You know, and so you just try to survive. That's what you're trying to do. Like 90 percent of my community, generally, I would say, is just trying to survive.

You know, I mean, in my community, we have rice. We still have our wild rice. And we can go, and we can harvest wild rice. And we can be Anishinaabe people. You know, we can still live off of our land. You know, these people have a much tougher time living off of their land. The buffalo were wiped out, you know? But this year is their stand. This is their stand. They've got a chance to not have one

more bad thing happen to them. And from my perspective, my perspective is, is that $3.9 billion pipeline, these guys don't need a pipeline. What they need is solar. What they need is wind. Look at this wind. You know, what they need—they have like class 7 wind out here. What they need is solar on all their houses, solar thermal. They need housing that works for people. They need energy justice. This is this chance, America, to say, "Look, this community does not need a pipeline. What this community needs is real energy independence." They call this energy independence, you know, shoving a pipeline down people's throats, so that Canadian oil companies can benefit, and, you know, a bunch of people can—the world can worsen. That is not energy independence. Energy independence is when you have solar. Energy independence is when you have wind. Energy independence is when you have some control over your future. That's what these people want.

AMY GOODMAN: That was Winona LaDuke, longtime Anishinaabe activist from White Earth Reservation in northern Minnesota.

emerging today must be addressed squarely. For all her vivid writing and journalistic effort, Naomi Klein's monochrome synthesis promotes only a politics of evasion and despair. The world society that has developed in the last half-century has some features never seen before and many that are perennial. Any way forward will be worked out by China, Europe, the USA and regional leaders such as Russia, India, Brazil and South Africa. They will build on an existing diversity that is hardly illuminated by catch-all phrases like 'neoliberalism' and 'American capitalism'.

We are in the middle of an economic disaster, all right. So far the politicians, bankers and CEOs who got us into this mess seem to be surviving, even prospering. But before long, people everywhere will be asking loudly 'What happened to our money, our jobs and our houses? How did we let them get away with it? How can we make sure it doesn't happen again?' Things are likely to become a lot more turbulent yet, and debates about political economy will then need much more historical substance than literary fashion seems able to offer at present. ●

Anthropology and the fossil fuel era

Guest editorial by Thomas Love

Thomas Love is professor of Anthropology and Environmental Studies at Linfield College, Oregon. He specializes on rural livelihood in the Peruvian highlands and adjacent Amazonia, as well as in his native US Pacific Northwest. His current focus is on the social and cultural implications of oil consumption patterns in these regions. His email is tlove@linfield.edu.

Humanity today faces several converging crises, but our prolific use of fossil fuels, particularly oil, underlies and links together several of these, including pollution and global warming. Our need for continued access to fossil fuels drives many of the conflicts we see today, whether in the Middle East or elsewhere. Should growth in demand continue to outpace a declining supply, we shall be forced to make difficult choices about our ways of life.

In his essay on energy and human evolution, the late David Price noted how human beings use energy as heterotrophs, in other words by capturing and storing autotrophs (which in turn store energy from solar radiation). Humans differ from both autotrophs and other heterotrophs in their abundant use of extrasomatic energy, i.e. capturing and storing energy outside of the body. Following Leslie White, Price argued that humans have used this energy to sustain life in ever denser settlements requiring plenty of cheap energy. Once energy becomes scarce, humans have problems: 'if there are survivors, they will not be able to carry on the cultural traditions of civilization' (Price 1995: 1).

Humanity is already in ecological overshoot (Catton 1980). No known alternatives have the quality and usefulness of our current energy base. A barrel of oil contains the energy equivalent of about 25,000 hours of human labour; the average citizen of an OECD country now lives materially better than the wealthiest elites a century ago. People around the world, especially in India and China, are stepping up their consumption of fossil fuels.

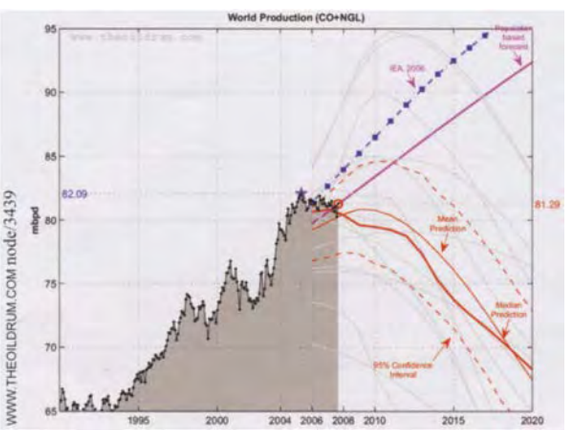

Fig. 1. *World oil production from 1990 and as forecast through to 2020 AD.*

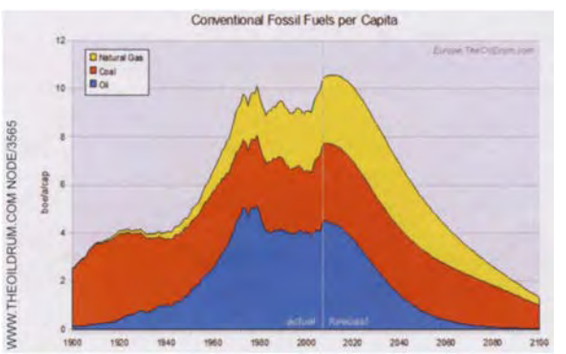

Fig. 2. *Consumption of conventional fossil fuels per capita, actual and as forecast through to 2100 AD.*

From the mid-19th century onwards, petroleum (literally 'rock oil') and other fossil fuels took over from horsepower, wood, whale oil and coal. With their apparent abundance, we quickly found a multitude of uses for them. Modern civilization is built on cheap fossil fuels, which accounted for 88% of the total commercial energy consumed in 2005, with oil alone constituting 39% of that total. Oil is at the hub of the world economy. Humanity's seemingly insatiable demand for it has transformed human life and cultures in producing and consuming societies alike. The price of food and agricultural products, petrochemicals and plastics, the cost of anything transported by air or over land rises with the price of oil. Rising oil prices contribute to inflation and influence monetary policy and interest rates, and in turn affect US, UK and other countries' foreign policies. The appeal of the US dollar as a world currency is being reduced as US domination of world oil markets diminishes, and access to oil has become a matter of national security deemed to merit military intervention.

Oil is so vital to our growth economy today that we find it almost impossible to imagine a world without it. Whilst the notion that we are near the peak of world oil production is still being debated, with oil prices doubling in 2007 to now surpass an all-time high of US$100 a barrel, the stresses and strains of inelastic supply are beginning to show and are not easily resolved. Escalating oil prices are already encouraging development of alternative energy sources, but this hardly helps us deal with oil's scarcity in the short, medium and even long term.

We are in the last days of cheap oil. Based on 13 models, Figure 1 shows how world oil production is predicted to peak between 2008 and 2010 at 77.5-85.0 million barrels per day (Foucher 2007). Decline in the rate of production after 2010 means that we need to find large new deposits every year just to stay even, let alone fuel the growth in demand we are experiencing. We are now consuming oil at four times the rate it is being discovered; coupled with increasing domestic demand in the oil-producing and other non-OECD countries, this portends serious shortages in the near future. Figure 2 adds natural gas and coal to this analysis, along with population growth trends, to demonstrate how humanity faces an imminent crisis of peaking fossil fuels (de Sousa 2008).

No known combination of alternative fuels can be scaled up quickly enough to avoid major supply shocks in the short and medium term. Since alternatives to oil can be used to produce electricity, rather than primarily liquid

fuels, electrification of industrial processes and transport is essential. But what combination of nuclear (with all the concerns surrounding it) and renewable sources will be the primary means for generating electricity? While renewables (wind, solar, hydro, tidal etc.) will help, and impressive developments are already under way, we need a crash programme of renewable and nuclear development at least ten years before oil production peaks to avoid the disruptions which now loom (Hirsch et al. 2005).

* * *

Nobody can predict how this will unfold. Maybe some combination of genetically modified organisms, nuclear power, enlightened leadership and luck will make for a softer landing for most. Meanwhile, in the medium term at least, we need to prepare to face the consequences.

Rising energy prices may prolong availability for those who can afford it, but they will cause uneven economic contraction and threaten globalization. They will contribute to the deterioration of labour conditions in sweatshop economies. If the growth paradigm itself is threatened, people may borrow and consume less, ushering in a deflationary spiral after initial inflation from higher oil prices. Devaluing currency is a policy often used to respond to the mounting costs of maintaining complexity and the state's deepening fiscal crisis (Tainter 1988).

Intensification of class conflict seems inevitable. While the poorest people will suffer first and most, both those on the global periphery and the lower classes in the industrial centres, with economic contraction middle classes will feel downward pressure on wages and be hard pressed to keep suburban sprawl functioning. The Asian regions that industrialized too late in the cheap fossil fuel era seem likely to be hard hit.

As we begin to reach these limits to growth, a broad process of relocalization – more reliance on regional and local products and systems – is already under way. This has many implications, from learning new skills of production to developing and rediscovering forms of social capital and relearning what it means to live in local community. On the other hand, how will hard-won universal rights be defended in a more fragmented, relocalized world?

Of particular concern are agriculture and the dependence of the industrialized food system on cheap fossil fuels. How are seven billion of us going to feed ourselves? The UN predicted 2007 as the year when more than half the world's people would have become urbanized, and the majority are dependent on oil-derived agricultural products. Freed up from direct agricultural production, most people now are deeply ignorant about how food is produced and where it comes from. While people in the developed economies have yet to see serious increases in food costs, the converging forces of climate change, markets and attempts to diversify out of fossil fuel (e.g. into bioethanol) are already resulting in soaring grain prices, seriously affecting the world's poor majority. Nevertheless, the total amount of fossil fuel devoted to agriculture is still small in relation to the overall economy. As oil scarcity effects deepen, people and governments will have to prioritize food at the expense of other uses, with huge policy and economic implications.

Political pressures to address declining net energy are building, entailing what appears to be the increasing militarization of energy supply chains. With Europe's growing dependence on Russian natural gas, for example, one can imagine major geopolitical realignment. The oil-driven world economy is basically run by a set of mutually dependent elites (the Saudi royal family and US offering a type case) who are all aware of the difficulties of maintaining security of access to supplies.

Economic contraction will certainly deepen states' fiscal crises and instability. Should there be a big turn toward nuclear energy, how well will weakened states maintain the centralized control and management nuclear power requires? A big push toward solar, wind and other renewables, on the other hand, suggests other consequences. New political power may accrue to states in the solar energy- and biomass-rich tropics.

* * *

The complexity of the interwoven problems sketched above calls for a holistic examination to which anthropologists can contribute by documenting and understanding how people make sense of these issues and frame their responses. How does this crisis resemble previous ones? What metaphors and symbols do people use to make sense of it all? To what discursive structures will people turn to make sense of the potential unravelling of their worlds? How has the fossil-fuelled growth system already affected the lives of people in producing areas?

We need cross-cultural perspectives and commitment to ethnography to understand how such large-scale forces play out on the ground in the everyday lives of ordinary people. Detailed grasp of the non-fossil-fuelled ways of living of pre- and non-industrial peoples will convey to interested publics and policy-makers alternative ways of organizing human society. We can help understand how humans might manage to power down without precipitating collapse.

Peak oil pessimists envision a return to harsh pre-industrial agrarian conditions. Some rely on Joseph Tainter's (1988) work, which represented collapse of complex societies as an economizing strategy: the marginal costs of maintaining complexity simply become no longer worthwhile to bear.

Yet the spectre of marauding bands of starving urbanites need not materialize. Recent research suggests that humans are genetically predisposed to fairness, even at cost to ourselves: think of the normative pressure among foragers toward generalized reciprocity (Heinrich et al. 2004, Richerson and Boyd 2005). This would suggest that powerdown could be managed if the burden of reducing consumption were shared more or less fairly, as is indeed evident in experiences of scarcity in the industrial countries during the Great Depression and World War II as well as the daily burden of living on a low energy budget for the world's poor majority. Economic contraction would encourage ethnogenesis and cultural diversification, making use of known and new cultural materials. But how might emerging local communities protect local adaptations from the corrosive effects of corporate-driven, mass media-propagated high consumption?

Cheap energy made it possible for the offspring of a temporarily prosperous middle class to be freed up from manual labour and to savour philosophy, literature and the arts. Anthropology itself is hardly immune to these larger processes, having been constructed in the flush of 19th-century industrialization, when fossil-fuelled industrial production helped liberate significant proportions of humanity from drudgery, disease and poverty. Large conferences and frequent trips to distant research sites will become more difficult.

Wandering around Washington, DC, at the 2007 AAA meetings, I recalled my visit to the majestic crumbling pyramids at Tikal; I wondered how future archaeologists might gaze at our monumental architecture. Will they grasp how power was accumulated and exercised, how global was the reach of this civilization, how temporarily prosperous was the average person's lot in life before conflicts over energy so fundamentally changed our lives? Let us examine the real crises upon us. ●

Introduction

Fossil fuels helped create both the possibility of modern democracy and its limits. To understand the limits, this book begins by exploring what made the emergence of a certain kind of democratic politics possible, the kind I call carbon democracy. Before turning to the past, however, let me explain some of the contemporary limits I have in mind.

In the wake of the US invasion of Iraq in 2003, one of those limits was widely discussed. A distinctive feature of the Middle East, it has often been said, is its lack of democracy. For many who write about the region, this lack has something to do with oil. Countries that depend upon petroleum resources for a large part of their earnings from exports tend to be less democratic. The wave of uprisings that spread across the Arab world in 2011 appeared to confirm this relationship between large oil earnings and the difficulty of mounting claims to a more democratic and egalitarian life. By and large, the less oil a country produced, and the faster its production was declining, the more readily the struggles for democracy unfolded. Tunisia and Egypt, where the uprisings began, and Yemen, Bahrain and Syria, where they quickly spread, were among the region's smallest oil producers, and in all of them the production of oil was declining. Of the eight large producers in the Middle East, only in Libya, the smallest producer among them (and where production had also suffered a recent decline), did a similar political struggle gain momentum, although the conflict in the Libyan case was the quickest to collapse into violence and foreign intervention.[1]

Most of those who write about the question of the 'oil curse', as the problem is sometimes called, have little to say about the nature of oil and how it is produced, distributed and used. They discuss not the oil but the oil money – the income that accrues after the petroleum is converted into government revenue and private wealth. The reasons they offer for the anti-democratic properties

---

1 In 2010, oil production for the first five countries ranged from 668,000 barrels per day (Egypt) to 44,000 bpd (Bahrain). The eight large producers (Algeria, Iran, Iraq, Kuwait, Libya, Saudi Arabia, and the United Arab Emirates, plus Qatar), produced from 10.51 million bpd (Saudi Arabia) to 1.79 million bpd (Libya); Qatar produced only 1.43 million bpd of oil, but had the largest production per capita, and in addition was the region's second-largest producer of natural gas. Oman (869,000 bpd, mild political protests in spring 2011) fell neatly between the two groups. The five countries of the region with minimal or zero oil production include four whose political dynamic is interconnected through the Palestine conflict more than oil politics (Israel/Palestine, Jordan and Lebanon) and one dependent on a different mineral export, the booming phosphate industry (Morocco). Figures are for crude oil and other liquids, from www.eia.gov.

of petroleum focus on this surplus revenue: it gives governments the resources to repress dissent, buy political support, or relieve pressures for a more equal sharing of prosperity, with public handouts and price subsidies. The explanations have nothing to do with the ways in which oil is extracted, processed, shipped and consumed, the powers of oil as a concentrated source of energy, or the apparatus that turns this fuel into forms of affluence and power. They treat the oil curse as an affliction only of the governments that depend on its income, not of the processes by which a wider world obtains the energy that drives its material and technical life.[2]

Ignoring the apparatus of oil production reflects an underlying conception of democracy. This is the conception shared by an American expert on democracy sent to southern Iraq, nine months after the US invasion of 2003, to discuss 'capacity building' with the members of a provincial council: 'Welcome to your new democracy', he said, as he began displaying PowerPoint slides of the administrative structure the Americans had designed. 'I have met you before. I have met you in Cambodia. I have met you in Russia. I have met you in Nigeria.' At which point, we are told, two members of the council walked out.[3] For an expert on democracy, democratic politics is fundamentally the same everywhere. It consists of a set of procedures and political forms that are to be reproduced in every successful instance of democratisation, in one variant or another, as though democracy occurs only as a carbon copy of itself. Democracy is based on a model, an original idea, that can be copied from one place to the next. If it fails, as it seems to in many oil states, the reason must be that some part of the model is missing or malfunctioning.

An idea is something that is somehow the same in different places – that can be repeated from one context to another, freeing itself from local histories, circumstances, and material arrangements, becoming abstract, a concept. An expert in democracy has to make democracy into an abstraction, something that moves easily from place to place, so that he can carry it in his suitcase, or his PowerPoint presentation, from Russia to Cambodia, from Nigeria to Iraq, showing people how it works.

Once one has made democracy into something that moves around the world as an idea, in order to move with it, one is committed to a particular

---

2 An important exception to this tendency to ignore the materiality of oil in discussions of the rentier state is Fernando Coronil, *The Magical State: Nature, Money and Modernity in Venezuela*, Chicago: University of Chicago Press, 1997, where the problem is connected to a wider erasure of nature in understanding the formation of wealth. See also Michael Watts's discussion of the 'oil complex' and the 'governable spaces' it builds, drawing on pre-oil political structures, in 'Resource Curse? Governmentality, Oil and Power in the Niger Delta, Nigeria', *Geopolitics* 9, 2004: 50–80; and Robert Vitalis's examination of the labour regime and image-making that organised the production of oil in Saudi Arabia, in *America's Kingdom: Mythmaking on the Saudi Oil Frontier*, 2nd edn, London: Verso, 2009.

3 Rory Stewart, *Occupational Hazards: My Time Governing in Iraq*, London: Picador, 2006: 280.

way of explaining how the idea works, how people become democratic. If democracy is an idea, then countries become democratic by the idea getting into people's heads. The problem of democracy becomes a question of how to manufacture a new model of the citizen, one whose mind is committed to the idea of democracy.

A central theme in discussions of the contemporary Middle East in the United States has been the question of how to manufacture new kinds of citizen. In debates about the war in Iraq, economic reform, the future of Palestine, political Islam, obstacles to democratisation, the spread of anti-Americanism, and the 2011 uprisings, one finds a recurrent interest in the question of how to produce a new kind of political agent. How can one create subjects of power who are adequately equipped to impose limits on authority? How does one form a citizenry that refuses to authorise authoritarianism? What kinds of education, enlightenment, training or experience are required to engender forms of economy based on agents who act according to their rational self-interest rather than corruption or cronyism? What produces forms of politics based on mutual trust and respect for opponents rather than suspicion and repression? In short, these debates ask, how can people learn to recognise themselves and respond as subjects of new forms of power? What forms of power, conversely, can engineer the liberal or democratic political subject?

There has been plenty of criticism of the way these questions have been posed and answered, especially in the debates about democratisation, often faulting them for ignoring the so-called 'larger forces' at work. American writings on the problem of democracy in the Middle East typically have little to say about capitalist globalisation and the work being done to turn people into the docile workers and willing consumers required to solve economic crises in the West; about the forces of empire for whom democratisation schemes are a minor, diplomatic part of wider efforts to shore up a weakening hegemony; and about the tools of violence and repression that occupying powers and military regimes deploy. Such criticisms, however, overlook what is interesting in these debates: the notion that democracy is an engineering project, concerned with the manufacture of new political subjects and with subjecting people to new ways of being governed.

Take a recent example of research on democratisation in the Middle East, the Arab Barometer project. The project carried out opinion surveys in five Arab countries, in order to measure the presence of individual attitudes and orientations that might be conducive to the establishment of democracy. These orientations include 'political tolerance, respect for diversity, civic engagement, and interpersonal trust'.[4] The project was funded, initially, by the Middle East

4 Mark Tessler and Amaney Jamal, 'Political Attitude Research in the Arab World: Emerging Opportunities', *PS: Political Science and Politics* 39: 3, 2006: 433–7.

Partnership Initiative of the US Department of State and governed by a board that includes scholars from each of the countries whose political culture the project seeks to measure and record. The Arab Barometer project forms part of a wider initiative called the Global Barometer, which carries out similar research in Africa, Latin America and other regions. The Arab version, along with a number of similar surveys of the region, has published results of opinion surveys that claimed to put in question many of the prevailing assumptions in official circles in the United States about political attitudes in the Arab world.

Whatever the usefulness of showing us some of the limits of official discourse, the project seems at first sight to suffer from a weakness that affects much of the research on questions of democratisation and civil society. It appears to be looking for what one might call 'democracy without democratization'.[5] The premise of the project is that 'successful democratization requires a citizenry that values democracy and possesses the elements of a democratic political culture'.[6] Yet there is no reliable evidence, as far as I am aware, that the presence of a civic culture – attitudes of trust, tolerance, mutual respect and other liberal virtues – facilitates the emergence of democracy. There is, in fact, no shortage of historical evidence to suggest the opposite. One can find repeated examples in the history of democratic struggles in the West of tolerant, educated, liberal political classes who were opponents of democratisation, fighting to prevent the extension of effective political rights to those who did not own property, to religious and racial minorities, to women, and to colonial subjects. In many cases, the civic virtues that dominant political classes possessed provided the grounds on which to oppose democratisation. Their own civility and reasonableness, they often claimed, qualified them to act as spokespersons for the interests of those who were not yet ready to speak for themselves. Once democratic rights have been achieved, their exercise may encourage the development of virtuous civic attitudes, at least among members of the expanded political class – virtues whose inculcation and practice become a mode through which people subject themselves to democratic authority. Democratisation, on the other hand, has often been a battle against those attitudes. It has required a more intransigent set of engagements and practices.[7]

This book is concerned with those more intransigent engagements, and with the ways in which carbon energy helped manufacture forms of agency capable of effective intransigence.

I began writing the book because I wanted a better understanding of the relations between democracy and oil. Initially, like everyone else, I thought of oil as

one thing and democracy as another, and wanted to make better sense of why one seemed to be bad for the other. But after following the way the oil industry was built in the Middle East, as I traced the ways in which people had explored for oil, built pipelines and terminals, transformed the petroleum into forms of heat energy and transportation, converted the income from those processes into profits, and sought ways to circulate and govern those flows of money, it became increasingly clear that carbon energy and modern democratic politics were tied intricately together. Rather than a study of democracy and oil, it became a book about democracy *as* oil – as a form of politics whose mechanisms on multiple levels involve the processes of producing and using carbon energy.

When studies of oil and democracy confine their attention to the problem of oil money – the income from oil and its corrupting powers – rather than starting with the process through which oil is produced and distributed, they are unconsciously imitating the way energy networks were first built. In 1914, when Royal Dutch/Shell began producing oil in Venezuela, the country's dictator, General Gómez, asked the company to build its refinery offshore, on the Dutch island of Curaçao. He wanted the money from oil, but did not want the large concentration of workers and accompanying labour demands that a refinery would bring.[8] A decade later, when the company now known as BP began building an oil industry in Iraq, it planned a pipeline to carry the oil across neighbouring countries to the Mediterranean, from where most of the oil would be shipped to refineries in Europe, stretching out the thin line of oil production over an even greater distance. When a nationalist government later requested that BP build a modern refinery in Iraq, the company vigorously opposed the demand. In other words, if oil appears to affect the producer states largely after its transformation into flows of money, that appearance reflects the building of pipelines, the placing of refineries, the negotiation of royalties, and other arrangements that from the start, in their effort to evade the demands of an organised labour force, were concerned with questions of carbon democracy. The transformation of oil into large and unaccountable government incomes is not a cause of the problem of democracy and oil, but the outcome of particular ways of engineering political relations out of flows of energy.

Failing to follow the production and circulation of oil itself, accounts of the oil curse diagnose it as a malady located within only one set of nodes of the networks through which oil flows and is converted into energy, profits and political power – in the decision-making organs of the individual producer states. This diagnosis involves isolating the symptoms found in producer states that are not found in non-oil states. But what if democracies are not carbon copies, but carbon-based? What if they are tied in specific ways to the history of

8 Coronil, *Magical State*: 107.

carbon fuels? Can we follow the carbon itself, the oil, so as to connect the problem afflicting oil-producing states to other limits of carbon democracy?

The leading industrialised countries are also oil states. Without the energy they derive from oil their current forms of political and economic life would not exist. Their citizens have developed ways of eating, travelling, housing themselves and consuming other goods and services that require very large amounts of energy from oil and other fossil fuels. These ways of life are not sustainable, and they now face the twin crises that will end them.

First, new discoveries of oil are unable to keep pace with the exhaustion of existing supplies. Although estimating reserves of fossil fuels is a politico-technical process involving rival methods of calculation, it appears that we are about to enter an era of declining supplies.[9] The earth's stores of fossil fuels will not be exhausted. As coal and oil become more scarce and the difficulty in extracting them increases, the cost and the expenditure of energy their extraction requires will bring the era of fossil fuels to an end, with consequences that we cannot know.[10] The earth's stock of this 'capital bequeathed to mankind by other living beings', as Jean-Paul Sartre once described it, will be consumed in a remarkably short period.[11] In the case of oil, the fossil fuel that was the easiest to extract but has now become the most difficult to increase in supply, more than half the total consumed in the 150 years between the 1860s, when the modern petroleum industry began, and 2010 was burned in the three decades after 1980.[12] From the perspective of human history, the era of fossil fuels now appears as a brief interlude.

The second crisis is that, in using up these sources of energy, humankind has been 'unwittingly conducting a vast geophysical experiment', as the US President's Science Advisory Committee warned almost half a century ago, in 1965. By burning within a few generations the fossil fuels that had accumulated in the earth over the previous 500 million years, humanity was injecting carbon dioxide into the atmosphere that by the year 2000 was expected to increase the concentration of atmospheric CO_2 by 25 per cent. 'This may be sufficient to produce measurable and perhaps marked changes in climate', the 1965 report had warned, adding that

On the increasing quantity of energy required to produce fossil energy as supplies become more difficult to extract, a problem known as declining EROI (energy return on energy invested), see ibid.: 275–80.

11 Jean-Paul Sartre, *Critique of Dialectical Reason*, vol. 1, *Theory of Practical Ensembles*, London: Verso, 1977: 154.

12 Until recently it was assumed that coal reserves would long outlast oil, with plentiful supplies for hundreds of years. Recent studies suggest that estimates of coal reserves are even less reliable than those for oil, that production in the US – the country with the largest reserves – has already peaked and begun to decline, and that global production may peak as early as 2025. Werner Zittel and Jörg Schindler, 'Coal: Resources and Future Production', EWG Paper no. 1/01, 10 July 2007, available at www.energywatchgroup.org.

these changes could be 'deleterious from the point of view of human beings'.[13] The experiment proceeded more rapidly than expected. Levels of carbon dioxide in the atmosphere have now increased by 40 per cent since the start of the industrial age, with half that increase happening since the late 1970s. The consequent changes in the earth's climate threaten to become not just deleterious from the human point of view, but catastrophic on a planetary scale.[14] A larger limit that oil represents for democracy is that the political machinery that emerged to govern the age of fossil fuels, partly as a product of those forms of energy, may be incapable of addressing the events that will end it.[15]

Following the carbon does not mean replacing the idealist schemes of the democracy experts with a materialist account, or tracing political outcomes back to the forms of energy that determine them – as though the powers of carbon were transmitted unchanged from the oil well or coalface to the hands of those who control the state. The carbon itself must be transformed, beginning with the work done by those who bring it out of the ground. The transformations involve establishing connections and building alliances – connections and alliances that do not respect any divide between material and ideal, economic and political, natural and social, human and nonhuman, or violence and representation. The connections make it possible to translate one form of power into another. Understanding the interconnections between using fossil fuels and making democratic claims requires tracing how these connections are built, the vulnerabilities and opportunities they create, and the narrow points of passage where control is particularly effective.[16]

13 R. Revelle, W. Broecker, H. Craig, C. D. Keeling and J. Smagorinsky, 'Atmospheric Carbon Dioxide', in *Restoring the Quality of Our Environment: Report of the Environmental Pollution Panel*, Washington: White House, President's Science Advisory Committee, November 1965: 126–7.

14 Intergovernmental Panel on Climate Change, *Fourth Assessment Report*, 2007, available at www.ipcc.ch. Research by James Hansen and his colleagues on paleoclimate data suggests that feedback loops in the melting of ice can cause a rapid acceleration in the loss of ice cover, forcing much more extreme climate change with potentially cataclysmic consequences. These findings make even the dire warnings from the IPCC look absurdly optimistic. James Hansen, Makiko Sato, Pushker Kharecha, Gary Russell, David W. Lea and Mark Siddall, 'Climate Change and Trace Gases', *Philosophical Transactions of the Royal Society A*, vol. 365, 2007: 1,925–54.

15 Elmer Altvater offers a lucid account of these twin threats, and goes on to suggest that they represent the end of a period of 'congruence' between the logics of capitalism and the physical properties of fossil energy ('The Social and Natural Environment of Fossil Capitalism,' *Socialist Register* 43, 2007: 37–59). In the chapters that follow I offer a different account of those properties – the transportability of oil, for example, is very different from that of coal – which is difficult to fit with the idea of capitalism as a historical process with a set of unchanging 'logics'.

16 Gavin Bridge directs attention away from the exclusive focus on producer states and the resource curse, to look at the diverse network of firms involved in oil, from production, refining and distribution, to those now involved in the capture and storage of carbon and the trading of carbon credits, each of which may be governed by a different political regime. 'Global Production Networks and the Extractive Sector: Governing Resource-Based Development', *Journal of Economic Geography* 8, 2008: 389–419. On the sociology of translation, and 'obligatory passage points', see Michel Callon, 'Some Elements of a Sociology of Translation: Domestication of the Scallops and the Fishermen of St Brieuc Bay', in John Law, ed., *Power, Action and Belief: A New Sociology of Knowledge?*, London: Routledge, 1986.

Political possibilities were opened up or narrowed down by different ways of organising the flow and concentration of energy, and these possibilities were enhanced or limited by arrangements of people, finance, expertise and violence that were assembled in relationship to the distribution and control of energy.

Like energy from fossil fuels, democratic politics is a recent phenomenon. The development of the two kinds of power has been interwoven from the start. This book traces the way they were co-assembled, starting in Chapter 1 with coal and the rise of mass politics in Europe and America in the late nineteenth and early twentieth centuries. It has long been understood that the rise of coal, made possible by the use of steam power to access seams of carbon deep underground, allowed the development of large-scale manufacturing and the modern city, and that out of mines, factories and modern urban life emerged the forces that struggled for democracy. But these forces have usually been thought of, one-sidedly, as 'social movements'. Gathering in workplaces, labour unions, and political clubs, it is said, people forged a political consciousness with which they fought for more egalitarian and democratic collective lives. The account is one-sided because it leaves out the equipment with which this political agency was assembled, and ignores the technical vulnerability to which oligarchic forms of rule were now exposed. As Chapter 1 shows, the socio-technical worlds built with the vast new energy from coal were vulnerable in a particular way, and it was the movement of concentrated stores of carbon energy that provided the means for assembling effective democratic claims.

Keeping in mind this new understanding of the relations between energy flows and the emergence of democracy, I turn in Chapter 2 to examine the beginnings of the oil industry in the Middle East. The standard history tells a story of heroic pioneers discovering oil in remote and difficult locations and of far-sighted statesmen on the eve of the First World War acting to secure this strategic prize. Having learned from the history of coal and democracy that the politics of energy involves acquiring the power to interrupt the flow of energy as much as securing its supply, I propose a different account. I explore how oil companies collaborated to delay the emergence of an oil industry in the Middle East, and politicians saw the control of oil overseas as a means of weakening democratic forces at home. From its beginnings, the history of Middle Eastern oil forms part of the making and unmaking of democratic politics.

The struggle against democracy helped trigger the First World War, out of which emerged the League of Nations and a new machinery to control the oil regions of the Middle East – the system of League of Nations Mandates. These events are usually described as a battle between the idealism of President Woodrow Wilson's 'Fourteen Points', championing the democratic principle of self-determination, and the self-interest of the European powers that took control of the main oil regions of the Middle East, in particular Iraq. Chapter

3 provides a different history, in which a wartime battle for a more democratic control of imperialism and the acquisition of raw materials, fought by the European left, was translated into an undemocratic machinery for producing 'the consent of the governed'. The most important site for producing this 'consent' to imperial rule was Iraq. In Chapter 4 I examine how political forces in Iraq and other parts of the Middle East responded, and the way in which control over the oil reserves of Iraq was forged. The subsequent construction of an oil industry in Iraq and neighbouring countries opened up new possibilities for organising democratic political claims. At the same time, the distribution and scale of the new energy flows made the advancing of those claims increasingly difficult.

The term 'democracy' can have two kinds of meaning. It can refer to ways of making effective claims for a more just and egalitarian common world. Or it can refer to a mode of governing populations that employs popular consent as a means of limiting claims for greater equality and justice by dividing up the common world. Such limits are formed by acknowledging certain areas as matters of public concern subject to popular decision while establishing other fields to be administered under alternative methods of control. For example, governmental practice can demarcate a private sphere governed by rules of property, a natural world governed by laws of nature, or markets governed by principles of economics. Democratic struggles become a battle over the distribution of issues, attempting to establish as matters of public concern questions that others claim as private (such as the level of wages paid by employers), as belonging to nature (such as the exhaustion of natural resources or the composition of gases in the atmosphere), or as ruled by laws of the market (such as financial speculation). In the mid-twentieth century, this 'logic of distribution' began to designate a large new field of government whose rules set limits to alternative political claims: the field that became known as 'the economy'.[17]

Chapter 5 traces the making of the economy as a new object of politics in the mid-twentieth century (most accounts mistakenly locate the emergence of the economy one or two centuries earlier). It also examines how the production of rapidly increasing quantities of low-cost carbon energy, in the form of oil, contributed to this new mode of political calculation and democratic rule. In contrast to the forms of material calculation characteristic of government in the age of coal, the new calculations made possible by the abundance of oil allowed ways of administering collective life based on the novel principle of unlimited economic growth. The management of economic growth provided new kinds of reason and modes of regulation to govern carbon democracy.

---

17 Cf. Jacques Rancière, *Hatred of Democracy*, London: Verso, 2006, which discusses democratic struggles as a battle against a logic of distribution that designates some matters as public and others as private.

While the making of the economy provided ways of ordering material life at the level of the nation-state, it was unable to manage the forces that many people considered responsible for the crisis of democracy in the interwar period: the flows of private international capital whose speculative movement had caused the collapse of European financial and political systems. Here, too, oil appeared to provide an answer, underwriting the creation, after the Second World War, of a new method of controlling international capital. Alongside the making of the national economy, Chapter 5 traces the building of international financial mechanisms that were intended to curb the threat of speculation by private international banks – a threat to democratic politics that was to re-emerge on a new scale later in the twentieth century. Since the new machinery of control operated partly by governing flows of oil, and the Middle East was becoming the main source of the world's oil, organising the region under imperial control again became important for the possibility of democracy as a mode of government in the West. Postwar attempts to place Middle Eastern oil under a form of US-run 'international trusteeship' were blocked by the oil companies, to be replaced with the simpler framework of the 'Cold War'. The logic of distribution that designated certain areas as inappropriate arenas for advancing democratic claims incorporated the Middle East as just such an area.

My account of carbon democracy began by tracing a rather simple relationship between the vulnerabilities created by a dependence on coal and the ability to make effective egalitarian demands. By this point in the book, however, it has taken on multiple dimensions, reflecting the switch from coal to the increasing use of oil, the much more extended networks for producing and distributing energy, the new forms of collective life that abundant fossil fuels made possible, and the rapidly expanding circulations of goods and finance that were dependent upon the production of oil.

In Chapter 6 I return to Iraq and the wider Middle East, examining how domestic political struggles in the 1950s and 1960s were transformed into struggles with the oil companies over the control of oil. The history of the rise of OPEC is well known, along with the role of nationalist forces in driving the effort by the oil-producing states to assert control, first over the rate at which the production of oil by foreign companies was taxed, and then over the ownership and operation of those companies. From the perspective of carbon democracy, however, we need to emphasise new aspects of this story. The chapter traces the battle over oil at the level of refineries, pipelines and shipping routes, and of their sabotage; it explores how the purchase of high-tech weaponry by the oil states, beginning with Iran, could provide a uniquely tailored mechanism for recycling oil revenues, and how new doctrines of 'security' were packaged with arms sales; and it connects the question of oil in the Middle East to new methods of managing democratic political demands in the West. These developments led to the crisis of 1973–74, explored in Chapter 7. Misleadingly called

simply an 'oil crisis', the pivotal events of this period involved a transformation in modes of governing international finance, national economies and flows of energy, placing the weakened carbon democracy of the West into a new relationship with the oil states of the Middle East. The shift in US relations with oil-producing states also allowed political forces on the right, opposed to the management of 'the economy' as a democratic mode of governing collective life, to reintroduce and expand the laws of 'the market' as an alternative technology of rule, providing a more effective means of placing parts of the common world beyond the reach of democratic contestation.

Over the three decades that followed, from the 1979 Islamic Revolution in Iran to the Arab uprisings in the spring of 2011, two themes came to dominate discussions of oil and democracy in relation to the Middle East. One was the rise of Islamist political movements that appeared to many to present an obstacle to building more democratic forms of politics. The other was the growing level of military violence in which the oil states were involved – in particular the series of wars in the Gulf, culminating in the US invasion of Iraq in 2003. A popular study of this period described its dynamic as a conflict between the globalising powers of capital and the narrow forces of tribal and religious identity, or 'Jihad vs. McWorld'. Chapter 8 offers a different way of thinking about the relations between oil, so-called globalisation, and the powers of political Islam, using the concept of 'McJihad'.

In the concluding chapter, I return to some of the contemporary limits to carbon democracy: the ending of the era of abundant, low-cost carbon energy, as the difficulty of replacing depleted oil fields with new discoveries deepens, and as new discoveries become increasingly expensive and energy-intensive to exploit; and the accelerating threat of climate collapse, as existing forms of democratic government appear incapable of taking the precautions needed to protect the long-term future of the planet. I show how the technical uncertainty around these questions allows a certain form of reasoning – that of economic calculation – to occupy the space of democratic debate, and argue that the socio-technical understanding of carbon democracy pursued in this book offers a better way to overcome this obstacle to our shaping of collective futures.

CHAPTER 5

Fuel Economy

We are learning to think of democracy not in terms of the history of an idea or the emergence of a social movement, but as the assembling of machines. Those who assembled the supply of coal into an apparatus for democratising the industrialised world had tried to extend its mechanisms to govern relations with non-European regions. Following the crisis of the First World War, they proposed devices to govern the international flow of finance and redirect its profits to beneficial ends. The imperial powers, in uneasy alliance with local forces, managed to forge an alternative device, one that replaced democratic claims with the process of 'self-determination' and substituted for the democratic control of international capital the emergent apparatus of 'development'.

The difficulty in governing the movement of money continued to be an obstacle to the growth of more egalitarian and democratic politics, an obstacle increasingly connected with the flow of oil. A generation later, in the wake of the failure of democratic governments in Europe and a second global war, another effort was made to devise a method for managing the international flow of finance, the arrangement known as the Bretton Woods system. Its development coincided with new forms of democratic politics in industrialised countries, based on the management of what had recently come to be called 'the economy'. Both the international financial arrangement and the apparatus of 'the economy' were devices for governing democracies; both systems, as we will see, were constructed in ways that took advantage of the rapidly increasing use of non-renewable carbon energy, which with the shift to the age of oil continued its exponential rate of growth. In order to grasp the changing relation between carbon energy and democracy in the second half of the twentieth century, we must explore the place of oil in these two machineries of government.

OIL TO DRIVE THE MONEY LENDERS FROM THE TEMPLE

The collapse of democracy in Europe in the 1920s and 1930s, the rise of fascism and the slide towards another world war were understood to have been caused by the collapse of methods for maintaining the value of money. In central and eastern Europe, countries were forced to abandon the attempt to base the value of their currencies on reserves of gold. One by one their domestic financial systems collapsed, middle classes were pauperised, the poor endured widespread unemployment, and interwar democracy was destroyed. 'The breakdown of the

international gold standard', Karl Polanyi wrote in 1944, was 'the mechanism which railroaded Europe to its doom'.[1]

During the Second World War, Britain and the United States made plans to engineer a new mechanism for managing the international movement of money. At a meeting in July 1944 at the Mount Washington Hotel in Bretton Woods, a faded New Hampshire resort built in 1902 with the fortune of a Pennsylvania coal magnate, the forty-four Allied states reached agreement on a plan, setting up the International Monetary Fund and International Bank for Reconstruction and Development, today known as the World Bank. The Bretton Woods agreement abandoned a system that had been built on the wealth and technologies of coal and replaced it with one based on the movement of oil.

To prevent a repeat of the interwar financial catastrophe and another collapse of democracy, governments had to control those whose actions had caused it – the currency speculators. The discovery of the Witwatersrand goldfields in southern Africa in the 1880s (see Chapter 3), and the consolidation there of the British gold-mining monopolies and their racialised labour regime, had allowed the expansion of international trade regulated by reserves of gold. It also encouraged the growth of large private banks, which profited from speculation in the value of national currencies. The goal of the Bretton Woods reforms was to eliminate the power of the bankers to speculate. In his address at the closing of the Bretton Woods talks, the Secretary of the US Treasury, Henry Morgenthau, said that the purpose of the new monetary system was to 'limit the control which certain private bankers have in the past exercised over international finance' and drive 'the usurious money lenders from the temple of international finance'.[2] To curb large-scale speculative movements of capital, the value of currencies was to be tied not to reserves of gold but to the exchange of goods, whose value reflected human and material wealth. Declaring that no people or government 'will again tolerate prolonged or wide-spread unemployment', Morgenthau argued that with the new international financial machinery 'men and women everywhere can exchange freely, on a fair and stable basis, the goods which they produce through their labor'.

The new system managed to limit the destructive power of private currency speculators for about two decades. It achieved this, however, by connecting the value of currencies not to the general flow of goods produced by the labour of men and women, but principally to the movement of oil. The speculators were able to weaken the mechanism in the late 1960s thanks to stresses created by the

movement of oil, and destroyed it in the 1980s when they devised new ways to speculate in currencies.[3]

Currency systems are always material as well as calculative devices, built out of technical processes. The gold standard, the previous mechanism, had been initially made possible by coal and steam power, in ways we will examine later. Gold reserves could no longer provide the instrument to secure international financial exchange, because the European allies had been forced to send all their gold bullion to America to pay for imports of coal, oil and other wartime supplies. By the end of the war the United States had accumulated 80 per cent of the world's gold reserves. At Bretton Woods, the United States agreed to fix the value of the dollar on the basis of this gold, at $35 per ounce. The other participating countries agreed that the dollar would be the only reserve currency convertible at a fixed rate to gold, and that the value of their own currencies would be tied to the dollar, and thus indirectly to the American gold monopoly. However, the circulation of dollars soon began to outpace American accumulations of gold, in part because the gold miners of South Africa could not increase their production of gold as fast as world trade, fuelled by the easier flow of oil, began to grow.[4] In practice, what sustained the value of the dollar was that countries had to use the American currency to purchase the essential materials that formed the bulk of international trade, above all oil.

In both value and volume, petroleum had become the largest commodity in world trade. In 1945 the United States produced two-thirds of the world's oil, and more than half of the remaining third was produced in Latin America and the Caribbean.[5] Under the arrangements that governed the international oil trade, the commodity was sold in the currency not of the country where it was produced, nor of the place where it was consumed, but of the international companies that controlled production. 'Sterling oil', as it was known (principally oil from Iran), was traded in British pounds, but the bulk of global sales were in 'dollar oil'. The rest of the world had to purchase the energy they required using American dollars. The value of the dollar as the basis of international finance depended on the flow of oil.

The place of oil in international finance escapes most standard accounts of the postwar financial system. Yet it was clearly understood in postwar planning documents.[6] John Maynard Keynes and Harry Dexter White, the

architects of the Bretton Woods system, had argued for a third institution alongside the International Monetary Fund and the World Bank, to manage trade in oil and other essential raw materials.[7] Their proposals for rebuilding the international financial system after the war included schemes to create stockpiles of oil, rubber, sugar and other commodities to prevent shortages, gluts and price swings. Even those opposed to Keynes – in particular the nascent neoliberal movement, which objected to the government regulation of international banking – accepted the need to reduce financial speculation by tying the movement of money to trade in key commodities such as oil. Drawing on Benjamin Graham's proposal for 'a modern ever-normal granary', Friedrich Hayek, the intellectual leader of the movement, argued for an 'international commodity standard' to replace the gold standard, in which currency would be issued in exchange for 'a fixed combination of warehouse warrants for a number of storable raw commodities'.[8] Both sides of the debate about preventing the speculative destruction of currencies believed that postwar financial stability, and thus the future of democracy, depended on managing the storage and exchange of key commodities. Increasingly the movement of just one commodity, petroleum, provided the mechanism that stabilised, or threatened to disrupt, the democratic order.

The concern with oil was visible in the sequence of meetings that established the new arrangements. Between the talks at Bretton Woods in July 1944, which created the postwar financial regime, including the IMF and the World Bank, and those at Dumbarton Oaks in the autumn of the same year, where the allied powers formulated arrangements for a successor to the League of Nations, a third meeting was held: representatives of Britain and the United States met in Washington in early August to draw up a postwar petroleum order. The meeting finalised plans to establish a permanent body to be called

---

Cooperation Administration (the US government agency that administered the Marshall Plan). The neglect of oil in standard histories of the international financial system can be seen, for example, in Barry Eichengreen, 'The British Economy Between the Wars', in Rodrick Floud and Paul Johnson, eds, *The Cambridge Economic History of Modern Britain*, Cambridge, UK: CUP, 2004, and *Globalizing Capital: A History of the International Monetary System*, 2nd edn, Princeton: Princeton University Press, 1996; and in Francis J. Gavin, *Gold, Dollars, and Power: The Politics of International Monetary Relations, 1958–1971*, Chapel Hill: University of North Carolina Press, 2004.

7 Harry Dexter White argued for an 'international essential raw material development corporation' whose function would be 'increasing the world supply of essential raw materials and assuring member countries of an adequate supply at reasonable prices'. the International Petroleum Council. Just as the IMF was intended to limit the chaos caused by the speculative dealings of international banks, the parallel organisation for petroleum was intended to limit the trouble caused by international oil companies – and to pre-empt the oil-producing countries, especially in the Middle East, from taking control of the oil themselves. In an echo of the mandates established under the League of Nations to obstruct the demand for political independence in the Arab world, the International Petroleum Council was envisaged as a form of 'trusteeship' to facilitate Anglo-American control of Middle Eastern oil.

A TRUSTEESHIP OF THE BIG POWERS

The major oil companies cooperated with the scheme for an international oil body as an alternative to Keynes's wider plans for the international control of commodities – plans that were to be discussed at the inaugural meeting of the United Nations in April 1945. The head of Shell's US subsidiary warned that if the companies failed to support the International Petroleum Council they risked a 'master agreement made in San Francisco that proposes to cover all sorts of commodities with all sorts of countries'. In the special oil agreement, he said, 'we have something we have had a hand in making'.[9] The impetus to create a new regime governing Middle Eastern oil also came from the weakened position of the American international oil companies in their main overseas region, Latin America. There was alarmist talk from oil executives about the depletion of US reserves and new military needs for petroleum, which helped them win subsidies from Washington for developing Middle East production. But the real problem they faced was to the south.

Immediately before the war, the 'rude expropriations' of American interests in Bolivia and Mexico, as the State Department's petroleum adviser put it, and the move towards state monopolies or much stiffer concession terms in the rest of Latin America, had made it more difficult for US firms to make large profits there.[10] Postwar profits would have to be obtained increasingly from the Middle East, where large undeveloped oil resources continued to pose a threat, but pressure for national control of oil resources seemed easier to prevent. US companies had acquired concessions there in the interwar years, but made little effort to develop them. With declining wartime need for oil from the Middle East, they were able to scale back their modest operations. In 1945 the Middle

East produced only 7.5 per cent of the world's oil, two-thirds of which came from the British-controlled oilfields in Iran.[11]

In building oil industries in Venezuela, Mexico and other parts of Latin America, the oil companies had been obliged to deal with sovereign states, independent for more than a century and increasingly able to negotiate more equitable oil agreements. In the Middle East, sovereign states were still forming out of older local and imperial forms of rule. The oil companies could portray their role there as the 'development' of remote and backward peoples, and impose less equitable arrangements.

The State Department wanted to prevent the US oil companies from causing the same problems for themselves in the Middle East that they had created in Latin America. An international framework, in agreement with Britain, would give corporate oil operations the appearance of a trusteeship, the new term for the old idea of the mandate. A petroleum agreement could frame Anglo-US control of the oilfields of the Middle East as a means of making the oil available to every country that needed it, and present this 'equitable' management as a principle that disqualified the claims of producer countries to control their own oil. A report for the State Department by the Office of Strategic Services suggested, 'The principle of equitable distribution and exploitation overrides to some extent the sovereign rights of the oil producing countries and presupposes a kind of trusteeship of the big Powers over the world's oil resources.'[12]

Initially Washington intended to have a government agency play the role of trustee. In 1943, the US Petroleum Administration for War established a government oil company, the Petroleum Reserves Corporation, to assume control of the oil reserves of Saudi Arabia. It planned to take majority ownership of the California-Arabian Oil Company, the American joint venture that owned rights to the oil. Washington also extended wartime Lend Lease aid to Saudi Arabia (relieving US oil companies of the need to subsidise the rule of Ibn Saud), and drew up plans to construct a US government-owned pipeline to carry oil from the Saudi oilfields to the Mediterranean. By taking control of the oil of Saudi Arabia, the State Department hoped to do a better job than the oil companies in preventing nationalisation, in part by funnelling financial support to the region's ruling families to use for 'development'.[13] After the First World War, the British government had envisioned its mandate over Iraq as a scheme for the 'development' of the country's material resources, to create a new form of protectorate and encourage the oil companies to invest in the stability of imperial power. Washington's plans for trusteeship were a new version of imperial development.

13 Robert Vitalis, *America's Kingdom: Mythmaking on the Saudi Oil Frontier*, 2nd edn, London: Verso, 2009: 62–125.

The American owners of the Saudi rights, Standard Oil of California (later renamed Chevron) and Texaco (now merged with Chevron), blocked Washington's attempted takeover. To create the impression of an official American partnership with the Arab state, they changed the name of their joint venture from the California-Arabian to the Arabian-American Oil Company (Aramco). Rather than allowing the government to invest in the company, they raised the capital they needed for postwar expansion by arranging for the Standard Oil Companies of New Jersey and New York (now ExxonMobil) to buy a 40 per cent share in Aramco. They also defeated the pipeline plan, but then demanded government support for building themselves (see map overleaf).

Similar American plans for a 'trusteeship' over oil were unfolding in Iran, which Britain and Russia had occupied during the war. Attending a meeting with Churchill and Stalin in Tehran at the end of 1943, at which a tentative plan for creating the UN was agreed, President Roosevelt took up State Department ideas for framing the US role in postwar Iran as an international trusteeship. He described the team of fifty US administrative advisers already working in Iran as a 'clinic' that was 'demonstrating the practicability, and something of the form of the projected new "trusteeship"'.[14] Like the mandate for Iraq after the First World War, the trusteeship idea for Iran offered a way for the United States to challenge Britain's control of the oil, while pushing the American oil companies to take steps towards the country's broader 'development.' The State Department pressed the Standard Oil companies and another US firm to bid for oil concessions, but when American petroleum geologists failed to find good prospects in the south-east, and began surveying in the north near the border with the Soviet Union, Moscow responded by asserting its own claims to an oil concession in the north.

The reason why Middle Eastern oil should be placed under American control was sometimes hard to clarify. Herbert Feis, a former economic adviser at the State Department who had chaired its Committee on International Oil Policy in 1943, tried to explain to the public the need for the international oil agreement. 'Nations that lacked oil had to bargain or barter for it; they became dependent on the will and bounty of others', he wrote, adding with barely veiled sarcasm: 'the United States was unused to the idea'.[15] A senior economic policy-maker may have enjoyed pointing out, after leaving office, that for oil companies the principle of market exchange – bargaining for something and depending on this interaction with others – was an unfamiliar idea. The Cold War soon provided the oil companies with a way to deflect such cynicism.

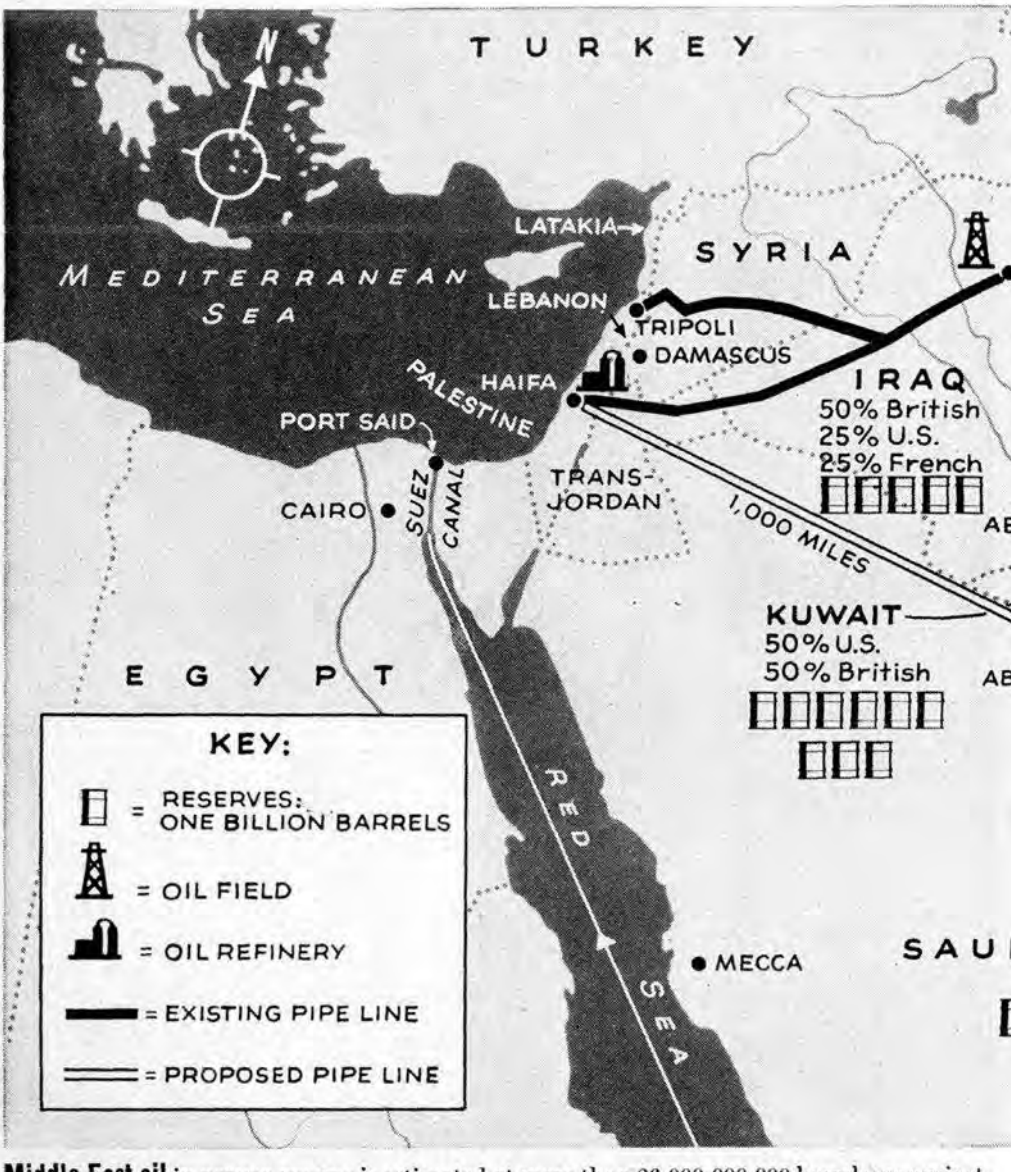
Middle East Oil CONTINUED



Middle East oil in proven reserve is estimated at more than 26,000,000,000 barrels, as against U.S. reserve of 20,000,000,000, enough to last 15 more years at present rate of consumption. Britain monopolizes all the working Iran fields. Russia would like north Iran oil and Dutch have a great unexplored concession in northwest Iran. Britain controls Iraq oil (*see next page*) but

'Middle East oil: Trouble erupts as great powers jockey for the power that petroleum provides', *Life*, 11 June 1945

U.S., French and Dutch have interests there. U.S. operates Bahrein (*see pp. 32–33*), has inside track in Saudi Arabia (*pp. 34–37*) and shares the new Kuwait field with British. Only fields shown above are those explored and working (but nonproducing Qatar and Kuwait are shown because of importance). Proposed U.S. pipeline across Arabia is far shorter than water route.

The ambition of the State Department in establishing an oil agency to stand alongside the IMF and the World Bank, in the words of a departmental memo, was to create a 'worldwide system of actual administrative control of the world's petroleum resources'.[16] The Anglo-American Petroleum Agreement, drawn up in 1944 to provide the framework for the post-war petroleum order, called for 'the efficient and orderly development of the international petroleum trade', and said this required 'international agreement' among producing and consuming countries – a clear alternative to the unilateral actions of the Latin Americans. Article 1 of the agreement laid out the new formula for the defeat of any further efforts by producer countries to control their own oil: supplies of petroleum should be made available in international trade to all countries 'on a competitive and nondiscriminatory basis' and 'within the framework of applicable laws and concession contracts'; thereby, 'the interests of producing countries should be safeguarded with a view to their economic advancement'. In other words, the large oil companies would represent the interests of all countries in managing access to oil, on the basis of the existing system of concession agreements, while compensating producer countries by contributing to their development. To further these goals the agreement proposed the creation of a body called the International Petroleum Commission, to collect statistics and publish reports. Feis, the former economic adviser, dismissed the agreement as a proposal 'to create no more than a continually active conference room, attended by a staff of experts, and supplied with a multigraph machine'.[17] He was right, but failed to note that holding multilateral meetings and duplicating endless statistical reports would help make oil 'international', countering any claims that producer countries might make to treat the oil as a national resource.

FAILURE OF LONG-RANGE PLANS

The international petroleum agreement was never implemented. The rivalry between Britain and America over the control of oil was unresolved. The major oil companies forced the revision and weakening of the agreement, and domestic US oil companies blocked its ratification in the Senate. Meanwhile the plans for trusteeships over the oil of Iran and Saudi Arabia were dropped, and the United States found a simpler way to claim control of the region's oil, and thus secure the circulation of dollars.

The British had one main goal in the oil negotiations: to organise the production and flow of oil in a way that would rebuild the value of the pound sterling, as a second international reserve currency alongside the dollar. Britain wanted an agreement that would allow it to exclude American oil imports from

16 Randall, *United States Foreign Oil Policy*: 138.
17 Feis, 'Anglo-American Oil Agreement', 1,187.

British markets (the so-called sterling area, consisting of most countries of the British Empire, plus Iraq, Kuwait, and other Persian Gulf territories). It also hoped to strengthen the pound by increasing postwar British oil production in the Middle East. Since there was, as usual, more oil available than could be produced without lowering prices and reducing the large flows of company income on which the value of sterling increasingly depended, it also sought to limit any postwar expansion of US production in the Middle East.

Britain's attempt to defend the pound sterling as a rival international currency was a struggle over oilfields. When the heads of the Trans-Arabian Pipeline Company, the non-profit joint venture set up by the US oil companies to ship Saudi oil to Europe, were deciding the route for the pipeline, they initially planned to terminate it in Palestine, a state to which Britain, before the war, had promised independence by 1949. After the UN voted instead to partition Palestine into three states (one Arab, one Jewish, and an internationalised city of Jerusalem), but provided no way to carry out the break-up of the country or the eviction of the Arab population from the Jewish state, allowing the Zionist movement to seize most of it by force, the oil companies changed their minds. They briefly considered a southerly route terminating on the northern coast of the Sinai Peninsula, in Egypt. Egypt, however, remained within the British sphere of influence. That raised a further problem besides the question of the troubles in Palestine. Egypt was a member of the sterling area. In fact, Egypt and Iraq were the only non-Commonwealth members of this exchange mechanism.[18] The American oil companies wanted to use the route of the pipeline to undermine the sterling area. To assist with this financial engineering, they diverted the pipeline north into Syria and Lebanon. Meanwhile the British built a rival pipeline at the same time, to increase the flow of sterling oil from Iraq to the Mediterranean. But whereas the Americans built a thirty-inch line, the British line was half that size (carrying about one-third as much oil), 'the limitation of diameter to 16-inch being enforced by the inability of sterling-area manufacturers to produce larger pipe and the equal impossibility of obtaining dollars'.[19] The battle over the postwar international monetary system was being fought in pipeline routes and in rival diameters of pipe.

Oil was so large a component of its international trade that a 1955 report on the treatment of oil in Britain's trade accounts suggested that 'the international

---

18 For an explanation of the currency mechanism see Elliot Zupnick, 'The Sterling Area's Central Pooling System Re-Examined', *Quarterly Journal of Economics* 69: 1, February 1955: 71–84. Egypt agreed to leave the sterling area in July 1947, hoping to convert its sterling balances, accumulated in London during the Second World War, into dollars. Shortly after, however, Britain broke the terms of the agreement by suspending the convertibility of Egypt's sterling balances. Frederick Leith-Ross, 'Financial and Economic Developments in Egypt', *International Affairs* 28: 1, 1952: 29–37.

19 Stephen Longrigg, *Oil in the Middle East: Its Discovery and Development*, 3rd edn, London: OUP, 1968: 79–80.

ramifications of the oil industry (including its tanker operations) are so large and so complex as almost to constitute oil [as] a currency in itself'.[20] Europe and other regions had to accumulate dollars, hold them and then return them to the United States in payment for oil. Inflation in the United States slowly eroded the value of the dollar, so that when these countries purchased oil, the dollars they used were worth less than their value when they acquired them. These seigniorage privileges, as they are called, enabled Washington to extract a tax from every other country in the world, keeping its economy prosperous and thus its democracy popular.

In February 1945, on his way home from a second conference of the Big Three powers, at Yalta, President Roosevelt stopped in Egypt and held meetings with three regional monarchs – the rulers of Saudi Arabia, Egypt and Ethiopia. The meeting with Ibn Saud is taken to mark the sealing of a special relationship with Saudi Arabia, concerned with Middle Eastern oil. This was not the reaction of William Eddy, the agent in the Office of Strategic Services (a forerunner of the CIA) who helped arrange the meeting and went on to a career in the CIA under the cover of working as a political agent for Aramco. Six months later, a fellow US agent in the region was bemoaning to Eddy the failure of their hopes for 'a long range plan for Saudi Arabia' after 'we all worked like dogs on it in Washington' – a reference to their failure to win large-scale US support for the country.[21] The programme of Lend Lease aid enjoyed by Saudi Arabia and Iran during the war was cancelled, the Saudi request that America not support the Zionist programme for making Palestine into a Jewish state was ignored, and wartime plans for trusteeships and large-scale development programmes for Iran and Saudi Arabia were dropped.[22]

Later on, President Truman would refuse to extend a programme of Marshall Aid to the Middle East, offering instead the Point IV programme. America would not be able to share capital or material wealth with the world's 'underdeveloped areas', Truman explained, for those resources 'are limited'. As a consolation, Washington would offer them ideas. US businesses would be encouraged to share their 'imponderable resources in technical knowledge', which 'are constantly growing and', in contrast to material wealth, 'are inexhaustible'. Technical knowhow would enable countries to use their existing material resources to produce more food, clothing and mechanical power.[23] The idea of

Linda Wills Qaimmaqami argues that Truman's business-led model of development helped precipitate the nationalisation of oil in Iran: 'The Catalyst of Nationalization: Max Thornburg and the Failure of Private Sector Developmentalism in Iran, 1947–51', *Diplomatic History* 19: 1, 1995: 1–31.

development would play a subsidiary but important role in US relations with the non-West, but its role would be to manage the difference between extraordinary levels of affluence for some and modest levels of living for the vast majority of the world, rather than to offer effective means of addressing those differences.

Meanwhile, another way of managing relations with the non-West, including the oil states of the Middle East, was emerging. Following the Yalta talks, the US had begun planning to move armed forces rapidly from Europe to the Pacific theatre, and wanted arrangements for landing rights and refuelling in the Middle East. This concern, rather than cementing a new relationship over oil, was the main reason for Roosevelt's meeting with Ibn Saud. Unable to get further large-scale financial support from Washington, Aramco and Ibn Saud settled for the building of an airport at Dhahran, which was to serve as a US air base. By the time the funds for the base were approved, the war in the Pacific was over and the US Department of War had decided that the airfield was 'of doubtful military usefulness'. Aramco, however, realised that playing on fears of military vulnerability offered a method for securing continued subsidies from Washington.[24] With the abandoning of larger development plans, oil companies could now begin to recast their interests not as a 'trusteeship' over the world's oil but, in a parallel language, as necessary for securing 'strategic' concerns.

A larger opportunity soon emerged for creating a strategic frame in which to place American oil interests, and thus to organise postwar international finance. As the Second World War ended, the dispute with the USSR re-emerged over oil concessions in Iran, triggered by American oil prospecting near the Soviet border. Over the following months, the United States turned the dispute over Iranian oil into an international crisis. This gave American officials the opportunity to make Iran into a different kind of clinic – a place in which to incubate a new context to support American oil policy in the Middle East, and an expansion of American power more generally. At the height of the Iranian oil concession crisis, in February 1946, George Kennan dispatched the famous Long Telegram from Moscow, his 'psychological analysis' arguing that the Soviet Union acted not on the basis of rational calculation of its interests but through the complex psychology of a paranoid commitment to absolute power, and thus to filling 'every nook and cranny available to it in the basin of world power'. To counter this threat, Kennan argued, democratic states had to become, in effect, less democratic, and operate more like the state that was said to threaten them. This pervasive threat could not be effectively countered by 'the sporadic acts which represent the momentary whims of democratic opinion', but only by policies that were 'no less steady in their purpose, and no less variegated and resourceful in their application' than those of the paranoid Russian state. The threat required 'the adroit and vigilant application

24 Vitalis, *America's Kingdom*: 82.

of counter-force at a series of constantly shifting geographical and political points'. The feeble whimsy of democratic politics was to be replaced by an all-encompassing imperial vigilance. Democratic weakness was also to be countered at home, by taking incisive measures 'to solve internal problems of our own society, to improve self-confidence, discipline, morale and community spirit of our own people'.[25]

Opponents of this programme to transform American rivalry with the Soviet Union into a global political, cultural and psychological battle labelled it the 'Cold War' – the term that the neoliberal critic Walter Lippmann had borrowed from George Orwell's essay warning of the oligarchic and technocratic state that would emerge from a condition of permanent war.[26] The critics lost, the Cold War was constructed, and ordinary corporate ambition to control resources overseas, in the increasingly difficult context of postwar decolonisation and the assertion of national independence, could now be explained by invoking and elaborating this global 'context'. In the Middle East, devices like the mandate and the trusteeship, and grandiose plans for development, were no longer necessary. US officials and oil executives could explain why American oil companies needed to control production in the region by referring to its 'strategic importance' in a situation of permanent war, without mentioning corporate profits or the need to restrict the supply of oil from the Middle East. Academic analysis could then repeat the language of strategic necessity, helping to build the Cold War into a long-term device for managing American interests overseas, for organising financial flows through the control of oil, and for countering democratic threats to social discipline and community spirit at home. This way of talking about oil continues even today.

I concluded Chapter 1 with the Marshall Plan and the construction of the Cold War in Europe. After networks of coal production had enabled the assembling of forms of democratic agency that allowed the advancement of new claims for political justice, the Marshall Plan helped engineer a political and financial setup in Western Europe that was less vulnerable to such claims, by making Europe increasingly dependent on oil and the dollar. These arrangements were to be based on the development and control of Middle Eastern oil, and the trading of that oil in dollars. Thus the sites of democratic contestation and vulnerability were shifted to the Middle East.

The Anglo-American Petroleum Agreement, envisioned as the basis for an international petroleum commission to operate alongside the Bretton Woods institutions, had attempted to extend this engineering of democratic politics by providing the Anglo-American control of Middle Eastern oil with a collective international framework. The 1945–46 crisis in Iran, emerging as the US tried to challenge Britain's dominant position in Middle Eastern oil and consolidate the dollar-oil mechanisms, allowed the extension of an alternative framework to govern the control of oil and the management of democracy: the Cold War.

Postwar democracy in the West appeared to depend upon creating a stable machinery of international finance, an order assembled with the help of oil wells, pipelines, tanker operations and the increasingly difficult control of oil workers. The fact that flows of oil were the basis for intersecting networks of global energy supply and global currency movements helped introduce a disjuncture that would become increasingly apparent by the end of the 1960s, leading to the energy, dollar and Middle East crises of 1967–74. The following chapter will consider those interlocking crises. Before that, let us explore a second dimension of postwar carbon democracy, a dimension that was also linked to oil and would also be transformed in the 1967–74 crises: the mid-twentieth century politics of 'the economy'.

THE CARBON ECONOMY

John Maynard Keynes, the economist who played a leading role in devising the postwar apparatus for tying the value of money to the movement of oil, helped formulate and describe another innovation of the mid-twentieth century: the modern apparatus of calculation and government that came to be called 'the economy'. A further set of connections between oil and mid-twentieth-century democratic politics concerns the role of economic expertise. Like twentieth-century democracy, twentieth-century economic expertise developed in a specific relationship to the hydrocarbon age.

Keynes's main contribution to the making of this object was to devise new ways of describing and managing the domestic circulation of money. In a memorable passage in *The General Theory*, his classic treatise of 1936, he explained the difference between the market devices of *laissez-faire* economics and the modern need for government to organise the circulation of money by picturing banknotes buried in disused coalmines:

> If the Treasury were to fill old bottles with bank notes, bury them at suitable depths in disused coal mines which are then filled up to the surface with town rubbish, and leave it to private enterprise on well-tried principles of *laissez-faire* to dig the notes up again . . . there need be no more unemployment and, with the help of the

> repercussions, the real income of the community, and its capital wealth also, would probably become a great deal greater than it actually is.[27]

British coal production peaked in 1913. By the time Keynes began writing *The General Theory*, twenty years later, the country's coal mines were being exhausted at an unprecedented rate. William Stanley Jevons, the author of an earlier revolution in British economic thinking, the mathematical calculation of individual utility of the 1870s, had published a book warning of the coming exhaustion of coal reserves. Keynes was reading that book as he published *The General Theory*, and gave a lecture on Jevons in 1936 to the Royal Statistical Society.[28] It is indicative of the transformation in economic thinking in which Keynes played a role that the exhaustion of coal reserves no longer appeared as a crisis. The management of coal reserves could now be replaced in the mind, and in the textbooks of economics, with reserves of currency. In the era that Keynes's thinking helped to define, the supply of carbon energy was no longer a practical limit to economic possibility. What mattered was the proper circulation of banknotes.

The shaping of Western democratic politics from the 1930s onwards was carried out in part through the application of new kinds of economic expertise: the development and deployment of Keynesian economic knowledge; its expansion into different areas of policy and debate, including colonial administration; its increasingly technical nature; and the efforts to claim an increasing variety of topics as subject to determination not by democratic debate but by economic planning and knowhow. The Keynesian and New Deal elaboration of economic knowledge was a response to the threat of populist politics, especially in the wake of the 1929 financial crisis and the labour militancy that accompanied it and that re-emerged a decade later. Economics provided a method of setting limits to democratic practice, and maintaining them.

The deployment of expertise requires, and encourages, the making of sociotechnical worlds that it can master. In this case, the world that had to be made was that of 'the economy'. This was an object that no economist or planner prior to the 1930s spoke of or knew to exist. Of course, the word 'economy' existed prior to the 1930s, but it referred to a process, not a thing. It meant government,

Lecture delivered on 21 April 1936. *The Coal Question* is quoted on p. 517.

or the proper management of people and resources, as in the phrase 'political economy'.[29] The economy would now become the central object of democratic politics in the West – a process that paralleled the emergence of 'development' outside the West. The economy became an object whose management was the central task of government, requiring the deployment of specialist knowledge.

CIVILISATION IS THE ECONOMY OF POWER

Most thinking about the relationship between economics and the economy continues to reflect the influence of the great Austrian-born social theorist Karl Polanyi. Polanyi argued that the economy emerged as an institutional sphere separate from the rest of society in the nineteenth century. Before this moment of separation, the economy was absorbed or embedded in wider social relations. It follows, he argued, that the formal rules of classical, Ricardian economics relate only to a particular historical period, when market exchanges ceased to be a minor aspect of broader social relations and became an apparently self-regulating system to which other social spheres were subordinated. Moreover, he argued, classical political economy helped to achieve this separation of the market system from society, in particular by formulating ways of treating land, labour and money as though they were merely commodities – a set of fictions that were essential to the formation of the economy as its own institutional sphere.[30] Treating money, in particular, as though it were a commodity, in which speculators could trade, Polanyi suggested, had later led to the collapse of European democracies.

The consensus that the economy became a distinct object of intellectual knowledge and government practice in the late eighteenth or the nineteenth century overlooks a surprising fact. No political economist of that period refers to an object called 'the economy'. In the sense of the term we now take for granted, referring to the self-contained structure or totality of relations of production, distribution and consumption of goods and services within a given geographical space, the idea of the economy emerged more than a century later, in the 1930s and 1940s. Both in academic writing and in popular expression, this meaning of the term came into common use only during the years around the Second World War.

30 *In The Great Transformation* (1944), Polanyi describes the emergence of 'society' in the nineteenth century as a system of regulations and controls attempting to limit the spread of market relations. In later writings, he describes the latter as the emergence of 'the economy'. Karl Polanyi, Conrad M. Arensberg and Harry W. Pearson, *Trade and Market in the Early Empires: Economies in History and Theory*, Glencoe: Free Press, 1957.

From the works of Thomas Mun and William Petty in the seventeenth century to Adam Smith in the late eighteenth, political economy was not concerned with the structure of production or exchange within an economy. In *The Wealth of Nations*, Adam Smith never once refers to a structure or whole of this sort. When he uses the term 'economy', the word carries the older meaning of frugality or the prudent use of resources: 'Capital has been silently and gradually accumulated by the private frugality and good conduct of individuals . . . It is the highest impertinence and presumption . . . in kings and ministers, to pretend to watch over the oeconomy of private people.'[31] The objects of political economy were the proper husbanding and circulation of goods and the proper role of the sovereign in managing this circulation. An earlier tradition of writing on the economy or management of the large household or estate was extended to discussions of the management of the state, imagined as the household of the sovereign. The term 'economy' came to refer to this prudent administration or government of the community's affairs.[32] Political economy referred to the economy, or government, of the polity, not to the politics of an economy.

As countries moved from the agrarian world of the eighteenth century to an increasingly industrial and urban life in the nineteenth, the phrase 'political economy' continued to refer to the management or government of a polity, even as writers debated the need for new forms of government. The German-American journalist Friedrich List, whose *National System of Political Economy* (1856) is sometimes read as a precocious study of 'the national economy' in its twentieth-century sense, wrote in these terms. Popularising American arguments about the need for government policies to encourage and protect the development of industry, List contrasted 'the financial economy of the state', which referred 'to the collection, to the use, and the administration of the material means of a government', with 'the economy of the people', which referred to 'the institutions, the regulations, the laws, and the circumstances which govern the economical conditions of the citizens'. The term 'economy' denoted the forms of administration, regulation, law and social circumstance that defined the processes known as government.[33]

The book Keynes had been reading on the coal question, published by William Jevons in 1865, illustrates the meanings of economy before the twentieth-century invention of 'the economy', and their relation to the growth of coal and

steam power. Jevons suggested that the economy or prudent management of resources applied especially to the resource that had made industrial civilisation possible. He contrasted the vast dissipation of force and matter that occurs in nature with the tiny fraction of power whose economy was the basis of civilisation. 'Material nature presents to us the aspect of one continuous waste of force and matter beyond our control', he wrote. 'The power we employ in the greatest engine is but an infinitesimal portion, withdrawn from the immeasurable expanse of natural forces.' However, he continued, 'while the sun annually showers down upon us about a thousand times as much heat-power as is contained in all the coal we raise annually, yet that thousandth part, being under perfect control, is a sufficient basis for all our economy and progress'. Quoting the German chemist Justus von Liebig, he described this efficient management and control of the power of fossil fuels as the basis of the work of civilisation. 'Civilization, says Baron Leibig, is *the economy of power*, and our power is coal. It is the very economy of the use of coal that makes our industry what it is; and the more we render it efficient and economical, the more will our industry thrive, and our works of civilization grow.'[34]

CALCULATION IN THE AGE OF COAL

Nineteenth-century writing about political economy reflects the world of coal mines and steam engines. The mines and the engines, however, did more than provide objects of reflection. They helped form a world of calculation, circulation and control of which the doctrines of political economy became a part. The gold standard provides a good example of this. As Britain's overseas empire grew, and with it the national debt that funded colonial wars, the country needed a system of money that could increase greatly in quantity and travel over large distances, yet retain its value. The solution was to introduce token money: coins whose value resided not in the metal itself, of which the actual worth was slightly less than the value the coin represented, but in stores of gold held by the government that issued them. Token coinage had to be too expensive to counterfeit, yet affordable enough to manufacture in large quantities. The development of coal-powered, steam-driven rolling mills and presses made it possible to solve this problem. In the Great Recoinage of 1816–17, which inaugurated the use of silver coins as token money, the eight coining presses at the Royal Mint in London produced up to 250,000 coins per day.[35] Steam-powered coinage allowed Britain gradually to implement the gold standard (the rest of

34 Jevons, *Coal Question*: 122, 125; emphasis in original.

35 Great Britain, Committee on the Royal Mint, Report from the Select Committee on the Royal Mint, London: HMSO, 1849: 74; Angela Redish, 'The Evolution of the Gold Standard in England', *Journal of Economic History* 50: 4: 789–805.

Europe followed only after 1870), which contributed to the dominant role of British finance in world trade. It also contributed to the development of new ways of knowing about questions of money and wealth. The coining and circulation of money on a large scale produced new problems, including inaccuracy in striking coins and coins losing weight through usage. The problems were the object of repeated investigation, including a Royal Commission of 1849, and of an innovative statistical study by Jevons, who organised a survey of the age and weight of coins held by banking houses from which he calculated the average rate of wear.[36] In other words, an industrial, coal-fired coinage system generated forms of circulation, storage, accounting and investigation, one of several such developments though which an empirical science of political economy could emerge.

Other forms of steam-powered machinery laid out other forms of circulation, calculation and control. During his stay in America in the 1820s, Friedrich List became briefly involved in coal mining in Pennsylvania, and joined a venture to build a rail line to carry coal to its consumers. On his return to Germany, he began to champion an expanded use of railways, not just as lines connecting two points, but as webs of commerce and communication that could engineer a common space of exchange. 'The needs of industry and communication', he wrote in 1836, 'will compel the railway systems of the larger Continental nations to form a net-like shape, concentrating on the main points in the interior and radiating from the centre to the frontiers'.[37]

Coal production itself generated a new space of calculation and debate. Jevons wrote his study of the rate of exhaustion of coal supplies to draw popular attention to the use of statistical methods, by showing how the new tools he had helped develop to analyse tables of statistical information could be applied to questions of the day.[38] He wanted to show that statistics could be used to measure a natural law, the Law of Social Growth. He took estimates of remaining supplies of coal in Britain published by the geologist Edward Hull and statistics from the Mining Record Office to estimate the annual rate at which British coal consumption was increasing. Hull had estimated that, at the current consumption rate of 72 million tons a year, the country's recoverable coal was sufficient to last more than a thousand years. While acknowledging that consumption had doubled over the last twenty years, and that if it continued to increase at the same rate supplies would be exhausted in only 172 years, Hull argued that

supplies from America and 'greater economy' in 'the getting and using of the mineral' would extend Britain's supply, and that one should not suppose 'that any part of the Creator's universe has been regulated on so short-sighted a plan, that it shall become disorganized because some of the elements necessary to its economy have failed'.[39]

Jevons set out to dispel these 'plausible fallacies' of the geologists. To understand and measure progress, he argued, what matters is not the absolute amount by which production of a good increases, which tells us nothing, but the rate – the increase relative to the increase in a previous period. If the amount of coal a country produces increases in one year by a million tons, but that increase is smaller than the increase in the preceding year, then although its total production has increased, the rate of increase has declined. 'In statistical matters', he explained, one must cultivate the habit of treating all quantities 'relatively to each other'. The rate of growth indicated not a fixed annual increase of consumption, but a geometric process of growth, in which the amount of each year's increase would be greater than the previous year. Describing the novel social experience that coal and steam power had created, the experience that today we would call 'exponential growth', in which practically infinite values are reached in finite time, Jevons showed how quickly even very large stores of coal might be depleted. Applying his methods to the consumption data of the Mining Record Office, Jevons arrived at a figure by logarithmic calculation of 3.5 per cent annual growth. At that rate, the supplies of coal identified by Hull would last not for a thousand years, but only for one hundred.[40]

Jevons then showed that problems would arise much sooner, perhaps within twenty or thirty years. It was erroneous to think that 'some day our coal seams will be found emptied to the bottom, and swept clean like a coal-cellar', or that the country's fires and furnaces would 'be suddenly extinguished, and cold and darkness will be left to reign over a depopulated country'. Long before that, the rising cost of coal as its recovery became more difficult would cause 'the climax of our growth' and 'the end of the present progressive condition of the kingdom'.

From these calculations he drew an immediate and practical conclusion. In the few remaining decades while the country's revenue was expanding and wealth accumulating, efforts had to be made 'to raise the character of the people'. Pointing out the undeniable fact that 'the whole structure of our wealth' was built upon 'a basis of ignorance and pauperism and vice', he argued for a reduction in the employment of children in manufacture and a general system of education to dispel 'the ignorance, improvidence, and brutish drunkenness of our lower working classes'. Instead of spending current material wealth on 'increased

39 Edward Hull, *The Coal-Fields of Great Britain*, 2nd edn, London: Edward Stanford, 1861: 236, 238–9, 243.

40 Jevons, *Coal Question*: 4, 170, 236–40.

luxury and ostentation and corruption', the country should spend it on creating 'the increased efficiency of labour in the next generation'. He concluded with the warning that 'we are now in the full morning of our national prosperity, and are approaching noon. Yet we have hardly begun to pay the moral and social debts to millions of our countrymen which we must pay before evening.'[41]

Three themes emerge from Jevons's writing on coal, which we will follow forward to understand what was different for the making of the economy under the subsequent dominance of oil. First, the supply of carbon energy, like the industrial circulation of coinage and the development of railway lines, formed a concentrated movement of materials that, as a process, was reported, measured, tracked across time and compiled into tables. As problems and disputes arose, methods of inspection and information-gathering increased. The Mines Inspection Act of 1850, for example, led to the appointment of government inspectors of coal mines, who in 1854 began to compile the system of Mining Records, making available the statistics on which Jevons based his work. Second, these statistics made possible the mathematical measurement of progress, rates of growth, and the depletion of resources. The questions of material limits, the exhaustion of nature and future decline became matters of increasing concern. Third, with the consequences of modern industrial and urban life, a parallel concern developed with the measurement and amelioration of the moral condition of the poor, and its relationship to the efficiency of labour.

Following Jevons, the development of social statistics took two different paths. One was research on the measurement of poverty, the living conditions of the poor, and industrial accidents. By the end of the nineteenth century, almost all industrialised states had bureaus of labour statistics, created in response to the economic crises of 1873–95 and to the growing political strength of labour organisations. The information they collected on the life of the working classes shaped the new measures of social welfare, such as retirement pensions and various forms of industrial and medical insurance, and helped to implement the new programmes. The wartime campaign to generalise these measures, as we saw in Chapter 3, led to the creation of the International Labour Office as part of the Treaty of the Versailles at the end of the First World War.

The second path was research on race development and eugenics. The work of Francis Galton on the statistical analysis of heredity, inspired by the evolutionary theory of his half-cousin Charles Darwin, first appeared in 1865, but was unable to win wider support until the 1890s. Towards the end of the century, governing classes in Europe and America became alarmed by evidence of what was considered the deterioration of racial quality, revealed in Britain by the difficulty of recruiting physically healthy soldiers for the South African war, and elsewhere by fears that the poor and the less physically fit were reproducing

41 Ibid.: v, xxiii–xxvi.

faster than the racially strong part of the population, leading to the risk of 'race suicide'.[42] Galton and his followers proposed controlled breeding to improve racial quality, and to counter the effects of the widening of voting rights. People are not 'of equal value, as social units', Galton warned, 'equally capable of voting, and the rest'.[43] To advance the study and improvement of racial quality, Galton developed new statistical methods. In fact, modern, mathematical statistics with its methods of correlation, regression and error analysis, was developed for the purpose of the eugenics movement.[44] The work was continued by Galton's student, Karl Pearson, whose drive to universalise mathematical statistics was particularly successful in its influence in economics in the early twentieth century, where Irving Fisher and others 'were soon refining the method of correlation to use it as a test of the quantity theory of money'.[45] The monetarists simplified their theories to fit the ultra-empiricism of statistical correlation, looking for a single indicator that could reveal the role of the money supply in determining economic cycles. By the 1920s American economists were 'correlating furiously and indiscriminately and with an inverse correlation between zeal and discretion', wrote Jacob Viner. 'As might have been anticipated in a world full of nonsense correlations, the results were grotesque.'[46]

NATURAL RESOURCES AND RACIAL VIGOUR

In the early decades of the twentieth century, a battle developed among economists, especially in the United States, that shaped the future of economic knowledge and its relation to nature and the material world. The battle was to have important consequences for the way questions of natural resources entered democratic debate. One side wanted economics to start from natural resources and flows of energy, the other to organise the discipline around the study of prices and flows of money. The battle was won by the second group, who created out of the measurement of money and prices a new object: the economy.

Viner, *The Long View and the Short*, Glencoe: Free Press, 1958: 451, cited in Thomas M. Humphrey 'Empirical Tests of the Quantity Theory of Money in the United States, 1900–1930', *History of Political Economy* 5: 2, 1973: 307.

In the emergent profession of academic economics, many economists were concerned to measure the exhaustion of the earth. In the United States, leading economists like Richard T. Ely, a founder of the American Economics Association, and his student Thorstein Veblen, whose theory of capitalism as a system of 'sabotage' we encountered in Chapter 1, became preoccupied with questions of natural resources and their depletion, with excess or 'conspicuous' consumption, and with the dissipation and conservation of 'energy'. Economics, in their view, was to be a study not of the laws of markets but of material flows and resources.[47] These men lost the battle to shape the discipline they helped found to the rival forces of the price theorists, led by men like Irving Fisher. Economics became instead a science of money; its object was not the material forces and resources of nature and human labour, but a new space that was opened up between nature on one side and human society and culture on the other – the not-quite-natural, not-quite-social space that came to be called 'the economy'.

Many new devices and arrangements made it possible, during the first half of the twentieth century, to develop the forms of calculation and practices of representation that enabled people to talk about and manage the circulations of money that represented the 'national economy'. Rather than describe all the work that went into building it, we can illustrate some of the mundane and interconnected ways in which it came into being with the example of Irving Fisher – the man whom the *New Palgrave Dictionary of Economics* in 1987 called 'the greatest economist America has produced'.[48]

A disciple of the work of William Jevons, Fisher is remembered as the man who built the first working model of the economy. The model consisted of a tank of water fitted with cisterns, pipes, valves, levers and stoppers. He used this hydraulic-mechanical apparatus in his lectures at Yale as an experimental device to investigate how a shock to demand or supply in one of ten different commodities affected the overall level of water, or prices, in a general equilibrium system. A more practical example of the work of making the economy was Fisher's invention of the 'Index Visible', a device for managing information on small cards that is known today as the Rolodex, which he patented in 1913. He set up a company in his house in New Haven, the Index Number Institute,

47 Veblen argued that business should be run by engineers rather than businessmen, for engineers understood material processes and were orientated towards the more efficient use of resources, whereas businessmen were concerned only with profits. In response to the great anthracite coal strike of 1902, a movement among engineers in the US wanted to take control of the 'economic', not just of the 'technical', efficiency of business, and called for an alliance between engineers and organised labour. Donald R. Stabile, 'Veblen and the Political Economy of the Engineer: The Radical Thinker and Engineering Leaders Came to Technocratic Ideas at the Same Time', *American Journal of Economics and Sociology* 45: 1, 1986: 41–52.

where assistants working in the basement used the new equipment, along with the index formulas Fisher had devised, to calculate the first indices of commodity prices and the purchasing power of the dollar. The *New York Times* and other newspapers published his price indexes every week, together with a commentary by Fisher, enabling 7 million readers to follow and participate in the price movements that would come to be called the economy.

There were many other mechanisms for removing nature and material resources from economics and turning it into a science of prices – not as simple as the Rolodex, or as uncontroversial. For example, Fisher became a champion of eugenics. His mentor at Yale was William Graham Sumner, America's leading social Darwinist. In 1906, Fisher helped establish the Race Betterment Society, and in 1922 founded and became the first president of the American Eugenics Society. Racial improvement formed a logical part of his economic theory. Human labour was a form of wealth or capital stock. Like non-human capital, it was a resource that could be improved or left to degenerate. The progress of society depended on the decisions individuals took about whether to consume in the present or invest for the future. These decisions were affected by an individual's self-control, life expectancy, thrift and degree of foresight – something that inferior races, and degenerate members of a superior race, lacked.[49]

Appointed to President Theodore Roosevelt's National Conservation Committee, set up in 1908 to address growing concerns over the exhaustion of natural resources, Fisher produced a report arguing that the most important means of conserving nature was not for the government to regulate its exploitation, but to take measures to prevent 'racial degeneracy', since 'one of the first symptoms of racial degeneracy is decay of foresight', while 'the more vigorous and long-lived the race, the better utilization can it make of its natural resources'. Economics would withdraw from studying the capacities and resources of nature and attend instead to the capacities and resources of the human. Fisher advocated establishing a federal Department of Health as the main instrument of racial improvement, but economics too could work on the enhancement of human capabilities. It could extend individual powers of foresight by developing prosthetic devices like the Rolodex and the newspaper commodity price index, and subsequently by elaborating the entire machinery of calculation called the economy.[50]

MONEY ECONOMY

In the discipline of economics, the easiest place to trace the appearance of the idea that the economy exists as a general structure of economic relations would be in the publication of John Maynard Keynes's *General Theory of Employment, Interest and Money*, in 1936. Although tending to employ phrases like 'economic society' or 'the economic system as a whole', where today one would simply say 'the economy', the *General Theory* conventionally marks the origin of what would come to be called macro-economics.[51]

The economy was formed as a new object in the context of broader developments. Jan Tinbergen, a pioneer of the mathematical measurement of 'the economy', developed his first econometric model in response to a Dutch government request for policies to combat the depression.[52] Keynesian theory was also a response to the experience of mass unemployment and depression, and to the emergence of fascist, Soviet, New Deal and other general economic programmes that addressed not just individual human behaviour but the interaction of aggregate and structural factors such as employment, investment and money supply. Also important was the emergence after the First World War of the welfare and development programmes for European colonies (Keynes's first job was in the Revenue, Statistics and Commerce Department of the India Office), in response to the growing threats to colonial rule.

These broader events were not just the context for the emergence of a new conception of the economy. While the possibility of making the economy in the mid-twentieth century arose out of these events, economics was itself involved in the reconfiguring of social and technical worlds that gave rise to the economy, as we have seen with the work of Fisher. We can mention two larger aspects of this reconfiguration: new forms of circulation of money; and the weakening of European empires and other forms of imperial control, accompanied by the creation of 'national economies'.

The interwar period saw a significant alteration in the forms of circulation of money in countries such as Britain and the United States. The most dramatic change was the increase in the use of money – in particular paper money – for everyday transactions. Before the First World War, Keynes had remarked on how seldom people in Britain used token or paper money for financial transactions. He could think of only two purposes for which he himself regularly used money – to purchase railway tickets and pay his domestic servants.[53] Most everyday transactions were settled by running an account or writing a cheque. In the United

States, federal bank notes had been introduced by the National Currency Act of 1863, but their supply was limited. Their use remained unpopular, and they competed with a range of other regional bank notes and local scrips.[54] Again, local accounts and personal cheques were by far the most common ways to settle transactions. During the war the situation began to change, with the rapid increase in the printing of money, and the relaxation and later abandonment of the gold standard in most countries. The creation of the US Federal Reserve in 1913, and similar reforms in other countries, led to a standardisation of bank notes and the widespread and rapid acceptance of the use of paper money.

This transformation in the use and circulation of money illustrates how economic knowledge helped to form its new object. In the first place, economists developed new theories of money, entering into the political battles over questions of currency reform, the gold standard, and government control of exchange rates and money supply. Keynes's first published work, *Indian Currency and Finance* (1913), was a practical contribution to this politics, and was followed by the publication of *A Treatise on Money* (1930). In the United States, the conflict between Irving Fisher's quantity theory of money and the 'real bills' doctrine of J. Laurence Laughlin and his students shaped the creation of the Federal Reserve system.[55] The conceptions and calculative technologies provided by economists were built into the new financial institutions. In other words, economists developed practical tools for measuring and managing the value of money that became part of the novel day-to-day machinery of monetary circulation that was soon to be recognised as 'the economy'.

The next step was to begin to see this new mechanism of money circulation as a system in its own right, rather than just another 'market'. Following the publication of *A Treatise on Money* (1930), Keynes made a decisive break with the ideas of his predecessors at Cambridge, Marshall and Pigou, as well as with the work of Fisher and Frisch. Earlier theorists, he argued, had treated money as simply a neutral signifier of value, and thus saw no essential difference between a system of exchange using money and a barter system. In the earliest surviving drafts of *The General Theory*, which date from 1932–33, and in fragments of his Cambridge lecture notes from the same period, he discusses the differences between the 'real-exchange economy' or 'neutral' economy of classical economic theory, and the 'money economy' of the real world of the present.[56] These notes represent his first use of the concept of 'the economy' in its contemporary sense.

Keynes's breakthrough was to conceive of the new totality not as an aggregation of markets in different commodities, but as the circulation of money: the economy was the sum of all the moments at which money changed hands.

THE NATIONAL ECONOMY

A further step in the making of this economy was to construct mechanisms for measuring all the instances of spending and receiving money within a geographical space – the new national income accounts. Before the interwar period, attempts to calculate national wealth or 'national dividend' had come up against a series of insuperable obstacles. There was the problem of counting the 'same' goods or money twice. For example, commodities sold at wholesale could not be counted again, it was thought, when sold at retail. Income earned as a professional salary should not be included in national wealth a second time when paid as wages to the servants. And, as Alfred Marshall pointed out, there was the problem of accounting for all the waste that was incurred in the production of wealth – not only the depreciation of tools and machinery, but also the exhaustion of the country's natural resources.[57]

After the First World War, the Dawes Committee, set up to estimate Germany's 'capacity to pay' economic reparations, discovered the lack of not just reliable data concerning national income but of a manageable conception of what one was trying to count. In both Germany and the US there were extensive interwar efforts to remedy this problem.[58] It took two decades to solve it. The solution was not to count things more accurately, but to re-conceive the object being counted. No longer was the goal to count the nation's wealth or dividend, but rather its aggregate 'national income' – the sum of every instance of money changing hands. Each such instance represented income to the recipient, however productive or unproductive the activity and regardless of the waste incurred. The work of Keynes again played a critical role, and he and his students worked closely with the Treasury in London to design the methods of estimating national income.

In the United States, Simon Kuznets of the National Bureau of Economic Research systematised the new methods. In 1942 the US Department of Commerce began publishing national economic data, and in his 1944 budget speech President Roosevelt introduced the idea of 'gross national product'.[59]

Kuznets warned that 'a national total facilitates the ascription of independent significance to that vague entity called the national economy'.[60] The warning was of no use. The subsequent elaboration of the GNP of each economy made it possible to represent the size, structure and growth of this new totality. The making of the economy provided a new, everyday political language in which the nation-state could speak of itself and imagine its existence as something natural, spatially bounded and subject to political management.

The emergent national economy was dependent upon a 'nationalisation' of political and administrative power – the emergence of large-scale, techno-scientific governmental practices based upon the vastly expanded administrative machinery of post-1930s national governments. It also contributed to the making of these nationalised machineries of government, in which economics superseded law as the technical language of administrative power.[61]

For orthodox, pre-Keynesian economics, the sphere of economic behaviour was the individual market. This was the abstraction in terms of which the relations between costs, utilities and prices were to be analysed. When Keynes's *General Theory* replaced this abstraction, which had no geographical or political definition, with the 'economic system as a whole', it was a system defined by a set of geopolitical boundaries. The system was represented in terms of a series of aggregates (production, employment, investment and consumption) and synthetic averages (interest rate, price level, real wage, and so on), whose referent was the geographic space of the nation-state. This 'national' framing of the economy was not theorised, but introduced as a commonsense construct providing the boundaries within which the new averages and aggregates could be measured.[62] Subsequently, the division of economics into the separate fields of macro- and micro-economics inscribed this commonsensical reference to the nation-state in the structure of the discipline, where it remained unnoticed. Thinking of the national economy as simply 'the macro level' provided a substitute for a theoretical analysis of its geopolitical construction. In place of a study of the institutional forms of the state, economics reproduced this institutional structure within the structure of the discipline.

The forming of the economy in terms of the nation-state was related to the re-casting of the international order. The dissolution of the European and Japanese empires before and after the Second World War destroyed an older framing of political power in terms of position in an imperial order. Here too the economy provided a new way of organising geopolitical space. Previously

it had made little sense to talk of, say, the British economy, so long as Britain's economic realm was thought to include India and its other colonies. More generally, a world that was pictured as consisting outside Europe of a series of extensive but discontinuous European and other empires could not easily be imagined to contain a large number of separate economies, each coinciding with a self-contained geographical space and consisting of the totality of economic relations within that space.

The collapse of empire and the growing hegemony of the United States created a new order, consolidated first by the League of Nations and then by the UN, the World Bank and the International Monetary Fund, in which the world was rendered in the form of separate nation-states, with each state marking the boundary of a distinct economy. Again, the new macro-economics took these imagined objects as its untheorised referents: international trade was measured in terms of aggregates (imports and exports of goods and capital) and averages (terms of trade, exchange rates) that were defined in terms of the transactions between national economies.[63] Economic expertise, institutionalised in the World Bank, the IMF and other new agencies, helped construct the new global political order through the publication of statistics and the proliferation of political programmes defining as their object these separate economies.

The framing of the Keynesian national economy was part of a programme to limit and reduce the operation of market competition, through increased management of finance, trade and migration, and above all through the prevention of a global market in labour. It can thus be seen as a successor to the colonial order – an earlier and much older system of limiting market forces by means of monopoly, managed trade, the control of labour, and political repression, which began to collapse in the interwar period. Seen in this light, the making of 'the economy' should be connected with a parallel development that also sought to frame politico-economic relations to exclude the operation of market competition: the development of the large corporation, including its largest and most powerful variant, the multinational oil corporation.

Joseph Schumpeter argued that economists had more justification than natural scientists for using mathematical models to describe the world they studied.[64] This was because the economic world, unlike the natural world, was actually constructed out of numerical phenomena – prices, measures of quantity, interest rates, and so on. He saw this as an argument for the further development of quantitative and formal methods of economic analysis. This affinity between the methods of economics and the make-up of the world it studied was certainly a strength, but it was a strength that had further consequences.

---

63 Ibid.

64 Joseph Schumpeter, 'The Common Sense of Econometrics', *Econometrica* 1: 1, January 1933: 5.

It made it relatively easy for economic knowledge to become involved in the everyday making of the objects of economic analysis.[65] As a result, there could never be any simple divide between the models and representations developed by academic economics and the world it claimed to represent.

These transformations created in the twentieth century a political and material world densely imbued with the expertise, calculative techniques and conceptual machinery of modern economics. The so-called material world of governments, corporations, consumers and objects of consumption was arranged, managed, formatted and run with the help of economic expertise. The readiness with which it seemed that this world could be manipulated and modelled by economics reflected not simply that it was a naturally 'quantitative' world, as Schumpeter suggested. It reflected this imbrication of the concepts and calculations of economic science in the world it was studying.

FUEL MONEY

We can now connect the assembling of 'the economy' with the transition from a coal-based energy system to a predominantly oil-based one. The conception of the economy depended upon abundant and low-cost energy supplies, making postwar Keynesian economics a form of 'petroknowledge'.

The conceptualisation of the economy as a process of monetary circulation defined the main feature of the new object: it could expand without getting physically bigger. Older ways of thinking about wealth were based upon physical processes that suggested limits to growth: the expansion of cities and factories, the colonial enlargement of territory, the accumulation of gold reserves, the growth of population and absorption of migrants, the exploitation of new mineral reserves, the increase in the volume of trade in commodities. All these were spatial and material processes that had physical limits. By the 1930s, many of those limits seemed to be approaching: population growth in the West was levelling off, the colonial expansion of the United States and the European imperial powers had ended and was threatened with reversal, coal mines were being exhausted, and agriculture and industry faced gluts of overproduction. The economy, however, measured by the new calculative device of national income accounting, had no obvious limit. National income, later renamed the gross national product, was a measure not of the accumulation of wealth but of the speed and frequency with which paper money changed hands. It could grow without any problem of physical or territorial limits.

Oil contributed to the new conception of the economy as an object that could grow without limit in several ways. First, oil declined continuously in price. Adjusting for inflation, the price of a barrel of oil in 1970 was one-third of

65 Michel Callon, *The Laws of the Markets*, Oxford: Blackwell, 1998.

what it had sold for in 1920.[66] So although increasing quantities of energy were consumed, the cost of energy did not appear to represent a limit to economic growth. (In fact, economists explained the growth of their new object without reference to the consumption of ever-increasing quantities of physical energy, measuring only the input of capital and labour. This left an unexplained 'residual' growth, which for a long time they tried to attribute to factors outside their economic models that they called 'technology'.[67])

Second, thanks to its relative abundance and the ease of shipping it across oceans, oil could be treated as something inexhaustible. Its cost included no calculation for the exhaustion of reserves. The growth of the economy, measured in terms of GNP, had no need to account for the depletion of energy resources. The leading contributions to the academic formulation of the economy – Keynes's *General Theory*, Hicks's *Value and Capital*, Samuelson's *Foundations*, and the Arrow-Debreu model – paid no attention to the depletion of energy.[68] The economics of growth of the 1950s and 1960s could conceive of long-run growth as something unrestrained by the availability of energy.[69] Moreover, the costs of air pollution, environmental disaster, climate change and the other negative consequences of using fossil fuels were not deducted from the measurement of GNP. Since the measurement of the economy made no distinction between beneficial and harmful costs, the increased expenditure required to deal with the damage caused by fossil fuels appeared as an addition rather than an impediment to growth.[70] In all these ways, the availability and supply of oil contributed to the shaping of the economy and its growth as the new primary object of mid-twentieth-century politics.

The abundance of hydrocarbon energy contributed to the new forms of calculation in further ways, two of which were of particular significance. One was the industrialisation of agriculture. To earlier economic thought, land appeared as a primary source of wealth and as a limited resource, unable to

66 The price of oil fell from $31 a barrel in 1920 to $9 in 1970 (in 2006 prices). The average price per decade also declined, from $18 per barrel in the 1920s, to $15 per barrel in the 1930s and 1940s, $14 per barrel in the 1950s and $12 per barrel in the 1960s. *BP Statistical Review of World Energy 2007*, available at www.bp.com.

67 Dale W. Jorgenson, ed., *The Economics of Productivity*, Cheltenham: Edward Elgar, 2009. Robert U. Ayres and Benjamin Warr show that including a measure for energy, or rather exergy – energy when converted into useful work – provides a better accounting for all US growth since 1900. increase at the rate of population growth and liable to degeneration and exhaustion. The introduction of synthetic fertilisers after the First World War, manufactured from natural gas, and of chemical herbicides and insecticides after the Second World War, appeared to remove these natural limits to growth. The other contribution was the rise of synthetic materials, manufactured with hydrocarbons, which appeared as a direct answer to resource depletion. In 1926, a meeting of the Institute of Politics in Williamstown, Massachusetts, brought together mining engineers, geologists and chemists to talk with political scientists about the threat of resource depletion. The mining engineers warned about the threat of exhaustion of key minerals; but the chemists disagreed, arguing that the new synthetic materials developed during the First World War would make it possible to create any resources that ran short by artificial means. 'The mining engineers argued that when present stocks of important materials are exhausted, our civilization will be profoundly dislocated', according to a report on the meeting. 'The experts in chemistry, on the other hand, were pervaded with a striking optimism.' Acknowledging the possibility of temporary shortages, 'they looked forward with assurance to replacing exhausted materials with others equally suited to human needs.' The difference of view extended to political issues. The mining engineers warned that 'the natural distribution of resources is distinctly unequal, so that a condition approaching monopoly exists in many essential resources', oil being the most obvious example. The chemists, on the other hand, 'felt that synthetic products would, in many cases, break up national monopolies, and restore a really competitive situation'.[71]

If oil played a key role in the making of 'the economy', it also shaped the project that would challenge it, and later provide a rival method of governing democratic politics: the 'market' of neoliberalism. A group of European intellectuals under the leadership of Friedrich Hayek launched the neoliberal movement at a colloquium in Paris, organised in August 1938, to discuss the work of Walter Lippmann criticising the New Deal, as a movement against this new object of planning, the economy, and against planning itself as a method of concentrating and deploying expert knowledge. Neoliberalism proposed an alternative ordering of knowledge, expertise and political technology – the political apparatus that it named 'the market'. This was not the market of David Ricardo or William Jevons, but a term that began to take on new meanings in the hands of the nascent neoliberal movement. Drawing on Lippmann's warnings in *The Phantom Public* and *The Good Society* about the dangers of public opinion and the need to expand the areas of concern that are reserved to the decisions of experts, neoliberalism was envisioned by

71 Henry M. Wriston, 'Institute of Politics', *American Political Science Review* 20: 4, 1926: 853–4.

Hayek and his collaborators as an alternative project to defeat the threat of the left and of populist democracy.

The development of neoliberalism was delayed by the war and the programmes of postwar reconstruction. Its political challenge to the Keynesian apparatus got gradually underway a decade later, in modest form, with the founding of a think tank in London in 1955 called the Institute of Economic Affairs. The launch was triggered by the first postwar crisis in the oil-currency system: Britain's attempt to preserve the sterling area as a mechanism of currency regulation, despite the loss of its control of the hub of that mechanism, the Anglo-Iranian Company's oilfields in Iran. The desperate measures with which London tried to retain the pound's value despite the loss of the oil wells through which its value had been manufactured provided the point of vulnerability where the neoliberal movement first began to construct an alternative to the economy.

Likewise in the US, the origins of the neoliberal movement were tied to the struggles over the postwar issues of oil and the regulation of international financial speculation. The State Department's plans for American oil policy in 1945 were blocked by the Petroleum Industry War Council, whose foreign policy committee was chaired by Albert Mattei, president of the Honolulu Oil Corporation. Mattei warned the officials attempting to create an international body to regulate postwar oil development, 'we are going to come in with constructive suggestions, and if you don't accept our suggestions we are going to tear your playhouse down'.[72] He went on to help kill the Anglo-US Petroleum Agreement. A powerful northern California Republican, Mattei was a founding board member in 1946 of the Foundation for Economic Education – the original inspiration for Hayek's Institute of Economic Affairs in London. One of its first publications was Henry Hazlitt's *Will Dollars Save the World?*, an attack on the Marshall Plan and the forms of state planning in Europe on which it was based, as well as the ideas about the dollar and other currencies that it reinforced. Hazlitt called for the US to go on the real, not just the formal gold standard, and for others to follow.[73]

The oil wells and pipelines of the Middle East, and the political arrangements that were built with them, helped make possible the assembling of the Keynesian economy and the forms of democracy in which it played a central part. Democratic politics developed, thanks to oil, with a peculiar orientation towards the future: the future was a limitless horizon of growth. This horizon was not some natural reflection of a time of plenty; it was the result of a particular way of organising expert knowledge and its objects, in terms of a novel world

72 Stephen J. Randall, *United States Foreign Oil Policy 1914–1948*, 2nd edn, Montreal and Kingston: McGill-Queen's University Press, 2005: 199–200.

73 Henry Hazlitt, *Will Dollars Save the World?* New York: Appleton-Century, 1947. His analysis of Europe began with an attack on allied control of the German economy, based on the arguments of the ordoliberal Wilhelm Röpke.

called 'the economy'. Innovations in methods of calculation, the use of money, the measurement of transactions and the compiling of national statistics made it possible to imagine the central object of politics as an object that could increase in size without any form of ultimate material constraint.

We have now expanded the meaning of the term 'carbon democracy'. At first it referred to the central place of coal in the rise of mass democracy, and then to the role of oil, with its different locations, properties and modes of control, in weakening the forms of democratic agency that a dependence on coal had enabled. Oil has now taken on a larger significance in our understanding of democracy. In the postwar period, democratic politics was transformed not only by the switch to oil, but by the development of two new methods of governing democracies, both made possible by the growing use of energy from oil. One of these was an arrangement for managing the value of money and limiting the power of financial speculation, which was said to have destroyed interwar democracy – a system built with the pipelines, oil agreements and oligarchies that organised the supply and pricing of oil. It was accompanied by the construction of the Cold War, which provided a framework for the policing of the postwar Middle East that replaced the need for mandates, trusteeships, development programmes and other scaffoldings for imperial power. The other new mode of governing democracies was the manufacture of 'the economy' – an object whose experts began to displace democratic debate and whose mechanisms set limits to egalitarian demands. In the years 1967–74, as we will see in Chapter 7, the relations among these disparate elements were all transformed, just as they are being transformed again today. To understand the so-called 'oil crisis' of that period, we must first understand how political forces in the Middle East brought the postwar petroleum order to an end.

CHAPTER 6

Sabotage

While operating as part of an international financial system, and as the energy that made it possible to imagine the limitless growth of 'the economy', oil was a fluid that petroleum workers in production fields in different parts of the world recovered from beneath the ground, stored in tanks, processed in treatment plants, pumped into pipelines, loaded onto tankers and transported across oceans. The drilling rigs, pumps, pipelines, refineries and distribution networks of the oil industry were not as vulnerable to stoppages or sabotage as the carbon energy networks of the coal age. Nevertheless, as the Middle East replaced Latin America as the world's second-most-productive oil region after the United States, the possibilities for local disruption increased.[1]

Governments eventually came to power in Iraq, Algeria, Syria and Libya that were independent of British and French political influence, while the two American client states, Iran and Saudi Arabia, began attempting to loosen foreign control of their oil. These changes allowed local disputes and disruptions to be built into something more effective. Interrupting or reducing the supply of oil could become an instrument to be used for larger political purposes, aimed at altering the control of oil or changing other aspects of the political order in the Middle East. The construction of this instrument is usually described in terms of the emergence of a new political consciousness: the growth of a more assertive Arab nationalism. Equally important, however, were the practical forms of recalcitrance: the rerouting of oil supplies, the building of new refineries, and the acts of sabotage that made possible the first sustained challenge to the way Western oil companies managed the flow of oil.

REVOLUTION IN IRAQ

During the 1960s, the oil-producing states of the Middle East sought a way to take national control of their oil reserves without suffering the fate of Iran a decade earlier. When the government of Muhammad Mossadegh nationalised the assets of the Anglo-Iranian Oil Company in 1951, Iran had taken over the production of oil but was unable to sell it. The British blockaded exports from the refinery at Abadan, persuading tanker fleets and major oil companies to

1 Oil production in the Middle East and North Africa surpassed that of Latin America and the Caribbean in 1953, and of the US ten years later. DeGoyer & MacNoughton, *Twentieth Century Petroleum Statistics*, Dallas: DeGolyer & MacNaughton, 2009.

refuse to handle the oil. Anglo-Iranian made up the lost supplies by doubling production in the neighbouring oilfields of Kuwait, which became the largest producer in the Middle East. Since oil formed a large part of Iran's export revenues, the blockade threw the country into economic crisis, leaving the government an easy target for the Anglo-American-organised military coup of August 1953. The coup removed Mossadegh's parliamentary-based government, restored and enhanced the oligarchic rule of the shah, and exposed the left to violent repression.

Iraq was the next focus of the struggle between the oil firms and the producer countries. Like Iran it had a large agrarian population, while its cities were growing with the migrant poor driven from the countryside by the concentration of land in the hands of large landowners whose control over rural life and livelihoods had been consolidated under the British. In the oilfields, the railway yards and the textile mills, the workforce had formed active trade unions. The leadership of these and other popular political forces came largely from the Communist Party of Iraq, the largest and best-organised party in the country. The left campaigned for jobs, housing and other improvements to collective welfare, for ending the private control of large estates that caused misery in the countryside, for democratic rights in place of political repression and for ending foreign control of the oil industry.[2]

As the control of oil became the focus of popular political forces, it led to their undoing. The power of sabotage – the capacity to block or slow the flow of oil, a capacity that had previously been monopolised largely by the international oil companies – would be organised not by the workers who operated the oil industry, but by the state. When nationalist army officers led by Abd al-Karim Qasim overthrew the British-backed monarchical government in 1958, they relied initially on the Communists for popular support while trying to unify the country around a campaign for the control of oil. For Qasim and his successors, taking state ownership of the country's petroleum resources would offer a way to finance social reforms while bypassing those modes of wealth-creation that make the well off vulnerable to egalitarian demands. Oil revenues would remove the need to create national wealth through a radical redistribution of land and a large increase in manufacturing.

In other parts of the world (in much of East and South Asia, for example), effective agrarian reform was a critical instrument for building more egalitarian and democratic ways of life. Limiting the size of farms to the area that a family could work on its own removed from the wealthy the option of earning

2 Hanna Batatu, *The Old Social Classes and the Revolutionary Movements of Iraq: A Study of Iraq's Old Landed and Commercial Classes and of its Communists, Ba'thists, and Free Officers*, Princeton: Princeton University Press, 1978: 764–865; Joe Stork, 'Oil and the Penetration of Capitalism in Iraq', in Petter Nore and Terisa Turner, eds, *Oil and Class Struggle*, London: Zed Press, 1980: 172–98.

large rentier incomes from land, obliging those seeking to accumulate wealth to build it through the development of manufacturing. Such a change has a double effect, creating more equality (and smaller, more productive farms) in the countryside, while making those with capital gradually vulnerable to the power of an industrial workforce. Democratisation has generally depended on engineering such forms of vulnerability. The vulnerability arises not because manufacturing allows workers to gather and share ideas, or form what is called a 'social movement', but because it can render the technical processes of producing concentrations of wealth dependent on the well-being of large numbers of people.

The new Iraqi government attempted a redistribution of large agrarian estates, but struggled to implement the programme in the face of landlord opposition and a succession of serious droughts. It set the upper limit on landholding at 250 hectares (over 600 acres) of irrigated land, and double that area of rain-fed land.[3] In East Asia, governments driven by the fear that peasants and their allies might try to emulate the Communist revolution in China carried out land reform programmes that set limits on owning irrigated land as low as three hectares. Retaining their large estates, those with capital in Iraq had no need to take the difficult path of earning wealth through manufacturing, and would later enjoy the opportunities in trade, contracting and other services required by a government steadily enriched by oil. While manufacturing depends on complex human–mechanical processes that are vulnerable to sabotage, giving large industrial workforces the ability to make effective political demands, national control of oil would place its revenues in the hands of the state, gradually strengthening the powers of government and reducing its initial dependence on popular forces.[4]

Among the four large oil-producing countries of the Middle East in that period – Iran, Iraq, Saudi Arabia and Kuwait – Iraq's situation was peculiar. It was the country where the companies that controlled the world's major oil regions least wanted to produce more of it. The industry was under the management of the Anglo-Iranian Oil Company, now renamed British Petroleum.

3 Edith Penrose and E. F. Penrose, *Iraq: International Relations and National Development*, London: Ernest Benn, 1978: 240–8.

4 Studies of the impact of oil on democracy fail to consider these questions. Michael L. Ross, 'Does Oil Hinder Democracy?' *World Politics* 53: 3, April 2001: 325–61, for example, demonstrates a negative correlation between oil exports as a percentage of GDP and degree of democracy, as estimated in the Polity data set. The data are derived from an evaluation of the institutional procedures by which the candidate for chief executive is selected, elected and held accountable. The narrowness of this conception of democracy, the unreliability of its measurement, and the assumption that diverse institutional arrangements can be compared and ranked as embodying differing degrees of a universal principle of democracy, are among the many problems presented by the data. Ross is unable to establish reasons for the statistical relationship between oil exports and Polity data ranking, or to account for places, such as Venezuela and Indonesia, that experienced a different relationship between the development of oil and the emergence of more democratic forms of rule.

From the creation of the Iraqi oil industry in the 1920s, BP had sought to develop the country's oil more slowly than production in neighbouring countries. The company produced oil on behalf of a consortium, the Iraq Petroleum Company, in an arrangement similar to that in the neighbouring countries (including Iran after 1953). BP's partners in Iraq, however, included not only other members of the 'seven sisters', the cartel formed by BP, Shell and the five major US oil firms, but the French oil consortium Compagnie Française des Pétroles (known today as Total) and its ally Calouste Gulbenkian, the go-between who had built the consortium. Raising production in Iraq increased the market share of the French and Gulbenkian, whereas growth in the other three countries was shared only among the cartel.[5] As a result, oil production in Iraq grew at a much slower rate than among its neighbours.

BP delayed the completion of the pipeline to export the oil, deliberately drilled shallow wells to avoid discovering additional supplies, and plugged wildcat wells that yielded large finds to conceal their existence from the government. Although Iraq's reserves were comparable to those of the other three countries, its production in the 1950s and 1960s was kept at about half the level of the others, or less. BP and its partners used Iraq as the swing producer, with a large undeveloped capacity that was increased only to meet exceptional demand.[6]

Compared to Iran, where nationalisation had already been defeated, Iraq's position was even weaker. The bulk of its oil was exported by pipeline through Syria to the Mediterranean, so it did not control the point of shipment. It had a small refinery to process oil for domestic consumption, but the main refinery supplying regional markets was placed at the Mediterranean end of the pipeline, leaving Iraq no independent means of processing oil for export.

RELINQUISHMENT

When Qasim and his fellow army officers overthrew the British-backed monarchical government in 1958, they realised that these weaknesses would enable the major oil companies to defeat any attempt to nationalise the industry. Qasim's initial goal was to construct the equipment to overcome this vulnerability. He proposed that the Iraq Petroleum Company (IPC) lay a pipeline from the Mosul oilfields in the north to Basra in the south, and build a refinery there for export. The oil companies refused. They had no wish to give Iraq the ability to process

5 Independent companies had a token share in the Iran consortium, but in Iraq the CFP/Gulbenkian share was a much more significant 27.5 per cent. The operating companies in Kuwait and Saudi Arabia were not, strictly speaking, consortiums, but jointly owned subsidiaries of the parent companies.

6 *Twentieth Century Petroleum Statistics*; John Blair, *The Control of Oil*, New York: Pantheon Books, 1976: 81–5; Gregory Nowell, *Mercantile States and the World Oil Cartel, 1900–1939*, Ithaca: Cornell University Press, 1994: 270–5.

and export its own oil. Unknown to Qasim, moreover, there was already more than enough oil in the south. IPC estimated that the North Rumaila field near Basra might be the largest or second-largest oilfield in the world. In negotiations with the Iraqi government, however, BP kept this secret, noting that it would not be prudent at this stage 'to mention latent possibilities of greater Rumaila development'.[7]

The annual dividend BP paid its shareholders had grown from 16 pence per share in the early 1950s to 43 pence in 1954, or 43 per cent of the original value of each share. Given the postwar economic austerity in Britain and the demand of Iraq and other producer countries for a greater share of the income, the senior minister at the British Treasury had become embarrassed by the level of shareholder profits, and demanded in private that it be reduced. 'It is impossible to go on with these *stooges*', he wrote in an internal memo, threatening to publicly repudiate the directors of 'this unpatriotic organization'. BP refused to bend, pointing to the criterion that mattered most: its rival, Shell, paid higher returns. The 43 per cent return was soon surpassed; BP increased its dividend to 75 pence per share in the late 1950s, and to 117 pence in 1960.[8] Since increased production would lower prices and threaten this extraordinary rate of surplus income, BP was anxious not to see a new field like North Rumaila developed.

Unable to nationalise IPC, Iraq planned to develop a national oil industry alongside it. It proposed that the company relinquish part of the concession area, which covered almost the entire country. Under the original concession agreement of 1925, IPC had been required to relinquish all except about 0.5 per cent of the concession area within thirty-two months of starting exploration, but the consortium had forced the government to remove this provision from the revised agreement of 1931. BP and its partners now agreed to discuss giving up 50 per cent of the area – an offer later increased to 54 per cent – provided the area given up was expressed in square miles rather than as a percentage of the total (to make it more difficult for other countries to demand an equivalent deal).[9] The companies also insisted on deciding which areas to relinquish. Iraq was willing to let IPC keep all currently producing wells and areas with proven reserves, but wanted a say in which remaining areas were given up, so as to have

attractive prospects to offer other companies with which it might work. The Foreign Office in London feared that Iraq might respond by annexing Kuwait, previously a dependency of Basra province. By depriving BP of the Kuwaiti oilfields it had used to replace Iranian supplies when it imposed its embargo on Iran in 1951, Baghdad could make it harder for BP to impose an embargo on Iraq in the event of nationalisation.[10] To the disquiet of officials at the Foreign Office, who found Iraq's proposals on relinquishment 'not in fact unreasonable', the oil companies rejected them.[11]

A PREFERENCE FOR CRISIS

The oil companies preferred to provoke a crisis. As the Foreign Office noted, the IPC owners 'may prefer to have 75 per cent taken away from them than to surrender 54 per cent, in view of implications in other areas'.[12] Forcing Iraq to act unilaterally would give the impression that IPC had no say in the matter, and make it harder for other countries to request similar arrangements. More importantly, it would enable the IPC partners to threaten litigation against any company that agreed to work in the confiscated areas, as BP had done successfully in Iran in 1951. Unable to reach an agreement, in December 1960 Iraq passed Law 80, cancelling the 1931 concession agreement and expropriating 99.5 per cent of the concession area, leaving IPC its producing wells but not the fields it had refused to develop, including North Rumaila. Its remaining 0.5 per cent share corresponded to the area it would have been allowed to retain under the original 1925 concession. The oil companies resolved 'to wait out Qasim', in the words of the authorised history of BP, 'hoping for a change of government'.[13]

The US and Britain, it seems, had already decided to eliminate Qasim. The CIA's attempt to kill him in February 1960 failed, as had an effort to assassinate him the previous year, but he was removed from power and murdered in the military coup of February 1963.[14] The US supplied the new government with the names of more than a hundred leftists for its death squads to hunt down,

Brandon Wolfe-Hunnicutt assesses the evidence from these sources and explains the shifting battle in the US government between those open to working with Qasim and those arguing for his elimination: 'The End of the Concessionary Regime: Oil and American Power in Iraq, 1958–1972', PhD thesis, Department of History, Stanford University, 2011: 26–90.

many of them prominent intellectuals, and Britain reported within a week that the 'winkling out' of the Communists was succeeding and 'the army has the situation under control'.[15] Large numbers of the leadership and rank-and-file of the country's popular political movement were killed, and thousands more imprisoned. James Akins, an American diplomat in Kuwait, from where the US was said to have liaised with the coup plotters, returned to Baghdad following the coup. 'We were very happy', he later recalled. 'They got rid of a lot of communists. A lot of them were executed, or shot. This was a great development.'[16] The military government requested that IPC turn over a disused pumping station to house political prisoners, asking the oil company 'to help equip the station and build it up into a concentration camp' capable of holding 1,200 political prisoners. IPC preferred not to become involved in the construction of a concentration camp – the term used by the government – but agreed to supply piped water to the desert prison.[17]

With Qasim out of the way and the left and the labour movement eliminated or 'under control', America and Britain were disappointed to discover that IPC was still uncooperative. The British embassy in Baghdad told London that 'the whole basis of the IPC concession here is out of date' and should be replaced with a partnership with an Iraqi state enterprise.[18] IPC, however, demanded that the new regime rescind the expropriation of its concession area. While continuing to pump the limited supplies of oil it wanted from Iraq, the consortium persuaded the US government to pressure independent oil companies not to take up any oil contracts offered by Iraq as long as the dispute over Law 80 was unresolved, and meanwhile delayed settling the dispute.[19]

The method of provoking a crisis and delaying its resolution was aided by a series of regional crises. In 1966, Syria tried to obtain higher transit fees from IPC for using the pipeline that carried Iraqi oil to the Mediterranean. Rather than pay the higher fees, IPC preferred to halt the pumping of oil through the pipeline. The closure lasted from November 1966 until the following March, and reduced

Iraq's oil income by two-thirds.[20] BP was happy to shut down Iraqi production, as this offered a way to deal with the problem of oversupply, while causing a further crisis with Iraq. In June 1967, Israel launched the Six-Day War against Egypt and Syria, and in protest the Syrian government cut the pipeline again.

The strategy of crisis and delay gained the major oil companies a decade, but came to an end in the aftermath of the 1967 war. In August 1967, Iraq rescinded a proposal to restore the large North Rumaila field to IPC, a plan favoured by the Oil Ministry but blocked by nationalist opposition to the role of the international oil companies. Over the following months the government made agreements for the state-owned Iraq National Oil Company, established in 1964, to develop the country's oil resources with partners not susceptible to pressure from the oil majors or the US government. In December 1967 it agreed a joint venture with a French state-owned oil company, and the following April it invited bids for technical support to develop North Rumaila and build a pipeline to a new refinery at Basra, to be operated not as a partnership but as an enterprise run directly by the Iraq National Oil Company. An offer from the Soviet Union was finalised a year later, after a coup in July 1968 that brought to power right-wing army officers allied with the Ba'th Party. Iraq was now able to build the independent capacity to process and export oil that Qasim had first sought in 1959.[21]

Arab states that had developed oil industries outside the jurisdiction of the world's seven large oil firms had already established national control. Syria nationalised its small petroleum industry in 1964, Algeria took majority ownership of its French-built industry in February 1971, and Libya began to nationalise foreign-owned oil production in December 1971. The following year, Iraq became the first Middle Eastern producer to wrest control of oil from the dominant Anglo-American cartel. When production from the Rumaila field began in April, IPC cut its production in the north by 50 per cent. After preparing austerity measures and taking two leaders of the Communist party into the cabinet to ensure popular support, on 1 June 1972 the Ba'thist government nationalised the Iraq Petroleum Company.[22]

BOXED IN

In the oil-producing states the powers of sabotage over which oil workers and oil firms had struggled were being increasingly taken over by governments – which were equipping themselves with the palace guards and intelligence services that

22 Bamberg, *History of British Petroleum*, vol. 3: 171, 469–70.

by the late 1960s made them immune to further foreign- or domestic-organised military coups. In industrialised countries, the 'power of inhibition' underwent a different change.[23] The rise of oil had weakened the old alliance of coal, which brought together miners, railwaymen and dockworkers, allowing them unprecedented power. By 1948, spurred by the role of the Marshall Plan in subsidising the switch from coal to oil, the era of the mass strike was over. In its place emerged a new method of making political claims, based on new ways of interrupting industrial processes.

In 1958 the French sociologist Serge Mallet studied workers at the CalTex oil refinery at Bec d'Ambes on the Gironde Estuary, near Bordeaux. CalTex was a joint venture created by the owners of Aramco to market oil from Saudi Arabia, originally operating in Africa and Asia. In 1947, when construction began on the Tapline to bring Saudi oil to Europe, CalTex took over the former Texaco refinery near Bordeaux, which had been destroyed during the war, and rebuilt it with Marshall Plan funds to handle the new shipments from Saudi Arabia. So the Bec d'Ambes refinery was part of the equipment installed to manufacture a less recalcitrant labour force in Europe.

Ten years later, unaware of this history, Mallet described the formation at Bec d'Ambes of what he called the 'new working class'.[24] The oil refinery exemplified a form of industrial production, dating from the 1930s but spreading rapidly since the 1950s, based on the automated processing and synthesising of materials. Unlike the old assembly-line methods in which workers directly constructed objects, Mallet argued, in a refinery or petrochemical plant workers supervised a flow of substances and managed the automated assembling of complex new materials. In oil refining, synthetic chemicals, electrical energy and telecommunications, workers were now managers, governing automated, computer-controlled processes. The same methods of automated processing were spreading to car manufacturing, railways, steel making, and even coal mining. Work was becoming technicised, eliminating many of the differences between manual labour and lower management: 'Between the operator of a cracking unit who, in a white collar, watches over the continuous flow of oil and the diverse pressures to which it is subjected and the engineer or higher level technician who supervises him, there is no longer a difference in kind, simply a difference of hierarchical situation.'[25]

The rise of forms of labour based on the supervision of continuous, automated processes did not eliminate industrial action. It produced a new form of strike. Rather than attempting to shut down an enterprise indefinitely through a total stoppage of work – an action difficult to sustain given its impact on the income of strikers – workers were now able to use their technical knowledge and critical role in automated processes to bring about 'the systematic disorganization of production' by causing limited work stoppages, 'spread out along the production process at the most sensitive places'. Brief interruptions aimed at vulnerable points or critical moments within an industrial process could paralyse an industry for months, without workers feeling the impact on their household income.[26]

From the 1880s to the 1940s, workers had built the power to sabotage critical processes at the level of national coal-based energy systems. They had used this power to organise mass parties and win radical improvements in their conditions of social vulnerability. By the 1950s and 1960s, the location, scale and duration of effective sabotage had shifted, now focusing on critical points and flows in complex chemical, metallurgical, communication and other processes. Its more localised scale made this power appear less revolutionary. But the strike waves of the later 1960s, Mallet argued – including the great upheavals of 1968, in which his writings became influential – suggested workers could use this power to acquire greater control of production.

By the late 1960s, as a struggle over the control of energy supplies unfolded in the Middle East, in the industrialised world the efforts among the forces of labour to protect or improve levels of income and conditions of work had intensified. The conflicts were found in the new manufacturing processes, but also in an older industry where the coordinated flow of materials could still be successfully interrupted: transportation. Disruptions to railways, shipping and docking, and increasingly aviation, accounted for 35 to 40 per cent of world labour unrest in the 1950s and 1960s. Shipping and docking, where stoppages had the most power to affect multiple upstream and downstream processes, accounted for more than half this unrest.[27]

The most effective challenge to these struggles once again made use of oil. A generation earlier, the switch to oil as a source of fuel for motive power was decisive in the defeat of the coal miners. The vulnerability of rigid regional energy networks carrying coal had been overcome with flexible, transoceanic energy grids, which isolated the producers of primary energy from those who put it to work in the main industrial regions. Once again, the fix that petroleum offered

26 Ibid., 43.

27 Beverly Silver, *Forces of Labor: Workers' Movements and Globalization Since 1870*, Cambridge, UK: CUP, 2003: 98–100.

was partly spatial, and was based on the introduction of more fluid processes.[28] This time, the transoceanic separation rested on the use of cheap oil to transport a standardised metal box.

This second change was made possible by containerisation. The introduction of metal shipping containers of standard dimensions that could be carried by road, rail and sea allowed goods to be moved in bulk without using labour to unload, stack and reload the individual merchandise as it switched from one mode of transport to another. Much as the fluidity of oil allowed energy to move easily over great distances because it could be pumped onto tankers, eliminating coal heavers and engine stokers, the shipping container made the movement of solid, manufactured goods into a fluid, uninterrupted process. Earlier attempts to introduce the use of containers had failed because different shippers preferred different sizes, making it difficult to stack the containers or build trucks, trains and ships to an optimum size. The escalation of the American war against the Vietnamese people in 1965 produced a logistics crisis as the supply of military goods overwhelmed Saigon's port facilities, leading the US military to introduce containerisation and speed the adoption of standard container dimensions. In 1969, shipping companies introduced huge new custom-built ships that could carry more than 1,000 containers in their holds and on deck. Containers eliminated most of the skilled labour and unionised power of dockworkers, and helped bring a halt to the 'unprecedented advance' in the conditions of labour in industrialised countries in the two decades after 1945.[29]

The container did more than reorganise relations of control at the narrow point where dockworkers could exercise power. Combined with the cheap oil of the 1960s, it made possible the moving of manufacturing overseas, just as the supply of energy used in industrialised countries had earlier been outsourced. After delivering military supplies from the US to Vietnam, the container ships returned empty. Looking for ways to earn additional income, the shippers began to stop in Japan and pick up manufactured goods to carry back to the US, cutting dramatically the cost of shipment and creating the boom in Japanese exports to the US.

Industrial labour could now be threatened with lower costs and unemployment, caused by outsourcing production to Japan and other countries with less unionised, lower-paid workforces. In the decade after 1966, the volume of international trade in manufactured goods increased at double the rate of the volume of global manufacturing.[30] The expansion of global shipping increased the demand for oil, helping create conditions that contributed

28 On the 'spatial fix', see David Harvey, *Spaces of Capital: Towards a Critical Geography*, Edinburgh: Edinburgh University Press, 2001.

29 Marc Levinson, *The Box: How the Shipping Container Made the World Smaller and the World Economy Bigger*, Princeton: Princeton University Press, 2006: 4.

30 Levinson, *The Box*: 11, 184–8.

to an increase in oil prices. The jump in oil prices in 1973–74 interrupted the development of outsourcing, as savings from containerisation were suddenly offset by much higher fuel costs for transoceanic shipping. In 1976, however, stable energy prices and the introduction of a new generation of even larger container ships allowed the growth of outsourcing to resume. At the same time, as we will see, the oil crisis and its market laws provided the 'shock' to explain the ending of improvements in conditions of labour, and a gradual reappropriation of the political powers and more egalitarian forms of life won over preceding decades.

INSTITUTIONALISED USELESSNESS

In 1964, the British government had tried to encourage the new military government in Baghdad to settle the dispute with the foreign owners of the Iraq Petroleum Company by offering it something in exchange: weapons. At a meeting with the Iraqi prime minister to discuss the oil law passed by the Qasim government before its overthrow the previous year, the British ambassador 'took the opportunity of making a reference to our supplying Iraq with arms and equipment'. Reporting that he 'merely juxtaposed the two things', he told London that its plan to use the sale of military equipment to gain concessions in the oil dispute was unlikely to succeed, since 'they are really doing us a favour in buying arms from us'. The Iraqis were supporting Britain's weakening trade balance by 'paying large sums in sterling', he explained, and at the same time were 'well aware of our desire that they should not seek alternative sources of supply'. A month later the Foreign Office noted in the same file that Iraq was now purchasing arms from the Soviet Union, and that 'partly as a result of poor after-contract performance by major British firms', Britain would 'have to fight hard to persuade the Iraqis to continue to buy British'.[31]

Although the ambassador pretended that oil and weapons were merely juxtaposed, in fact the two fit together in a particular way: one was enormously useful, the other importantly useless. As the producer states gradually forced the major oil companies to share with them more of the profits from oil, increasing quantities of sterling and dollars flowed to the Middle East. To maintain the balance of payments and the viability of the international financial system, Britain and the United States needed a mechanism for these currency flows to be returned. This was especially a problem for the US, since the value of the dollar was fixed in relation to gold, and provided the basis for the Bretton Woods financial system. Arms were particularly suited to this task of financial recycling, for their acquisition was not limited by their usefulness. The

31 'Roger Allen, Ambassador in Baghdad, to Foreign Office', 8 February 1964, FO 371/175780; cover note added 12 March 1964.

dovetailing of the production of petroleum and the manufacture of arms made oil and militarism increasingly interdependent.[32]

The conventional explanation for the rapid increase in arms sales to the Middle East, beginning in the mid-1960s, relies on the arguments offered by the arms salesmen, and by the governments that supported their business. Since the arms trade encouraged the militarisation of Middle Eastern states, its growth shaped the development of carbon democracy. To understand this dimension of the relationship between oil and democracy, we need to unpack the justifications used for selling weapons and provide an alternative account.

The purchase of most goods, whether consumable materials like food and clothing or more durable items such as cars or industrial machinery, sooner or later reaches a limit where, in practical terms, no more of the commodity can be used and further acquisition is impossible to justify. Given the enormous size of oil revenues, and the relatively small populations and widespread poverty of many of the countries beginning to accumulate them, ordinary goods could not be purchased at a rate that would go far to balance the flow of dollars (and many could be bought from third countries, like Germany and Japan – purchases that would not improve the dollar problem). Weapons, on the other hand, could be purchased to be stored up rather than used, and came with their own forms of justification. Under the appropriate doctrines of security, ever-larger acquisitions could be rationalised on the grounds that they would make the need to use them less likely. Certain weapons, such as US fighter aircraft, were becoming so technically complex by the 1960s that a single item might cost over $10 million, offering a particularly compact vehicle for recycling dollars. Arms, therefore, could be purchased in quantities unlimited by any practical need or capacity to consume. As petrodollars flowed increasingly to the Middle East, the sale of expensive weaponry provided a unique apparatus for recycling those dollars – one that could expand without any normal commercial constraint.

Since 1945, the United States had relied upon the 'institutionalised waste' of peacetime domestic military spending to soak up surplus capital and maintain the profitability of several of its largest manufacturing corporations.[33] It

32 Nitzan and Bichler offer an important study of this relationship. They locate its dynamic in the dominant place of arms manufacturing among leading US corporations and the superior profitability of arms exports over supplying domestic government demand. However, they downplay the role of dollar recycling and the deliberate wastefulness of military sales, especially in the case of oil states for which alternative spending options were limited. Jonathan Nitzan and Shimshon Bichler, 'The Weapondollar-Petrodollar Coalition', in *The Global Political Economy of Israel*, London: Pluto Press, 2002: 198–273.

33 Thorstein Veblen noted the role of 'conspicuous waste' in *The Theory of the Leisure Class: An Economic Study of Institutions*, New York: Macmillan, 1899: 36–42, but did not connect it with military spending, even in his subsequent discussion in *Imperial Germany and the Industrial Revolution*, New York: Macmillan, 1915.

enhanced this mechanism of waste with spending on the Korean and Vietnam wars. When projections for expenditure on Asian warfare began to drop in the later 1960s, America's two dozen giant military contractors were in urgent need of new outlets for their hardware. No longer able to rely on increased purchases by the US government, they sought to transform the transfer of weapons to foreign governments, previously a relatively small trade financed mostly through US overseas development aid, into a commercial export business.[34] The financiers concerned with dollar recycling now had a powerful ally.

Meanwhile, for the autocrats and military regimes of the Middle East, arms purchases provided a relatively effortless way to assert the technological prowess of the state. More importantly, once the West turned the supply of arms from a form of government-to-government aid into a commercial business, a space opened for middlemen to operate as brokers between the local state and the foreign firms. Members of ruling families, their in-laws and their political allies were well placed to fill this role, allowing a part of the revenues from oil, recycled as arms purchases, an easy diversion into prodigious levels of private accumulation.

After 1967, Iraq turned to France and the Soviet Union for arms, rewarding the countries that were helping it develop a national oil industry. For Britain and the US, the main recycling point was Iran, which imported almost three times as much weaponry as Iraq in the decade after 1967.[35] In 1966, the shah of Iran agreed to a large purchase from General Dynamics of its new F-111 fighter-bomber, an aircraft that was over budget, failing to meet performance targets, and frequently crashing in test flights.[36] He then persuaded the Western oil consortium to increase production by 12 per cent a year to finance this and future military spending. The following year the companies were able to increase production by double that amount, thanks to the Arab oil embargo during the June 1967 Arab-Israeli war, but in 1968 and 1969 Iran demanded even larger increases in revenue. As the supply of weapons and equipment accelerated, increasing numbers of arms contractors, bankers, construction companies, consultants, public relations firms and military officers began to profit from the flow of finance, building themselves into the capillaries and arteries through which it flowed. US banks and arms manufacturers, aided by their British,

36 The smaller naval variant of the aircraft, the F-111B, had so many faults it was cancelled soon after going into production and replaced with the Grumman F-14, the plane eventually delivered to Iran in a deal that saved Grumman from bankruptcy. Marcelle Size Knaack, *Encyclopedia of US Air Force Aircraft and Missile Systems*, vol. 1, Washington, DC: Office of Air Force History, 1978: 222–63; Anthony Sampson, *The Arms Bazaar*, London: Hodder & Stoughton, 1977: 249–56.

French and Italian counterparts, transformed the export of weapons into one of the West's most profitable export industries.[37]

THE GUAM DOCTRINE

Since arms sales were useful for their uselessness, and there was no precedent for the volume of weapons sold, they needed a special apparatus of justification. The work of transforming the superfluous consumption of weaponry on a gargantuan scale into necessity was performed by a new rhetoric of insecurity, and by a series of US actions to produce or sustain the required experience of instability and uncertainty.

The old rhetoric of the postwar period about a communist threat to American interests in the Middle East was proving hard to keep alive. Having finally found a foothold in the oilfields of the Gulf, the Soviet Union had failed to threaten supplies of oil to the West, despite the warnings of Cold War experts. Soviet aid in exploiting the vast reserves of North Rumaila, offered in 1968, would allow Iraq to produce oil from a field whose development Western companies had spent four decades trying to delay (or seven decades, if one counts back to the days of the Baghdad Railway). Instead of threatening the security of the West's oil supplies, the Soviet Union was threatening to increase them.

The Arab defeat in the June 1967 war weakened Arab nationalists and strengthened the conservative, Western-backed regimes in the Gulf. The defeat also hastened a financial crisis in Britain. The brief Arab oil embargo and the closing of the Suez Canal interrupted the supply of Britain's sterling oil from the Gulf, creating a balance of payments crisis that forced the Labour government to devalue the pound and abandon its postwar effort to maintain sterling as an international trading and reserve currency. To address the financial crisis, Britain announced in January 1968 that it would end its role as an imperial power in the Middle East, withdrawing all military forces from the sheikhdoms of the Gulf within four years.[38]

Militarists at right-wing think tanks in Washington, in particular the new Center for International and Strategic Studies, began to warn that the British withdrawal would create a 'power vacuum' in the region. In reality it was thanks to the creation of a vacuum, or at least a 'deflation' in local power, that Britain could justify ending its military presence in the Gulf. Since the 'revolutionary Arabs' had been 'completely deflated' by the 1967 defeat, the Foreign Office noted, the sheikhdoms of the Gulf could survive without a

British military presence.[39] The State Department official responsible for the Arabian peninsula agreed, arguing that the claim of the US ambassador in Tehran that hostile forces were ready to fill 'a vacuum' in the Gulf caused by the British departure was 'overdrawn if not inaccurate'. He pointed out that the major Arab powers, Egypt, Syria and Iraq, 'are pinned down elsewhere by the Israelis and Kurds' (whose rebellion in northern Iraq was funded by Israel), while the conservative Arab states saw an armed Iran 'more as a threat than a reassurance'.[40]

The shah of Iran seized the opportunity of Britain's departure to portray the large Iranian military purchases already underway as a scheme to turn Iran into the region's policeman. The only significant threat the shah faced was the growing number of domestic political opponents his government hunted down and imprisoned, a form of police work that had no need for most of the weapons he wished to purchase. He nevertheless demanded to buy ever more sophisticated and expensive arms, and to be given the increased oil revenue and large US government loans to pay for them. The US ambassador relayed to Washington the arguments the shah picked up from the American arms manufacturers, reporting his view that increased arms sales 'would benefit US industry (he mentioned DOD [was] obliged to bail out Lockheed), substantially help difficult US balance of payments situation, and serve our own vital strategic interests in Gulf and Middle East'.[41]

The arms manufacturers helped promote the doctrines of regional insecurity and national military prowess, instructing their agents to discuss arms sales not as commercial arrangements but in terms of strategic objectives. In September 1968, Tom Jones, the chief executive of Northrop Corporation, wrote to Kim Roosevelt (the former CIA agent who had engineered the overthrow of Mossadegh in 1953, and whose consulting firm now facilitated arms sales to the shah) about trying to sell Iran Northrop's P530 lightweight fighter, for which it had been unable to find buyers: 'In any discussions with the Shah', Jones explained, 'it is important that they be kept on the basis of

39 Foreign Office Minute, May 1971, FCO 8/1311, cited in William Roger Louis, 'The Withdrawal from the Gulf', in *Ends of British Imperialism: The Scramble for Empire, Suez and Decolonization: Collected Essays*, London: I. B. Tauris, 2006: 877–903, at 888. For a similar US assessment, see Central Intelligence Agency, 'National Intelligence Estimate 34-69-IRAN', 10 January 1969, in US Department of State, *Papers Relating to the Foreign Relations of the United States, 1969–76*, vol. E-4: *Documents on Iran and Iraq, 1969–1972*, ed. Monica Belmonte and Edward C. Keefer, Washington DC: US Government Printing Office, Document 1, available at history.state.gov, referred to in subsequent notes as FRUS.

fundamental national objectives, rather than allow it to take the appearance of a sales plan.'[42]

In 1969 the newly elected administration of Richard Nixon inadvertently offered the arms manufacturers and their clients a new term for these 'fundamental national objectives' – the so-called Nixon Doctrine. On a trip to south-east Asia in July, the president made some off-the-record remarks to the press at a stopover in Guam, intended to reassure the American-backed military dictatorships of the region that his promise to begin withdrawing forces from Vietnam did not imply any overall change in US policy, which would continue to rest on arming and assisting its client states to fight the threat of popular and democratic movements – or what Washington called 'subversion' – with the US intervening overtly only when local counterinsurgency programmes failed. The remarks about the limited role of direct intervention also provided cover for the action on which the Nixon government was secretly embarking, behind its public promise – a large escalation of the war against Vietnam and its extension into Cambodia and Laos. Since the reassurance about continuing to arm client states was off the record and could not be quoted directly, the US press started referring to it in shorthand as the Guam Doctrine, and then simply as the Nixon Doctrine, a term later adopted by Nixon's foreign policy team. This continuation of longstanding American military relations with client states was heralded in the American media as marking a new direction in American policy, a claim subsequently echoed in almost all academic scholarship on US foreign policy and the Middle East.[43]

The advantage of turning existing US counterinsurgency policy into a 'doctrine' was that rulers like the shah, and his allies in American arms firms and think tanks, could now appeal to it and demand to be given the same role as the south-east Asian dictatorships. Insisting that Washington either subsidise his weapons purchases with Congressional loans or pressure the American oil companies to pump more Iranian oil to pay the arms bills, the shah told the US ambassador 'he could not understand why we did not want to help him implement [the] Nixon doctrine in [the] Gulf area where our and our allies' interests were also threatened'.[44]

Deploying the Nixon doctrine enabled the shah and his supporters to overcome opposition in the State Department and other parts of the US government. By 1972 the American ambassador to Tehran was writing to Henry Kissinger, the national security advisor, criticising those in Washington who argued that

the US should do what was possible 'to prevent Iran, in our studied wisdom, from overbuying'. Using a back-channel communication to bypass the State Department, he warned that Britain, France and Italy were competing for arms contracts, and insisted 'there is no reason for us to lose the market, particularly when viewed over the red ink on our balance of payments ledger'. In the margin of the message Kissinger added a handwritten note: 'In short, it is not repeat not our policy to discourage Iranian arms purchases.'[45]

Facing a collapse in the value of the dollar, and increased lobbying from the arms firms, the Nixon administration decided to sell the shah all the weapons that he and his American lobbyists were demanding, allowing the sales to circumvent the normal governmental reviews and creating what a Senate report called 'a bonanza for US weapons manufacturers, the procurement branches of three US services, and the Defense Security Assistance Agency'.[46] Since Congress was unwilling to finance additional military sales credits, and the large New York banks were beginning to voice concerns about the shah's ability to maintain payments on the money they were lending him to buy weapons, the US government also began to push for an increased price of oil to pay for them.[47] The decision to weaponise the oil trade with Iran, and later other oil states, was announced as an extension of the 'Nixon Doctrine' to the Gulf, supplying the extraordinary levels of arms transfers with the equipment needed to explain them. Subsequent histories of these events faithfully reproduce this apparatus of justification.

As we will see in the following chapters, the Nixon administration also blocked the efforts of the UN and the Arab states, and at times even its own State Department, to settle the Palestine question, helping to maintain the forms of instability and conflict on which American 'security' policy would now increasingly depend. In Kurdistan, the other conflict keeping Arab states 'pinned down', Washington was unable to prevent Iraq from reaching a settlement with the Kurds in 1970, but responded to this threat of stability in the Gulf two years later by agreeing with Israel and Iran to reopen the conflict with renewed military support to one of the Kurdish factions. The aim was not to enable the Kurds to win political rights, according to a later Congressional investigation, but simply to 'continue a level of hostilities sufficient to sap the resources of our ally's neighboring country [Iraq]'.[48]

The arms sales to Iran and their supporting doctrine played no important role in protecting the Gulf or defending American control of the region's oil. In fact the major US oil companies lobbied against the increased supply of weapons

to Iran and the doctrine used to justify them. They argued that political stability in the Gulf could be better secured by America ending its support for Israel's occupation of Arab territories and allowing a settlement of the Palestine question. The Nixon administration had also initiated a large increase in the sale of arms to Israel, although weapons sent to Israel were paid for not with local oil revenues but by US taxpayers. Arming Iran, an ally of Israel, the companies argued, only worsened the one-sidedness of America's Middle East policy. The oil companies also objected to the extraordinary level of weapons sales to Iran because the increased oil revenues Tehran required to pay for the weapons would force them to switch more production away from the Arab states, weakening the companies' relations with those states and benefiting the European oil firms and independent US firms that shared production in Iran. It might also lead Iran to demand an even higher share of profits.[49]

The absurdity of the scale of arms sales to the oil states later became apparent, when the hyper-armed Iranian state was brought down by street protests and a general strike led by oil workers in the 1979 revolution, and when the tens of billions of dollars Saudi Arabia spent on weapons left it helpless in 1990 against Iraq's occupation of Kuwait. Whatever the excess, however, the arms sales also militarised the oil states, with continuing consequences for local populations. The Kurds of Iraq had already discovered this in the 1960s, when the government used its British-supplied weapons against them, and would discover it again when Iran and the US abruptly cut off support for the Kurdish insurgency in 1975. Protesters in Iran felt the consequences when the government deployed American-supplied helicopters to fire on political demonstrations in 1978–79, and in countless other episodes. The militarisation also lined up numerous interests in the US that preferred to see regional crises unresolved and wars in the Middle East prolonged.[50]

REORGANISING THE POWER OF SABOTAGE

Iraq had assembled the political power to take control of its oil by developing an oilfield, a pipeline and a refinery. Taking full control of oil required more: not just the ability to produce oil independently of the major American and British oil companies, but the coordinated ability to cut back production as a means of putting pressure on the companies. Up to this point, producer states had been individually demanding an increased volume and share of production. They now sought to construct the collective capacity to limit production. Libya was the first producing country to achieve this, but the ability to cut back was assembled out of wider acts of sabotage.

To reach refineries and markets in Europe, where most of it was consumed, oil from the Middle East was carried in pipelines running from Iraq and the Gulf to the Mediterranean, and in oil tankers along another narrow conduit, the Suez Canal. These conduits and the points where they branched, narrowed or terminated were among the most significant parts of the energy system. Their control was a leading concern of the handful of transnational oil companies that, until the 1970s, still dominated the production of oil in the Middle East. This control was not simply a question of keeping the conduits open. The oil majors also wanted the power to limit the flow of oil, in order to deal with the persistent threat of oversupply, and thus declining prices and lower profits. They tried to limit the development of independent conduits outside their control that would undermine their agreements on production quotas and price-fixing. And they needed to maintain a grid of alternative supply routes and sources. These would function like an electrical grid, so that particular production sites or transmission routes could be shut down or bypassed if they were disrupted or subject to disputes.

Until the late 1960s, this management of oil flows remained largely intact, surviving a series of crises in the 1950s and early 1960s. It even survived the Soviet threat. This was not the imaginary threat discussed in public, ever since the Soviet attempt to keep American oil companies out of northern Iran had been used in the manufacturing of the Cold War in 1946 – namely that the Soviet Union might try to seize the oilfields of the Middle East, imagined as a continuation of the 'Great Game' of Russian expansion to the south, whose invention we encountered in Chapter 2. The more serious concern was that the USSR might find a way to connect its Caspian oilfields and the extensive new fields of the Volga region and western Siberia to customers in western Europe, thereby subjecting the multinational oil companies to the threat of price competition. In the 1950s, after recovering from the wartime destruction of the Caspian fields, the Soviet Union began trying to export oil to Europe. The multinationals blocked these sales, relying on their control of distribution channels and on the US government, which pressured NATO members on 'security' grounds not to allow Soviet oil into Western Europe.[51] With the containment of the Soviet threat, the main challenge to the oil majors in the 1960s had been the rise of smaller, independent producers, refiners and distributors. These had begun to build a small share of the oil trade by undercutting the prices fixed by the cartel of major companies, forcing the majors to discount downstream

51 Sweden provided the main exception to this embargo. It was not a member of NATO, and its coal, iron and steel, and petroleum refining conglomerate, A. Johnson and Co., was powerful enough to act independently of the oil multinationals and trade with the Russians. Hans de Geer, 'Trading Companies in Twentieth-Century Sweden', in Geoffrey Jones, ed., *The Multinational Traders*, New York: Routledge, 1998: 141–4; and Peter R. Odell, *Oil and World Power*, Harmondsworth: Penguin, 1979: 48–71.

prices (in refining and distribution) and rely increasingly on their enormous profit margins from production in the Middle East.[52]

From the late 1960s the situation began to change. In the June 1967 Arab-Israeli war, the Iraq–Syria pipeline was cut again, the Suez Canal was blocked to shipping, oil workers in Bahrain shut down two refineries, and a general strike by oil workers in Libya stopped exports from Tripoli. The Arab states imposed an embargo on oil supplies to the US and other states that supported Israel's attack, including Britain and West Germany. Iraq proposed that the embargo be extended for three months from 1 September, on the grounds that only by restricting supplies during winter would the embargo have an effect. Iraq also called for the nationalisation of local oil-production companies. But Saudi Arabia succeeded in getting the embargo lifted, while the Libyan government ended the oil strike and imprisoned its leaders.[53]

In May 1969, a Palestinian resistance group blew a hole in the Tapline, the pipeline that carried oil from Saudi Arabia to the Mediterranean, where it passed through a part of Syria now occupied by Israel. Although such acts of sabotage were normally repaired within a few hours, Israel refused to allow Aramco to repair the pipe unless it agreed to pay Israel a fee for protecting it. The dispute kept the pipeline closed for four months.[54] Israel was simultaneously maintaining the closure of the other major conduit for carrying oil to Europe, the Suez Canal. Its invasion of Egypt in 1967 blocked the Canal, and its rejection of UN and American proposals for a peace settlement based on a return to the pre-1967 borders kept the waterway closed.

Although the story is little known, the blocking of the Canal enabled Israel itself to become an oil conduit. The Israeli government collaborated with Iran to build a pipeline from Eilat to Ashkelon, financed in secret by West Germany. The pipeline carried Iranian oil from the Red Sea to the Mediterranean, bypassing the Suez Canal, allowing Iran to loosen the control of the major oil companies over its oil industry. It also enabled Israel to export oil it took from an Egyptian oilfield in Sinai, which its forces had seized in the war.[55] To evade the

Dajani, 'The 1967 Oil Embargo Revisited', *Journal of Palestine Studies* 13: 2, 1984: 71–2, 80. The Saudis had already allowed Aramco – the US company that controlled the Trans-Arabian Pipeline, or Tapline, which carried oil from the Saudi fields to the Mediterranean – to resume pumping oil, even though a few miles of its route cut across the north-east corner of the Golan Heights, the part of southern Syria now under Israeli occupation.

54 The Tapline Company agreed to pay for the repair and cleanup and to cover the cost of protecting the pipeline. James Feron, 'Israel in Accord with Aramco on Repair of Damaged Tapline', *New York Times*, 11 July 1969: 7; 'Israeli Jets Strike Military Targets in Egypt and Jordan', *Washington Post*, 17 September 1969: A26.

55 Uri Bialer, 'Fuel Bridge across the Middle East: Israel, Iran, and the Eilat-Ashkelon Oil Pipeline', *Israel Studies* 12: 3, 2007: 29–67. The pipeline replaced a smaller one, built using 200 kilometres of pipes, together with pumps and other equipment stolen from Egypt during Israel's 1956

oil majors' control of marketing, Iran and Israel sold the oil through a Swiss-registered joint venture, Trans-Asiatic Oil Ltd, shipping most of it via Romania to Spain, where the fascist government under Franco had successfully excluded the international oil companies from operating.[56] Meanwhile, Egypt tried to build a pipeline to bypass the Suez Canal on the other side, connecting the Gulf of Suez to the Mediterranean, but its efforts to open a conduit outside the control of the oil majors were blocked by the British government.[57]

The closing of the Suez Canal also hastened another weakening of the oil majors' control over supply routes. Western Europe began to obtain significant supplies of oil from the Soviet Union, evading the embargo the transnational companies had tried to enforce since the Second World War. Following the first closing of the Suez Canal in 1956, the Italian state oil company, ENI, led by Enrico Mattei, had begun to obtain oil from the Russians. In 1968 the Soviet Union completed a pipeline to the Baltic Sea, terminating at Ventspils on the Latvian coast. Soviet oil could now be shipped cheaply to northern Europe.[58]

These disruptions and alterations to the flow of Middle Eastern oil had further effects. Since the grant of the first oil concession in southern Iran in 1901 – which was partly motivated, as we saw in Chapter 2, by an earlier effort to block the export of Russian oil – Western oil companies had controlled the flow of oil from the Middle East, using this control to manage its price around the world. Seven decades later, within three years of the upheavals of the 1967 war, that ability had been destroyed.

On 1 September 1969, a group of army officers seized control in Libya and removed the monarchy from power. They released from prison the thirty-six-year-old leader of the 1967 oil strike, Mahmud Sulaiman al-Maghribi, and appointed him initially as prime minister and the following April, after Captain Muammar Qaddafi emerged as leader of the coup and took al-Maghribi's place as prime minister, as head of a team to renegotiate the terms of the country's

---

invasion of Sinai, and used to bring smaller quantities of Iranian oil to the refinery at Haifa. The post-1967 pipeline secured supplies to Israel, but was also intended to reduce Europe's dependence on Arab oil.

56 In the 1970s, the trader who handled the Israeli pipeline oil, Marc Rich, used it to break the contract system for oil sales and create the spot market in oil, which would end the method of pricing oil through agreements within and among the large oil companies and allow the development of speculative markets in oil futures. Previously part of the Bretton Woods mechanism for limiting the global threat of financial speculators, oil would itself become a medium of financial speculation. contracts with foreign oil companies.[59] Talks with Exxon and Occidental made no headway, until Libya's position was reinforced by a Syrian bulldozer. On 3 May 1970, a mechanical excavator laying telephone cable in southern Syria near the Jordanian border cut the Tapline. The Saudis called the incident 'planned sabotage'.[60] Using the interruption in supplies to negotiate higher transit fees, Damascus refused to allow repairs and kept the line closed for nine months.[61] Two weeks after the pipeline was ruptured, the Syrian oil minister met with his Libyan and Algerian counterparts (Algeria was demanding a revision of its oil agreement with France), and agreed to 'set a limit to the lengthy and fruitless negotiations' with the oil companies, implement their demands for a higher share of the oil income by unilateral action if necessary, and set up a fund for mutual support in any confrontation with the oil companies.[62] With 500,000 barrels a day of Saudi supplies to Europe cut off, Libya was able to pressure Occidental Petroleum, a relatively small California-based company with no alternative sources of oil, to agree to a new tax rate, breaking the united front among oil companies. Libya became the first producer country to use an embargo on supplies to win an increase in the level of taxation of oil production.

POSTED NOTES

Reinforced by the interruptions in supply from the Gulf, the Libyan embargo had broken the ability of the oil companies to dictate to the countries with large oil reserves the tax they would pay on their profits from the production of oil.

Since the 1930s, world oil prices had been governed by the international oil companies, which attempted to limit the supply of oil from the Middle East, in collaboration with a system of government production quotas and import controls in the United States. Overseas, the cartel agreement made between the seven major international oil corporations in 1928, in response to the large discoveries in Iraq and to the 'oil offensive' from the Soviet Union, established exclusive territories for each company and set quotas intended to maintain world prices at the level of US prices.[63] From 1932 the Texas Railroad Commission set

quotas to regulate domestic US production.[64] As production in the Middle East began to increase after the Second World War, threatening to lower the price of oil, Congress pressured the major oil companies to protect US oil prices by limiting imports from the Middle East. In 1954 the Oil Policy Committee, an industry-government body, established regular US import quotas, formalised by a proclamation by President Eisenhower in 1959, limiting imports to 9 per cent of domestic demand.[65] The blocking of imports allowed domestic US production to continue expanding despite the availability of oil at much lower costs of production in the Middle East. As a result, American oil reserves were exhausted more quickly than those of other regions. By 1971, US production had started to decline, as the volume of reserves in the lower forty-eight states passed their peak. Declining production, coupled with continually rising demand, meant that the US no longer had the surplus capacity required to regulate prices.

In 1960, in response to the drop in demand for non-US oil caused by Eisenhower's import quotas, Venezuela and Saudi Arabia – together with the other three large Gulf producers, Iraq, Kuwait, and Iran – set up the Organization of Petroleum Exporting Countries (OPEC). For Venezuela, where a revolution had overthrown the military government and brought an elected government to power, the aim was to imitate the collective arrangement among US states for restricting production, in order to negotiate an increased share of oil revenues and conserve supplies, and thus to allow an orderly process of economic growth and avoid a premature depletion of reserves. Initially the Middle East producers were trying to maintain their tax revenues from oil by increasing the volume of production. Only a decade later were they in a position to increase revenues by adopting the US method of limiting the volume of production.[66]

Part of the difficulty facing the producer states in negotiating the tax revenues to be paid by the production companies was that, before the mid-1960s, there was no 'market' price for crude oil. US prices were established by government production and import quotas, while elsewhere most crude was transferred by the large firms to their own refining affiliates, or traded from one major to another at low prices under long-term contracts. The level of tax paid to the

64 The Texas quota system was reinforced by the federal Connally Act, known as the 'Hot Oil' Act, of 1935. Harold F. Williamson, *The American Petroleum Industry*, 2 vols, Evanston: Northwestern University Press, 1959–63, vol 2: 543–4. Thirty years later, OPEC took the Texas system as a model for its system of international quotas. Anthony Sampson, *The Seven Sisters: The Great Oil Companies and the World They Made*, London: Hodder & Stoughton, 1975: 92.

65 Williamson, *American Petroleum Industry*: 543–4. 'Overland' imports were exempt from the import quota, to protect Canadian suppliers whose pipelines gave them no alternative market. Mexican suppliers had no pipelines to carry oil to the US, but took advantage of the same exemption: tankers that had previously shipped Mexican oil to New Jersey were diverted to Brownsville, Texas, from where the oil was carried in tanker trucks twelve miles south across the Mexican border and then re-imported overland. Richard H. K. Vietor, *Energy Policy in America Since 1945: A Study of Business–Government Relations*, Cambridge, UK: CUP, 1984: 130.

66 Parra, *Oil Politics*: 89–109.

producer countries was calculated in reference to an artificial figure called the 'posted price' – a benchmark set by the oil firms, with the tax per barrel set at 50 per cent of that figure. Following Eisenhower's introduction of import quotas, the companies lowered the posted price, thereby reducing their tax payments to the producer states. When the latter responded with the creation of OPEC, the companies agreed after 1960 to leave the benchmark at a fixed level. This guaranteed the producer states a set income per barrel of oil produced, even as the price of oil outside the US began to decline due to competition from independent oil companies and from the Soviet Union. Since the posted price was not adjusted for inflation, however, the real tax rate per barrel of oil fell, especially in the later 1960s when the value of the dollar began a rapid decline.

Meanwhile, a group of independent, mostly German oil dealers started to publish regular figures on the price of refined oil products in Europe. An American oil economist, Morris Adelman, was able to take these figures, deduct known costs for refining and shipping, and infer for the first time an approximate 'market price' for Middle Eastern oil (it would take another decade to create a functioning global oil market). His figures showed that in 1960 the oil companies were producing oil at a cost of 10¢ cents per barrel, including a 20 per cent return on invested capital, and earning a profit above that return of 68¢ per barrel. For the major oil companies, Adelman later remarked, 'a market price was an uninvited intruder'.[67]

The general public failed to notice the intruder for almost a decade – an ignorance from which the oil companies continued to benefit. Negotiations over rates of taxation on the extraordinary profits that international firms were earning from Middle Eastern oil took the form of attempts to raise the posted price. Unaware that the 'posted price' was simply a device for calculating tax rates, the news media and the public assumed these were negotiations over the price of oil. The companies could then portray the increased taxation of their windfall profits from oil as an increase in its 'price' – an increase that they would be obliged to pass on to the consumer.

Following the success of Libya in winning a new tax rate in 1970, OPEC was in a position to challenge the setting of tax rates by the major US and European companies. Iran led the OPEC states in demanding a general increase in the posted price, along with an increase in the tax level based on that price from 50 to 55 per cent. This represented an attempt by the producer countries not to increase the price of oil, but to return real tax rates to the levels they had enjoyed before inflation, Israel's closing of the Suez Canal and other factors had pushed up the oil price in the later 1960s.

67 Morris Adelman, 'My Education in Mineral (Especially Oil) Economics', *Annual Review of Energy and the Environment* 22, 1997: 21; and *The Genie Out of the Bottle: World Oil Since 1970*, Cambridge, MA: MIT Press, 1995: 41–68.

Supported by the State Department, which arranged for the Justice Department to waive anti-trust regulations, the companies met together and decided to accept an increase in the benchmark. Undersecretary of State John Irwin had circulated a memo following the Libyan deal pointing out that, given the import quotas that made crude oil prices in the US much higher than in Europe, an increase in Middle East prices would be to America's benefit:

> Many claim that access to cheaper energy sources has given European producers an advantage over goods produced in the United States, particularly in certain industries such as petrochemicals. The Libyan settlements will increase energy costs to Europe (and probably to Japan) and could reduce whatever competitive advantage those areas enjoy over the US because of access to lower cost oil.[68]

By April 1971, the companies had agreed with OPEC to raise the posted price from less that $2 per barrel to more than $3. The price at which oil from the Gulf actually traded remained at just over half the posted price, rising from about $1.30 to $1.70 per barrel – still below the level of the mid-1950s in nominal terms, and well below that level when adjusted for inflation. Meanwhile, refined oil products were selling in Europe at a price of more than $13 per barrel, 60 per cent of which represented government taxes in the consumer country. Following the 1971 OPEC tax increase, in other words, European states were still earning about four times as much revenue from each barrel of oil as the OPEC states.[69]

The 50 per cent increase in tax rates was only a temporary measure. It ensured the OPEC countries a higher share of oil profits, but the system of allowing international companies to earn all the profits from oil and then attempting to tax those profits was itself coming to an end. Led by Iraq, the large producer states had gradually built the infrastructure and the expertise to take control of production themselves. Iraq announced its nationalisation of the British-controlled Iraq Petroleum Company in 1972. Iran had already warned the oil companies that, when the 1954 consortium agreement expired in 1979, it would expect a radically different arrangement.[70] Saudi Arabia negotiated a gradual transfer of ownership of Aramco to the state, threatening the company

with the same fate as the Iraq Petroleum Company if it refused to negotiate. By the end of 1972, the other large producers in the Gulf, Kuwait and Iran, were making similar arrangements.

GOLD FINISH

Facing the loss of their control of the oilfields in the Middle East, the international oil companies now needed a means of generating a large increase in the price of oil. A much higher price would enable them to open up new production sites in less accessible areas, such as the North Sea and Alaska. It would also allow them to realise a greater share of profits from the downstream refining and marketing, compensating for the loss of profits from producing Middle Eastern oil.

There were three changes that would allow the reorganisation of the mechanisms for pricing oil. First, following the successful collaboration developed to raise the Libyan oil price, the producer states had to take over from the oil companies the system of restricting production, to prevent surplus oil from lowering the price. This would be easier for a group of sovereign states to achieve than for a cartel of oil companies liable to anti-trust investigation if they were seen to be forcing prices up.

Second, the international firms, which would process and market oil for the new state-run production companies, had to find ways to sell more oil and protect it against rival sources of energy. To raise the price of oil, it was not enough for those producing it to make the supply scarce. A higher price would simply drive consumers to switch to cheaper alternatives. The oil companies needed ways to 'sabotage' the supply not only of oil, but also of coal, natural gas and nuclear power. For this reason, as we will see in the following chapter, what is now remembered as the 1973–74 oil crisis was first discussed not as a problem of oil, but as an 'energy crisis'. Since oil was the largest commodity in world trade and shaped the international flow of dollars, the transition to a new petroleum order also began as a financial crisis.

Third, to maintain demand for oil as its price increased, the international oil companies needed to open up new markets. The largest market to which their access was restricted was the United States. The US import quotas helped prevent lower-priced Middle Eastern oil from competing with domestic production, which in the first half of 1971 was selling for $3.27 a barrel – almost double the new price of oil from the Persian Gulf. However, the import controls had become a mechanism of the postwar international financial system, protecting the value of the dollar. By restricting imports of oil into the United States, Washington reduced the flow of dollars abroad, limiting the accumulation of dollar reserves overseas. Later it tried to give further support to the dollar's value by interventions in the London gold market. When these two mechanisms

proved insufficient, a third technique was added: the rapid increase in arms exports to oil-producing countries, especially Iran.

The oil companies needed an alternative to the use of oil (and escalating arms sales) to control dollar flows. The quota on US oil imports was denying them access to the world's largest petroleum market, and the drive to sell arms to Iran was putting pressure on them to increase production there. The solution for which the oil companies had begun to argue was to abandon Bretton Woods.[71]

In March 1967, Chase Manhattan Bank, the Rockefeller financial house closely tied to Standard Oil of New Jersey (Exxon), proposed that the United States abandon the gold standard. The American Bankers Association condemned the proposal, and Chase quickly offered a retraction. Questioning the automatic convertibility of dollars into gold was considered a threat to the stability of the postwar international monetary system and to America's political and financial authority. Eight months later, however, Eugene Birnbaum, senior economist at Standard Oil, published a report entitled *Changing the United States Commitment to Gold*. The report called for the US to end the Bretton Woods system unilaterally by rejecting the obligation to convert dollars into gold. Birnbaum's arguments were critical to making the idea of abandoning Bretton Woods acceptable.[72]

A year after Birnbaum's report, in November 1968, America's decade-long effort to support the value of the dollar collapsed. The US tried to transform Bretton Woods into a mechanism that allowed the gold peg to float. In an effort to combat inflation by lowering domestic oil prices, Washington began removing the controls on oil imports in 1970, but this caused more dollars to flow abroad. By the following year, the US had used up most of its non-gold reserves, and only 22 per cent of its currency reserves were backed by gold. When European banks requested payment for their dollars in gold, the US defaulted. Abandonment of the gold standard in August 1971 amounted to a declaration of bankruptcy by the US government.[73]

The transformation in methods of controlling flows of oil and finance was completed in the 1973–74 crisis, to which the following chapter turns. We do not know for certain how far these changes were planned by the oil companies,

---

71 The major oil companies wanted the import quotas rationalised, to remove the hundreds of exemptions that favoured mostly small operators, and steadily increased. Vietor, *Energy Policy in America*: 135–44.

73 Fred Block, *The Origins of International Economic Disorder: A Study of United States International Monetary Policy from World War II to the Present*, Berkeley: University of California Press, 1977: 164–202; William Engdahl, *A Century of War: Anglo-American Oil Politics and the New World Order*, 2nd edn, London: Pluto Press, 2004: 127–49. In contrast to Engdahl, Block makes no mention of the oil dimension of the crisis.

and how far the transformation came about through the rivalries between them, their conflict with the producer countries, and the changing agendas of the US government. But there was no doubt that the creation of a crisis made it easier to blame outside forces for the radical alterations that occurred.

Politics, ecology, and the new anthropology of energy: exploring the emerging frontiers of hydraulic fracking

Anna J. Willow[1]
Sara Wylie

Ohio State University, USA
Northeastern University, USA

Abstract

This article reviews recent literature relevant to the ongoing shale gas boom and introduces the *Journal of Political Ecology*'s Special Section on hydraulic fracking. We highlight the need for ethnographic studies of the tumultuous social and physical transformations resulting from, and produced by, an unfolding frontier of energy production that unsettles social, economic, and ecological landscapes. We examine how intercommunity connections are vital to recognizing the shared structural conditions produced by the oil and gas industry's expansion, through examining the roles played by the oil field services industry, the sequestration of information and agnotology (the deliberate production of ignorance), divide and conquer tactics, and shared experiences of risk and embodied effects. Summarizing the contributions of the five articles included in the Special Section, we offer recommendations for further inquiry. We examine how social science studies of hydraulic fracking are producing new and innovative methodologies for developing participatory academic and community research projects.

Key words: digital media, embodiment, energy, hydraulic fracturing, oil field services industry, shale gas

Résumé

Cet article est une revue de la littérature récente pertinente sur le boom du gaz de schiste, pour cette section spéciale dans le *Journal of Political Ecology* sur la fracturation hydraulique. Nous soulignons la nécessité d'études ethnographiques des transformations sociales et physiques résultant d'une déroulement de la production d'énergie qui déstabilise les paysages sociaux, économiques et écologiques. Nous examinons comment c'est essentiel a reconnaître les similitudes structurelles existent entre les différentes communautés par l'expansion de l'industrie du pétrole et du gaz. Conclusions importantes concerne les rôles joués par le secteur des services de champ pétrolier, la séquestration de l'information et agnotology (la production délibérée de l'ignorance), les tactiques de diviser et conquérir, et les expériences partagées de risques et effets intrinsèques. Résumant les contributions des cinq articles inclus dans la section spéciale, nous concluons avec des recommandations pour des enquêtes plus approfondie. Enfin, nous examinons comment les études en sciences sociales de la fracturation hydraulique produisent de nouvelles méthodes pour le développement de projets de recherche universitaires et communautaires participatives.

Mots clés: médias numériques, l'énergie, la fracturation hydraulique, l'industrie des services pétroliers, le gaz de schiste

Resumen

Este artículo revisa la literatura reciente en curso y relevante al auge del "gas de esquisto" para esta sección especial sobre fractura hidráulica del *Journal of Political Ecology*. Destacamos la necesidad de estudios etnográficos acerca de las transformaciones tumultuosas sociales y físicas resultantes de y producidas por el despliegue de la producción energética que perturba los paisajes sociales, económicos y ecológicos. Examinamos como las conexiones entre las comunidades son vitales para el reconocimiento de las

1. What is *fracking* and why is its relevant?

Technological advances have made it possible and profitable to extract fossil fuels (especially natural gas, but also oil and coalbed methane) that were until recently believed to be out of reach. In the past decade, a technique borne of the merger of hydraulic fracturing and horizontal drilling—known in the industry as *high-volume slick water horizontal hydrofracturing*—has been exported from the United States to every inhabited continent on earth. This process (colloquially and hereafter known as *fracking*) entails pumping a mixture of water, proppants (silica sand and/or manufactured granules used to prop rock fractures open), and assorted chemicals deep into the ground at high pressure. As a result, small fractures are produced in the target rock layer, releasing the hydrocarbons contained within. In some places, the resulting rush to extract these resources has already significantly altered physical environments, economic systems, community structures, and human health. Although proponents have celebrated unconventional fossil fuel development as a key to energy independence and a critical catalyst for economic recovery, it has numerous detractors (MITEI 2011).

It is not merely its abrasive sound that led environmentalist author Bill McKibben (2011) to declare *fracking* "the ugliest word in the English language." As indicated by the intensity of ongoing anti-fracking campaigns—some of them documented in this special section—many seem to agree. Commonly voiced ecological and human health concerns surround water quality and availability, discharges of toxic substances into the environment, air emissions released during production and processing, explosions from methane build-up, and earthquakes. While actual and potential environmental degradation resulting from fracking has received a significant amount of scholarly attention (e.g., Entrekin *et al*. 2011; Holzman 2011; Howarth, Santoro, and Ingraffea 2010; Jackson *et al.* 2013; McKenzie *et al.* 2012; Osborn *et al*. 2011) and is currently being investigated by the United States Environmental Protection Agency (2012), equally devastating—and clearly interrelated—sociocultural consequences have been comparatively overlooked.[2]

The number of published social science studies on the impacts of fracking is steadily growing. Much of this work, however, has been informed by quantitative survey methods rather than qualitative ethnographic inquiry (e.g., Anderson and Theodori 2009; Brasier *et al*. 2011; Jacquet 2012; Theodori 2009). Notable exceptions include Simona Perry's comparative consideration of the place-based consequences of regional and national energy politics in the "global countryside" (2011), Perry's more direct demonstration of ethnography's value as a tool for monitoring community health in unconventional energy production zones (2013; see also Wylie 2011), recent examinations of the political production and/or obfuscation of risk in the face of uncertainty about fracking's actual effects (Cartwright 2013; Finewood and Stroup 2012), and ethnographic overviews of unfolding conflicts surrounding unconventional extraction (e.g., de Rijke 2013a, 2013b; Pearson 2013; Willow *et al.* 2014). These articles have added valuable voices to the conversation and, in the process, made a strong case for qualitative research on fracking. Still, critical analyses that

[2] The EPA released a progress report in 2012 and is expected to release a draft of the compete study for public comment and peer-review later this year. For more information and updates, see http://www2.epa.gov/hfstudy [accessed February 22 2014].

illuminate the consequences, implications, and cultural practices associated with fracking have yet to appear in significant volumes.[3] This Special Section aims to fill this gap.

The articles included here have their origins in two overlapping organized conference sessions that took place in late 2012 and early 2013. Recognizing the need to foster coordination and communication among anthropologists seeking to understand the social and cultural impacts of ongoing unconventional energy development, Anna Willow (of the Ohio State University) organized a panel on the theme of hydraulic fracking for the November 2012 American Anthropological Association meeting in San Francisco, California. Sara Wylie (of Northeastern University) served as a discussant for this panel. Thomas Pearson (of the University of Wisconsin-Stout) organized a similar panel and a productive roundtable discussion for the March 2013 meeting of the Society for Applied Anthropology, held in Denver, Colorado. These events led to the development of a new (and still growing) scholarly network, sowed the seeds of fruitful collaborative relationships, and revealed widespread interest in this timely topic.

Fracking merits close social scientific attention. As it proliferates, impacts are poised to increase exponentially, not only in extraction zones but also throughout the global system that supplies the oil and gas industry and demands the continued production of fossil fuel energy. Because commodity-chain effects are experienced worldwide and because national and international political and economic decisions have emplaced implications, the anthropology of hydraulic fracking demands attention to global connection as well as local specificity. Presenting perspectives from New York, Ohio, Pennsylvania, and Australia, the articles that follow approach the cultural contexts and consequences of hydraulic fracking with numerous questions in mind: How are community structures, social networks, land use decisions, and the cultural meanings of rural landscapes changing as a result of fracking? How is ongoing and impending energy development transforming people's experiences and understandings of the landscapes they inhabit, utilize, and/or work to protect? How do the human impacts of resource extraction converge and diverge over time and space? What new dialogues, political formations, social movements, and alliances are emerging, and which discussions and discourses are being emphasized or obscured? How can new ethnographic formats deepen our understanding of these changes?

In the United States and beyond, the rapid intensification of fracking provides a new and urgent lens through which to explore the diversity, dynamism, and politics of human-environment relationships. Increased scrutiny of oil and gas activity has resulted in new prospects for collaborative mobilization and inspired academic studies aimed at influencing environmental public policy and industrial practices. With uneven transformations in regulatory terrain alternatively designed to speed, moderate, or halt development, exciting new opportunities are emerging for comparative case studies in anthropology, public policy, and environmental history.[4] Social scientific studies of fracking have much to contribute to imperative discussions about energy futures, global climate change, and other definitive challenges of twenty-first century life. While the case studies included in this special section are diverse, contributors all aim to apply a holistic understanding of the human impacts of hydraulic fracking to the larger task of promoting the best possible future for our planet and the people who share it. Collectively, they underscore the fact that fracking—like other anthropogenic ecological disturbances—must be approached not only as an environmental issue, but as a cultural and political one as well.

2. Contexts and connections

Human experience is at the front line of changing technological, economic, and social conditions. Attending to local ethnographic detail as well as broad systemic inequity, the articles reveal that residents of

[3] The *Journal of Environmental Studies and Sciences* and *Culture, Agriculture, Food, and Environment* have published special issues on this topic in 2014 and 2013, spotlighting Marcellus Shale development and energy more broadly.

[4] Within the United States and internationally, policy decisions governing shale development have varied considerably. In the United States, recent regulatory changes have served to speed extraction in some states (e.g., Ohio and New Jersey), while others have effectively brought citizen and environmental perspectives to the table to encourage environmental and human health protection alongside resource development. New York and Maryland, for example, have moratoria in place that effectively postpone shale development, and Vermont has banned the practice outright. Similar diversity is seen internationally, with Australia, the United Kingdom, South Africa, and Poland eager to develop shale resources even as France and Bulgaria have banned such development (de Melo-Martín *et al.* 2014).

geographically distributed and culturally distinct regions are experiencing strikingly similar situations. Unconventional energy extraction presents formidable challenges for those living in close proximity to it (Perry 2011, 2013; Wylie 2011). The lives of people in industrial supply areas, and consumers of energy, are also altered by changes in international production and distribution systems. Here, we identify common contexts, highlight unifying themes, and identify important opportunities for future research.

Fracking in historical context

Viewing celebratory television advertisements and passing billboards offering cash for subsurface leases (for those of us who are residents of fracking zones) or reflecting on the numerous public campaigns and policy battles fought by those who oppose unconventional energy extraction (for concerned citizens everywhere), it's easy to forget how recently fracking has arrived on the scene. In the second decade of the 21st century, fracking has captured the interest not only of those individuals who confront its environmental, economic, and social effects directly, but also of scholars, advocates, and activists seeking to understand how emerging forms of unconventional resource extraction are resulting in new kinds of displacement and disempowerment, transforming relationships between people and technology, and altering relationships between people and the environments they inhabit.

Fracking is an outgrowth of established energy production patterns, as well as a novel socio-technical phenomenon. Even as it employs new processes and generates new hazards, fracking extends trajectories of physical and social impact initiated in earlier resource extractive eras. Unmapped, abandoned, and decaying infrastructure from previous oil and gas extraction are just one of the many failures of effective regulatory oversight that are being unearthed as debates over the health and safety of fracking unfold (Horwitt 2011). And, given that oil field wastes have historically been largely unregulated (EWG 2009), the expanding use of chemicals has brought significant media and public attention to the toxicity of oil and gas production. Ironically, public concern over the environmental and human health threats associated with fracking has served to open the industry to the potential for more effective monitoring. This is creating new avenues for state and federal oversight of fossil fuel extraction.

Previous phases of fossil fuel extraction (especially oil and coal) also provide a baseline for comparative/diachronic social analyses. Since the 1970s, rural sociologists have been investigating what is commonly known as the "boomtown" phenomenon or syndrome (e.g., England and Albrecht 1984; Freudenburg 1981; Gilmore 1976) in which rural areas experience rapid industrialization and population growth catalyzed by the discovery of natural resources. Researchers have found that the negative consequences of development often outweigh the advantages; even as the availability of jobs and local tax revenues increase, strains on physical infrastructure, housing, and social services combine with social disruption caused by rapid population growth and perceptions of environmental degradation to produce an overall decrease in community satisfaction (Anderson and Theodori 2009: 115). On the other hand, longitudinal studies have led some observers to propose a "boom-bust-recovery" cycle in which many of the initial problems associated with rapid growth are resolved over time (Brown *et al*. 2005; Rolston 2013). Although communities undergoing rapid increases in hydraulic fracking activity can be expected to follow the sequential social stages of boomtown development (enthusiasm- uncertainty-panic-adaptation), many of the current impacted areas have histories, topographies, environmental and economic conditions, and regulatory structures that differ considerably from those examined previously (Brasier *et al.* 2011: 37-38). Due to these differences and to the process's unique technological and social attributes, the current fossil fuel boom diverges from historical oil and gas production in important ways.

The effects of fracking on water resources, for instance, have been widely recognized as posing novel risks that differ from conventional oil and gas extraction (Merrill 2013).[5] After the 11th Circuit Court of Appeals ruled in 1997 that fracking should be regulated as a form of underground injection by the "plain language of the Safe Drinking Water Act," it appeared that emerging technology would be monitored

[5] The potential impacts on fresh water and ecosystems are immense (United States Environmental Protection Agency 2012). Millions of gallons of water are utilized in each fracking procedure, with scores of potentially harmful and/or carcinogenic chemicals injected into the ground, and flowback (a term used to describe the up to 70% of the fluid injected into a well that returns to the surface) that may contain naturally occurring radioactive materials (NORM).

federally by the EPA and by individual states through Underground Injection Control (UIC) plans. UIC plans would have required state-level reporting of chemical hazards in fracking, monitoring, and protection of underground sources of drinking water (LEAF 1997). However, seeking to preserve their market niche and to expand the development of unconventional fossil fuel reserves, the oil field service industry successfully lobbied for an exemption to the Safe Drinking Water Act of 1974 as part of the 2005 Energy Policy Act (Wylie 2011; Wylie *et al.* 2014). Closing this loophole—sometimes referred to as the "Halliburton Loophole"—has been a subject of fierce debate.

Also layered upon a complex array of emerging public health and policy issues is the unique physical landscape of shale energy extraction. While conventional extraction involved seeking pockets of oil or gas trapped beneath a non-porous capstone, the oil and gas contained within shale formations is spread out in a matrix. The small seismic events produced by fracking create routes for this distributed gas to travel to the well. The implication is that any well drilled into a shale formation could potentially be made to produce, dramatically increasing the density of wells on the surface.

How, in this context, might the rapid intensification of fracking challenge the dynamics documented by boomtown researchers and transform our understandings of energy development's social effects? How do local histories of extraction and factors like gender, age, and class shape residents' reactions? These questions are particularly pertinent in locales with long resource extraction legacies, such as the Pennsylvania coal mining country discussed here and elsewhere by Anastasia Hudgins and Amanda Poole, where local residents draw stark contrasts between the emplaced family narratives of the coal mining past and the "disaggregated, transient, and nonunionized" labor and uneven costs-benefits distribution associated with ongoing fracking development (Hudgins 2013: 55; Hudgins and Poole 2014; Poole and Hudgins 2014).

Fracking and embodied experience

Because global patterns of energy extraction create as well as respond to local conditions, *energopolitics* (defined as "power over (and through) energy" (Boyer 2011: 5)) must be examined at multiple scales. At its most intimate, this means contemplating how fracking affects human bodies. Our bodies are our interface with the external world. And, as historian Joy Parr notes, "…our senses are the conduits through which knowledge of technology and the environment flow and, through retuning habit and reflex, the ways we habituate to our changing habitat" (2010: 1). Technology shapes our experience of the world in ways that are both positive and negative, both conscious and intuitive. For individuals on the ground, concerns about unconventional energy development are often initially evident through sensory experiences. Foul odors and discolored waters reveal the presence of potentially hazardous wastes, spills, and/or pollution. Our senses tell us when something is wrong. Deborah Davis Jackson coined the useful term *dysplacement* to underscore how perceptible pollution can transform formerly positive sensory experiences of place to experiences of profound alienation (Jackson 2011). In other words, even when people are not physically displaced, the sensory experience of environmental degradation can lead to equally damaging *dysplacement*.

Qualitative research in anthropology and related fields is uniquely positioned to address the experiential dimensions of energy development. To be sure, quantitative scientific research contributes in important ways to understanding the embodied effects of fracking. But exclusively quantitative projects are unable to account for personal narratives and the scientific discourse from which they derive may undermine or effectively delegitimize local residents' perspectives. As Melissa Checker argues, in many cases "perceptions of risk contrast sharply with official evaluations of risk" (Checker 2007: 113), with official pronouncements regularly disregarding residents' convictions that very serious problems exist. Concerned citizens of fracking zones are often discredited as irrational within the wider public discourse (Finewood and Stroup 2012; for a broader treatment of this issue see Button 2010). It is not enough, therefore, to collect samples and compile statistics; we need to tell real stories that speak to real people's experiences, to give voice to views that may otherwise remain unheard.

Several of the articles that follow tell such stories (Hudgins and Poole 2014; Simonelli 2014; Willow; 2014; Wylie and Albright 2014). In so doing, they concurrently—though usually implicitly—contest the universality of Western science by questioning who has the power to affirm the existence of hazard and risk. Regardless of which version of reality is officially accepted, residents of impacted areas respond according to

their own perceptions and fears (Rappaport 1994). The surge in actual and impending environmental transformation resulting from fracking development has thus been met by an analogous surge in grassroots activism, a topic also addressed by articles in this special section (Mercer, de Rijke, and Dressler 2014; Simonelli 2014). Heeding calls to consider pollution as a form of social relation (Kirsch 2006: 220) and health as an ecological relation (Mitman 2007), the authors in this section work at the intersection of society, embodiment, and environment, thereby challenging modernist visions of an ontological separation of human culture from non-human nature (see Latour 1993).

Fracturing communities, fostering connections

As a new form of fossil fuel extraction, fracking has the capacity both to fracture formerly cohesive communities and to bring formerly disparate communities together. Wherever it takes place, fracking reshapes the social fabric. Local, state, and federal agencies are often overwhelmed by the pace of permitting and extraction and under-resourced to provide services to the communities experiencing it. These impacts are felt at the ground level, with landowners who encounter impacts (e.g., chemical spills on their property) forced to navigate bureaucratic warrens designed to reactively respond to hazards rather than proactively prevent them. The daily functioning, political machinations, and effectiveness of previously little-monitored and little-studied state and federal environmental resource and management agencies have become sites of contestation and intervention for proponents and critics alike. Especially in rural areas unzoned for certain land uses, few local regulations or regulatory bodies exist to intervene or influence extractive industrial development. This tends to encourage the rapid expansion of unconventional extraction and offers residents few opportunities to collectively contest or direct the development process.

Particular challenges are confronted by people who own the surface rights to their property but not the underlying subsurface minerals. Since mineral lease holders have the legal right to develop their resource, surface owners are frequently unable to participate in decisions concerning mineral development on their own property. Because leases negotiated by individual landowners are based on various categories of mineral or surface ownership, neighbors often have distinctly different experiences with the industry, with low-income surface owners and renters commonly experiencing the most detrimental effects. The resulting "divide and conquer" dynamic creates new divisions between community residents. Just as oil extraction companies operating in Ecuador deliberately deploy divide-and-conquer techniques to turn inhabitants against each other (in this case by differentially offering contracts for labor and land use to existing tribal groups and even working to constitute newly "authentic" ones) (Sawyer 2004), a similar process has deepened divisions between "haves" and "have nots" in fracking zones in the United States and elsewhere.

Interestingly, however, fracking is also creating unanticipated new connections between rural and urban areas as landowners in both places struggle with a loss of local control over their social, economic, and physical circumstances. For instance, suburban residents of Cleveland, Ohio have found themselves working with rural Texans and citizens' alliances from New Mexico (Wylie 2011), and impacted individuals in Pennsylvania and Colorado have found ways to share information through new digital forums (Wylie and Albright 2014). Grassroots coalitions are also reaching across national and state boundaries as local alliances and national nonprofits work to create community-to-community education and solidarity. Considering the notion of connection more literally, many of the environmental health debates surrounding fracking stem from concern that the subsurface fractures it generates could produce undesirable interconnections between gas-bearing formations and groundwater. The potential for surprising and unwelcome links have been the foundation for water contamination lawsuits and vitriolic disagreement between proponents of fracking who argue that the distances between aquifers and target formations is too great for contamination to occur (MITEI 2011) and critics who cite suppressed EPA studies showing how abandoned oil and gas wells can create such conduits to dispute this hardline separation (Horwitt 2011).

Inaccessible places, inaccessible information

Surface owners and residents of resource extraction zones are often the last to know about the shale reserves beneath their feet. In many instances, the industry is able to secure leases and access target resources before residents are able to mobilize resistance. It is therefore vital to examine the oil and gas

industry systematically and structurally in order to understand how and why the isolation of surface owners is produced. Oil and gas extraction is typically marked by an enclaving process, through the establishment of what Andrew Barry (2005) calls "technological zones," to which only certain people have access and in which space and time are marked differently (Appel 2011; Bowker 1987; Ferguson 2005; Santiago 2006). Access to technological zones is limited to employees, and their distinction from the surrounding landscape is further emphasized by particular spatial and temporal arrangements. These technological zones have reached an extreme form in offshore oil-rigs, which are run on 24-hour cycles and staffed by workers pulling 12-hour shifts (Appel 2011).

Such enclaves form a crucial part of "oil ecologies" organized to channel oil and the wealth it generates from regions of extraction to regions of social and political power (Peluso and Watts 2001; Santiago 2006; Watts 2003, 2005). Writing of the Ecuadorian and Nigerian contexts, Watts describes "petro-imperialism" as a Faustian pact in which "…a national project (modernity, development, civilization)…is purchased at the expense of sovereignty, autonomy, independence, tradition and so on" (Watts 2001: 205). Suddenly, through narratives that create networks across scales, a quiet and isolated rural region's fate is determined by global actors (Tsing 2005). Technological zones are a physical instantiation of these emerging global market relationships. These zones appear to be technically justified, but simultaneously hide their political and economic interests. Such disengaged or, as Appel (2011) describes them, "modular" technical arrangements provide for the perpetuation of an oil and gas industry in which alternative modes of life and populations in producing regions are continually made structurally irrelevant to the success of resource extraction. Whereas the structure of oil and gas development in the United States formerly stood as an exception to the enclaving practices developed in international and postcolonial contexts, these practices are now being re-imported into the United States to facilitate the present natural gas boom.

The current boom further differs from previous boom-bust cycles dependent upon the discovery and tapping of resources in new regions - not so much because of the nature of the technology itself, but because of the intellectual property associated with it. Hydraulic fracking is controlled by a unique and powerful sub-sector of the oil and gas industry, namely oil field services companies (Casselman 2008; Hamburger and Miller 2004; Nijhuis 2006). Beyond the emergence of new regimes for managing physical property, then, oil and gas development is sped by the drive to secure intellectual property, with prominent companies like Schlumberger and Halliburton now fighting vigorously to retain sole control over the processes and chemicals that make hydraulic fracking possible (Wylie 2011). These multinational corporations (which include some of the wealthiest in the world) make their money neither from owning territory nor from controlling pipelines, but from controlling intellectual property—in this case the technological knowledge associated with high-volume slick water horizontal hydrofracturing (Bowker 1994; Wylie 2011). This has important consequences for the public availability of information about the chemicals employed in fracking. The "Halliburton Loophole" exemption to the Safe Drinking Water Act, described above, means that companies are rarely required to report or monitor the chemicals they use. It has also prevented the Environmental Protection Agency from regulating the practice at the federal level.

From a "down-hole" to a life-cycle approach

Chemicals used in hydraulic fracking have become central to vociferous national and international debates about the health and safety of the ongoing unconventional fossil fuel boom. Concerns about the toxicity of these chemicals to humans and the environment are cited as primary causes for concern, as multiple articles in this special section confirm. At the same time, however, environmentalism's traditional focus on wildlife and protected area legislation makes it easier to prevent fracking in wilderness and other "natural" areas than in urban or rural locales. Analyses of environmentalism in Science and Technology Studies (STS), toxicology, and the field sciences have argued that the development of laboratory science—along with well-funded corporate chemical research and development programs—make it structurally difficult to link illness to chemical exposure (Langston 2010; Murphy 2006; Nash 2006; Oreskes and Conway 2010). Through "informated environmentalism" (Fortun 2004)—in which environmental organizations generate research and share data digitally—NGOs, citizens' alliances, and online organizations are contributing new ways to study and respond to the environmental health issues posed by fracking chemicals (see also Fortun 2011; Wylie 2011). New ways of producing and sharing environmental

knowledge are emerging as communities organize "bucket brigades" and as citizen water monitoring projects and online mapping and databasing tools are developed in attempt to fill gaps in knowledge and monitor the true environmental and health impacts of fracking (Martinez-Alier *et al.* 2014; Penningroth *et al.* 2013; Steinzor *et al.* 2013; Wylie 2011).[6]

The fusion of embodied experience of the oil and gas industry and informated environmentalist efforts to document chemicals used in the hydraulic fracking process, connect those chemicals to health effects, and prove exposure and damage has inspired a shift from a limited "down hole" perspective on the safety of fracking to a life-cycle approach that empowers and interrelates local residents' experiences. As a result, the following calls are now being heard in activist, advocacy, and academic circles:

- Supply chain analyses are needed to address the widespread impacts of the unconventional fossil fuel boom, including the extraction of sand for proppants and the manufacture and storage of hazardous chemicals.
- A greater understanding of seismic imaging and leasing processes is required.
- Broad monitoring of fracking operations is needed, not only at well sites but also as energy development impacts truck traffic and the development of allied infrastructure such as roads, pipe-lines, and compressor stations.
- Further analysis and monitoring of waste disposal and storage—including injection wells—is imperative.
- Finally, longitudinal studies of the industry's social, environmental, economic, and political impacts must be pursued and their results connected to meaningful regulatory reforms.

How this extensive monitoring will be achieved is an open question that is currently being answered in the United States through citizen science as well as EPA and Presidential panel investigations. Given the importance of documenting fracking zone residents' experience across communities, qualitative researchers are uniquely situated to assist in advising, conceptualizing, coordinating, and conducting studies that make constructive sense of the cumulative effects of hydraulic fracking.

3. The importance of ethnography

Social scientific studies of unconventional energy development are well-positioned to begin building vital bridges between technical discourse and human experience. On the ground, qualitative ethnographic details can complement quantitative scientific risk-assessment processes and make underrepresented voices more audible (Checker 2005, 2007). While individual scholars will undoubtedly continue to choose their own paths, many seem to agree that we have a moral and ethical duty to bear witness when injustice impacts those with whom we work and from whom we learn (Healy 2014). Stuart Kirsch, who has worked extensively with Yonngom residents of New Guinea affected by the environmentally and culturally devastating Ok Tedi mine, suggests that "by documenting political violence and representing its human costs, anthropologists can amplify indigenous forms of political expression, bring the resources of the discipline and the moral weight of the academy to bear on injustice" (Kirsch 2006: 187). In the case of fracking, "indigenous" expressions are also often our own (Simonelli 2014).

In the first featured article, "The new politics of environmental degradation: Un/expected landscapes of disempowerment and vulnerability," Anna Willow (2014) investigates connections between fracking in the Midwestern United States and indigenous experiences of environmental injustice. The article begins in the author's home state of Ohio, where citizens are discovering their lack of ability to influence the expansion of

[6] For information on some of these projects, see:

- Skytruth: http://blog.skytruth.org/2012/11/skytruth-releases-fracking-chemical.html

shale gas into their communities. The surprising similarity between emerging middle-class vulnerability to environmental degradation and Willow's prior ethnographic work documenting chronic environmental injustices experienced by an Anishinaabe First Nation in Canada triggers her theoretical analysis of unconventional energy extraction as a neoliberal process of environmental and social dispossession. Focusing on the experience of environmental degradation as a hallmark of changing social position, Willow investigates a troubling and potentially socio-politically transformative new parity between middle-class Americans and indigenous communities. She argues that

> …even as distinctive historical and cultural contexts set these situations apart, common perceptions of disempowerment and vulnerability seem to suggest extensive systemic changes, as growing numbers of people from increasingly diverse walks of life are now being forced to face immediate—and often very serious—environmental challenges that they did not authorize and do not benefit from (p. 240).

In "Home rule and natural gas development in New York: civil *fracking* rights", by Jeanne Simonelli, we learn about New York State residents' response to fracking and to the infrastructure connected to it. Simonelli (2014) reviews the growth of a social movement for civil rights and home rule that has accompanied oil and gas development. A longtime resident of the region, the author explores how community understanding of the impact and infrastructure associated with hydraulic fracking has translated into social action within the social, political and ecological context of rural New York. She uses actual and virtual interviews and oral histories to provide a case study of a struggle for environmental justice amidst conflicting visions and experiences of rural life in one New York region in order to show how "individual townships in the shale gas regions of the state have used home rule in an attempt to chart their own development course" (p. 263). Intersecting with Willow's analysis, the author notes, this movement has built upon listservs, websites, and protest tactics similar to those developed by the Zapatistas in Mexico. Accordingly, Simonelli looks to the global context, noting that although the historical and political conditions surrounding the Zapatista movement and the NY anti-fracking movements are different—and injustice is on a different scale—the threat to life and lifestyle gives rise to similar long term responses. Individuals have come together to learn to use the legal and political power available to them, in the interest of a collective struggle for both the local and global environment.

Transporting readers to the other side of the globe (but remaining as relevant in the North American context as the preceding articles are elsewhere), Alexandra Mercer, Kim de Rijke, and Wolfram Dressler (2014), authors of "Silence in the midst of the boom: coal seam gas, neoliberalizing discourse, and the future of regional Australia", employ text-based critical discourse analysis to examine the similarities and differences apparent in documents produced by the oil and gas industry, the Queensland state government, and a social movement called Lock the Gate. Approaching neoliberalism as an unfolding process, the authors demonstrate how both industry and government construe economic decisions as apolitical and see engaging with political questions as threatening "good economic outcomes" (p.286). Lock the Gate, in contrast, calls on decision-makers to take a myriad of non-economic issues (e.g., health, food, water) into account, thus challenging the neoliberalizing "economy is everything" perspective associated with the coal seam gas industry and the government that supports it.

Calling attention to the development of local social movements in response to fracking, the relevance of environmental and social justice perspectives, and anthropology's distinctive appreciation for the primacy of human experience, these articles show that the structural disempowerment that accompanies fracking is not an isolated local phenomenon, but is instead shared by residents of distant places who possess diverse cultural backgrounds and different personal interests. Through rich ethnographic narratives, the intensely stressful nature of the fracking process as well as the ongoing fear, uncertainty, and confusion it causes are made tangible. Fracking, these articles clearly demonstrate, *goes far beyond the well that is drilled* and fractured; it is also—and, we believe, even more importantly, like all issues interrogated from a political ecology perspective—about *a much broader set of interrelated political, ecological, and social impacts*. Finally, these articles encourage us to think in new ways about the now commonplace notion that people

understand the environment in very different ways. Fracking reveals existing differences in how people construct, conceive, and know "nature" and exposes human-environment relationships as constantly in flux. Today's technological changes are transforming physical environments as well as relationships among environmental, social, and political elements of our world that were formerly perceived as disparate. Although it has not always been recognized, these elements have always been interconnected. We are now realizing, confronting, and contemplating these connections in new and urgent ways, as they are transformed before our eyes.

4. Methodological innovations

Together, the articles in this special section illustrate how collaborative activities and communication networks can shed new light on wider structural and systemic issues that are currently being experienced at the individual level. Some contributing authors are reaching for new ethnographic methods that empower concerned citizens to control and comprehend the impacts of unconventional energy development on social, political, and economic lives and on physical and cultural landscapes.

The fourth featured article, "Framing fracking: private property, common resources, and regimes of governance," by Anastasia Hudgins and Amanda Poole (2014), examines new forms of neoliberal industrial governance emerging in the context of Marcellus Shale drilling in Pennsylvania. Like the article by Mercer, de Rijke, and Dressler, it describes how industry—often in concert with state government—demands impacted individuals "reframe their human needs and desires to parallel those of capital" (p.305) and shows how forms of expertise that are not amenable to the interests of industry are effectively shut out. Building on previous analyses of the relationship between the state, capital, and civil society, Hudgins and Poole offer a case study that illustrates how political processes are able to convert manufactured consent into actionable legislation. They argue that a "new regime" is emerging in rural Pennsylvania, as land, water, and people are re-categorized, resistance minimized, and profit maximized (p. 304). Hudgins and Poole also suggest that the discourse of patriotism and job creation constructed by proponents of shale gas development obscures troubling realities and inequities—a problem also recognized by other authors in this Section. Based on innovative methodology involving the development of an ethnographic field school for students at the Indiana University of Pennsylvania (held in the summer of 2012), Hudgins and Poole's work demonstrates how local students can become involved in ongoing debates about unconventional energy development. By facilitating a field school, a unique opportunity was created for communities to comprehend and reflect upon shared interests and structural differences.

"WellWatch: reflections on designing digital media for multi-sited para-ethnography," by Sara Wylie and Len Albright (2014), also draws on and describes innovative ethnographic methods. Wylie and Albright consider the role of digital media in developing new networked approaches to oil and gas industry monitoring by concerned citizens and academics. They argue that " networked online databases provide a methodological framework for responsive community-based academic research " (p. 323). As "…both a research tool and intervention" (p.341), the WellWatch project allowed residents impacted by oil and gas development to post personal stories and to connect with others experiencing similar situations in an attempt to "intervene in the technical and informational asymmetries between [the oil and gas] industry and impacted landowners by developing closer relationships between communities and academics and developing free, open source tools for communities and community organizations" (p. 324). As the article details, WellWatch proved useful for affected individuals and community members as well as for researchers seeking to understand the impacts of energy development. The construction of a new kind of digital infrastructure allowed people in locations as distant as Pennsylvania and Colorado to speak for themselves and to compare their own health impacts, feelings of vulnerability and fear, and experiences of corporate/government negligence with others.

5. Conclusion: changing roles, changing scholarship

That the number of engaged scholars turning their attention to hydraulic fracking and other forms of resource extraction is rising rapidly speaks to an ongoing transformation in how we define our roles, how we conduct our work, and how we construct our fields of study. It is our hope that the pieces presented here—

along with those of others who seek to give their scholarship similar substance—contribute not only to enriching our collective knowledge about humanity and the world we share but also to constructive ways of envisioning and enacting a positive future. Over three decades ago, Laura Nader made an apt observation: "The energy problem is not a technological problem," she wrote, "it's a social problem" (1982: 104). This point is more relevant than ever.

While each of these articles can be appreciated independently, reading this theoretically and methodologically diverse Special Section as a single entity leads to additional insights. The articles included here illustrate how multiple methodological approaches—ranging from field school facilitation and technologically-assisted online ethnography to text/media-based discourse analysis and participant-observation/interview strategies—can elicit rich ethnographic data to reveal striking similarities in the social, cultural, and political impacts of oil and gas development as it plays out across time and space. Contributors are forging new fieldwork trajectories based upon collaborative research philosophies. All of the included articles seek to connect academic work and advocacy. All constitute vehicles for sharing human experience. And, all are frankly critical of neoliberal economic policy, industrial domination, and the displacement of human concerns that appears to follow unconventional energy development wherever it goes. Some authors use writing as a primary strategy for creating these connections (e.g., Mercer, de Rijke, and Dressler 2014; Simonelli 2014; Willow 2014), constructing critical analyses and narratives that question the current state of affairs. Others (e.g., Hudgins and Poole 2014; Wylie and Albright 2014) have concurrently developed active and empowering new platforms for community collaboration that break down the structural barriers that too often separate not only industry/government and citizens, but also citizens and academics.

The barriers that once existed between scholarship and advocacy—reflected in purported divisions between academic and applied social science—are being broken down (Checker and Fishman 2004; Ginsburg 2004). The articles featured in this collection forge links between these formerly isolated ways of knowing the world, thus contributing to important conversations about the future of academia. Given that many of us are employed by universities, we are compelled to ask what engaged scholarship means when universities are leasing land for unconventional energy development (or considering doing so). What does it mean when many university departments and centers are structurally embedded in scientific and technical developments that seek to increase energy extraction? And, more broadly, what does it mean when researchers are also *residents* of impacted areas who sometimes have pressing and highly personal motives for exploring energy extraction? Together, the articles in this Special Section begin to answer these important questions and chart a course toward an engaged anthropology of energy that is emerging in zones of hydraulic fracking, and in other places where resource-extractive industrial development is changing lives.

Native Representation, Popular Culture, and Criticism

Race, Colonialism, and the Politics of Indian Sports Names and Mascots: The Washington Football Team Case

Kevin Bruyneel
Professor of Politics
Babson College
kbruyneel@babson.edu

Introduction

In July 2014, the Center for American Progress released a study entitled "Missing the Point: The Real Impact of Mascots and Team Names on American Indian and Alaska Native Youth." Written by Erik Stegman and Victoria Phillips, this study further substantiated that the use of Indian team names and mascots has a clear negative social and psychological impact on Indigenous people, especially young people. (Stegman, 2014; Fryberg, 2008) To introduce and publicize the report, the Center invited guest speakers and a panel to address the topic. The keynote speaker was Congresswoman Betty McCallum (D-MN), who in discussing the controversy over the Washington football team's name noted that if a derogatory word for people who are Jewish, African American, or Chinese was proposed as a sports team name, it "wouldn't be allowed, no one would stand or it, but for some reason, the term 'Redskin,' gets a free pass." (Center for American Progress, 2014) Rep. McCallum is firmly on the side of those seeking to end the use of these names and mascots for sports teams at the high school, college, and professional level in the United States. At the same time, her "for some reason" statement reveals an underlying confusion about why this is even an issue at all, and why there has not been comprehensive indignation and swift action to end this practice. McCallum is not alone in her confusion, as it is articulated often by those who oppose such names and mascots. The source of this confusion is the inability to grasp the manner in which settler colonialism is both ubiquitous and, for most people, relatively invisible in U.S. political and cultural life. The history and present of settler colonial violence toward and dispossession and appropriation of Indigenous people's bodies, territory, and identity is everpresent in the sports names and mascots issue. However, what most political actors and observers see and discuss in this debate is not settler colonialism but rather race and racism. To deem as racist names such as the 'Redskins' is not so

much wrong as it is analytically incomplete and thus politically off the mark for grasping why these names and mascots get a‘free pass’ – why they were created in the first place, persist, and are so vehemently defended today by those who seek to maintain the status quo.

The present debate and politics regarding Indian sports names and mascots, such as with the case of the Washington football team’s name, provides an excellent opportunity to politicize and center settler colonialism as a historical and contemporary structuring force of the United States. The sports names and mascot issue is a persistent and public practice of U.S. settler colonial rule. It is a mnemonic device that disavows the dispossession of Indigenous territory and the violent and aggressive assimilatory practices against Indigenous peoples. Paying attention to the political functioning of memory matters here because understanding and intervening in this and other issues requires more than just getting the historical facts straight. Facts matter, but an awareness of facts will not do enough politically to generate change, and this is where we need to see and directly engage with collective memory, specifically settler memory. Settler memory refers to the mnemonics – that is, the functions, practices, and products of memory – of colonialist dispossession, violence, appropriation, and settlement that shape settler subjectivity and governmentality in liberal colonial contexts such as the United States. Settler mnemonics include not only places and teams named after Indigenous peoples, but also calendric commemorations such as Columbus Day and Thanksgiving, military nomenclature such as Apache helicopter, and many other examples. These mnemonics are so ubiquitous that they are, at once, present and absent in American collective memory. That is, in settler memory Indigenous people are both there and not there at the same time, before our eyes across American culture but also disavowed of active political meaning in and by the settler imaginary – ubiquity and invisibility as two sides

of the same settler colonial coin. This disavowal is not a forgetting of colonialism and settlement. The problem with American settler society's relationship with its past resides in the manner in which the nation and its component parts remembers and reproduces its past, as facts and myths, and the important role of this remembering in the re-legitimation of contemporary violence, dispossession, and appropriation. This is a cycle that replays and reproduces settlement on a mnemonic loop. Indian team names and mascots are a public example of this contemporary loop in the American settler memory and imaginary, whereby Indigenous people are both everywhere in symbolic appropriative form but relatively invisible as active, contemporary political subjects.

In this essay, I turn first to the history of the issue, seeing the emergence and development of these names and mascots as coterminous with and reflective of U.S. Indian policy and settler colonial practices of late 19th century and first half of the 20th century. Upon this basis, I then examine the role of race in the contemporary debate over this issue, revealing the prevalence of this discourse and its popularity in mainstream American political culture, especially to the degree that it relies upon and reproduces the presumptions of racial liberalism. The predominance of the discourse of race makes invisible the practices of colonialism, and leaves Indigenous people to be seen, if they are seen, as another minority group within the United States, rather than as Indigenous nations that have a history of a nation-to-nation treaty-based relationship with the U.S. federal government. The point of this critique is not to marginalize race for the sake of colonialism, but rather to approach our analyses with an appreciation of their distinctive dynamics and co-constitutive relationship. In that regard, what I see at work here in perpetuating the Indian sports name and mascot phenomenon are the dynamics of colonial racism, which racially categorizes and generates hierarchies in the name of preserving settler

colonial relations and white supremacy. After setting out a corrective that centers settler colonialism, I analyze and critique two popular claims made in defense of these team names and mascots; that it is a tradition of the team and an honoring of Indigenous people. While I focus on the example of the Washington team name, I see the dynamics at work in that case to be representative of the wider politics and discourse around this issue.

The Historical and Political Context: The Allotment Era

The history of the Washington football team's name points to how this naming practice is deeply tied to settler colonial governance. In 1933, George Preston Marshall re-named his Boston based National Football League (NFL) team the "Redskins;" the name had been the "Braves" in 1932, the team's inaugural season. As to the name itself, while the etymology of the term 'Redskins' can be traced back to the late 18th and early 19th centuries when, according to one historian, it was not a derogatory, negative term, by the late 19th century one could no longer make such a case. (Goddard, 2005:1) For example, in the wake of the U.S.-Dakota War of 1862 an ad in the September 24, 1863 edition of the *Winona Daily Republican* in Minnesota offered the following: "The State reward for dead Indians has been increased to $200 for every red-skin sent to Purgatory. This sum is more than the dead bodies of all the Indians east of the Red River are worth." (*Winona Daily Republican*, and see Routel, 2013) The genocidal tone and aims for which 'red-skin' is utilized in this public forum shows that the word fit comfortably as part of settler colonial discourse and practices of the time. This colonialist racialization dehumanizes Indigenous bodies as objects of commodification through genocidal violence. This is colonial racism. Putting the team name in historical and political context also reveals that the naming of

the Washington team in 1933 marked the end, or close to the end, of a defining era in U.S. Indian policy.

In his comprehensive study of the history of the topic of Indian team names and mascots, J. Gordon Hylton discovered that "the practice of identifying professional teams by Indian names most likely began in 1886." (Hylton, 2010: 895) Prior to that there were no such names for professional teams, but soon after they begin to proliferate and most of the team names with which we are now familiar emerged between 1886 and 1933. The baseball Boston Braves (eventually located to Milwaukee and then to Atlanta) got their name in 1912, Cleveland Indians in 1915, Chicago Blackhawks in 1926, and then the Washington football team in 1933. After 1933, one still sees intermittent cases of such naming – the Kansas City Chiefs in 1960 for example – but there is a clear decline and no new names of this sort after 1963. Hylton's study, however, does not point out the relevance of this time period that starts with 1886 and ends, for the most part, in 1933. Infamously, 1887 marks the passage of the General Allotment (Dawes) Act, commencing the massive dispossession of Indigenous people's territory through the allotment of collectively owned tribal property into individual parcels to adult male tribal members who were expected to earn U.S. citizenship over time and assimilate by becoming private property holders in a liberal capitalist polity. The surplus of land beyond that distributed to Indigenous adult males was then made available for sale as private property on the free market. This process reduced Indigenous territorial holdings from 138 million acres in 1887 down to 48 million acres in 1934. (Hoxie ed. 1996: 154; Hirschfelder and Kreipe de Montano eds. 1993: 20-22) Also, 1890 marks the low point in terms of the recorded population of Indigenous people in the U.S. context, at 248,000 people. (Thornton, 1987) These are just two

features of a time period that saw massive land dispossession and appropriation by and into liberal capitalism that went hand in hand with the genocidal practices and policies that involved not only direct killing of Indigenous people, but also the effort to remove Indigenous people from their nations and assimilate them into the American population. In this regard, consider President Theodore Roosevelt's words, from 1901: "In my judgment the time has arrived when we should definitely make up our minds to recognize the Indian as an individual and not as a member of a tribe. The General Allotment Act is a mighty pulverizing engine to break up the tribal mass." (Roosevelt, 1901) Along with General Allotment Act, other settler colonial measures taken to "pulverize" tribes and forcibly assimilate Indigenous people included the 1924 Indian Citizenship Act, which unilaterally made Indigenous people U.S. citizens, regardless of whether they consented or not. (Bruyneel, 2004) Also, as Jennifer Guiliano demonstrates in her studies of the gendered discourse of Indigenous sports naming and mascotry, the growth of college and professional sports during this historical period provided an important vehicle for the expression and production of the racial and gendered superiority of white middle class masculinity in the United States by means of white male participation in and support of an emergent, popular sports culture. (Guiliano, 2010 & Guiliano, 2015) In all, the U.S. Indian policies and related political developments from the 1880s through the 1930s shaped the context for the emergence and flourishing of the naming of professional sports teams after Indigenous people. The timing of these two developments is not a coincidence, as they mark the compatible relationship between the ubiquity and invisibility of settler colonial governance and of Indigenous people in the American settler imaginary.

Policies such as the General Allotment Act and the Indian Citizenship Act were components of a public, active, comprehensive effort to make Indigenous people disappear, either through death or forced assimilation, and to destroy tribal communities and landholdings. The increasing invisibility of Indigenous people as distinctly Indigenous in their territorialized, collective existence, both as a reality in some sense as a consequence of said policies and more actively as a component of the American settler vision of Indigenous people as a disappearing people, opened the space for and was also fostered by the active symbolic appropriation of Indigenous identity for the sake of the reproduction of American settler identity and belonging. As American state actors and American settlers forced Indigenous people more to the margins through policies and practices of displacement, violence, and assimilation, symbolic Indigeneity moved increasingly and necessarily to the center of the settler imaginary. This mutually constitutive dynamic reflects the relationship among the three pillars of settler colonialism; focusing on territory, people, and identity. The appropriation of territory and the violence toward and forced assimilation of Indigenous people are two key pillars of settler colonialism, and the third pillar is the appropriation of Indigenous identity and culture. The naming and mascot phenomenon is just such an appropriative settler practice, which requires the first two pillars to clear the way for and are also facilitated by the third. I refer to this as a settler practice because it helps to constitute and acculturate a sense of settler belonging on this land through the production of a settler tradition that both acknowledges the presence of Indigenous people as historical beings while disavowing their presence as contemporaneous beings. Thus, to the settler imaginary, Indigenous people and settler colonialism itself are both everywhere and nowhere, ubiquitous and invisible, a vibrant, generative if tragic part of America's past rendered absent in the American present. It

is this dynamic that shapes and constrains the politics over team names and mascots to this day, and this is because it is reproduced through settler memory.

To conclude this section, I return to the history of the Washington football team. George Preston Marshall's motivation for giving the team this name derived from his "long time fascination with Native Americans" and in honor of the identity of his coach William 'Lonestar' Dietz, who was "believed to be a Native American," from the Sioux Nation, although in all likelihood he was not. (Hylton, 2010: 888; Waggoner, 2013: 1) Dietz's previous positions included coaching at the Haskell Indian School, and he recruited six Indigenous men, a number from Haskell, to play for the 1933 Boston team. (Hylton, 2010: 888-9) As well as introducing the new name, that year Marshall also required Coach Dietz to "walk the sidelines wearing a Sioux headdress" and he had the players, white and Indigenous, "wear war paint when they took the field." (Hylton, 2010: 902). In this way, the white settler own imposed not only the name but an entire performance of stereotypical Indigeneity, one reflective not of actual Indigenous practices but of the owner's settler imaginary. This settler imaginary is also deeply shaped by anti-blackness, as Marshall's actions showed after he moved the team to Washington, D.C. in 1938.

By 1961, the Washington football team stood as the only the NFL team to have never had a Black player on its roster. Under the new John Kennedy administration and with the presence of an increasingly powerful Civil Rights Movement, Kennedy's Secretary of the Interior, Stewart Udall, pressured Marshall to sign a Black player so that the team residing in the nation's capital would no longer be, in Udall's words, "lily-white," or the "paleskins" as he called them. Marshall resisted, cementing his reputation as a notorious, open white supremacist, stating at one

point that “We’ll start signing Negroes when the Harlem Globetrotters start signing whites.” Marshall had supporters in his effort to resist the Kennedy administration’s pressure to integrate the team. Notably, the American Nazi Party marched in support and one photo shows two distinct signs carried by the uniformed Nazis. The first is a banner stating “America Awake,” with a Swastika positioned between these two words. Next in line is a marcher holding a sign that says: “Mr. Marshall: Keep Redskins White!” (Park, 2013)

Udall eventually compelled Marshall to cede on this issue and integrate his team because the Secretary had important leverage over the owner. Marshall had recently signed a 30 year lease on the stadium in which his team would play, and that stadium – at the time called D.C. Stadium, and then RFK stadium – resided on federal lands. As such, Marshall’s landlord was the Department of Interior, and Udall threatened to deny use of these lands if the team persisted in its discriminatory practices. (Smith T., 2011) Here settler colonial invisibility and its modern functionality and material presence came in to play. These lands are part of the traditional territory of the Powhatan Confederacy, specifically the Nacotchank people. British colonizers and settlers seized this land in the late 17th and early 18th century. In the late 18th century, 10 square miles of the land was turned over to the federal government in order to locate and build the nation’s new capitol in Washington D.C. The complicated, mutually constitutive relationship between settler colonialism and white supremacy is evident in the history of Marshall’s ownership of the team, and it foreshadows the contemporary debate over the team’s name.

To start, take note of the American Nazi claim to “Keep Redskins White,” which echoed Marshall’s effort to keep Black players off of his team. Here, the preservation of whiteness is

maintained through direct anti-blackness, the core of U.S. white supremacy. It also premised upon a foundation of settler colonialism in which an overt claim to an identification with and appropriation of Indigeneity in the early 1930s does not upset the desire for racial purity, because in settler memory Indigenous people have been made functionally absent, a safe part of the past. This is the work of a white settler tradition that deploys settler colonial practices of appropriation and dispossession to generate settler belonging and also the work of white supremacist practices of anti-blackness that affirm white racial superiority. This particular story ends with the Kennedy Administration succeeding with regards to ending Marshall's practice of a particular form of anti-blackness, that being the exclusion of Black people from the marketplace – in this case that of professional athletics – due to racial discrimination. Marshall was violating a tenet of racial liberalism, in the nation's capital no less. The settler government's claim over this land proved the leverage needed for Marshall to eventually and very reluctantly allow for the inclusion of Black players on his team. This was a victory for racial liberalism won through the deployment of settler colonial governing power over land dispossessed from Indigenous people. The difficult relationship of settler colonialism to white supremacy and Indigeneity to race witnessed in this historical moment resonates in the contemporary debate, revealing both potential problems but also possibilities in how to understand, frame, and intervene in the public discussion occurring over this issue.

The Contemporary Debate: The Anti-Naming Claim of Racism

Just as in the early 1960s when the Washington football team stood at the center of a storm over a violation of racial liberalism and the owner's anti-blackness, in the contemporary era this same franchise in the most profitable professional sports league in the United States is under intense

scrutiny over the team's name. A wide range of Indigenous and non-indigenous political actors have voiced their opposition to the name, demanding that present team owner Dan Snyder change it. They include Suzan Shawn Harjo, Cheyenne and Muscogee writer and activist who legally challenged the trademark status of the team name, the Oneida Nation under the leadership of Ray Halbritter, the National Congress of American Indians (NCAI), the Leadership Council on Civil and Human Rights (a coalition that includes the National Association for the Advancement of Colored People, the American Civil Liberties Union, Human Rights Campaign, the National Council of La Raza, and American-Arab Anti-Discrimination Committee), and President Barack Obama, who stated that if he was the owner of a team with a name "that was offending a sizeable group of people, I'd think about changing it." (Vargas, 2013) Halbritter, while leading the Oneida Nation's public campaign against the name, also wrote a 2014 editorial critiquing what he saw to be hypocrisy in the NFL pondering a plan to penalize players for saying the word "nigger" on the field while the Redskins remained the name of one of its franchises. Comparing the N-word and the R-word, Halbritter argued that the latter is like the former in that it is a well-recognized racial slur. (Hallbritter, 2014) And in the wake of the National Basketball Association banning Los Angeles Clippers' owner Donald Sterling in April, 2014 for making racist statements in the private realm, a number of public figures have used this moment as an opportunity to demand the NFL take action on the Washington team name, seeing the two situations as analogous. Football player Richard Sherman, when asked if the NFL would have taken the same stance on racist statements as did the NBA, stated: "No, I don't. Because we have an NFL team called the Redskins." Senator Majority Leader Harry Reid (D-NV) implored the NFL to follow the NBA's lead, mocking those who defend the Washington team name as a matter of tradition, stating "what tradition, a tradition of racism." Representative Henry Waxman

(D-CA) has called for a Congressional hearing on the team's name stating that the Committee "could play a constructive role in challenging racism" by calling Goodell and Snyder to testify and defend the name. And on May 21, 2014, 50 U.S. Senators, all Democrats, signed on to a letter to Commissioner Goodell calling for a change to the Washington team's name. The letter also builds on the NBA example and includes the following claims and statements:

> …that racism and bigotry have no place in professional sports;
>
> What message does it send to punish slurs against African Americans while endorsing slurs against Native Americans?
>
> This is a matter of tribal sovereignty – and Indian Country has spoken clearly on this issue.
>
> At the heart of sovereignty for tribes is their identity. Tribes have worked for generations to preserve the right to speak their languages and perform their sacred ceremonies…. Yet every Sunday during football season, the Washington, D.C. football team mocks their culture.
>
> The NFL can no longer ignore this and perpetuate the use of this name as anything but what it is: a racial slur. (U.S. Senators, 2014)

This issue may be getting close to a so-called tipping point, as an increasing number and range of individuals and organizations feel comfortable taking a clear public stance against the Washington football team's name. This emerging movement against the team name is a positive development in that it may mean the name will be changed in the not too distant future. On the other hand, one 2013 poll found that 79% of Americans think the Washington team should not have to change its name. (Steinberg, 2013) Thus, while the issue has gained momentum to the degree that mainstream political and public figures are comfortable speaking out against the name, a significant portion of the public does not see it as a serious problem. To makes sense of these twinned dynamics, we need to take a close look at the politics and discourse of race deployed here.

The predominant claim made by those opposing the Washington team name is that the name is racist, a slur upon Indigenous people. One can find this claim throughout the public realm, and

especially across social media as people call out and protest the use of the identities and imagery of Indigenous people for team names and mascots. The claim that this practice is racist, or a racist slur, is clearly defensible in that the Washington football team is a dictionary defined slur and a dehumanization of Indigenous people. The problem here is not the charge of racism itself, but that it has become hegemonic in the debate. In so doing, this discourse marginalizes to the point of making invisible the idea and claim that these team names and mascots are persistent practices of settler colonalism that exist in a constitutive relationship with white supremacy. The relative invisibility of settler colonialism in this debate is as much a product of disavowal than it is a consequence of a lack of knowledge or as a mere byproduct of the predominant focus on race. For example, the letter from the U.S. Senators asserts that the issue is a matter of tribal sovereignty, which thus conveys their knowledge of that fact Indigenous nations stand in a distinct relationship to the United States. This assertion might have opened a path to defining this naming practice as a settler colonial one – one of appropriation built upon genocidal and dispossessive practices against peoples who assert their status as sovereign nations. But the Senators' letter closes with the presumptive assertion that the team's name is "what it is, a racial slur." This is unsurprising, as U.S. Senators – specifically Democratic Senators – can comfortably stand against racism in this particular form while also standing, if implicitly, for the maintanance and reproduction of American settler colonialism in the form of liberal colonialism. By liberal colonialism I mean polities comprised of institutions, norms, and practices that reflect a compatible encounter between liberal-democracy and colonialism in the political development and contemporary formation of nations such as the United States. Within a liberal colonial context there is no tension between an open opposition to practices that explicitly violate racial

liberal principles and the simultaneous disavowal and reproduction of settler colonialism. They go hand in hand.

To be more precise on racial liberalism, the liberal discourse about race is one that marks out for attention and potential amendment those evident exclusions and discriminations that could forestall some form of standing as equal or with the potential to be equal in the U.S. polity, as defined by Civil Rights era norms of inclusion to an ideal of a racially egalitarian, even post-racial, American republic. With the Washington football team of the early 1960s we saw government intervention to stop then team owner Marshall from excluding Black players from eligibility to be employed by his team. Now, in the early 21st century, mainstream politicians and public actors and activists are seeking to get present owner Snyder to change the Washington team name based upon the notion that it is a form of racial discrimination that excludes Indigenous people from realizing the norm of treatment under racial liberalism. This emerging popular and mainstream movement against the Washington team name is built upon a very narrowly tailored sense of what counts as racism. To refer to the issue of the Washington team name as a matter of racial discriminaton frames the problem and the solution within the assimilatory logic of racial liberalism, which does not allow room to productively mention, let alone debate and challenge, the role of historical and contemporary settler colonialism. Rather, as with the conflict over the Washington team's exclusion of Black players in the 1960s, the existence of settler colonial governance is presumed, both invisible and ubiquitous.

Political theorist Robert Nichols sheds light on the tensions that emerge when anti-racist politics and critiques that focus on closing the gap between the ideals of a racially egalitarian society and

the reality of a racially unjust society presume the persistence of settler colonialism and the settler state. He notes, "antiracist critique may inadvertently reproduce the official state narrative of the settler colony, in which the (colonial) state is the best approximation of the ideal social construct and indigeneity is understood as a derivation or deviation from this ideal, in need of additional normative justification…. In fact, it is often through the removal of so-called race-based barriers to integration and subsequent enclosure and incorporation of previously self-governing Indigenous polities that settler colonialism has operated." (Nichols, 2014: 103) As a consequence: "Insofar as this form of antiracist critique enables settler colonial sovereignty to structure the terms of its own contestation, it is classically, hegemonic." (Nichols, 2014: 113) It is this hegemony that is in play in the race-based critique of team names and mascots, one in which race-based discriminations and barriers become the primary focal point of the discourse such that not only is settler colonialism rendered invisible, but the resolution to this racial violation follows the logic of inclusion within and thus affirmation of settler colonial governance. The resolution to the exclusion of Black players from the Washington football team in the early 1960s came by means of settler state actors using as leverage against a white supremacist team owner the fact that said team owner sought to profit from long term access to lands dispossessed from Indigenous peoples. Racial inclusion was achieved and settler colonial governance was the means to achieving this aim, which thereby reaffirmed the settler state's status and authority over territory dispossessed from Indigenous people. When settler colonial governance shapes the "terms of its own contestation" in this way, the deeper historical and political sources and meaning of the appropriation of Indigenous identity and imagery for team names and mascots get subsumed and disavowed. As a consequence, so does the distinction between various group experiences in relation to American liberal colonialism.

With this critical perspective in mind, I see in the example of the letter from the 50 U.S. Senators as well as other forms of opposition to the Washington team name and similar sports names a form of liberal colonial discourse at work. This discursive work can be seen in the popular rhetorical trope referenced by Representative McCallum, by which one posits a hypothetical in which there is an analogous appropriation of the identities and imagery of non-Indigenous racial and ethnic others to the white Christian norm. A visual example of this device can be seen in the image widely shared across social media that shows three baseball caps side by side, that of the New York Jews, the San Francisco Chinamen, and the Cleveland Indians, each with its own derogatory caricature of an individual from these respective groups.

This particular image is from a poster and social media campaign produced and disseminated by the *National Congress of American Indians* (NCAI). The image includes the following tag line: "No race, creed or religion should endure the ridicule faced by the Native Americans today.

Please help us put an end to this mockery and racism by visiting www.ncai.org." (Graham, 2013) The point being made here is that if one finds unacceptable the hypothetical New York and San Francisco teams names and mascots, then one should by racial liberal analogy find the third, that being the actually existing Cleveland Indians and their grotesque logo/mascot Chief Wahoo, also unacceptable. In terms of short term political maneuvering it may make sense for activists to utilize this form of race-based discourse to generate public attention to the issue. However, this is likely less a calculated political move than an example of the hegemonic power of the discourse of race, and racial liberalism in particular. It is fair to question at a practical level whether this race-based approach does indeed work best in the short term in the effort to address and overcome the arguments made to defend such names/mascots and, connectedly, what this approach means in the long term effort to maintain and further generate an anti-colonial politics. The potential problems with a discursive move such as the example of the three baseball caps are that; first, it is premised upon the idea that the experiences and resolutions to the injustices perpetuated upon these groups are analogous; and secondly, in so doing it also undermines the effort to grasp why Indigenous sports names and mascots persist. This baseball cap analogy does not answer the question of why Indian team names and mascots get the 'free pass,' but instead unintentionally serves to further inscribe this pass. This is because the question that the hypothetical poses – how can we tolerate the Cleveland Indians when we would not tolerate the New York Jews or San Francisco Chinamen? – portends to be exposing the hypocrisy or inconsistency in the application of racial liberalism, but what it really does is mask the deeper, disavowed problem. The problem being that colonial relations define the production and persistence of names like the Redskins and mascots such as Chief Wahoo, which exist in a constitutive relationship to race, but cannot be collapsed as a matter of race, and race alone.

The creation and the persistence of these naming and mascot practices are deeply tied to the Allotment Era appropriations of land, and the violence and assimilative practices toward Indigenous peoples that remain structuring forces of U.S. liberal colonialism. Thus, deconstructing the baseball cap analogy for the settler dynamics at work here does not serve, first and foremost, to reveal that in contemporary life most people would not tolerate the New York Jews or San Francisco Chinamen as team names and mascots. Instead, it sheds light on the fact that in U.S. history there is no point in which the creation of such team names and mascots would have made sense in the first place. This is the critical historical and political point that is missed when settler colonialism is not placed at the center of this debate. Compared to settler appropriations of Indigenous identity, settler memory finds much less identificatory fuel in anti-Semitic or racist anti-Asian representations. This is not to say that Jewish and Asian people did and do not experience structural discrimination productive of American political identity and development, but rather that there is a more distinct, constitutive role for Indigenous identity and settler colonialism in relation to American settler identity and political development. Without such a shift of registers from racial liberalism to settler colonialism and its corollary colonial racism, the issue as presently and predominantly debated is more likely to reproduce than challenge and disrupt settler colonialism. I turn now to address a couple of the main arguments made in defense of Indian team names and mascots to reveal the theoretical and political benefit of directly upsetting the productivity of settler memory in the contemporary debate.

Two Defenses of Naming/Mascots, and Anti-colonial Responses

There are two prevalent contemporary arguments made to defend the practice of Indian team names and mascots: 1) For the team and its fans, the name or mascot is an important tradition worthy of respect and preservation, and 2) These names and mascots are meant to honor Indigenous people, culture, and traditions, and in that spirit they are utilized to reflect and enhance team pride. These two arguments are often articulated in the defense of the Washington football team's name, and they are important to analyze because of their constitutive relationship to white settler memory and identity. In particular, the argument that these names are meant as an honor to Indigenous people reveals settler practices that are tightly tied to white supremacist presumptions.

It's a Tradition

In an October 9, 2013 letter to the season ticket holders of the Washington football team, team owner Dan Snyder addressed the controversy over the team's name. While stating that "he respects the feelings of those who are offended by the team name," over the course of the letter Snyder invokes a number of common defenses of the name, in particular that of it being a tradition and an honoring. I start with the way he concludes the letter:

> So when I consider the Washington Redskins name, I think of what it stands for. I think of the Washington Redskins traditions and pride I want to share with my three children, just as my father shared with me -- and just as you have shared with your family and friends.
>
> I respect the opinions of those who disagree. I want them to know that I do hear them, and I will continue to listen and learn. But we cannot ignore our 81 year history, or the strong feelings of most of our fans as well as Native Americans throughout the country. After 81 years, the team name "Redskins" continues to hold the memories and meaning of where we came from, who we are, and who we want to be in the years to come.
>
> We are Redskins Nation and we owe it to our fans and coaches and players, past and present, to preserve that heritage. (Snyder, 2013)

Dan Snyder's assertion that the team's name is a tradition that is meaningful to him and to the fans should be taken as a sincere, legitimate claim. He is right, it is a tradition; a settler colonial tradition. In no small part, a settler colonial tradition is one that supplants and replaces Indigenous people's history and presence with a settler history that seeks to establish a sense of settler belonging in the territory. Historian and Indigenous Studies scholar Jean O'Brien refers to this as a "replacement narrative" that effects a "stark break from the past, with non-Indians replacing Indians on the landscape." (O'Brien, 2010: xxii-xxiii) O'Brien's focus is on the production of the replacement narrative in 19th Century New England, and she finds "five locations" in which it can be read: "the erection of monuments to Indians and non-Indians, the celebration of historical commemorations of various sorts, the enterprise of excavating Indians sites, the selective retention of Indian place-names, and claims Non-Indians made to Indian homelands." (O'Brien, 2010: 57) I see Indian sports names and mascots as forms of a monument and historical commemoration that serve a similar purpose of establishing settler belonging at the expense of Indigenous presence, and Snyder's words explicitly concede the production of such a narrative.

In response to protests, Snyder counters with a claim premised upon the weight and meaning of the over 80 year history of the Washington team's name. It is his team's history, what he refers to as a nation, that he positions as under threat from those who seek to change the name. For Snyder, this 80 year historical span has generated a collective identification and belonging, explicitly avowed in his assertion that the name "continues to hold the memories and meaning of where we come from, who we are, and who we want to be in the years to come." These are settler memories built upon the appropriation, representation, and replacement of Indigenous

identity and presence by an emergent settler tradition and identity. Snyder constructs a 'we' comprised of non-Indigenous people, of settlers, who find in the Washington team a mnemonic bond that links together fans and players of the "past and present." Snyder's construction of the 'we' is demonstrated by the fact that he starts his mnemonic tale with the meaning the name has for his own family, extends that feeling out to "your family and friends," and finally to "most of our fans as well as Native Americans." The latter is a telling construction in that it splits off a settler fan base from Indigenous people. And even if Snyder included settlers and Indigenous people in his 'we' of the Redskins nation, the tradition he is defending is a settler tradition in its creation, development, and purposes. This a tradition built upon locating active Indigenous identity in the past that settlers then *honor* via appropriation in the present day. In this way, the Washington team name and the team name and mascot phenomenon in general are active components of a contemporary replacement narrative that constitutes and with each articulation reconstitutes the story of settler belonging as a tradition unto itself.

To take at face value the claim to tradition and then deconstruct and consider the meaning of such a claim is to engage in an anti-colonial critique by marking it as an appropriative practice that serves in the constitution of settler identity. This goes further politically and critically than the claim that the name is racist. This approach refuses to allow settler colonial governance to set the terms of this debate. It does so by putting the team name's into historical and mnemonic perspective as part of a persistent, deeply rooted settler colonial logic and set of practices traceable from the past to the present and thereby tying it to, rather than cleaving if off from, the history and present of settler colonial governance. Thus, when Dan Snyder makes the claim that names and mascots matter because they convey memories about "where we came from, who we

are and who we want to be in the years to come," opponents of such names and mascots can concur with him and then take him up on the very historical arc invoked here, one which goes right back to the Allotment Era and all that it has wrought. As well, this critical approach places settler colonialism at the center of this debate such that it can facilitate the articulation of a racial critique that goes beyond the parameters of racial liberalism. I draw this relationship out in the next section, regarding the claim that these names and mascots honor Indigenous people.

It's an Honor

The claim that this naming practice is not a slur but is, to the contrary, an honoring of Indigenous peoples is closely bound up with the view that Indian team names and mascots are a tradition. Both the claim to tradition and to honoring articulate an implicit concern with defending settler identity, meaning, and memory. Here are three examples of its deployment in reference to the Washington team name. First, the following is an excerpt from NFL Commissioner Roger Goodell's June, 2013 letter to two Congressional representatives:

> Neither in intent nor use was the name ever meant to denigrate Native Americans or offend any group. The Washington Redskins name has thus from its origin represented a positive meaning distinct from any disparagement that could be viewed in some other context. For the team's millions of fans and customers, who represent one of America's most ethnically and geographically diverse fan bases, the name is a unifying force that stands for strength, courage, pride and respect. (Goodell, 2013)

Second, in an August, 2014 interview with the television sports network ESPN, Dan Snyder offered the following in response to the question: What is a Redskin? "A Redskin is a football player. A Redskin is our fans. The Washington Redskin fan base represents honor, represents respect, represents pride. Hopefully winning. And it's a positive." (Steinberg, 2014) Finally, the website Redskinsfacts.com, a team alumni website funded by Dan Snyder with the listed support of such former players as Joe Theismann, Billy Kilmer, Mark Moseley, and Clinton Portis,

makes the following claim: "**We believe the Redskins name deserves to say.** It epitomizes all the noble qualities we admire about Native Americans—the same intangibles we expect from Washington's gridiron heroes on game day. Honor. Loyalty. Unity. Respect. Courage. And more." (redskinsfacts.com, emphasis original)

Just as original team owner Marshall saw the name as an honorific that would stand as a positive symbol for his team in 1933, the parties supporting the name in the early 21st century are likely being sincere when they say that the name speaks to the "noble qualities" they admire about Indigenous people. In the conclusion to his book*, Playing Indian*, Historian and Indigenous Studies scholar Philip Deloria spoke to the function that 'playing Indian' serves for Americans in the production and meaning of their national identity, stating: "The self-defining pairing of American truth with American freedom rests on the ability to wield power against Indians – social, military, economic, and political – while simultaneously drawing power from them. Indianness may have existed primarily as a cultural artifact in American society, but it has helped *create* these other forms of power, which have then been turned back on native people." (Deloria, 1998: 191) The key word here is power. The comments of Goodell, Snyder, and on the team alumni website articulate a vital, constitutive relationship between the honor that the name purports to convey to and about Indigenous people and the power that the team and its fans get from the name, as a "unifying force," signifying "intangibles" they "expect from Washington's gridiron heroes on game day. Honor. Loyalty. Unity. Respect. Courage." The components and purpose of honoring as defined here by significant figures of the NFL and the Washington team expressly invokes a process of drawing power from Indigeneity as a cultural artifact for the sake of enhancing the power of the collective identity of the team and its fans. The purpose here is to

constitute settler identity, as the claim to honoring shows itself to be an appropriative practice for which the Washington team name is a metonym for the wider dynamic constitutive of American self-identity. This appropriative practice of honoring is also a form of replacement narrative, in which settler collective identity – the American nation, the Redskins nation – draws power from Indigeneity conceived as cultural artifact that in its noblest form is ubiquitous in the past and invisible in the present. The replacement narrative here implicitly asserts that noble Indigenous people have tragically disappeared and we, the settlers, honor them by taking up their name as our own in contemporary settler form.

In referring to honoring as a practice of appropriating Indigenous identity, I mean this as both building upon and occurring alongside the appropriations/dispossession of Indigenous territory and the effort to eliminate and undermine Indigenous people as a distinct people. Regarding this latter point, in their study of the psychological impact of American Indian Mascots, Psychologist Stephanie Fryberg et al., discovered that there are indeed negative impacts to such names and mascots, especially for Indigenous youth, and these "effects are not due to negative associations with mascots." They found that even when Indigenous youth have, in Dan Snyder's terms, "a positive" association with an Indian team name or mascot there was still a negative impact on the self-esteem of these young Indigenous people." These researchers conclude:

> Although pro-mascot advocates suggest that American Indian mascots are complimentary and honorific and should enhance well-being, the research presented runs contrary to this position. American Indian mascots do not have negative consequences because their content or meaning is inherently negative. Rather, American Indian mascots have negative consequences because, in the contexts in which they appear, there are relatively few alternate characterizations of American Indians. The current American Indian mascot representations function as inordinately powerful communicators, to natives and nonnatives alike, of how American Indians should look and behave. American Indian mascots thus remind American Indians of the limited ways in which others see them.

In sum, the appropriation here diminishes and confines the ways in which many young Indigenous people understand and enact their sense of identity. This is a deeply colonialist practice premised upon the enforced invisibility of Indigenous people as contemporary agents, and the ubiquity of limited representations of Indigenous people through such cultural forms as sports team names and mascots. And as a colonial practice it concomitantly serves to embolden settler identity, as supported by Fryberg et al., who reference two studies which "revealed that after exposure to various American Indian representations, European Americans reported higher self-esteem compared to the control condition and to a nonnative mascot, namely, the University of Notre Dame Fighting Irish." (Fryberg, 2008: 216) As such, just as the colonialist appropriation of Indigenous territory reduces and limits the territory of Indigenous people in the process of enhancing the territorial claims of the settler population, so does the appropriation of Indigenous identity through team names and mascots undermine the self-esteem and sense of identity of many young Indigenous people while enhancing the self-esteem of settlers, of European Americans.

The relationship between appropriation of territory and of identity is indicative of the wider colonialist dynamics at work here. What I marked out as a mutually constitutive relationship during the Allotment Era continues to this day. As with the response to the tradition defense, an anti-colonial response to the honoring defense does not need to challenge the idea of it being a positive representation, an honor, or a sign of admiration. Whether an image is meant as an honor or to be derogatory is not the fundamental point, as the psychological studies themselves show. Rather, the point to be made is that these names and mascots are created by the colonizer to represent the identity and existence of the colonized, drawing power to the former from the

latter at a symbolic and cultural level that is tightly tied to the appropriations and violence which occur in the material and political sense. This anti-colonial response to the honoring defense refuses to allow this debate to be reduced to race alone while providing the opportunity to reveal the important constitutive relationship between colonialism and white supremacy.

While in U.S. Indian policy the period from the 1880s to the 1930s is known infamously as the Allotment Era, in the history of formalized white supremacy this time period represents a portion of the Jim Crow era that did not formally end until the mid-1960s. In a nation built upon the cheap labor garnered through the violent enslavement of Africans and their descendants and the cheap territory gained through violent dispossession of territory from Indigenous people, during the Allotment/Jim Crow Eras sports teams turned to Indigenous identity to draw power in order to generate their honorable, noble, and courageous team identities. However, they did not turn to African American identity for this same purpose. The production of white American settler identity did involve the appropriation and drawing of power from African American identity, but in different form and with distinct meaning. As Eric Lott shows in his book, *Love and Theft*, since well before the U.S. Civil War the wearing of "blackface" by white Americans was a product of their feelings of both admiration of and repulsion for African Americans, and these minstrel performances served in the production of, in particular, white American male working class identity that was negotiating and defining the parameters of racial designations, meanings, and hierarchies. (Lott, 1993) There are two important differences between these forms of appropriation that speak to why a debate over team names and mascots reduced to the terms of racial liberalism does not recognize the more fundamental and persistent role of anti-blackness at work here. First, blackface minstrelsy presumed and continues to presume the presence of

African Americans in an abject state at the bottom of the racial hierarchy of U.S. white supremacy, whereas Indian team names and mascots presumes the disappearance of the noble Indigenous people who are honored as a cultural artifact. Second, in the post-Civil Rights era Blackface minstrelsy has become culturally and politically taboo, almost universally accepted as offensive and inappropriate, whereas the presence of Indian team names and mascots remains acceptable to many. In white American settler memory, the abjected, everpresent Black American at the bottom of the hierarchy of U.S. white supremacy and the noble Indigenous person made tragically invisible by U.S. settler colonial practices signify two distinct and compatible, constitutive imaginaries. In the white settler imaginary the abjected presence of Blackness stabilizes white superiority in the U.S. racial hierarchy and noble, disappearing Indigeneity stabilizes the settler replacement narrative and claim of settler belonging. When looked at in this way one can safely posit that to white settlers in the early 20th century the idea of looking to draw power from Black American identity so as to create an honorable team name was, quite literally, unimaginable, whereas utilizing Indigenous identity was readily imaginable, ubiquitously so. In this regard, original Washington team owner Marshall's views exemplify the manner in which anti-Blackness and the claim to honoring while replacing Indigeneity go hand in hand.

While present-day fans of the team would certainly disavow previous owner Marshall's open white supremacy, as well as the assertion of the American Nazi Party to "Keep Redskins White," the team's very public history on this account is not a mere exception to the rule of settler memory and tradition, but rather speaks to a collaborative relationship between settler colonialism and white supremacy in the U.S. context. This collaborative dynamic matters a great

deal when attending politically to the likes of Goodell, Snyder and so many others who do not view the use of the N word and the R word as being analogous, because while they concede the N word is a slur they insist that the R word is an honor. That the likes of Goodell and others do not see the two words to be analogous was only further proven in 2014 when, as noted earlier, the NFL seriously considered instituting a new on-field penalty for the use of the N-word by one player towards another, a situation that occurred primarily amongst African American players. (Burke, 2014) To those opposed to the Washington team name, this further demonstrated that the R-word was a getting a free pass. (Moya-Smith, 2014) While this response is understandable, these two situations are analogous only if one sees them through the framework of racial liberalism. An anti-colonial perspective reads the banning of the N-word and the maintenance of the R-word as further evidence that the persistence of the latter is in no small part premised upon the view of Black Americans as abject, as the un-honorable who need white American protection from further dishonor so as not to violate the tenets of racial liberalism and upset the white American myth that we now exist in a post-racial society. One can see colonial racism at work here in the manner in which a profound anti-blackness is subtly woven into the honoring defense, especially in light of the potential N-word ban. In the context of the NFL proposed policy regarding the N-word, the claim that the Washington team name honors Indigenous people implies that one particular group, Indigenous people, is worth the honor of white settler admiration while another group, African Americans, is worthy of only white liberal paternalism from further symbolic denigrations that openly reference abjected presence. To draw upon Professor Andrea Smith's formulation, these moves in relation to the R-word and the N-word mutually reinscribe the binaries of Indigenous-settler and Black-white. The former binary presumes the disappearance/invisibility of Indigenous people. The latter binary presumes the

presence and abjection/exploitability of Black Americans. (Smith A., 2012) This pairing of the honoring/invisibility of Indigenous people and abjection/presence of Black people forms the core of a colonial racism. This tightly tied historical and political relationship is not a significant part of the debate over team names and mascots in the 21st century, and this absence undermines the effort to generate more radical political arguments, interrogations, and alliances.

An anti-colonial, and thus anti-colonial racist, approach in this debate would make clear that the disappearing, noble and honorable Indian that Dan Snyder and his supporters posit relies historically and logically upon the co-constitutive unhonorability, exploitability, and ever-presence of African Americans. In so doing, this more radical approach maintains the focus on settler colonialism and white supremacy as deeply inter-related structures. In this case, it does so by taking the honoring defense at face value and re-posing it as one that relies upon both Indigenous invisibility/honorability and Black American abjection/exploitability. This approach does not appeal to the inclusive, assimilatory framework of racial liberalism, but instead sees the team name as a component of a larger dispossessive, appropriative, exploitative, and violent set of colonial racist practices. In response to the honoring defense, an anti-colonialist argument does not say we would never tolerate a derogatory name like the New York "Negroes" so we should not have the Washington team name, but instead asks why would the former have never entered the white settler imaginary in the first place whereas the latter was ubiquitous in its formative period and persists to this day, and what is the relationship between these two dynamics today? This more radical political question speaks to the history and present of settler colonialism and white supremacy so as to push the way towards a more profound and disruptive response to the honoring defense. Such a response begins with not reducing the issue to a solely

racial discourse in which colonialism is rendered invisible, but instead traces and interrogates the role of colonialism and colonial racism in the politics of Indians team names and mascots.

Conclusion

The free pass enjoyed by the Washington football team persists to the degree that settler colonialism remains invisible in this political debate. In making this case, the purpose of this paper is not to discredit the efforts of those seeking to do the important work of bringing an end to these names and mascots, but rather to consider the implications of the arguments that are deployed and to suggest alternative, more historically attentive and politically radical, ways to intervene in the debate and politics of this issue. The political efforts to oppose names and mascots have a great opportunity to upset the mnemonic loop that reproduces settler colonial logic. They can do so through a direct focus historically on the Allotment Era in order to argue that this present practice of names and mascots is part of a connected chain of appropriations and dispossessions that continues right on up to our day. However, if these efforts to raise and engage Indigenous political issues remain within the logic and narrative of racial liberalism in a post-Civil Rights era paradigm that defines the mascot issue as a matter of offensiveness, exclusion, and discrimination rather than an anti-colonial focus on appropriation, dispossession, and violence, they are more likely to reproduce, even if unintentionally, settler memory as a practice that sustains liberal colonialism. The present politics of Indian team names and mascots can bring the politics of settler colonialism to the center of public debate, and this can be done not at the exclusion of questions of race but rather to push this discussion in an even more radical direction. In the least, it is imperative to engage in a politics that works to refuse the invisibility of settler colonialism and Indigenous people, and while this may complicate the argument a bit

more than it is at present the benefit would be to compel the widening of the discourse on this issue beyond the narrow parameters of racial liberalism.

Note

I would like to thank the Babson College Research Fund for providing support in the researching and writing this article. I was also greatly assisted by the comments and suggestions received from the anonymous reviewers for the journal and from discussants and audience members during the presentation of this work at the 2014 *Native American and Indigenous Studies* annual meeting and the 2014 Inaugural workshop of the Tufts Consortium of Studies in Race, Colonialism, and Diaspora.

The Radical Conscience in Native American Studies

by Elizabeth Cook-Lynn

Most of the time when I begin a discussion of Native American Studies, I begin by addressing the past, the educational practices which have failed, the hypocritical goals of assimilationists, the self-serving agendae of those whites who have been in charge of educating America's first people. This time, however, I would lilke to begin by talking about the present, by examining the modern influences which have been so astonishingly and profoundly forcing those of us who would like to consider ourselves scholars in the discipline in inappropriate and puzzling directions, both in our intellectual lives as well as our social lives.

I began giving some serious consideration to this influence after I saw the film *Dances with Wolves*, that movie which genuinely touched me, that movie which so effectively used with subtitles the language of my real life, that film which, without any hesitation whatsoever, I would take my grandsons, who are four and nine years old, to see. It is a movie about Indians which, in the year before the Columbus quincentennial, has made all of America remember that this country once belonged to the Indians and, perhaps, still does.

After the glow of that film showing, however, as is the case in every seduction, I clearly saw the movie as part of the problem, not as a part of the solution. For that reason, I've begun to believe that it is important for us to try to disengage ourselves from the distortions so evident in our conntemporary and professional lives, and to do that we might proceed on the bases that, first, pop culture, as an instrument of social change and intellectual pursuit, is no less dangerous today than it was in 1860 when the soap opera novel *Ramona* became enormously popular and overshadowed the essential work that Helen Hunt Jackson was doing in publishing *A Century of Dishonor*; and second, that Indian Studies as an academic discipline can survive its subordination to the popular imagination of America only by carefully examining its true mission in the context of the radicalization of academic thought of the 1960s and early 70s.

First of all, we must start by admitting that popular culture as a vehicle for social change has worked *for* us as well as *against* us. Those of us who in the sixties insisted that whatever the intellectual tradition, it had to be validated by our own interests, i.e., our tribal values and histories, are the same people who started out as students and graduate fellows to eventually become the directors of programs, the professors, scholars, writers, researchers. We were the challengers then and we continue to share that legacy today. Some say we have won the first phase, in that Native American Studies centers exist at institutions of higher learning all over the country and abroad. Our demands for relevance in humanistic study which merged with the so-called popular cultures of the sixties brought about the progressive stance of universities across the country which included *us*, a precious few of us, to be sure, as well as our courses on Indian America, the very courses which have become the core curriculum of the discipline.

The radicalization of the academic consciousness that we all shed blood for back in the sixties brought about Indian Studies as we know it. It achieved visibility by mounting a significant assault upon the narrow-minded notion that there are fixed authorial and western values that distinguish good from bad. We moved away from the idea that we could validate homogeneity of thought by sifting little "homilies" from every historical event, every piece of literature, from all the texts, most of which have been written by the male European thinkers of the past.

Twenty years later, and at its most imperious, the popular imagination which brings us the movies and

fiction and poetry of the nineties seems to suggest that we are still back there, back in the pre-sixties never-never land, where the white man's imagination about Indians was valid. It suggests that we are still at the mercy of those non-Indians who would imagine for us what our histories mean. You know, back when any improbable idea about Indians was legitimate.

The Kevin Costner movie which has invaded the consciousness of all of us, Indian and white alike, seems to suggest that after the Civil War in the mid-1860s there was some bridgeable gap between Indians and whites, if only on an isolated and individual level. It examines a wonderfully poignant notion about justice toward Indians and an appreciation of their cultures as though it really had some significance at that time and in that place. Indians, of course, and Sioux in particular, know that these sentiments are neither clear-eyed nor realistic and probably so rare as to be mythical.

The reason the movie is important and the reason that the discussion of the popular imagination of America is part of our intellectual inquiry in Indian Studies is not because it says something real about history but because it says something significant about the popular culture concerning Indians in this country. It is important because it tells us that America still cannot abide any real disruptive implications about the history that it shares with Indians, that America, in its popular imagination, still wants the simple solutions to the massive racial issues brought about by its own imperialistic origins. *Dances with Wolves*, is, more than any movie in recent times, a machine for dispensing the congenial implication that the American colonialist is capable of expressions of benevolent humanism.

Well, you ask, what's wrong with that? It, surely, cannot be all bad, to believe that your fellow man is capable of compassion.

What's wrong about it, even dangerous, is that it co-opts the historical fact that the U.S. military machine in the mid-1860s turned its guns on the American Indian in terrible, obscene wars of annihilation, bathing the northern plains in Lakota/Dakota blood, triggering federal policies of extermination which are still in place today, at least they are on the Indian homelands that I know. In light of the recent war, this recognition of the past seems more than ever to be important.

It is absurd to try to have some confidence in this movie's brand of nineties-style boy scout benevolence toward Indians when, in fact, the genocidal policies, the making and breaking of treaties with the Indians, the thefts of land, the political assassinations of Native leadership, the utter contempt shown by scholars, historians, and politicians toward Indian lives have been the dynamic thrust of nearly all intellectual and political pursuits in this country of the last hundred years. This movie asks us to believe that all of the crimes and vices of the American/European colonialist's character are somehow outweighed by Kevin Costner's boyhood wish to "be an Indian."

In this instance, the popular imagination as an instrument for social change will work against us not only because it trivializes our common histories but because there is not one item on any Indian political or cultural or intellectual agenda which can be addressed through the misleading notion perpetuated by this movie that some kind of social cohesion is possible between the murderer and murdered, the thief and the victim, the rapist and the raped. The position that the oppressed and the oppressors are all Americans together is indefensible, especially when the resultant effects of the oppressors, i.e., the paternalism and poverty of modern American Indian life, is rarely addressed and never transcended.

A good example of that is the Black Hills Land Case which the Lakota/Dakota people have had in the courts since the 1920s, a case which the white politicians in South Dakota are loathe to take forward for a political solution even though the Supreme Court in 1980 affirmed that the theft by the federal government was "rank." The modern Sioux are asking for land reform so that they may hold land "in common" as they once did, and so that their economic needs may be addressed in some platform other than beggary. The feds have simply offered a "pay-off" which will keep the Sioux in poverty for the next century as they have been for the last century. A land-base reform measure is essential to alleviating the appalling economic conditions of this Indian nation, yet not one important politician in the state of South Dakota will address the issue on tribal terms.

If the popular culture has failed to achieve a genuine alternative view of the Indian world which may have been expected of it by some of us who are "throw-backs" to the sixties, it is because it is in the charge of the so-called bottom-line, and these days that means it has given in to the economic interests of the world. Movies must make money. Novels will be accepted by filmmakers or for television miniseries development because they offer the easy solutions that American audiences want and sponsors promote, not because they have a lively and realistic grasp of Indian-white relations.

The distortions, then, must be taken up as the intellectual work of those of us who claim a vested interest in developing Native American Studies as an

academic discipline. The integrity of what we do comes from the sober understanding of, and the regulating, and defending of the parameters of that discipline, parameters which may be either tribally specific or global or panindian.

The first is the cultural parameter which asserts a claim upon the spiritual and philosophical notions embedded in language and literature and religion and mythology; and second, its counterpart, is the historical parameter which examines the legal status of Indian nationhood and Indian citizenship, the mechanism upon which all indigenous legal rights and political condition are dependent. The integrity of our work comes from believing that the definition of Indian Studies, i.e., the "endogenous consideration of American Indian Societies and Nations," first articulated in an essay published in the mid-seventies by sociologist Dr. Russell Thornton, means that American Indian scholars must study their own societies and histories and what they find out in this intellectual pursuit must provide the essential bases for the development of the discipline. If we expect a restoration of integrity to our historical and present lives, we as Indian people and native scholars have a particular obligation to promote the theory that our societies have a sense of values which we, as functioning members of those societies, mean to examine in a modern intellectual framework, not in the popular imagination of those who "want to be Indian," i.e., the Costners. There is nothing radical about this, but we may expect to be called radical, especially by outsiders who suggest that the only important contributions to knowledge have been made by European technological societies. We may expect to be labelled radical by our own constituencies as well because all of this suggests drastic change. The institutions which have been responsible for our survival in the modern world, including the new tribal governments instituted in our own time, did not exist immemorially, neither have the educational ones and, so, we are charting new ground.

The functions of the parameters of the discipline have been several. First, they set about defining an alternative regime of intellectual thought, distinguishing Indian Studies from Anthropology and History and the social sciences and related disciplines, not only through content but through methodology. Scholars have begun to regulate the development of the discipline within various institutional settings by bringing about a number of models, some of which are more appropriate than others. Some models are tribally described, presuming to serve particular societies, nations, cultures within the state's borders, or within the university's regional perspective. These are, in my view, the most important models since they seem to be the most impervious to outside interests such as the popular American culture we have just spoken of but, more importantly, because their faculties are generally made up of the tribal intelligentsia, native language speakers, reservation-based scholars, native poets and singers and dancers and writers. Their curricula are generally geared to the economic, political, and cultural realities of the people. Other models are global in their approach to curriculum development. Even other models seem to be geared toward urbanization as an essential and inevitable movement in indigenous life. Some models seem to exist without any input from the native communities at all and they see themselves as mostly informing the non-native student and population about Indians. They center their interests on cultural diversity courses and the discussion of "minority" groups in the United States, discrimination, and racism in America. These models oftentimes seem unconnected, scattered; they are inherently suspect because they are seen as unable or unwilling to enter into the business of political transformation so necessary to Indian Education.

The defensive function of the parameters is most effective in the tribally described models since the discipline is obliged to serve the tribal nation rather than the state or the United States, or the non-Indian populations. They often have their own Indian Board of Trustees, and it is, therefore, the disciplinary model most likely to resist the assimilationist view so prevalent in the educational services available to Indians. These models stress the matters of treaty-making, sovereignty as a concept, the nation-to-nation legal status of tribes, an historical view which is oftentimes ignored in other educational institutions. A reactionary or a merely symptomatic stance in the development of curricula is, of course, a danger in these models but that is generally offset by the transformative function of the discipline, i.e., the research and writing that must accompany the development of any body of thought.

Some of these models in various university settings have thrived, others withered. The survival of many, the birth of others, and the changes rendered in all of them by the educational conservatism and the discriminate budget slashing of the Reagan and Bush years, not to mention the white backlash to Affirmative Action policies, suggest that the next twenty years of development in Native American Studies will face powerful challenges.

The most important question facing Indian Studies professors in the coming decades is, *on what terms are are we willing to go on with the work in the*

American university systems that have emerged from the sixties' radicalization of academia?

Are we content with filmmaker Costner's proposition that a collective benevolent humanism of the nineties erases history? I, for one, am not. I would like to see myself riding (philosophically, at least) from Ft. Yates, North Dakota, to Wounded Knee with the Minneconjou and Oglalla during the Big Foot Commemoration. I want to be part of that historic recreation which took place in December 1990, about which the mainstream media and academia were virtually silent! I want to continue to ask, "What is my responsibility to my ancestors and to my grandchildren, and to what extent can that responsibility relate to the educational goals of America?"

I also want to know whether or not we will be intimidated by the white scholars (as well as some scholars of color--Steele, D'Asuza, Rodriguez) who say that Affirmative Action is a policy which does away with standards of merit and forces upon U.S. institutions our inferiority. If we are intimidated, our young scholars will find themselves doing the slave work of the universities, not the intellectual work of their tribes. They will think that hiring policies, salaries, tenure and promotion problems are the issues of the day. They will ask, *How can I advance my career?,* not *Is what I am doing important to the tribes?* There is reason enough to believe that they are, even now, congregating as faculties at these universities for selfish reasons.

Will we address the "token" status which is so much a part of our existence? I am talking about the isolation in which we do our work. I am talking about the extraordinary numbers of hours which our faculty members are obliged to put in serving on every committee on campus simply because we meet the federal requirements for "minority" consultation. We are asked to give lectures in other courses at a rate far higher than the average faculty person, but, of course, we say cynically, "It will look good on my vita." I wonder if we will continue to be all things to all people, the door mats at institutional entrances.

Are we to be distracted by the charge that we in Native American Studies, along with our Black and Chicano brethren, are "ghetto-izing" the concepts of "liberal education" and the free exchange of ideas and knowledge itself? Are we to take seriously the charge that because we are not talking about academic issues but about politics we cannot separate truth from falsehood? I would be much more comfortable in a sober discussion on this argument, and, indeed, I may have even at one time in my career embraced it if it weren't for the fact that I have for too long seen that universities are the "cemeteries of ideas," to use a Chicano colleague's phrase. We cannot allow universities to continue to be the burial places of creative thought. There is simply too much at stake. Therefore, I urge all of us to dismiss the "ghetto-izing" charge as a specious one meant only to keep us from our work.

More important to all Indian people, I think, is the question of whether or not we wish to defend the sovereign right of Indian nations to be in charge of conferring citizenship upon our own people. Indian nations still retain that right, you know. And, we as individuals can possess only what our tribes possess, both in terms of status as well as knowledge. Lately, we seem to be content to let the self-identification method for both faculty and students prevail. It has now become the subject of controversy, secrecy, and fraud (i.e., The Foster Carter *The Education of Little Tree* Controversy). Why should the university systems of this country and Indian Studies units and publishing houses define who an Indian is? This is absurd. Why not devise Indian Studies as a mechanism which defends the Indian nation's right to do what it has always done. Such a mechanism would defend the notion, too, which is implicit in the definition of our discipline, that Indians themselves must be in charge of this intellectual developmennt which is by its very nature tribally-specific. In the long run such a mechanism would defend us from nefarious and dangerous pretenders who have become numerous as flies in this modern valueless world, writing books and conducting workshops on everything from moon ceremonies for the middle-aged woman to religious-freak pipe ceremonies to how to save the earth, Indian-style.

Though none of the answers to these questions appear to be finalized, it is essential to our future that we pose them. That the next step in the development of Native American Studies appears to politically dangerous is evident. That the white academic communities would like to continue the paternalistic and colonialistic ways of the past is also evident. It is up to this generation of scholars to remember that for most of our history, the issues of our sovereignty as Indian nations has been linked to education in the most oppressive way. We have been asked over and over again, in the name of education, to violate the parameters of culture and history in order to participate in the university system, never to defend them. And many of us have paid that price. Never, until the radicalization of academia in the sixties which, in my mind at least, can in large part account for the advent of Indian Studies, has that educational link been boldly in defense of sovereignty, in defense of our cultures and histories, in defense of the idea that American Indians, alive and well in the twen-

tieth century, can enrich and vitalize the educational institutions of America by their presence.

It is up to this generation of native scholars to continue to believe that the western values as they apply to American Indians which have dominated the intellectual mileau of America, offer us only the narrowest view of humanity, that our exlusion, our domination, our destruction has been the price that we have had to pay for our admission to the universities of this country. As some of the early native scholars reduce their teaching loads as I have done, or go on to writing and research careers, or retire, it is up to the new generation of American Indian academics to develop new and continuing radical alternatives.

No one says it will be easy. It isn't just a question of victimization, racism, exlusion, poverty, or powerlessness. Nor is it a question of real Indian existence or Indian Studies being co-opted by the influence of Costner's *Dances with Wolves*, the most recent example of the pop-culture, as we approach the 1492 "discovery." It is a question of embracing the idea that all knowledge is historically and socially conditioned, that it is neither inferior nor superior in that conditioning, nor is it certain or false. It exists and it survives and in doing so it has no claim to special reverence, only a claim to its own integrity. That our knowledge is encompassing those worldviews of indigenous peoples, having survived the colonization period, can no longer be denied us is an ethical idea worthy of representation in the academic institutions of America.

If it is true as Professor Vine Deloria, that consummate Sioux Indian scholar has said in his latest essay, "The most important question that an Indian student can ask him/her self is, *is what I am learning useful to Indians?*, (and I believe it to be), it is even more true that Idian intellectuals must ask, *"is what I am teaching and writing and researching of value to the continuation of the Indian Nations of America?"*

Elizabeth Cook-Lynn is Professor Emeritus at Eastern Washington University and Visiting Professor at the University of California, Davis. This paper began as a university lecture at U.C. Davis.

Elan

(a poem for the young men who are the Big Foot Memorial Riders of 1990)

by Elizabeth Cook-Lynn

Sometimes after the glare of sunrise
but before the moon shines
they ride the frozen wind,
danse du ventre in killing snow;
he holds the broken heart of a grieving god
in elegaic memory, bears in his gloved had the sacred eaglestaff.
Courage! *Il ne passeront pas!*

Between the monasticism of
priesthood and the flaring love
of a warrior's ways he
holds his whitened breath and
becomes heroic
to the nation he honors.

Looking for a place to cross the creek
I hear a beaver splash and see him
hurry away in spirals of transparency
model busybody on his own
private journey to get home in one piece
alive and well. Like most translators
of these waterways, tributaries to the
vast Mni Sosa, he avoided
the great bluffs where I stood
and dropped into low waters
when he heard me intrude.
Predictable, sensible, he
feared the tread of humans,
probably learned he was no match
for the damn builders
whose turbid reservoirs could be heard
upstream for eight hundred miles.

Dusty trails along the tree-lined creek
turn to mud in shaded spots, cow
trails and horse paths lead to the
struggle for meaning of a hardscrabble
life, traditional values of the people
who lived here for thousands of years
displaced as easily as the river chewing
at its banks. Like a Muslim amid
the relics and ruins of any holy city
I weep for Tatekeya's Earth.

—Cook-Lynn, *I Remember the Fallen Trees* (1998)

Notes 217

Preface

In my lifetime the inexorable logic of Indian life in America has undergone deliberate diminishment. In my lifetime hundreds of thousands of acres of treaty-protected indigenous lands have been lost to Sioux Nation title, thousands of Lakotas and Dakotas have been forced away from their homelands because of anti-Indian legislation and poverty and federal Indian policy; and white Americans, by and large, have no more respect for or understanding of native cultures and political status than they did during Jefferson's time, though they continue, as he did, to collect bones and Indian words and delay justice. It is because of these losses that I write.

Today, America's tongue is cloaked in ignorance and racism and imperialism as much as it was during the westward-movement era; and "removal" is still the infuriating thrust of Indian/white relations. The tribal tongue o Nativism, by contrast, struggles to foretell a future filled with uncertainty. I is because of this reality that I write.

The agency town—military fort where I was born, *kudwichacha,* is nestle in the fluvial hills of Mni Sosa. It was famous as one of the guarded places o U.S. overseers of Indian policy, and its inhabitants were mostly ex-military active missionaries, Catholic priests, merchants, public-health doctors an nurses, schoolteachers, white hangers-on, and, of course, Sioux Indians About twenty years before I was born they took down the fifty-foot-hig board fences that protected them from my people, whom they saw as th arrogant, mad Dakota Sioux who gave the country its name.

I am stunned by the natural beauty of that place, horrified by the destruc

eral decades, and we must concern ourselves with the development of internships for our native students in the areas we feel are significant.

We must promote research and writing in appropriate and meaningful ways, which means that we don't need too many more doctoral dissertations on "Who Am I?," "Who Is an Indian?," "What I Learned from My Cherokee Grandmother," and "Mother Earth Is My Friend." We don't need too many more doctoral dissertations on the life of N. Scott Momaday (interesting though that may be), unless the scholarship includes a critique of his outrageous defense of the Bering Strait Theory and the role of science in describing native origins, and what this essential conflict means to indigenousness (a major concept of the discipline) on this continent. This defense of science concerning native origins by Momaday appeared in the *New York Times,* and a rebuttal by Vine Deloria appeared in *Indian Country Today,* which gives us some notion of the places noted scholars publish their works. It is successful Indian novelists who get to publish in the *New York Times,* where they write on subjects they often know very little about.

We need dissertations on the Yankton Land Case that will reveal the anti-Indian legislation that comes out of Congress and is promoted by the state and federal court systems. We need to publish the facts of the Dann Case and the Utah Land Case revealing more of the illegal activity of lawmakers that reduces reservation life to a life of poverty. We need to study the water rights cases of the Missouri River tribes and we need to pnblish our stndies.

Obviously, as a writer who has struggled to make sense of the political world, I believe we need to train our young people to do research and to write and publish. They must learn the fundamentals of research design and writing and publication. This may be the most important set of skills they can bring back to their tribes from university training.

It is our responsibility to continue the struggles toward a decent future for Indian people and the empowerment of Indian nations. In our twentieth century, the antagonists, the enemies of our nations, the thieves who want our land and water and other resources, they are still out there. I believe that the 1990s task force on Indian education, which says that our nations are at risk, is something we all should take very seriously.

Lecture given at the University of South Dakota at Vermillion, Oct. 10, 1998, to an audience of students and faculty and directors of NAS institutes and programs.

16

RECONCILIATION, DISHONEST IN ITS INCEPTION, NOW A FAILED IDEA

Hau. . . . nape che u za pe. . . . This is a brief greeting used now by contemporary Sioux speakers to ingratiate themselves with their audiences, a greeting used to say that I, the speaker, am friendly and on good terms with you, the audience. I am not sure how appropriate that phrase is for me to use today, because when I look at the focus of our coming together at this university today, "Reconciliation" and "Tribal and State Relations," I realize that I have little to say that is friendly. Indeed, I will probably, on the contrary, have many unpleasant things to say.

I know that Mandela and Bishop Tutu talk of reconciliation in South Africa to those who have murdered and oppressed them for most of this century. I know that the Irish now talk of peace, and the Palestinians and Israelis talk of how to forgive one another. In the face of all that recognition, I want to talk seriously to you about why, in my view at least, the so-called Indian/white reconciliation movement in South Dakota, apparently initiated by newspaperman Tim Giago, a member of the Oglala Sioux Tribe, and George Mickelson, a former governor of the state, is a dumb idea and should end up on the scrap heap of dumb ideas. Reconciliation, so far as I undertand the word, means "to cease hostility or opposition," or "to accept or be resigned to something not desired." It could mean "to compensate someone." That latter definition has been used as a tactic in the Black Hills Case, and it is nnacceptable to those Indians from whom the state of South Dakota and the U.S. federal government stole the Black Hills. Since 1980, in a century-long litigation brought by the tribes, that "acceptance" or "resignation" or

"opposition" or "compensation" has been unacceptable. It is important to recognize the unacceptability of these tried and failed solutions.

Before we can talk of "ceasing of hostility" we need land reform in the state of South Dakota, and that means that stolen lands must be returned to their rightful owners. This is not a church matter, after all, in which we can give in to the buying and selling of indulgences and various forms of penances. This, instead, concerns the very survival on this earth of a nation of people, the Sioux, who occupied the land for millennia before the white man's invasion. We need to have a state government that is based in ethics and history rather than greed, racism, and tourism, and a federal government that will stand up to pressure.

My talk today will attempt to convince you that the reconciliation movement of the 1990s is ill-advised and doomed to fail, and is in fact, at this moment, if not defunct, certainly moribund. I will tell you why.

I want to start by telling you a brief little story. It was, I think, in the summer of 1980 that I went to a tribal water meeting with my father, who was then very old and very ill and was no longer an elected official of the tribe as he had been. He was using a cane and could no longer drive his car and had to rest frequently. Another old man, a white man whose name was Bill Veeder, was there. He was an old water-rights lawyer from Washington, D.C., who had worked with the tribes for many years, and that's why we were there, so my father, a longtime rancher and politician from the Crow Creek Sioux Reservation, could visit with the old lawyer, whose business was the defense of tribal water rights along the Missouri River and its tributaries.

I remember the speech very well that Mr. Veeder gave that day. The old Washington, D.C., water-rights lawyer talked about land and water monopolists and states' rightists and racists. He talked about the courts and the Winters Doctrine, which most of you know was first enunciated in the upper Missouri River basin back in 1907, a very important piece of legislation that defended tribal rights to the use of the Missouri River and its tributaries. Implicit in the Winters Doctrine, the old lawyer said, is the fact that Native American tribes are sovereign nations. Explicit in the doctrine and many others, not the least of which are the treaties, is that our forefathers guaranteed to the tribes that their reserved rights are exempt from state control and jurisdiction. Our forefathers. That means white forefathers as well as Indian forefathers. All of the white people who live in South Dakota should understand that it was an agreement their forefathers made with Indians and Indians made with them.

As you know, the Secretary of the Interior and the Corps of Engineers totally ignored the Winters Doctrine rights of the Sioux tribes in the Pick-Sloan

Plan, which brought about the development of hydro power dams in the Missouri—Garrison, Fort Randall, Oahe, and the others. Up the river for hundreds of miles, lands were seized and inundated and the tribes were paid a pittance payoff and deprived of any participation in the economic development for years and years. Had we participated appropriately in that development we would today have a sound economic base on Indian reservations up and down the Missouri River. We did not. So we have Bingo palaces and casinos. And poverty. And substandard houses in which we raise our children and take care of our grandparents.

This kind of history is repeated throughout the West. Salt River rights of White Mountain Apache in Arizona. Ahtanum Creek rights of the Yakima Nation in Washington state. The Colvilles. The Spokanes. We could name tribe after tribe.

When the old water-rights lawyer Bill Veeder talked of these matters seventeen years ago, he said this: "The Missouri River is now *totally controlled and channelized* and Indians find themselves in irreconcilable conflict with politically powerful water users who are claiming rights under state law."

While some may argue that much of this dilemma has been attended to through recent legislation and state government action, "state/tribal compacts," various "agreements" reached, coalitions established, quite the opposite is true. Even the much-touted Mni Sosa Water Coalition is a strategy to *quantify* tribal water rights, not defend them.

At present, there is what is being called a "land transfer" bill in Congress promoted by thrice-elected (soon elected a fourth time) Bill Janklow and Senator Tom Daschle that is called "South Dakota Land Transfer and Wildlife Habitat Mitigation Act of 1997," which is designed to diminish tribal sovereign status in the state, to claim land for the state that is treaty-protected land, to broaden a tax base for the state, and to claim jurisdiction concerning hunting and fishing. Look at that bill carefully and you will see that it is another land grab by the state, that it will benefit no tribe along the Missouri River economically on a long-range basis. Yet it is touted as a measure to "put to rest" all jurisdictional questions over hunting and fishing.

The tribes do not need this legislation to reserve and protect native hunting and fishing rights along the Missouri River. These rights are, according to water-rights lawyer Bill Veeder, implicit in treaty and history. Tribal nations have the right to use, to administer, to control and exercise the property rights independent from state control and interference. And they should be developing the strategies to assert those rights. Moreover, the federal government in its fiduciary role must assert its defense of tribes through pro-

viding funding and assistance for tribal development along these waterways independent of the greedy and self-serving state and county governments.

The kind of legislation that prevails, unfortunately, brought to bear by pressure from state officials, the Secretary of the Interior, and officials of the federal government, should be recognized for what it is, a failure of the "fiduciary" responsibility of the federal government, and an effort to drastically limit the claims of Indians. In the kinds of "reconciliation" legislation offered here, something called "settlements" are undertaken. These "settlements" attempt to convince the tribes that their rights are being preserved and protected. But in actuality, their rights are being sacrified over and over again in the furtherance of the needs of greedy water monopolists and states' rightists. Non-reservation-based farmers. Hog producers. Cattlemen. We should know that. And we do know that. The deception practiced by the Secretary of the Interior to seize the invaluable reserved rights to the use of water from the tribes was known when the great Sioux Nation lost its rights in the Pick-Sloan Plan. This is a superb example of the kind of manipulation that is ubiquitous in native/state relations. No one should feel that the future is secured by the now-agreed-upon Mni Sosa Water Coalition, because it denies the sovereign rights of native water holders and does nothing to ensure an economically sound future.

In a *Rapid City Journal* article last December, the offices of Janklow and Daschle put out some information to the public concerning a "settlement" idea about land "transfer" and "wildlife habitat mitigation" and it sounded good to the uninformed public. The headline read "Legislation Ends Missouri Dispute," and it referred to their self-centered, state-inspired legislation on "mitigation," a new word, perhaps, for the now-trite "reconciliation." The article quoted the officials as saying that the dispute would be ended because "the Federal Government is no longer the *middleman* [my emphasis] in deciding who owns land and who has jurisdiction."

What kind of history is this? What kind of law is this? Everyone knows that the federal government has *never* been a middleman between tribes and state governments. It has been a "trustee" of Indian lands and it holds a "fiduciary" responsibility to its treaty co-signatories, the United Sioux Tribes. What this kind of talk and this kind of legislation mean is that at the end of the day, the federal government, the fiduciary in the cases the Sioux Nation faces with the state, forgoes its legal responsibility and enriches itself and the state while draining the assets of the tribes to which it owes treaty obligations. It's like an estate lawyer selling off his client's assets to enrich himself. For such

actions in the real world, lawyers go to jail!! Only in Indian cases is the fiduciary rewarded for such illegal behavior.

I find the public silence toward this strategy of white politicians in their dealings with Indians very interesting. Where is the free press? Where are the scholars? Where are the educators? Where is the native leadership? In the highly organized "misconduct" and "malfeasance" which have characterized the behavior of one government toward another, there is a consistent theft of not only the corporate assets of the tribe like land and water, but also the very sovereign status embedded in our concomitant histories. And there is no outcry from the public, by and large. The reason is that *the general public benefits from every one of these thefts* from Indians and always has. Indians don't need leveraged buyouts or insider trading or greenmail. Indians just need congressional legislation or executive order or an inert tribal governing body, along with a state attorney general at the local level who believes it is his *duty* to constantly harass and confront the tribes in court, appeal every decision, argue and thwart every move the tribes make. What I want to point out here is this: the success of these outlaw maneuvers is dependent upon the public silence that accompanies them.

Many times, the kinds of issues talked about here between governments and government officials are called "conflicts." I'm reminded of the Minnesota history that calls the theft of Santee country in 1862 the *Dakota Conflict.* That is what it is called in the history books that are written. The truth is, the Minnesota event of 1862 was not an "uprising," or "conflict"; rather, these histories can be described as acts of war, and Santee chieftain Little Crow was unambiguous about declaring war, leading his people in opposition to the U.S. military. This war ended with the hanging of members of the Dakota forces by the United States of America, the largest mass execution in U.S. history of the only people to be hanged by a colonial government for defending themselves. Certainly there was no mass hanging of Confederate military men during or after the Civil War during that same era. These modern acts of war against the Indians are generally perpetuated by the elected and appointed officials of one of the most powerful countries in the world against some of the poorest, colonized, and oppressed people in America not because the victims are poor, not because they are freemen or slaves, but because they are Indians, non-Christian indigenous peoples claiming to be landowners.

If you want another example of "reconciliation" efforts, look at the recently litigated case *Yankton Sioux Tribe v. South Dakota,* in which the state of South Dakota and the courts have "diminished the Yankton Sioux treaty-protect-

ed tribal lands by 168 thousand acres," and, in fact, the state of South Dakota in that case argued for the total elimination of the Yankton Sioux Reservation. This is astonishing behavior on the part of the courts of this democratic country now, at the turn of the century, a time when we are supposed to have learned something from history, a time of supposed enlightenment concerning race relations. It's not only wrong. It's genocide.

Your elected officials are responsible for this. Jim Abourezk, the former state senator who now has a law firm of his own that does "business" with the tribes, and who took this case to the courts in spite of hesitation on the part of some local tribal leaders, has tried to put the best face on this enormous loss by saying that tribal leaders have said "they can live with divided jurisdiction." If that is the case, tribal leaders are as complicit as anyone. But whether or not that statement is accurate, that is hardly the point. What is made clear here is that any "reconciliation" effort to litigate fairness has always meant to Indians that they be resigned to their fate—continued land loss and rights and underdeveloped economic systems. The point is, Indians and the future of Indian nationhood have once again been sacrificed.

This recent Yankton court case, we are told, is based upon past federal legislative action. Thus, a racist history begets a modern racist legal interpretation. Explicitly, according to the legal argument, the court decision to give the state 168,000 acres of Yankton Sioux land is based on an 1894 Act of Congress that "opened unalloted lands to white settlement," in which, it is said, the Yanktons voluntarily "ceded" these lands. This argument is wrong morally, ethically, and probably legally. If you understand history, you understand that this Act of Congress was undertaken just four years after hundreds of Lakotas were murdered at Wounded Knee by the U.S. Army. The so-called cession of Yankton lands occured just four years after that massacre by U.S. government troops, which were, by that time, stationed on all Sioux homelands. Four years. Hardly enough time for the grass to grow over the grave. And the U.S. military was stationed within the borders of the reservation, a fearsome occupation army. Does anyone believe Indians were voluntarily "ceding" lands during that period of time?

This 1894 Act of Congress, which is cited in 1997 as evidence for further land theft, rose out of a policy of extermination and genocide. A policy that was put in place because the Sioux could not be defeated on the battlefields of the Northern Plains. They could not be coerced, in a hundred other ways that were tried, into giving up their lives. The Sioux efforts to survive thirty years of warfare in defense of their place on the Northern Plains was dealt with by these illegal actions of Congress and the courts and other bureaucracies in which the Sioux had no status. This Act of Congress in 1894 was inspired by the officials who made up the government of South Dakota, which was then in its infancy. Its powerful land monopolists were everywhere. Today, these same powerful interests in South Dakota, sitting in high places and throughout the country, prevail upon their racist past to continue land theft. They do it through government and the courts. Make no mistake, this 1997 court decision to "remove" Indian lands from Indian title and "transfer" them to the state is a crime not only against the Yanktons but against all peoples who are powerless and colonized.

The state has not been, as anyone can tell you, an innocent bystander in the continued theft of lands and rights, and for us to suggest that a people's movement in this state toward "reconciliation" can have any meaning while these acts of war continue is foolish. The Santees, the Oglalas, Hunkpapas, Ihanktowan, Sicangu, Minneconjou, and Sihasapa, all of us have suffered from this kind of paper warfare that not only legalizes land theft but legalizes the death of the tribes. To have your courts legally declare the tribes nonexistent, in case you care to give a name to it, is called genocide. Isn't genocide a crime? In Bosnia? Iraq? But not in the United States? No wonder our Sioux leaders have gone to the international courts in the last few years to try to get a hearing on what is happening to us. In the international arena there may be more of a chance for an appropriate discussion of the consequences with those who perpetuate genocide as national policy.

The governor of our state considers the Yankton Reservation case resolved. He is "optimistic" about building relations with the Yankton Sioux and he now wants to talk about "tracking down" Indian parents who do not support their children. If this kind of inequality and hypocrisy is allowed to continue in our state and on our reservations, untold crimes will follow and we will be horrified by them. Child abandonment will be the least of them.

There is a term that needs to be used here. The term is Anti-Indianism. In the same way that Anti-Semitism was in the beginning the offspring of religious persecution, Anti-Indianism here in our region has been the child of legal and church institutions that govern our lives. What history has shown us is that even when the Jews gave up their religion and their identities, they were still unacceptable to German society, and Hitler began to move toward their complete extermination. Likewise, even as Sioux Indians became Christians, there has been no avenue of escape from political oppression and massacre and discrimination, and, finally, the theft of the homelands. If there is to be a peace process here, we must begin with the return of land for two important reasons: first, there is no more important value to colonized peo-

ple than the land; and second, it is in the land that the native finds his morality and religion, his life and his survival.

What Indians here in our region have understood is that we have had very little power to affect the body politic in the state of South Dakota and this has always been true. When we have no way to affect the body politic in our state, we have tried to believe that we could depend on the federal government, with which we have signed solemn treaties. Unfortunately, the federal government, our "trustee" that holds our lands in limbo, has proven to be as corrupt and unreliable as any other self-serving institution in its dealings with us. When you cannot affect the body politic and when your "trustee" is corrupt, you turn to the courts. It has taken a long time to learn the lesson that we cannot depend on the courts either to go all the way with us. Halfway justice is no justice at all.

In the last decades, the courts have turned out to be the last places Indians should turn to for justice. Indeed, a 1994 case called *Hagen v. Utah* has been a central case in what is now called the "diminishment" movement, a movement led by key states in the West, among them Utah, Washington, New Mexico, and South Dakota. I call this twentieth-century movement a movement of legalized genocide, which is traced to a denied history. The decision in *Hagen v. Utah* holds that Utah state courts have jurisdiction over Indians as to crime on land within original reservation boundaries. This is based on a ruling that Congress in past acts had the intent to diminish the reservation. A ruling which, if upheld, is evidence of a genocidal federal policy. Obviously, this is an effort on the part of states to place land outside of Indian Country as defined in 1902, and it clearly indicates the ambiguity concerning Indian tribal survival. On the one hand, the courts say they try to be fair. On the other, they express the historical view that America must be rid of tribal nations once and for all.

You might be interested to hear Blackmun's and Souter's dissenting views from the Supreme Court on the Utah case. They wrote:

> ... the state of Utah lacked jurisdiction because lands where the offense occured were Indian Country, since (1) there was no clear expression in either the face, surrounding circumstances, or legislative history of the 1902 statute that Congress INTENDED to diminish the reservation and (2) even if the 1902 statute's public domain language constituted express language of diminishment, such language did not remain operative in the 1905 statute, which actually opened reservation lands for settlement, but did not restore unalloted lands to the public domain.

Blackmun and Souter did not agree that jurisdictional issues in Indian Country could be decided on such flimsy evidence of historical intent. Dissenting views do not always carry the day, but they are often concerned with the larger issues and are often used in defense of further legal, political, and legislative dialogue. In the view of many, we have not heard the last of this discussion. The unfortunate fact about this kind of behavior on the part of the courts and certain ideologues who sit in high places is that sooner or later these decisions will have to be reexamined, and very likely overturned or rewritten in the name of justice and fairness. In the meantime, tribes have spent hundreds of thousands of dollars in defense of themselves, money that could have been used to develop tribal economies. In the meantime, tribes remain in poverty and dependent on the church or the Bureau of Indian Affairs or the tribal government, or gaming, for reservation jobs. And in the meantime people wonder why racial relations suffer in the very contested places where it is vital that the people learn to live together in harmony.

Under these circumstances, I do not talk to anyone about "reconciliation." I feel it is inappropriate and hypocritical to talk of reconciliation in the face of this kind of massive assault on tribal lands and rights. This current "diminishment" movement is a powerful one, and it is backed by states' rightists and several current governors, senators, and the courts, and if anyone cares about fairness between the races, he or she had better be informed about who these antagonists are and what their motives and strategies are. White folks in this state don't need to learn our tribal language, white people don't need to invade our sun dances and other religious rites of the people. European-inspired sculptors and politicians don't need to blow up mountains in the Sacred Black Hills and call it Crazy Horse Mountain, when his people live desperate lives not a hundred miles away. No one even needs to talk about Wounded Knee to come to some kind of rational thinking on these matters. What is needed is a critical examination of the institutions that surround all of us, Indians and whites, with racist strategies.

What is needed is political opposition to what is now the status quo in the legislative and political arena here, discourse concerning the Black Hills land-reform issue and a way to keep the governor off the Missouri River—real things that affect the real lives of real people.

Let us be honest and admit there are many antagonists to tribal sovereignty and the defense of tribal rights, land, and resources, not the least of which is the powerful state government and its agencies, which are the center of the current move to diminish Indian rights. This should come as no surprise to

anyone, since state governments everywhere in the American states have always had contentious relationships with tribes. The history of the state of Georgia and the Cherokees a hundred years ago taught us about the risk to tribal nations in the aggressive rise of state power. The state of South Dakota has been constant in its desire to dispossess the Sioux. There is no ambiguity about where the state stands on matters of land and jurisdiction. Before we can talk about reconciliation, South Dakotans have to understand this history of dispossession and its connection to present life. White South Dakotans who have benefited from this dispossession and continue to benefit have to be willing to return stolen lands to tribal title and jurisdiction. They must honor and respect old agreements before new ones can be made.

Drastic measures are sometimes needed. Right now we hear that in New Mexico, the Pueblo Indians, who are just outside of Albuquerque and who have been in constant litigation over jurisdiction with the state, are talking of blockading main highways and freeways, I-25 for example, the main artery that crosses Pueblo lands. There is serious talk in some sections of Indian society in New Mexico of blockade and it is reported in the newspapers of the state; this shows how desperate Indians can get. In fact, this talk by the Pueblos is in response to the reality that the Pueblo casinos pay hundreds of thousands of dollars in taxes to the state of New Mexico. Some of these groups, among the poorest people on the face of the earth, pay as much as a quarter of a million dollars to the state every year and never see anything in return except racism and joblessness.

I want to return, as I close this talk, to a quote from that old water-rights man, Bill Veeder, who spoke with my father twenty years ago. He said this: "It is an ongoing practice in America to devastate Indian tribes. You tribal people must expose the deadly consequences of being subjected to state court jurisdiction. There must likewise be exposed the devastating consequence of federal and state officials practicing deceit upon the Native American tribes under the guise of 'settling' conflicts among the tribes and non-Indian claimants."

Not much has changed in twenty years. The old man, that day, was talking to tribal people. He did not say what well-meaning white people should do or could do. Today, "settlements" and "reconciliations" go forward, but there is no dialogue concerning land reform, the return of stolen lands, the sacred Black Hills, the return of the state-run Bear Butte Park, the illegal allotment act, which devastated tribal economies for the last hundred years with the result of "checker-boarded" Indian lands, the wrongs commited by Congress and the courts in diminishing the tribal land base. Indeed, since the old man spoke to my father and the general public that day, hundreds of thousands

of acres of tribal lands all over this country have been removed from tribal title and tribal peoples are further impoverished.

The violation of the tribes' vested and reserved rights for the benefit of greedy developers of this country has to be stopped before tribes and tribal people can talk seriously about reconciliation. At universities like this one, we must not become irrelevant to the struggle for justice and the struggle for decency in Indian lives and on our homelands. We must inspire our children by doing the right thing; by understanding the crimes of the past and paying the price of punishment. We do that through self-examination, by looking critically at the institutions that govern our lives and reforming them.

No one would deny, and certainly not an old college professor like myself, that what we talk about and what we teach to one another about American history is critical to self-understanding. Surely we should include in our teaching the study of the Constitution, 1889 statehood, the Civil War, Thomas Jefferson, brave pioneers, explorers, and scientists. But what we have to say about all of that history is that it dispossessed the indigenous peoples of this country, among them the Sioux in South Dakota, through verifiable criminal behavior that has been legitimized in the courts. What we must say is that this criminal behavior still goes on in our present lives. What we must say about this so-called reconciliation movement is that it has provided a mechanism that has allowed us to excuse past crimes, to cover them up with avoidance and denial, and that there has been an intention to fool ourselves concerning equality and the right and the possibility of Indians to make a good life.

Most of all, we should teach our children that crimes, just like the rivers that have been exploited, stolen, and damaged, do carry footprints. Those footprints are what have kept the Sioux people from sharing in the abundance of their own lands, but they are also the footprints of our ancestors, who fought wars and signed treaties so that we could live.

In conclusion, I say that it is time for all of us to examine those footprints. They are the footprints of history. It remains to be seen whether the United States can reform its behavior toward its indigenous peoples and take its place among nations that live up to their treaty obligations. It remains next to inquire whether or not the state of South Dakota can live with its Indian coresidents or whether it will continue its relentless effort to extinguish us and our rights as tribal people entirely before it will be satisfied. At the close of the twentieth century these matters are crucial. It is time to look closely at the genocidal practices I've talked about here today and stop them.

As you know, it is not easy to do the right thing. I tell this often to my children and my grandchildren. It is not easy to do the right thing. But it is no-

ticeable in all of the conversations that I have with people now how often this phrase, "Do the right thing," appears and reappears. That, in itself, is a hopeful thing.

Presented at the seventh annual history conference of South Dakota State University at Brookings, Feb. 25, 1998. The theme was "State/Tribal Relations."

17

AMERICAN INDIAN STUDIES: AN OVERVIEW

Good Afternoon!

The title of this conference, "Translating American Indian Cultures: Representing, Aesthetics, and Translation" is a bit intimidating, especially to a tribal scholar like myself who has always thought of Indians in America in terms of *nationhood.* Culture, it seems, has been left to Anthropology, and there seems little sense in pursuing that line of scholarship if we are concerned with the struggle to survive as nations-within-a-nation political entities.

Nationalism, I think, is the major focus of Native American Studies as an academic discipline, in contradistinction to Anthropology. So the title of this conference is broad and, yes, intimidating, but of course quite useful to all of us who have gathered here at this moment to discuss the differences in disciplinary approaches to bodies of knowledge.

I'd like to begin by saying that there is a disturbing reality about the academic dialogue these days concerning the intent of NAS, and much of it is centered in the language we have used and the languages we have invented for whatever purposes have emerged. Much of the dialogue suggests that unless you are willing to talk about diversity or multiculturalism or postmodernism or postcolonialism, you are simply out of the loop, to use a George Bush phrase with which we have become familiar. In fact, there is even a native scholar of our acquaintance who is now promoting the use of the term *post-Indian* in his particular dialogues.

Post-Indian? What is this? Could it be an effort to conceptualize the annihilation of Indians or their nations or their histories? Well, maybe not. I can

18

ANTI-INDIANISM AND GENOCIDE: THE DISAVOWED CRIME LURKING AT THE HEART OF AMERICA

Just before my latest non-fiction book, *The Politics of Hallowed Ground,* a book about the politicization of Indian histories and the Massacre at Wounded Knee was going into its second printing, I picked up a local newspaper and read in a column written by the conservative Republican television "talking head" George Will that the "Serbian atrocities in Kosovo [taking place in the last decade of the twentieth century] are *not* genocide, but they are war crimes." In the same newspaper Zbigniew Brezinski, National Security Advisor to President Jimmy Carter, wrote that "the Serbs are engaging in what may be called *mini*-genocide."

This confusion about the violent and oftentimes criminal actions of western governments is nothing new, yet there is something terribly disturbing about this confusion as we move into the new century. Often such crimes have been placed into the historical dialogue to describe what is a "just" war and what is an "unjust" war, but rarely have they been admissions of campaigns to exterminate an entire people. For example, when Theodore Roosevelt said that the American war with the "savage Indians" over this land was the most "just" war in all of history, he made the stealing of native lands and the murder of its possessors a most admired history, and he deliberately confused the killings done by the United States of America with what we may call justifiable homicide. It was a brilliant tactic of historical manipulation by a powerful man in the most powerful of nations, and it was a mark of his influence that continues today.

Teddy Roosevelt and countless other leaders of colonizing nations have no

doubt believed and acted upon what Pericles in ancient Athens was supposed to have said: "Before I praise the dead, I should like to point to the institutions and by what *principles* of action we rose to power and under what *institutions* and through what *manner* of life our empire became great" (Thucydides, *History of the Peloponnesian War*). Pericles went on to enumerate the virtues of Greek civilization, i.e., "We are called a democracy," "The law secures equal justice to all alike," "Our style of life is refined," "The fruits of the whole earth flow in upon us," "We contend for a higher prize," and so on and so on. Under this kind of persuasion, it is easy to think colonization is a virtuous thing, and even easier to enlist the national population to destroy whatever stands in its way. The war of the Athenians with Sparta lasted twenty-seven years; they made slaves of women and children and killed all male children of military age of many surrounding nations. They put Socrates to death for the crime of speaking his mind.

In light of the atrocities of the past perpetuated in the struggle for power by democratic and non-democratic entities alike, the desire of western and non-western-style civilizations to achieve status in the twentieth century seems to predict continuing violence. Though they are thought by some to be rare throughout the world, look at some of the more obvious events: the Pinochet rule in Chile, Serb massacres of Muslims in the 1990s, the bloodbaths of African countries like Rwanda, and the murders by Pol Pot of his own people, as well as the over 100 million people who have died in the "just" and "nnjust" wars of the last decades. We are living, then, in the bloodiest century in human history.

By contrast, the 1890 Wounded Knee Creek killings and violations of civilized human rights in the Northern Plains, the subjects of my latest book, seem a pittance. A mere 300 or 400 Indians. Primitives, after all. Savages in the wilderness. Yet to understand the unrelenting atrocities by the powerful against the weak that continue into present time, we must first expose those who claim to be innocent, and then we must try to understand the nature, the origin, the cause(s) of state-sponsored genocide.

The first thing to acknowledge is that on a cold December afternoon four days after the newcomers to western Dakota Territory finished celebrating the holy rebirth of their savior, Jesus Christ, their armed forces slaughtered over 300 hunted, starving, tyrannized, and unarmed Lakotas traveling through their own country under a white flag, threw them into a mass trench, and covered them up. The first thing to acknowledge is that this was not just an "accident." It did not "just happen." It was not some kind of tragedy of war. This deliberate, premeditated slaughter of a non-Christian people who

could not be defeated on the battlefields of their own territory took place along a frozen tributary called Wounded Knee Creek, in the hills of a prairie ridge covered with pines, and it was a planned, inevitable crime committed by the U.S. military, an occupational force, and its legislature and its courts.

This crime, though still unacknowledged by many U.S. historians, the military, as well as scholarly and popular writers of history, has come to represent the federal policy of Genocide, which characterized relations with the indigenous occupants of the American continent and the West. Since the violent worldwide events of the last several decades, and particularly since the Vietnam era, this event at Wounded Knee has undergone some revision and is now described by some as it never was for a hundred years: a criminal act. It has come to represent the thousands of such killings of indigenous peoples across the land as the unexamined crimes at the core of a great nation developed since 1776 on the provocative principles of capitalistic democracy, principles based on the exploitation of resources and land.

Genocide, the systematic killing of a people, is always denied by powerful, tyrannizing, colonizing nations, and when they have talked of it, they have struggled to declare their innocence through careful defining of the word. To add to the problems of holding criminals responsible, those bent upon invading other nations and colonizing or destroying its people, which is seen as a major cause for the crime, rarely have left compelling evidence or written documentation of their policy and criminal behavior. America and its treatment of the indigenous peoples of this continent is no exception to this historical reality.

Throughout American history, the agonizing discourse concerning Indian/white relations is spoken of as "conflict," or "assimilation," or "postcolonial" in nature, but never as "genocide." As the twentieth century closes, it seems obvious that Genocide, in the matter of Indian/white relations in America, has not been just a matter of physical extermination. It has been broadened to include the concept of Ecocide, the intentional destruction of the physical environment needed to sustain human health and life in a given geographical region.

In the international arena there is dialogue concerning the deliberate destruction by the government of the United States of the buffalo in the Northern Plains and the salmon in the Northwest and the rivers throughout the land as a tactic to force submission of tribal peoples during the treaty era and since, and these acts are now debated as a function of genocide. This destruction, called ecocide (the killing of the earth) and deicide (the killing of god), is well documented. In the present light of nationalistic crimes across the

globe, this destruction has become a persuasive feature in the classical definition of historical genocide.

The repression of American native peoples during the last century is one of the least known genocidal stories of our time. Few pay any attention to the fact that native people in the Americas are among the most economically deprived and the least well educated of any of the peoples of the world, that they live as domestic nations in one of the most repressive governmental systems ever devised in a democracy. Hardly anyone says out loud or writes in the public media that the neglect of Native American health issues is the shame of the modern world. No one understands the brutal impact on a people of the loss of two-thirds of their national/tribal land base in the last eighty years. There is little discussion of the flooding of 550 square miles of treaty-protected lands along the Missouri River for hydro power, one of the most ecologically destructive acts of "progress" in the world, as representative of the actions of an ecocidal policy toward all the rivers on the continent. Few admit that these are the fruits of the national denial of historic genocide in the United States toward indigenons peoples, and that they characterize the codified behavior of the United States toward countries throughout the globe.

In contrast to those omissions in domestic public discourse, the capitalistic democracy called the United States believes itself to be benign toward Native Americans, known as an unfortunate and pathetic race of inferior people; believes it pours money down a bottomless pit called the "Indian reservation" system, and often expresses its contempt for native peoples who have tenaciously survived 500 years of Genocide. They often express these thoughts much in the same manner that the eminent (and retiring) senator from New York, Patrick Moynihan, expressed them in his 1993 book *Pandaemonium and Ethnicity in International Politics* when he said: "Reservations. Our worst mistake or worst dilemma as you wish." Except for reservations, he says, "the U.S. has been spared autonomous regions, bantustans, enclaves."

He should have said that except for reservations, the indigenous peoples of the North American continent have been dispossessed and murdered. Nothing is said in all of Moynihan's work, as far as I know, about the crime of genocide perpetrated by the United States against the natives of this land. And little is said publicly about the virtue that would be implicit if the modern development of Indian reservation lands were to be promoted as *treaty-protected homelands* for the indigenous peoples of democratic America. The native peoples who have survived the ongoing, persistent holocaust of the nineteenth century in America would be pleased to hear of such public discourse, for they know their reserved lands to be areas rich in resources, histories, and wonder, which have nurtured them for generations.

"The systematic killing of a people" was said in the old days to exist legally in three contexts: religious, racial, and ethnic. Whatever the label, the United States has failed to accept its history as a genocidal country in any of these contexts, or in the related spheres of ecocide and deicide. The United States continues to claim its historical innocence and benign intention. In the future, however, with the world as witness to modern nationalistic and human events in Europe and Africa and Asia, colonial America might have to broaden its perspectives on this subject if for no other reason than to refrain from looking foolish.

It is in these recent human behaviors that the United States may more appropriately understand its own tragic role. Whatever context is given, and whatever hopes we as members of modern civilizations may assess, it should be obvious that all forms of genocide are interrelated, pervasive, and criminal in every society known to mankind. Genocide, the world must admit as it views its own history and present condition, is *always* premeditated, forethought, purposeful, designed. Genocide does not, contrary to public notions, *just happen,* the fateful events known only to uncaring gods. Its motives are sometimes obvious, sometimes not, and they often seem fathomable to those who examine them.

Religious genocide is mistakenly thought to be a feature of ancient history, as exemplified by, for example, the Middle Ages, when the Crusades or the Spanish Inquisition or other like atrocities went relentlessly on, even if and when the killing of an entire people ran counter to a specific theology held by the society. In spite of a theology that may have argued against the mass killing of "others," genocide persisted in religious praxis, with religious zeal more than reason or theology supplying the fuel. And it was not just an "ancient" phenomenon, as students of recent history in Africa and Europe and elsewhere around the globe can attest.

Racial and *ethnic* genocide, a feature of the more modern histories exemplified by the German killing of the Jews in Europe in the twentieth-century Nazi Holocaust, is still thought to be a function of ancient history, old irrational hatreds against "others," and kept alive through a religious intolerance in the mainstream, coupled by zeal in the military. There seems to be little historical sense of the present-day so-called ethnocide in the former Yugoslavia, except that it is a function of the historical persistent and pervasive cleavages between the sections that have made up the country for many gen-

erations. Racial and ethnic genocide is premeditated in every instance known to history, whether or not it is admitted to by the perpetrators.

Political or *economic* genocide usually arises out of colonization; thus, it is a feature of pluralistic societies created through the activities of migrating and settling. The plural society brought about by invasion and colonization provides a structural base for genocide as pressures for domination, exploitation, and subjugation arise. America's history finds firm ground in this definition.

All of these types of genocide have several traits in common. First, the societies that are the perpetrators of genocide often *pass laws* designed to bring about or prohibit certain behaviors, and these laws are thought to appropriately give license for the complete destruction of a people in their midst. These laws give veracity to deliberate acts committed with the intent to destroy the language, religion, or culture of a national, racial, or religious group within the larger colony. Often laws are passed to prohibit the use of certain languages in daily intercourse or schools, and they destroy the libraries or repositories or objects or otherwise criminalize their use. In the case of indigenous peoples of the United States, laws against the practice of traditional religions and cultural customs were swiftly enacted and rigourously enforced. The Sun Dance was outlawed on the Northern Plains while at the same time Christian ministers prevented traditional marriage patterns and child-rearing practices by instituting compulsory educational institutions. There can be no doubt, despite the defensive rejoinder concerning intent, that these are genocidal laws put in place by a powerful and brutal colonizer intent upon extermination.

Second, societies that are the perpetrators of genocide *construct "badges"* or distinguishing characteristics to be exhibited by the victims as well as the perpetrators suggesting origin and praxis, and this often is intended to subjugate or dominate a people and deny to them their basic human rights. The Jews in modern Germany wore a yellow star. Others must carry cards that identify them with their out-group. Natives in America had to be given "permissions" of various kinds by their oppressors to hunt or gather domestic or religious materials from the countryside. Today they carry cards to identify themselves as tribal persons in order to sustain their treaty rights, which would otherwise be denied.

Third, societies that are the perpetrators of genocide *concoct theories of conspiracy* meant to assist the general populus in understanding the need to destroy or exploit their victims. These theories are upheld through educational institutions and assemblies of various kinds, and provide the structural bases

for longstanding and blatant aggression. *The stories of the Ghost Dance ceremonial, as the frenzied acts of a crazed Indian population* that preceded the Wounded Knee Massacre *has been concocted by apologist historians as the rationale for the mass killing.* This conspiracy theory is perpetuated even by present-day historians. The idea that Indians of that era by participating in an essentially religious ceremonial were agreeing to perform together an illegal, treacherous act that endangered their white neighbors has become a compelling rationale for genocide. By and large, western and European historians have accepted and promoted this explanation, rarely refuting it as a concoction of excuses. Even today, the governor of the state of South Dakota is quoted in the newspapers as fearing that Indian political action concerning land-reform issues in the state must be seen as an effort by Indians "to get the whole of western South Dakota returned to them." This kind of conspiracy theory has been a mainstay in the political power of white politicians.

Finally, societies that are the perpetrators of genocide often build or *arrange appropriate centers for destruction,* annihilation, or subservience. The most blatant example in modern history for the annihilation of the Jews all over Europe was the construction of incinerators and concentration camps. It has been suggested that in the United States the development of "plantations" in the southern states for the subjugation and exploitation of African Americans for slave labor would be another example of genocidal centers for destruction.

Some suggest that "reservations" for American Indians in the West were and are extermination centers, and it may have been the intent of the predatory democracy called the United States of America to kindle in this way an end either by death and starvation or economic destruction for the native peoples with whom they had fought wars of annihilation for many decades for possession of the land.

However, the leaders of the hundreds of Indian nations who signed treaties with the U.S. government after the war period, in order to "set aside" reserved homelands for the protection of the people, take an entirely different view of reserved land bases, and have probably taken that different view from the very beginning of the treaty-signing process in the seventeenth and eighteenth centuries. The citizens of Indian nations now believe "reservations" to be their homelands, and they defend them legally and economically on a daily basis. They do not deny the political possibility that at least some segments of American power structures at one time in the historical past set aside these lands and meant them as concentration camps and extermination centers for peoples they considered unassimilable. There is much written evidence that people sitting in high places in the governments of the

United States believed that such lands would serve to do away with an unwanted and unassimilable population.

How these "reserved land bases," now called Indian reservations or reserves, are viewed and described by modern America is critical not only to the survival of the native peoples of this continent, but to the promotion of world peace and cooperation. These treaty-protected enclaves, now called domestic "nations-within-a-nation," inhabited by the original peoples of North and South America, internal now to a democratic society called the United States of America, can become, in the future, an example of how a hated minority resulting from generations of war and land theft and exploitation can rise above the domination and subjugation and exploitation ordinarily accompanying European colonization and invasion. In general, today's American Indians from First Nation enclaves view the accompanying assimilation techniques of a colonial power on their homelands in government and school structures to be the continuation of genocidal practices, and they therefore seek and assert domestic sovereignty.

The extermination of an entire people, which can occur at any juncture in the relationship between various segments of a national society, are dependent upon certain elements and specific developments. The elements usually have to do with Law, and the developments usually have to do with Economics. Until World War II there was no competent tribunal, no global general assembly, no criminal court to investigate the issues of genocide throughout the world. Thus, the thousands of massacres of American Indians in North and South America were rarely investigated at all, and even more rarely investigated as criminal acts. No criminal perpetrators sitting in high places were indicted, and little real punishment was ever meted out. Much of that genocidal activity was simply charted as reasonable and inevitable colonial conflict, and it continues to be described in that way in most written histories.

After World War II, however, in 1948, a United Nations convention was held in order to try to understand the nature of the deliberate and systematic killing of a people in terms of the international crime of Genocide, the description of legal parameters of the crime, and the appropriate pnnishment of those who commit the crime. The interesting result of those U.S.-led conventions has been the persistent evasion of the issue of genocide in terms of its own history toward native peoples. The United States is willing to indict Adolf Hitler of Nazi Germany, Idi Amin of Uganda, and Pol Pot of Khmer Rouge fame, but not the hated Zionist leader Menachem Begin, or the U.S. frontier defender Philip N. Sheridan, or the Methodist minister-turned-colonel John Chivington, or the relentless Manifest Destiny president and perpetrator of murderous policies toward Indians Theodore Roosevelt. This unwillingness is inherent in colonial origins.

From the beginning of the settlement of this country by the French, English, and Spanish colonizing nations, the systematic killing of the indigenous peoples of the continent was a fact of life and death. It was relentless and premeditated. Demographers say that by 1650 about 95 percent of the population of Latin America was wiped out, and by the middle of the 1800s there were said to be 200,000 Indians left in continental America. These survivors have now, at the close of the twentieth century, come back from oblivion. They have defended what is left of their meager land bases, and they continue toward the future as dual citizens—of Indian nations and of the United States. It is said that they are one of the fastest-growing "minority" groups in the country.

The deliberate and premeditated genocide of the early years of invasion and theft, however, has moved on from religious fervor and ethnic and racial hatred to economic genocide and ethnocide. These genocidal tactics are ongoing not only through denial practices but also through outright aggressive governmental tactics. The story of the national denial of this reality is evidenced in national parks all over this country, where there exist plaques and gravestones suggesting that Indian families and tribes "gave of themselves and their land so that this great nation might be born and grow." The fur trade is romanticized in history books and in movies as just a capitalistic or economic event, not a genocidal one. Land laws were passed that removed over half of the treaty-protected lands from Indian title. And, outrageously, in the 1950s, termination and relocation laws were promulgated by the U.S. Congress in order to remove Indians from what remained of the homelands and force them to assimilate into the "mainstream" of American culture. Because of these laws, two-thirds of the indigenous population of America now reside in cities, landless and poor, rather than on their own reservation homelands, which remain, for the most part, underdeveloped enclaves of poverty. With appropriate care and legal remedies, these reservations could become communities well organized to meet the needs of their citizens.

Genocide is not now nor has it ever been just a matter of the physical extermination of a people through mass killings, enslavement or torture, or enforced segregation or colonial apartheid. *It is the denial of basic human rights through the development of a nationalistic legal and social and intellectual system that makes it impossible for a domestic people or domestic nation to express itself collectively and historically in terms of continued self-determination.*

In spite of the reasonableness of any critique of history, nations that have developed genocidal practices toward others within their own nation or society, or even outside of their province, protest their innocence by bringing up the matter of "intent." The United States as well as countless other colonizers have used the rejoinder of "intent" to any critical analysis of their history: "We never *intended* to destroy the natives," they claim. Therefore, if there is and was no "intent," there was and is no "genocide." Even as genocidal legislation and land and resource theft is passed by the modern U.S. Congress without the consent of the tribes, the people who benefit from the colonial practices of the past will excuse themselves as it concerns "intent" by saying, "But I haven't done these things. Maybe these things happened in history, but I am not personally responsible for what happened way back then." They generally excuse and rationalize a history so ugly it cannot be acknowledged.

Even today advocates of an innocent U.S. history say to protesting Indians, "You still exist, don't you? You still have land, don't you?" The suggestion is that if there were crimes committed, they were just the unfortunate incidents of economic development of a country. Indeed, when Brazil was charged with genocide against the Indians in the Amazon region in the mid-1960s, representatives of the Brazilian government said to the world human rights organizations that there was no "malice" toward the Indians, and there was no "intent" to destroy them. And therefore there was no genocide. They even claimed ignorance, saying that they didn't know it was against any law to kill Indians. These are arguments accepted by many of the countries that make up the world investigative bodies.

In Vietnam and Cambodia, there has been the attempt by critics of the wars there to say that the United States committed genocide in those countries for political power in the region and the world, but the colonial answer is always the same: we didn't intend to extinguish an entire people. The defenders of the U.S. policy there attempt, often, to distinguish between the acts themselves, such as the massive bombings that destroyed entire ethnic communities, and the intentions of the United States, which was there to protect other groups in the region. If the intentions were noble, then genocide did not occur, and there is often a massive but bogus paper trail constructed for the benefit of apologetic historians. Quite possibly, in the modern context, the Nazis who frenetically documented their crimes in Germany, have offered a model of what *not* to do if you want to get away with your criminal acts.

In spite of many ambiguities, the Vietnam argument is especially significant to the indigenous peoples of North and South America because the concept of *ecocide,* the intentional destruction of the physical environment needed to sustain human health and life in a given geographical region, has now been accepted in the international arena as part of the analysis of the term *genocide.* Its continuation into the present era is in need of further analysis.

This policy of deliberate destruction of the environment and resources and the continuing theft of Indian lands, which is, unlike the physical destruction endured by the people, well documented and available to researchers, could well become a persuasive feature in the definition of historical genocide as it concerns native peoples.

Indeed, contemporary federal policy, current court litigations brought by the tribes in the last forty years since the tribes have acquired access to the federal court system, must have as their main focus the examination of history in the context of U.S. nationalistic movements. The Wounded Knee genocide must be restored to the memory of the United States, studies must be conducted and human rights commissions must be instructed to reject the neutral stand always taken with regard to the sufferings of the indigenous populations in the Americas. An exhaustive and complete list of atrocities must be compiled and a civilized international community must lead a movement toward land reform and economic and cultural restoration. The humane treatment of oppressed and indigenous populations everywhere can no longer be discarded or avoided.

"Navajo Nations Crew Pullover (http://www.urbanoutfitters.com/urban/catalog/productdetail.jsp?id=22138945&color=004&color=004&itemdescription=true&navAction=jump&search=true&isProduct=

A search for "Cherokee" on the Urban Outfitters website reveals 1 result. A search for "Tribal": 15. A search for "Native": 10. "Indian": 2. But Navajo? 24 products have Navajo in the *name* alone.

This post started as a massive Urban Outfitters take-down, I spent an hour or so last week scrolling through the pages of the website, and adding anything to my cart that was "Native inspired" or had a tribal name in the description. I got through JUST the women's clothes and accessories (no mens or apartment), and had 58 items in my cart. So, then, like any good researcher, I began to code my cart for emergent themes, and the one that jumped out far above the rest? Urban Outfitters is obsessed with Navajos.

I want to show you some examples, and then talk a little about the issues with using tribal names in products that are decidedly not-. Finally, I want to share what the Navajo Nation in particular is doing about it, and the action they've taken is pretty cool.

Without further ado, some of the "Navajo" products to grace the pages of Urban:

From the basic:

(http://2.bp.blogspot.com/-b75z0oQpCQ0/TnyN6ECKXbI/AAAAAAAAA4A/4nDnNG-530k/s1600/Screen+shot+2011-09-23+at+9.46.59+AM.png)

“Title Unknown Techno Navajo Quilt Oversized Crop Tee (http://www.urbanoutfitters.com/urban/catalog/productdetail.jsp?id=21004734&color=004&color=004&itemdescription=true&navAction=jump&search=true&isProduct=

(http://2.bp.blogspot.com/-E7r_Ptsv5Hw/TnyOf0LWIZI/AAAAAAAAA4E/5_iSp8OYPEw/s1600/Screen+shot+2011-09-23+at+9.49.34+AM.png)

“Truly Madly Deeply Navajo Print Tunic (http://www.urbanoutfitters.com/urban/catalog/productdetail.jsp?id=18762765&color=061&color=061&itemdescription=true&navAction=jump&search=true&isProduct=

To the totally random:

(http://2.bp.blogspot.com/-zaGeko7hCds/TnyPIoVP4vI/AAAAAAAAA4I/pxS0OuR13nU/s1600/Screen+shot+2011-09-23+at+9.51.58+AM.png)

“Navajo Feather Earrings (http://www.urbanoutfitters.com/urban/catalog/productdetail.jsp?id=18428243&color=046&color=046&itemdescription=true&navAction=jump&search=true&isProduct=

(http://4.bp.blogspot.com/-hoYgL--Iy4U/TnyPftYxscI/AAAAAAAAA4M/93tqO3SuGyo/s1600/Screen+shot+2011-09-23+at+9.53.40+AM.png)

"Navajo Sock (http://www.urbanoutfitters.com/urban/catalog/productdetail.jsp?id=21170246&color=006&color=006&itemdescription=true&navAction=jump&search=true&isProduct=

The Antiquated:

(http://2.bp.blogspot.com/-uuLWamzWsm4/TnyP4HIMuJI/AAAAAAAAA4Q/JfGh_-IjX7k/s1600/Screen+shot+2011-09-23+at+9.55.26+AM.png)

"Leather Navaho cuff bracelet (http://www.urbanoutfitters.com/urban/catalog/productdetail.jsp?id=14890123&color=001&color=001&itemdescription=true&navAction=jump&search=true&isProduct=

And, finally, the totally offensive:

(http://3.bp.blogspot.com/-G2Czo7pzkZU/TnyQQIxl_DI/AAAAAAAAA4U/8WqhzDky3Tk/s1600/Screen+shot+2011-09-23+at+9.57.02+AM.png)

"Navajo Print Fabric Wrapped Flask (http://www.urbanoutfitters.com/urban/catalog/productdetail.jsp?id=18576884b&color=055&color=055&itemdescription=true&navAction=jump&search=true&isProduct

(http://3.bp.blogspot.com/-48cb7F3o2gU/TnyQjz6ZGPI/AAAAAAAAA4Y/jLx__5VKdiQ/s1600/Screen+sh 09-23+at+9.58.24+AM.png)

"Navajo Hipster Panty (http://www.urbanoutfitters.com/urban/catalog/productdetail.jsp?id=21234208&color=010&color=010&itemdescription=true&navAction=jump&search=true&isProduct=

Of course, there are many more if you head over to the site and search "Navajo" (http://www.urbanoutfitters.com/urban/search/search.jsp?searchPhrase=navajo&listViewSize=&indexStart=0&sortBy=&sortOrder=&categories=&categories2=&c

So what's inherently wrong with using Navajo in product names? And what can tribal nations do about it?

First of all, these products represent a stereotype of "southwest" Native cultures. The designs are loosely based on Navajo rug designs (maybe?) or Pendleton designs, but aren't representations that are chosen by the tribe or truly representative of Navajo culture. Associating a sovereign Nation of hundreds of thousands of people witl a flask or women's underwear isn't exactly honoring.

Additionally, it's more than likely that Urban chose "Navajo" for the international recognition–to most of the world Navajo (and Cherokee)= American Indian (my Jamaican friend didn't even know there were other tribes in the US until she met me). This conflation of Navajo with "generic Indian" contributes to the further erasure of the distinct tribes and cultures in the US and solidifies the idea that there is only one "Native" culture, represented by plains feathers and southwest designs.

Navajo has taken a bold step, and actually holds trademarks for 12 derivatives of "Navajo", three of which I'm citing below:

> 2061748: NAVAJO Sportswear; namely, slacks, shorts, skirts and jeans.
>
> 2237848: NAVAJO Clothing; namely, tops, vests, shirts, sport shorts, polo shirts, golf shirts, * jackets, * T-shirts and sweat shirts.
>
> 3602907: NAVAJO Online retail store services; namely, on-line ordering services in the field of clothing—specifically, men's and women's sportswear, namely, jeans, tops, shirts, sport shorts, polo shirts, golf shirts, T-shirts and sweatshirts.

I'm no law expert, but it feels like the products above might be violating the trademarks?

A few months ago, they Navajo Nation Attorney General actually sent a cease and desist letter to Urban Outfitters, and there are some great quotes from the letter (I'll try and post it in full in another post):

Your corporation's use of Navajo will cause confusion in the market and society concerning the source or origin of your corporation's products. Consumers will incorrectly believe that the Nation has licensed, approved, or authorized your corporation's use of the Navajo name and trademarks for its products – when the Nation has not – or that your corporation's use of Navajo is an extension of the Nation's family of trademarks – which it is not. This is bound to cause confusion, mistake, or deception with respect to the source or origin of your goods. This undermines the character and uniqueness of the Nation's long-standing distinctive Navajo name and trademarks, which—because of its false connection with the Nation—dilutes and tarnishes the name and trademarks. Accordingly, please immediately cease and desist using the Navajo name and trademark with your products.

As a Nation with a distinguished legacy and unmistakable contemporary presence, the Nation is committed to retaining this distinction and preventing inaccuracy and confusion in society and the market The Nation must maintain distinctiveness and clarity of valid association with its government, its institutions, its entities, its people, and their products in commerce.When an entity attempts to falsely associate its products with the Nation and its products, the Nation does not regard this as benign or trivial. TheNation remains firmly committed to the cancellation of all marks that attempt to falsely associate with the institution, its entities, its people or its products. Accordingly, immediately cease and desist using Navajo withyour products.

I haven't heard what the response was from Urban, if any, but I think it is a bold and positive choice for the tribe to take matters into their own hands and push back on instances of misrepresentation and cultural appropriation.

What do you think? Should tribes go the route of Navajo and trademark their tribal names? Do you think this will be an avenue for positive change or just mean tribal courts will be mired in lawsuits, taking away time from other important tribal business?

(Thanks Marj, Brian, and Aza!)

Adrienne, I've got to thank you for continuing to explore this subject.

This weekend, I went to Ikea and was looking at the kids toys and saw that they were selling a cloth feathered headband (i.e. the feathers were sewn and filled with polyester crap to make them stand up from the band part) obviously made to look generically Native. The incident was kind of surreal for me, as I was with my partner (who is Saulteaux) at the time. How can we buy "make believe" dress up clothes for our kids or sell them in our stores while the "make believe" people who still wear forms of regalia in seriousness exist, and patronize those shops? I don't know what the fuck I would do if I walked into a store and they said they were selling "Icelandic sweaters" with some shitty Nordic pattern printed onto a bastardized hoodie. Probably become a lecturing idiot and find the manager and say "Um, excuse me, to be an Icelandic sweater, this needs to be made of honest to God 100% itchy, uncomfortable Icelandic sheep's wool. And it needs to be made in Iceland. And it needs honest to God silver buttons with intricate filigree if it has buttons at all. Sorry, but no!" I would feel like my long-amma's old old handmade wool carders were a joke. I would feel like my mom telling me stories about relatives making yards and yards of yarn were "myths" instead of history. I would feel lost between a fairy tale past and a consumer-based future.

I think if people like you didn't keep pushing this subject of cultural appropriation, people (even people like me who are "educated" and "aware" and know that it is "bad" or "wrong" or "patronizing") wouldn't really get it, in the sense that we can know it's bad, but we can't empathize because we've never had our histories taken away and turned into lore and we

Magic in North America Part 1: Ugh.

In Uncategorized (http://nativeappropriations.com/category/uncategorized) by Adrienne K. / March 8, 2016 / 480 Comments (http://nativeappropriations.com/2016/03/magic-in-north-america-part-1-ugh.html#comments)

Fourteenth Century – Seventeenth Century

By J.K. Rowling

Yesterday I wrote about the trailer for JK Rowling's new multi-part background pieces on Pottermore, entitled "Magic in North America." You should read the post here if you need context (http://nativeappropriations.com/2016/03/magic-in-north-america-the-harry-potter-franchise-veers-too-close-to-home.html). Even before that, back in June, I wrote about my concerns with the bringing of the "magic universe" to the States. You can read that here. (http://nativeappropriations.com/2015/06/dear-jk-rowling-im-concerned-about-the-american-wizarding-school.html)

So this morning at 9am, part one of this mess was released. It's really short, I don't know what I was expecting, but definitely go over and read it in full (https://www.pottermore.com/collection-episodic/history-of-magic-in-north-america-en).

There are a number of things that stand out and deeply concern me, but the response to my critiques on my twitter timeline is even worse. I'll talk about that after I walk you through the text. Because, like with everything I critique, it's not just the mascot/image/text/movie/fashion itself, it's the response, how it's used, and the impact. This has the perfect storm of all of those categories. I really could write a dissertation about this, but I have a million papers to grade and work to do, so a quick rundown:

Part 1 of MinNA, The 14th to 17th century, starts with this:

Though European explorers called it 'the New World' when they first reached the continent, wizards had known about America long before Muggles (Note: while every nationality has its own term for 'Muggle,' the American community uses the slang term No-Maj, short for 'No Magic'). Various modes of magical travel – brooms and Apparition among them – not to mention visions and premonitions, meant that even far-flung wizarding communities were in contact with each other from the Middle Ages onwards.

So first off, we're centering Europeans, calling brutal colonizers benign "explorers" (yes, it's written for children, but I don't think anyone would argue the HP canon is absent of intense violence. I'm just *fascinated* to see how Rowling will address the brutality and complexity of colonization in the next stage). Also, "America" didn't exist during this timeframe.

The Native American magical community and those of Europe and Africa had known about each other long before the immigration of European No-Majs in the seventeenth century. They were already aware of the many similarities between their communities. Certain families were clearly 'magical', and magic also appeared unexpectedly in families where hitherto there had been no known witch or wizard. The overall ratio of wizards to non-wizards seemed consistent across populations, as did the attitudes of No-Majs, wherever they were born. In the Native American community, some witches and wizards were accepted and even lauded within their tribes, gaining reputations for healing as medicine men, or outstanding hunters. However, others were stigmatised for their beliefs, often on the basis that they were possessed by malevolent spirits.

"**The** Native American community." Oh man that loaded "the." One of the largest fights in the world of representations is to recognize Native people**s** and communitie**s** and culture**s** are diverse, complex, and vastly different from one another. There is no such thing as one "Native American" anything. Even in a fictional wizarding world.

The legend of the Native American 'skin walker' – an evil witch or wizard that can transform into an animal at will – has its basis in fact. A legend grew up around the Native American Animagi, that they had sacrificed close family members to gain their powers of transformation. In fact, the majority of Animagi assumed animal forms to escape persecution or to hunt for the tribe. Such derogatory rumours often originated with No-Maj medicine men, who were sometimes faking magical powers themselves, and fearful of exposure.

So, this is where I'm going to perform what Audra Simpson (http://pages.ucsd.edu/~rfrank/class_web/ES-270/SimpsonJunctures9.pdf) calls an "ethnographic refusal," "a calculus ethnography of what you need to know and what I refuse to write in." In her work with her own community, she asks herself the questions: "what am I revealing here and why? Where will this get us? Who benefits from this and why?"

I had a long phone call with one of my friends/mentors today, who is Navajo, asking her about the concepts Rowling is drawing upon here, and discussing how to best talk about this in a culturally appropriate way that can help you (the reader, and maybe Rowling) understand the depths to the harm this causes, while not crossing boundaries and taboos of culture. What did I decide? That you don't need to know. It's not for you to know. I am performing a refusal.

What you do need to know is that the belief of these things (beings?) has a deep and powerful place in Navajo understandings of the world. It is connected to many other concepts and many other ceremonial understandings and lifeways. It is not just a scary story, or something to tell kids to get them to behave, it's much deeper than that. My own community also has shape-shifters, but I'm not delving into that either.

What happens when Rowling pulls this in, is we as Native people are now opened up to a barrage of questions about these beliefs and traditions (take a look at my twitter mentions if you don't believe me)–but these are not things that need or should be discussed by outsiders. At all. I'm sorry if that seems "unfair," but that's how our cultures survive.

The other piece here is that Rowling is completely re-writing these traditions. Traditions that come from a particular context, place, understanding, and truth. These things are not "misunderstood wizards". Not by any stretch of the imagination.

Here is how Rowling responded to questions online about the term:

It's not "your" world. It's our (real) Native world. And skin walker stories have context, roots, and reality. twitter.com/jk_rowling/sta…

Dr. Adrienne Keene
@NativeApprops

This is clearly not legwork @jk_rowling did with this writing. Native communities use reciprocity, respect, and relationships as benchmarks.

I have more to say, but I'll end with this. These are things you don't mess with. So good luck with that.

The Native American wizarding community was particularly gifted in animal and plant magic, its potions in particular being of a sophistication beyond much that was known in Europe. The most glaring difference between magic practised by Native Americans and the wizards of Europe was the absence of a wand.

The magic wand originated in Europe. Wands channel magic so as to make its effects both more precise and more powerful, although it is generally held to be a mark of the very greatest witches and wizards that they have also been able to produce wandless magic of a very high quality. As the Native American Animagi and potion-makers demonstrated, wandless magic can attain great complexity, but Charms and Transfiguration are very difficult without one.

This whole wandless magic thing is bugging me. So Rowling has said multiple times that it takes a lot more skill to perform magic without a wand (Dumbledore does it at several points in the books), but points out that wands are what basically *refines* magic. Wands are a European invention, so basically she's demonstrating Eurocentric superiority here–the introduction of European "technology" helps bring the Native wizards to a new level. AKA colonial narrative 101.

The response online today has been awful. My twitter mentions have been exploding non-stop all day, with the typical accusations of my oversensitivity and asking if I understand that Harry Potter is fictional, and more directed hate telling me my doctorate is being misused and I'm an idiot. In addition are the crew who "would love to know the real history" of these concepts (again, not for you to know), or are so grateful that JK Rowling is introducing them to these ideas for the first time. This is not the way to learn about or be introduced to contemporary and living Native cultures. Not at all.

Decolonization: Indigeneity, Education & Society
Vol. 3, No. 1, 2014, pp. 218-224

An interview with Tania Willard on *Beat Nation*, Indigenous curation and changing the world through art

Jarrett Martineau

Jarrett Martineau: First, many thanks from everyone at *Decolonization* for taking the time to participate in this interview! We are pleased to have you join us for this special issue on "Indigenous art, aesthetics and decolonial struggle." Please introduce yourself and what nation you are from.

Tania Willard: My name is Tania Willard, Secpwemc Nation... and mixed Euro-Canadian. At times other white people and family have asked why I don't define the other 'half' of me. For me it is political to uphold my Secwepemc heritage: first, as an attempt to address the purposeful erasure of Aboriginal story, place, culture, spirituality and land. I reassert my Secwepemc heritage, story, land and rights in recognition of the whole story of these Indigenous territories we call a country.

You're the curator of *Beat Nation,* an exhibit that focuses on hip hop as Indigenous culture; can you tell us a bit about your own creative and curatorial practice? What guides or informs the art you make and curate?

Beat Nation has grown and become something less intimate than how it started and I have learned lessons in that. So, first of all, I never really set out to be a curator; I come to it as an artist and an activist, which I think is a well understood trajectory in Indian Country. We have amazing models and histories to see of all kinds of creative minds, philosophers, and leaders who sought creative ways to have their voices heard.

I went to art school at the University of Victoria, before Taiaiake Alfred and all of the Indigenous Governance programming there now. I think I was the only native student in Fine Arts at the time, or at least the only one who actively identified that way - and the Gustafsen Lake stand-off happened while I was at UVIC. I was active with things like Food Not Bombs and an anarchist,

youth-run info shop, so I was already politicized. But it was in this period that I started making prints and artwork outside of art school for political means. This is all to set the foundation for my approach to *Beat Nation*. After travelling through anarchist squats in Europe, I landed in Vancouver and after some time got back in touch with *Redwire Magazine,* who I had encountered before leaving Victoria and was really inspired by them. *Redwire* was largely born out of the *Native Youth Movement* and native youth stepping up and calling out the BC Treaty Process for not acknowledging our needs and futures and also negotiating away our rights. So, I got hooked up doing stuff with *Redwire* for years; we did a magazine distributed throughout Turtle Island that was native youth led and expressed our ideas, stories, politics, histories and more. We organized art shows - Tahltan artist and curator, Peter Morin, and I both had art backgrounds, so we went to demonstrations and conferences and did community engaged work. We hosted conferences and at times raised a stink. We were banned in schools for a while. We almost got sued… I think even years later, a news story ran in the right wing media (Sun News network) asking why the government funded us because, they alleged, we printed some illicit material around sabotage.

Anyway, so hip hop was all a part of this; *Native Youth Movement* folks were out at the Indian conferences using hip hop to talk amongst our communities about things like the BC Treaty Process, how it was not in the interest of our overall rights to the land and our children's futures, and all of that encompassed a lot of other ideas. So, then, as part of the music and the politics of hip hop there was also a whole lot of fashion and art and ideas floating around out there that many different artists were working with. I had phased out of *Redwire* by this time; we had always run it as a youth project (I think I was almost 27) and it felt like we needed to have fresh young minds in there, so there was a turn over. *Redwire* was one of these projects where, at different times, it was not radical enough and, alternately, too radical, depending on who you were taking to. We were funded. I was good at writing grants and we were a unique project, I think, but there were lots of internal political disagreements and ideals and one of the most dominant was this idea that we shouldn't be funded by the government. Which definitely has its ins and outs but, anyway, I wanted to be more liberated, less political dogma; more experimental and conceptual ideas that were freed from fitting, even into a radicalized politics, were engaging to me. I was making art as an artist and still active in many ways within a social and cultural community; curating felt like a way to organize and present some of these ideas.

At least that is what I thought when grunt gallery asked me to curate. Most of the early work was online curation, including the original beatnation.org, which I did before being accepted for a Canada Council for the Arts aboriginal curatorial residency with grunt gallery. So, in some ways, the original *Beat Nation* was somewhat before I started curating... kind of. Anyway, Glenn at the [grunt] gallery had asked Skeena Reece and I to co-curate this idea around native youth and

hip hop. Skeena was an amazing performer, involved in hip hop herself, and an activist. She had recently started a Native youth art collective at *Knowledgable Aboriginal Youth Advocates* (another UMAYC funded program like *Redwire* and involving similar people).

I am giving you a lot of backstory here (laughs). But it is the more holistic version of things. Skeena and I set about doing this for the website. And because it was coming from artists we knew and worked with and the hip hop movement, music was a part of that and it had to be part of the art - we were purposeful about that. Skeena later became an artist - I saw her performance in the Sydney Biennale in Australia and she blew me away - and her work was really important to *Beat Nation* as an exhibition.

I trusted Kathleen [Ritter, Associate Curator at the *Vancouver Art Gallery* (VAG)] and we worked well together, I gave space and she gave space and we negotiated *Beat Nation* into what it was at the VAG. We pushed for certain works like Duane Linklater's "Tautology" [2011], other works fell into place and they just had all these conversations with each other in some ways; the works had a way of storytelling with each other. Working at the VAG was new to me, I never intended *Beat Nation* to be a big show or a tour; it grew into that in ways I couldn't have predicted.

I have lots of questions about what it means to bring political work into institutions but I am also aware of the chasms that are left when the work is not there or those politics are not articulated. One of the behind-the-scenes negotiations was around sponsorship. I didn't feel I could hold the ideas in the show together if I felt compromised by sponsorship from major resource extraction projects, since almost all of those kinds of projects are contested within Indian Country. People have different views on that, and I am not steadfast one way, but for this work and for me it wouldn't have worked.

In other ways I think I didn't do enough, as much as possible. I was involved in the tour but in reality a touring exhibition and its logistics have these entire systems and processes. And, at times I let myself say, 'hopefully the show can speak for itself' because, you know, I can't be there to define and program and babysit everything. And thank goodness there were so many people who got it and stepped up in ways that were supportive and in solidarity with the exhibition and my ideas. And, other times, it was merely another art show, part of many that a gallery produces. So I am left with both amazing experiences and lots of questions about art and its effectiveness when it comes to social justice, politics, curating. And I haven't figured it out yet… so that propels me in my own process of unwinding and rewinding to find meaning.

I approach curatorial work with curiosity; I let passion and a sense of justice lead me, and I let myself open up to other ideas and mediums. And I try to do my best to keep to those ideas while negotiating all the many bureaucratic and logistical things curators do.

Is there a word for art in your language?

There are a few; there is a word for drawing that has the same root as writing. And then, I have to check on this but someone had said, the word for creating something like an object/art form was related to the word for birth… I'm going to ask my language mentors to clarify that in Secwepemcstin! I think the whole 'no word for art' is a bit bogus – we all had/have creative practices with whole bodies of language and knowledge around them, so I think it is more around the confusion of the English word for art and what that means to us.

What are Indigenous aesthetics? And how does this figure in your work?

I don't think you can really define them; they are as varied as each individual, in each distinct Nation, and then maybe even more so than that. But at some point I think they are informed by the experience of being informed by your family roots/heritage; even if that is an expression of a loss of those, it somehow embodies the work. This is different, I think, then saying it is identity-based; it certainly does not have to look like someone Native made it, but at some point I think in Indigenous aesthetics you can draw a parallel with some ancestral knowledges, philosophy, connection, loss, cultural practice, customs, contemporary context. So, there is Indigenous aesthetics, but defining it narrows it; you know it when you see it, or you know it when you feel it, I think. Without being too dreamy about it, art is often a communication with a different part of our brain – we absorb it and its possibilities differently than reading, or hearing a talk. It is very experiential, in some ways, even less direct than music. I think it functions on a much more esoteric level.

What makes Indigenous art political? Does, or should, Indigenous art have a responsibility to engage political struggle in form/content/practice/process?

Indigenous art is political because Indigenous people make it. Indigenous art should not have a 'responsibility' to engage in political struggle, it should have an opportunity or invitation or availability, but not an obligation. Indigenous people are already dying, fighting, struggling, learning, working – I don't think we need to limit ourselves. That said, depending on your experiences, your Nation, your family, teachings, and spirituality, you may be expected to carry your voice forward in a way that advances political struggle. I feel 'responsibility' in lots of ways; my community struggles like other smaller, rural ones. We also have outstanding talent and showing that, or creating a context to show that, becomes a political act, when so much of dominant culture is based on erasure, or what exists as a platform for Aboriginal people is already so weighted and constructed that there is only so much expression and freedom to those spaces.

What responsibilities do Indigenous artists carry in their work and practice that are unique to Indigenous people?

Well, that is a bit of an epic question! 'Indigenous artists' is just too diverse a

category. I can only speak to my experience and this isn't a definition of what I think that needs to be. I suppose one of the strongest struggles is negotiating spaces and places where you can be free to be who you are, without 'teaching' others or 'schooling' them or 'preaching' or being 'stereotyped' - all those isms get pretty heavy at times. So that affects a lot of Indigenous artists I think. For me, this idea of battling a never-ending tide, where you always have to unpack and relearn and reframe the way dominant histories and experience are told. It is creating space to not feel conflicted in who you are, but I don't think that is necessarily unique to Indigenous people.

We have to dislocate the ways we operate with this idea of homogeneity as an equalizing method. You may, as an Indigenous person, carry unique knowledges, languages, and practices and how you deal with those as an artist will be different than from a non-Indigenous artist. But it will also likely be different from another Indigenous artist, if you are from different nations, etc.

What has the response been to *Beat Nation* as the exhibit has traveled beyond Vancouver? Why do you think it has attracted such a huge audience?

I can't say I entirely know. For me, when Kathleen pitched the idea to bring *Beat Nation* to the VAG, it just felt right. It gave me chills and I followed that; I had reservations about the institutional space and many other things but I wanted to see these artists work in this space. I believed in what their work had to say and that it could bring down barriers. I was passionate about it, Kathleen was passionate about it, and as we worked on it what I hope comes through is a deep respect and excitement about the work.

Many Indigenous artists in *Beat Nation* and beyond have used hip hop and remix aesthetics in their work to respond to the legacy of colonialism and to the appropriation and misrepresentation of Indigenous cultures. What is the connection to hip hop culture and remix aesthetics that makes this appealing? Are there underlying affinities between Indigenous cultural production and hip hop/Black cultural production?

I used to work powwow's selling fruit for my auntie; one year a break dance crew came through the Kamloops Powwow, I was bowled over seeing them - and this was like more than 15 years ago now. Hip hop has been Indigenized for a long time… but back then most of the kids on the rez were still wearing metal shirts - it was metal, I would say, that in advance of hip hop expressed a sense of discontent with the way things were and expressed working class or poor people's ideals. But metal was pretty white. And when hip hop came it was real for people. I mean, hip hop has just made such deep inroads. It was basically storytelling, but in a way that allowed it to be used by young people to express their stories - not just traditional stories, but also traditional stories. It held such power as a medium because there was so much possibility there.

I think sometimes artists are working with remix culture, other times it is unmixing,

unravelling to find a clearer essence, excavating the cityscape to reveal Indigenous presence, singing in your language, telling your story.

Following this line of thought, what is the future of remix culture or, I guess, what comes after remix?

Re-mastering? (laughs) I don't think about art in some kind of linear way like, 'we had this art movement and then this one and now we are heading to this one.' Cultural and artistic expression form these interesting textures that weave all around us, sometimes encasing us, holding us, tying us, sometimes folding, embracing and carrying us.

Why is Indigenous art so relevant and "popular" in the current moment? Why now? Will it last?

You know, I think it always has been. We are creative people and we have dynamic ways of being in the world and maybe the landscape would look very different if artistic and cultural ways weren't so subject to a hierarchy of capitalism. I would hope that maybe the wider society around us is ready to start looking at ways of unravelling and remaking and remixing the histories of racism and oppression in this country...or what we call this country, this huge expanse of distinct Indigenous territories.

How important is self-representation (speaking to and for ourselves) in Indigenous art vs. speaking to non-Indigenous audiences? What role does audience play in your work?

A complicated one.

Is the 'traditional vs. contemporary' or 'two worlds' binary that is often associated with Indigenous art still a relevant consideration or distinction?

In terms of 'two worlds', which is to say segregation, I think a lot of people dismiss that idea these days as limiting. But I live back on my rez, in a fairly rural area, in an area of resource extraction, and that is still pretty real to me. And likely to others in even more remote communities etc. 'Traditional vs contemporary,' I never sit well with - contemporary is just a series of interventions and adaptations that become cemented from tradition; it is this cycle, and continuum, not a trajectory. Beadwork with glass beads is actually pretty contemporary, based on existing aesthetics and materials, and people are working in many different ways with this medium right now. I mean, painting and drawing can be considered traditional in a European art context too, but they are simultaneously current and contemporary and it doesn't confuse us. I think we can see different mediums and ways in which artists work with them in reference to both traditions, and contemporary contexts, and maybe customs.

Is art-making a form of decolonization? How, or perhaps when, is art decolonizing? Are there works, artists, or projects that you see successfully accomplishing this?

I think art can give voice to decolonization and it can be part of a process of

decolonizing, but I don't think it itself is only, or exactly, a form of decolonization. There are problems with art functioning as a form of social justice. I think art can be an initiator, an instigator, and inspiration but it needs to be a part of a community and other ways that are building and challenging existing ways with inspired revolutionary methods. Art can't be separate from community for it to be decolonizing. I think of it like ceremonial ways, where something might work on you without you even knowing it. I think every artist in *Beat Nation* is doing this in diverse ways, and then we are all also not doing it. There still needs to be people at the blockade, in the conference rooms, at the daycares; we can't think about artists as set apart from our community and struggle. We are all involved and hopefully support each other with the skills that we feel healthy and good about sharing, sharing what we can to make ourselves stronger together.

I have too lofty goals. People ask what I wanted *Beat Nation* to do and, really, as hilariously naive as it is, I want it to change the world. I want inequality to be lifted, I want our ways and languages back, I want it all, and I hope that the work I do in some ways – in both clear and strategic ways and in mysterious ways – does that.

.

***Tania Willard**, Secwepemc Nation, works within the shifting ideas of contemporary and traditional as it relates to cultural arts and production, often working with bodies of knowledge and skills that are conceptually linked to her interest in intersections between Aboriginal and other cultures. Willard has worked as an artist in residence with gallery gachet in Vancouver's Downtown East Side, the Banff Centre's visual arts residency, fiction and Trading Post and was a curator in residence with grunt gallery. Willard's recent curatorial work includes Beat Nation: Art Hip Hop and Aboriginal Culture, featuring 27 contemporary Aboriginal artists.*

***Jarrett Martineau** is Cree/Dene from Frog Lake First Nation in Alberta and a Ph.D. Candidate in Indigenous Governance at the University of Victoria. His research examines contemporary Indigenous political communication at the critical intersections of media, technology, art, aesthetics, music, and performance. His dissertation focuses on the role of art and creativity in Indigenous struggles for nationhood and decolonization. He is the co-founder and Creative Producer of Revolutions Per Minute (RPM.fm), a global new music platform to promote Indigenous music culture and an organizer with the Indigenous Nationhood Movement. He is currently a 2013-14 Fulbright visiting scholar at Columbia University and CUNY's Center for Place, Culture and Politics.*

Education, Schooling, and Pedagogy

Introduction: Unfolding the Lessons of Colonization

Marie Battiste

As the twentieth century unfolds to a new millennium, many voices and forums are converging to form a new perspective on knowledge. Many of these voices belong to the Indigenous peoples who have survived European colonization and cognitive imperialism. They represent the thoughts and experiences of the people of the Earth whom Europeans have characterized as primitive, backward, and inferior – the colonized and dominated people of the last five centuries. The voices of these victims of empire, once predominantly silenced in the social sciences, have been not only resisting colonialization in thought and actions but also attempting to restore Indigenous knowledge and heritage. By harmonizing Indigenous knowledge with Eurocentric knowledge, they are attempting to heal their people, restore their inherent dignity, and apply fundamental human rights to their communities. They are ready to imagine and unfold post-colonial orders and society.

This book reveals some of these voices of commitment. They emerged from the meetings of the delegates of the United Nations Working Group on Indigenous Populations, held every year in Geneva, that converged in debates and drafting sessions on Indigenous rights. In 1996, many of these committed voices gathered at the University of Saskatchewan in Saskatoon, Canada, to honour Rigaberto Menchu Tum, Chief Ted Moses, and Erica-Irene Daes, "organic" leaders in Indigenous human rights initiatives. In the intense summer days and nights of 1996, delegates from many lands – lands that colonizers called Australia, New Zealand, South America, Europe, and North America – assembled for an unprecedented honouring ceremony and a focused talking circle to seek remedies for the colonization of the minds and souls of their peoples. The participants were Indigenous teachers and scholars and non-Aboriginal "friends" or allies. In the following collection of essays, the voices of commitment and action articulate their teachings, stories, perspectives, and reflections in many

different styles – passionate, scholarly, poetic, painful, practical – all of them visionary.

A significant starting point for discussing these themes was the story of the elder's box as told by Eber Hampton, a Chickasaw educator and the president of the Saskatchewan Indian Federated College, the national post-secondary educational institute of the First Nations of Canada. He told of an elder who asked him to carry a box. Thinking well of his own youthful stature, he felt proud to be chosen and agreed willingly. The elder then thrust forward what appeared to be an empty box, which puzzled him:

> His question came from behind the box, "How many sides do you see?"
> "One," I said.
>
> He pulled the box towards his chest and turned it so one corner faced me. "Now how many do you see?"
>
> "Now I see three sides."
>
> He stepped back and extended the box, one corner towards him and one towards me. "You and I together can see six sides of this box," he told me. (Hampton 1995, 42)

Just as the elder revealed that there is more than one perspective required to view a box holistically, the gathering revealed many perspectives on how to map and diagnose colonization, how to heal the colonized, and how to imagine and invoke a new society. In group sittings and stories told in many dialogues and related in many texts, the gathering found multiple layers of experience and knowledge about colonization that profoundly challenged us to find remedies. We began to see the many sides of our confinement, our box.

Through our sharing, listening, feeling, and analyzing, we engaged in a critique of the trauma of colonization. We examined the frameworks of meaning behind it, we acknowledged the destructiveness that it authorized, and we imagined a postcolonial society that embraced and honoured our diversity. We shared many sides of a box that we came to know more fully. We came to see colonization as a system of oppression rather than as personal or local prejudice. We came to understand that it is the systemic nature of colonization that creates cognitive imperialism, our cognitive prisons (Battiste 1996).

Over the course of those ten days, the voices in the gathering converged to address strategies for neutralizing the systemic nature of our oppression, identifying its viral sources, and understanding how it imprisons our thoughts. Together we sought to find ways of healing and rebuilding our nations, peoples, communities, and selves by restoring Indigenous ecologies, consciousnesses, and languages and by creating bridges between Indigenous and Eurocentric knowledge. We discovered that we could not

be the cure if we were the disease. Discovering the cures that will heal and restore our heritage and knowledge is an urgent agenda occupying the daily and intellectual lives of Indigenous peoples. It will be the most significant problem facing Indigenous peoples in the Decade of the World's Indigenous Peoples, 1995-2004, as Indigenous peoples around the world continue to struggle against oppression. Understanding the processes that we detected in the course of our gathering will help to unravel ethnic tensions and wars and allow humanity to rebuild society based on diversity rather than on an ancient quest for singularity.

The participants were unique representatives of their peoples who brought to the meeting diverse ecological consciousnesses, languages, and cultures, as well as similar expressions of caring and kindness. They were the first generation of Indigenous scholars accomplished in both Eurocentric and Indigenous thought, thus providing a bridge that allowed us to enter into a dialogue and translate Indigenous knowledge and heritage. Each had walked in the colonizers' moccasins, learned to speak their languages and know their methodologies, thus earning their critiques and their respect as valued leaders and resources to protect the heritages of their nations, peoples, and communities.

Led by Leroy Little Bear, an eminent Blackfoot philosopher and scholar, now retired from the University of Lethbridge and the American Indian Programs at Harvard University, we worked together to solve the mystery of the box. He enriched our analyses and imagined the possibility of a postcolonial society that would enable us to create our own sustaining and nourishing realities. He gently urged us to respect the process of developing ourselves in healing and renewing ways and to dream for those equitable and shared benefits that we felt were necessary. He led our dialogues to sharpen our insights gained from our experiences, and he helped us to confirm our commitment to forms of inquiry both timely and exacting, as we developed new networks of solidarity.

Under the Medicine Wheel processes of the northern Plains, the sessions were organized around four related themes: mapping colonialism, diagnosing colonialism, healing colonized Indigenous peoples, and imagining postcolonial visions. As we shared our thoughts in our group dialogues, we sought to address some of the essential questions of colonization. What is it in the nature of European cultures that has resulted in the oppression of so many peoples worldwide? What is it in the nature of Indigenous peoples' culture that has allowed colonization to happen? What can we do now, and what principles can we bring forward to achieve these visions from those ten days together?

The participants shared their personal and collective pain, anguish, and analyses of their experiences with colonialism. Each had experienced most

or some aspects of colonization and was enmeshed in reforming colonial governments, laws, education, economies, and institutions that sought to erase their identities, languages, and cultures, creating new colonized identities that would be impoverished in the wake of violence and destruction. Each had experienced a side of the box that others had not experienced; for some of us, there were parts of the box that we could not fully access but we still felt their presence.

These sharing sessions and dialogues are enfolded within these essays, which represent modern Indigenous voices and syntheses of the experience of colonization and Indigenous thought in many styles and from many different points of view. Many of the essays contain the "orality" of Indigenous traditions, aspects that could not be changed without destroying these voices. These essays declare an Indigenous framework of meaning and of what has been destructive that is rarely shared. They provide new frameworks for understanding how and why colonization has been so pervasive among Indigenous peoples, as well as what Indigenous peoples desire and imagine as a better life in a postcolonial context. They also offer existing and new methodologies, conceptual designs, and approaches for implementing the healing and cultural restoration of Indigenous peoples across disciplines.

The writings seek to move beyond the existing Indigenous experience of colonization by liberating Indigenous thought, practices, and discourses rather than by relying on existing Eurocentric or colonial theory. Indigenous thinkers use the term "postcolonial" to describe a symbolic strategy for shaping a desirable future, not an existing reality. The term is an aspirational practice, goal, or idea that the delegates used to imagine a new form of society that they desired to create. Yet we recognized that postcolonial societies do not exist. Rather, we acknowledged the colonial mentality and structures that still exist in all societies and nations and the neocolonial tendencies that resist decolonization in the contemporary world. Such structures and tendencies can only be resisted and healed by reliance on Indigenous knowledge and its imaginative processes.

Postcolonial Indigenous thought should not be confused with postcolonial theory in literature. Although they are related endeavours, postcolonial Indigenous thought also emerges from the inability of Eurocentric theory to deal with the complexities of colonialism and its assumptions. Postcolonial Indigenous thought is based on our pain and our experiences, and it refuses to allow others to appropriate this pain and these experiences. It rejects the use of any Eurocentric theory or its categories.

The writings in this book firmly embed the fundamental concept that Indigenous knowledge exists and is a legitimate research issue. Many parts of the existing Eurocentric academy have not fully accepted this principle,

arguing that there is no such thing as an Indigenous perspective. Postcolonial, Aboriginal, and postmodern scholars have had to confront this position, as they have had to confront the institutions in which they function. Most delegates from university communities were having trouble articulating the differences between these two systems of knowledge, but through the shared dialogues they became aware of the singularity of Eurocentric thought – even if some of the issues around the diversity of approaches to life and nature remained unresolved. They came to understand the prevailing authority of Eurocentric discourses and how the unreflective dominance of these discourses in academia has led to the historical and contemporary immunity to understanding and tolerating Indigenous knowledge.

Indigenous knowledge, including its oral modes of transmission, is a vital, integral, and significant process for Indigenous educators and scholars. It has been upheld by the Supreme Court of Canada as a legitimate form for understanding and transmitting Indigenous knowledge, history, and consciousness. The Supreme Court of Canada has ordered the legal profession, in *Delgamuukw* v. *The Queen* (1997), to include and respect Indigenous oral traditions in standards of evidence, overruling centuries of development of the British rules of evidence. The justices of the Supreme Court held that Indigenous oral traditions are legitimate sources of evidence and ordered the courts to modify rules of evidence and procedures to acknowledge and value these traditions. This decision offers a powerful analogy for the interpretive monopoly of existing standards of research scholarship. If the courts are required to consider oral traditions, then all other decision makers should likewise consider the validity of oral traditions, including oral dissemination within Aboriginal and non-Aboriginal communities, as significant sources for the distribution and dissemination of Aboriginal knowledge and scholarship.

The necessity of bringing forward Aboriginal knowledge, perspectives, and research is being increasingly felt at all levels of scholarship. In a speech to the university community, the president of the Social Sciences and Humanities Research Council of Canada aptly pointed out that the traditions of the university to "publish or perish" have been globally tested and that the new agenda for universities will need to be "go public or perish" (Marc Renaud, Sorokin Lecture, University of Saskatchewan, Saskatoon, February 4, 1999).

Indigenous scholarship, along with research that requires moral dialogue with and the participation of Indigenous communities, is the foundation for postcolonial transformation. This scholarship evolves from a need to comprehend, resist, and transform the crises related to the dual concerns of the effect that colonization has had on Indigenous peoples and the ongoing erosion of Indigenous languages, knowledge, and culture

as a result of colonization. It has involved clarifying the contested interests that occur in the many disciplines and fields of thought.

Much of the focus of Indigenous scholarship in the early years was on liberal solutions that attempted to make modal adjustments to existing institutions and their modes of delivery. There has been a growing awareness of late that we need a more systemic analysis of the complex and subtle ideologies that continue to shape postcolonial Indigenous educational policy and pedagogy. The writings in this book document action-oriented research practices. These practices identify sites of oppression and emancipation. They also support the agenda of Indigenous scholarship, which is to transform Eurocentric theory so that it will not only include and properly value Indigenous knowledge, thought, and heritage in all levels of education, curriculum, and professional practice but also develop a cooperative and dignified strategy that will invigorate and animate Indigenous languages, cultures, knowledge, and vision in academic structures.

This book offers a complex arrangement of conscientization, resistance, and transformative praxis that seeks to transform the dual crises related to colonization and culture. It is constructed on the multidisciplinary foundation essential to remedying the acknowledged failure of the current Eurocentric system in addressing educational equity for Indigenous peoples, in particular the diverse groups of disempowered peoples around the world. Similarly, it recognizes that Indigenous education is not one site of struggle but multiple struggles in multiple sites. Thus, these diverse struggles cannot simply be reduced to singular, one-dimensional solutions. Interventions and transformative strategies must be correspondingly complex, and they must be able to engage with and react to the multiple circumstances and shapes of oppression, exploitation, assimilation, colonization, racism, genderism, ageism, and the many other strategies of marginalization. This collection seeks not to resolve all tensions or their complex interfaces but to acknowledge and expose their existence and to take account of the factors as they appear in multiple sites, including epistemology, curriculum, schools, and teacher education (Smith 1997).

This book seeks to clarify postcolonial Indigenous thought at the end of the twentieth century. It is not a definitive work, but it is a good reflection. It represents the voices of the first generation of Indigenous scholars and seeks to bring those voices, their analyses, and their dreams of a decolonized context further into the academic arena. It urges an agenda of restoration within a multidisciplinary context for human dignity and the collective dignity of Indigenous peoples. It recognizes the existing right of self-determination, and it urges Indigenous peoples to promote, develop, exercise, and maintain their orders and laws and to determine their political status and pursue freely their cultural destiny within supportive social and economic development.

One Indigenous educator, Nata Inn ni Maki–Sacred Hawk Woman (Rose von Thater), has written about the knowledge and experience that she gained at the gathering:

> We were bringing to conscious recognition those elements foreign to our knowing that had entwined themselves within us, sapping us of our natural strength. We were seeing the experiences that had defined our lives with new eyes. We were looking at our history, accounting for its impact, taking ourselves to the doorways of understanding, discovering new possibilities, other strategies, watching as sources of power and strength emerged to reveal themselves in a new light. From this place and from these days together we were selecting, like artists, the elements that would tell a new story, taking from the past, re-ordering the present, envisioning a future that felt very much like a vision that had been held for us until we could reach out and hold it for ourselves. (Personal communication, June 27, 1997)

Indigenous peoples worldwide are still undergoing trauma and stress from genocide and the destruction of their lives by colonization. Their stories are often silenced as they are made to endure other atrocities. Many of these Indigenous peoples were unable to attend the institute to share their stories, despite their efforts. For them and for all Indigenous peoples worldwide, we seek to initiate dialogue, advance a postcolonial discourse, and work actively for a transformation of colonial thought. It becomes our greatest challenge and our honour to move beyond the analysis of naming the site of our oppression to act in individual and collective ways to effect change at many levels and to live in a good way. These writers are actively seeking to reject the categories assigned to them and to make a difference in creating sustainable communities. Our efforts are to reveal the inconsistencies, challenge the assumptions and the taken for granted, expose the ills, and search from within ourselves and our Indigenous heritages for the principles that will guide our children's future in a dignified life. Our efforts are enfolded within the deep meaning of poet Antonio Machado's beautiful thought: "Caminante, no hay camino, se hace camino al andar" ("Traveller, there are no roads. The road is created as we walk it [together]") (as cited in Macedo 1994, 183).

Using the Medicine Wheel to guide and illustrate the interconnectedness and continuous flux of ideas, I have used the four directions of the Sacred Circle Wheel (the winds of West, North, East, and South) to characterize the divisions of this interrelated dialogue. The Medicine Wheel illustrates symbolically that all things are interconnected and related, spiritual, complex, and powerful. Indigenous writers have explained elsewhere about

the teachings of the Sacred Directions (Battiste 1995; Calliou 1995; Hampton 1995). I start with the Western Door, an unlikely place for most Aboriginal people to begin their journeys, as most Aboriginal people begin their ceremonies with the East. However, my friend Eber Hampton, in "Redefinition of Indian Education" (1995), has offered his understandings of the meanings of the directions taken from within traditional ceremonies, and for me the Western Door is appropriate for the theme of *mapping colonialism* because the west is the direction of "Autumn, the end of summer, and the precursor of winter. On the great plains, thunderstorms roll in from the west. In Lakota cosmology, the good red road of life runs north and south and the road of death runs east and west. The coming of Western civilization (meaning western European), with its Western forms of education, to this continent was the autumn of traditional Indian education" (31). The Western Door thus begins with mapping the contours of the ideas that have shaped the last era of domination underpinning modern society and the varied faces of colonization as it is maintained in the present era. It is introduced in the prologue by Erica-Irene Daes and developed in subsequent essays.

The Northern Door is the "home of winter." Long nights of darkness evoke feelings of struggle and cold; long winters are when our very survival is challenged. Indigenous peoples are challenged by winter, but from their experience they learn endurance and wisdom. The north, as Eber has pointed out, is cold and dark, with just a hint of light that makes it possible for us to hope and dream. This direction represents the theme of *diagnosing colonialism*. Whenever I teach my course Decolonizing Aboriginal Education, I find that my graduate students are enriched by the diagnosis of colonialism and by their own unravelling of their experience, whether they are the colonizers or the colonized. The Northern Door is the direction from which the diagnosis of colonialism emanates. It goes beyond the practice of colonial oppression to explore the unquestioned and conflicting assumptions that underpin oppressive relationships.

The Eastern Door is the direction of spring, of the sun rising. "The east is, through its association with the sunrise, a place of beginnings and enlightenment, and a place where new knowledge can be created or received to bring about harmony or right relations" (Calliou 1995, 67). In the morning, as we turn to the east, we pray for our children, our nations, and our future generations. We are conscious of how so many of our peoples have suffered through the winter, and now we look to find new ways to warm, nourish, and heal our fragile spirits. We can turn to the Earth, as Linda Hogan suggests, to find a different yield or to invoke new understandings from the collective efforts of Indigenous peoples, whether they come from political thought, constitutional reform, or international law. The Eastern Door of *healing colonized indigenous peoples* presents the

intellectual and practical challenges to current ways of pursuing humane relationships. It is a process of healing ourselves, our collective identities, our communities, and the spirit that sustains us.

Finally, the Southern Door is "the direction of summer, the home of the sun, and the time of fullest growth" (Hampton 1995, 28). The summer resounds with the healthy sounds of our peoples as we convene to honour our teachings, our elders, and our ancestors in ceremonies and gatherings. It calls to mind long summer days and nights in dialogue and laughter and sharing around campfires, at feasts, pow wows, potlatches, and multiple ceremonies. Our traditions, as Eber has pointed out, preserve and sustain us. Thus, the final section of this book resounds with hope and anticipation as we turn to our traditions to preserve our communities, our education, our governance, and our future through focusing on the integrity of Aboriginal knowledge, systems, and their applications. It offers the foundation for reclaiming ourselves and our voice, as we *vision the Indigenous renaissance* based on Indigenous knowledge and heritage.

Raising consciousness of the struggles of oppressed Indigenous peoples throughout the world has been an intensely challenging objective but one that Erica-Irene Daes has achieved quietly and laboriously in her role as chairperson of the United Nations Working Group on Indigenous Populations. In her essay, "The Experience of Colonization Around the World," Erica introduces the theme of mapping colonization. She acknowledges that the anguished and urgent voices that she hears persistently are linked inextricably with aggression, violence, repression, and domination. These acts of oppression tear at the very spirit of individuals, denigrating the relevance and meaningfulness of their individual human lives. But being oppressed and marginalized, they are also, she notes, closest to an understanding of their oppression and to the sources of their healing and renewal. She outlines the social and psychological process of self-discovery in an emerging postcolonial world and the concomitant need for rebuilding alliances, making commitments, and holding nations accountable for their peoples. Her note of optimism is a fresh breeze on a still, hot summer day.

Western Door

Domination and oppression cannot be altered without the dominated and the dominators confronting the knowledge and thought processes that frame their thinking, their complacency, and their resistance. In "The Context of the State of Nature," James Youngblood (a.k.a. Sákéj) Henderson maps the contours of the false context that has shaped the recent era of domination that underpins modern society. He describes the foundational constructs of an artificial social contract and the laws and institutions that

sustain it. The modern liberal state in Canada is the outcome of historic events. Sákéj suggests, however, that the liberal state was and is by no means the only alternative for developing a social contract for society. Treaty commonwealth is a social and legal alternative to colonization that challenges the current artificial context of the liberal state. As Sákéj explains, it is a viable alternative that represents rules of negotiation, consent, and remedies that embrace a more equitable relationship among people in a natural society.

Robert Yazzie, Chief Justice of the Navajo Supreme Court, contextualizes colonization among the Navajo, describing a series of laws, practices, and schemes that sought to control and dominate Native Americans in the United States. In "Indigenous Peoples and Postcolonial Colonialism," he chronicles the historical destruction of the Navajo and the consequences of this destruction for their worldview, traditions, and beliefs. He explains how historical clashes between Navajo and Eurocentric worldviews are manifested in legal and social discontinuity today. He offers a model of Navajo restoration of justice that is reemerging as a foundation for decolonized forms of justice and peacemaking within the Navajo Nation and that yields programs of recovery, reconciliation, and healing.

Poka Laenui (a.k.a. Hayden F. Burgess), a leading Indigenous lawyer, provides the voice of resistance of the Indigenous peoples of Hawaii. In his essay, "Hawaiian Statehood Revisited," he relates the cost of statehood to self-determination and raises vital questions for the future of the Indigenous people of Hawaii. The annexation of the islands that were called Hawaii to the United States was characterized as a glorious moment of celebration, a seemingly win-win liaison of positive value and merit to both Hawaii and the United States. However, a decade later the Indigenous voices of opposition began to be heard amid the large-scale destruction of Indigenous lands, rights, and sovereignty. Fraud rooted in colonial attitudes and policies led to Indigenous lands being "ceded" to the United States. The call for self-governance in the territories, a process meant to break the chains of colonization, ultimately led to an intentional perverting of the alternatives to statehood for Indigenous Hawaiians, which led to their further colonization.

Northern Door

Dismantling colonization to create a postcolonial state is an unfolding vision for Indigenous peoples worldwide. Sákéj Henderson, in "Postcolonial Ghost Dancing: Diagnosing European Colonialism," continues his analysis of colonization by examining the strategies, techniques, and competing components that constitute the system of colonialism. The theory of universality and the strategy of difference that underpin Eurocentric

thought serve colonial domination by universalizing negative caricatures of Indigenous peoples to justify aggression, control, and domination. In the late nineteenth century, in their desperate longing to restore their past, the Plains Indians danced the Ghost Dance. The Ghost Dance that Indigenous peoples are dancing today is for the restoration of their worldviews in all areas of scholarship and professional practice.

Leroy Little Bear, the animator of the ten-day summer institute, provided ongoing analysis of the clashing worldviews of Aboriginal people and Canadian immigrants. His mapping of the Plains Indian worldview, culture, socialization, and methods of social control in "Jagged Worldviews Colliding" explains the jagged edge of empire that the Blackfoot encountered. It also explains how colonization results in overlapping, contentious, and competing cultures in modern society. Recognizing how these differences create discontinuity, division, and dissent among oppressed Indigenous peoples, including areas of law and education, Leroy seeks a new global order built on respect for diversity.

The psychological consequences of colonization for the oppressed have been largely characterized by Western psychology's attempt to achieve a state of "normalcy," an identity projected onto Indigenous peoples from European origins and images. In "Applied Postcolonial Clinical and Research Strategies," Bonnie and Eduardo Duran investigate cross-cultural psychology and seek a recognition of the sociohistoric reality that created the psychology of the oppressed – their acute and chronic reaction to genocide and colonization. They seek a decolonized analysis that includes giving credence to Native American history, identities, traditions, dreams, and visions, as well as utilizing Native people's own theories and methods for restoring the self and the nation. This essay, drawn from their book *Native American Post-Colonial Psychology,* seeks to reconceptualize cross-cultural psychology and to build bridges between Western therapy and Native American healing methods.

The psychology of the oppressor and the psychology of the oppressed are different faces of the same coin, dependent on each other for their value. Ian Hingley, a Saskatchewan teacher, chronicles his personal journey as dominator in "Transforming the Realities of Colonialism: Voyage of Self-Discovery," an introspective narrative that brings him to the awareness of his own privilege. He outlines his growing awareness of a systematically internalized mind-set that benefited from the subjugation and oppression of others. His journey to aspire to social justice, he acknowledges, must come with an awareness of his own privileges, often gained at the cost of others. He describes his awakening realization of his personal responsibility to make a conscious choice for change, a change that will result in a postcolonial world where privilege is not an inherent ingredient of oppression and self-honesty can lead to a collaboratively structured society.

Eastern Door

Our visions and dreams of a postcolonial world are not just emerging from a cognitive realm, and thus subject to the great or small minds of humanity, but they are also evolving from the whole Earth, which has its own yield. "A Different Yield," by Linda Hogan, is excerpted from her book *Dwellings: A Spiritual History of the Living World.* In it she offers a view, taken from an Aboriginal awareness, of the Earth as alive – thinking, creating, cautioning, and offering a new and humane alternative. She reminds us that the Earth responds to kindness, respect, prayers, and songs in the same way that humans do. She urges humanity to listen to the underground language in us. Its currents pass between us and nature to reveal a new clarity and reverence for life found in an ecology of the mind, a yield that returns us to our own sacredness, self-love, and a respect that will extend to others.

People speak their languages and relate their stories not just to tell of subsistence or sovereignty but also to tell of all that is meaningful for understanding ourselves, individually and collectively, as human beings. In "From Hand to Mouth: The Postcolonial Politics of Oral and Written Traditions," J. Edward Chamberlin reminds us how the world of reality and the world of imagination are sites of struggle for authenticity and authority. These worlds are manifested in languages, which are instruments of both survival and power. Chamberlin draws on language to examine the parameters of postcolonial theory, as one way but not the only way of looking at the lands, livelihoods, and languages of Indigenous peoples. He anticipates that postcolonial theory can open new understandings of the situation faced by peoples involved in the challenge of decolonization.

Asha Varadharajan provides a critical examination of the Western intellectual tradition that has institutionalized racial and cultural differences, thereby excluding "Others," and she urges a dialogue about the ideological conflicts in the Western intellectual tradition. In her essay, "The 'Repressive Tolerance' of Cultural Peripheries," she argues that it is not particularly useful to find or declare who is guilty in Western culture for colonialization, or to substitute one culture for another, but it is vital for modern society to explore the paradigmatic power of Western conceptions and to interrogate their function as normative categories in colonization. Her essay relates how race, sex, and class configure the critical discourse of Western thought from what is essentially a position of difference and how race, sex, and class subsequently inform anticolonial dissent and a vision of an antiracist future.

In "Processes of Decolonization," Poka Laenui again brings forward the Hawaiian example to illustrate the processes of colonization and decolonization and to describe what the processes of rediscovery, recovery,

mourning, dreaming, commitment, and action mean in the context of Hawaii's quest for sovereignty.

This book raises some essential questions for Indigenous peoples. How do we create a postcolonial society? How do we create a just society and an innovative consciousness? How do we heal people who continue to suffer? Recognizing the role that society and its institutions have played in imposing their script on Indigenous peoples, Sákéj Henderson examines the legal system of jurisprudence. In "Postcolonial Ledger Drawing: Legal Reform," he points out both the cognitive and ideological prisons of modern legal thought and the postcolonial dreams and processes that can in practice empower peoples. Restoring rights to the diverse worldviews, languages, identities, and treaty orders of Indigenous peoples in the supreme law of Canada is not just a dream; it has been achieved in the Constitution of Canada in sections 35 and 25, which affirm and protect the rights of Aboriginal people. Aboriginal orders, visions, and dreams are entrenched in the Constitution. These constitutional rights offer one layer of restoration for Indigenous peoples; the next layer is one for each of us to undertake, to implement restoration in responsible and reciprocal ways.

Aboriginal peoples have been invisible. Their rights have been trampled on by nation-states that protect themselves behind domestic and international laws that simultaneously speak out against standards of injustice, while they routinely normalize the genocide and torture of Indigenous peoples. The principle of non-interference in the internal affairs of states has led to massive human rights violations. The Indigenous peoples of Canada in small but vocal groups have made their way to the international forums to find people of like mind who have had to endure similar treatment worldwide and who are ready to stand together in solidarity against these oppressions. In "Invoking International Law," Ted Moses, Ambassador to the United Nations for the Cree Nation, describes the efforts made in bringing Indigenous issues to the international community and the struggles that continue in multiple layers of diplomatic activity as Indigenous peoples persist in their efforts to protect their Indigenous right for self-determination.

Southern Door

Seeking a postcolonial education begins with Indigenous peoples exploring their own symbols, expressions, and philosophy of Indigenous education and creating the context that they need, not only to make sense of who they are but also to assert that sensibility in all aspects of their lives. It begins with Indigenous peoples knowing their languages, their metaphors, their symbols, their characters, their stories, their teachers, and their teachings. In "Indigenous Knowledge: The Pueblo Metaphor of Indigenous Education," Gregory Cajete offers some Pueblo teachings embedded

in the symbols of his people as a way to reflect on how we can use the tools of education in the process of redefining and reinventing the contemporary philosophy of Indigenous education. These teachings reverberate in Indigenous societies throughout North America in many different forms and practices and serve as a model for reconnecting with what was once hidden or suppressed, to find ourselves whole, balanced, open, and responsive, ready to assume the map that we have inherited and enfolded within each of us.

Given the persistent travesty of trust of Indigenous children in federal and public schools in Canada, the challenge for postcolonial educators is to transform education from its cognitive imperialistic roots to an enlightened and decolonized process that embraces and accepts diversity as normative. In the essay "Maintaining Aboriginal Identity, Languages, and Culture in Modern Society," I have sought to unravel and challenge the assumptions of modern society and to seek alternatives and processes that acknowledge the rights outlined in the Canadian Constitution and United Nations conventions and declarations. Legislation and policies that advance equitable education and respect for distinctive perspectives and understandings and ways of knowing are offered as a means of achieving these goals. Modern Western society has much to gain by learning about and from Indigenous peoples, but without a structural framework to achieve these ends the goals of decolonization will fall short of being actualized.

In the course of seeking a postcolonial vision, Indigenous peoples find many sites of struggle where they must actively assert themselves, their visions, and their knowledge to make transformative change a viable and lasting process. Sharing the Maori manifesto of Aotearoa (New Zealand) in "Protecting and Respecting Indigenous Knowledge," Graham Hingangaroa Smith addresses some of the central themes of decolonization and offers the Maori experience to illustrate some of the resistance and proactive strategies that have resulted in many of their successes. No longer content with mere social equality or good race relations that serve the status quo, the Maori have coalesced their struggle into a vision of self-determination. Drawing on their own schools and language to educate their children to their greater destiny, they have merged their Indigenous knowledge with their objectives and have developed the holistic vision and philosophy of Kaupapa Maori. Kaupapa Maori has defined and solidified their individual and collective roles, responsibilities, and processes to empower their vision and their future.

The need for a decolonized context inspires Indigenous peoples to break their silence and regain possession of their humanity and identity. Linda Tuhiwai Te Rina Smith, a leading Maori scholar, identifies the challenges for Maori people in making research a retrieved space from which to carry

out the aims of Kaupapa Maori philosophy. Her essay, "Kaupapa Maori Research," maps out the developing field of an Indigenous epistemology that is as much emerging philosophy as it is adherence to a cultural worldview and process. It involves Maori peoples taking responsibility for what gets researched, as well as for how research is done, not just from some vague Western codes of ethics but also from within the parameters of Maori language, culture, and philosophy. Good Kaupapa Maori research takes into account the people, their history, their philosophy and principles, their legitimacy, and their struggle for autonomy over their own self-determination, their *tino rangatiratanga*.

The remaining obstacles to understanding Aboriginal consciousness and order are challenged in Sákéj Henderson's final essay, "*Ayukpachi:* Empowering Aboriginal Thought." Sákéj explores the application of the Aboriginal mind, spirit, and language to modern challenges and explores how that application remains interrelated with their traditional ecology and the knowledge base developed within their worldview and language. Mapping out some of the "langscape" of those Indigenous worldviews, he illustrates how an indeterminate yet empowered future can unfold from reliance on Indigenous thought, rather than from total reliance on Eurocentric thought.

Maintaining Aboriginal Identity, Language, and Culture in Modern Society

Marie Battiste

Aboriginal people in Canada pose a serious question to the Canadian educational system: How should schools be structured and content developed and delivered to offer equitable outcomes for Aboriginal peoples in Canada? Aboriginal peoples articulated their goals for education in 1972, when the National Indian Brotherhood sought to take control of Indian education. These goals have not changed in the intervening years. Aboriginal parents still wish for their children to participate fully in Canadian society but also to develop their personal and community potential through a fully actualized linguistic and cultural identity and from within their own Aboriginal context.

There have been innovations in Aboriginal education in the past twenty-five years, both at the First Nations and at the provincial levels, but these reforms have not gone far enough. The existing curriculum has given Aboriginal people new knowledge to help them participate in Canadian society, but it has not empowered Aboriginal identity by promoting an understanding of Aboriginal worldviews, languages, and knowledge. The lack of a clear, comprehensive, and consistent policy about Aboriginal consciousness has resulted in modern educational acts that suppress these integral cultures and identities. Most public schools in Canada today do not have coherent plans about how teachers and students can know Aboriginal thought and apply it in current educational processes.

Educators have suggested that problems arise because the "style of learning" through which Aboriginal students are enculturated at home differs markedly from the teaching style of the classroom. Linguists have pointed out that these differences may lead to sociolinguistic interference when teachers and students do not recognize them. These theories, however, do not get to the root of the problem. Non-Aboriginal scholars have avoided the major evaluative issue, which I have previously called cognitive imperialism or cognitive assimilation.[1] Scholars within the United Nations have called it cultural racism.[2] Cognitive imperialism, also known

as cultural racism, is the imposition of one worldview on a people who have an alternative worldview, with the implication that the imposed worldview is superior to the alternative worldview.

The 1996 report of the Royal Commission on Aboriginal Peoples reaffirms both the goals of Aboriginal parents for the education of their children and the gaps in the current educational system.[3] It explains how current educational policy is based on the false assumption of the cultural superiority of European worldviews, and it recommends ways to eradicate the many obstacles that stand in the way of the advancement of Aboriginal peoples in Canada today. The report attests to the need for the transformation of knowledge, curriculum, and schools. It recognizes that the current curriculum in Canada projects European knowledge as universal, normative, and ideal. It marginalizes or excludes Aboriginal cultures, voices, and ways of knowing. In this chapter, I will explore how Aboriginal identity, languages, and cultures can be maintained in the current educational system of Canada and what innovations are required to do this. I will also explore the challenges that lie ahead for educators in effecting an education that respects and nourishes Aboriginal languages, cultures, and identity.

It should be stressed that Aboriginal consciousness cannot be maintained without first challenging the assumptions of modern society. Confronting the difficulties in maintaining Aboriginal consciousness in modern thought may be too much for the current educational system, but language revival, maintenance, and development remain as a challenging task for Aboriginal peoples to undertake in their quest for decolonization and self-determination.

Public School Education: Benign Fragmentation

Most Canadians trust their educational system. Education is not only the arena in which academic and vocational skills are developed but also the arena in which culture, mores, and social values are transmitted to the student. The educational system, fostered by government and society, is the basis of Canadian cultural transmission. However, for children whose languages and cultures are different from mainstream immigrant expectations, this educational system is a form of cognitive imperialism.

The military, political, and economic subjugation of Aboriginal peoples has been well documented, as have social, cultural, and linguistic pressures and the ensuing detrimental consequences to First Nations communities, but no force has been more effective at oppressing First Nations cultures than the educational system. Under the subtle influence of cognitive imperialism, modern educational theory and practice have, in large part, destroyed or distorted the ways of life, histories, identities, cultures, and languages of Aboriginal peoples.

Most Canadians, both Aboriginal and non-Aboriginal, have long accepted some of the fundamental assumptions underlying modern public school education. We have assumed that education is a kind and necessary form of mind liberation that opens to the individual options and possibilities that ultimately have value for society as a whole. On the face of it, education appears beneficial to all people and intrinsic to the progress and development of modern technological society.

But public schooling has not been benign.[4] It has been used as a means to perpetuate damaging myths about Aboriginal cultures, languages, beliefs, and ways of life. It has also established Western science as a dominant mode of thought that distrusts diversity and jeopardizes us all as we move into the next century. After nearly a century of public schooling for tribal peoples in Canada, the most serious problem with the current system of education lies not in its failure to liberate the human potential among Aboriginal peoples but in its quest to limit thought to cognitive imperialistic policies and practices. This quest denies Aboriginal people access to and participation in the formulation of government policy, constrains the use and development of Aboriginal cultures in schools, and confines education to a narrow scientific view of the world that threatens the global future.

There are two different points at issue here. The first is the right of Aboriginal peoples to exercise their own culture; the second is the benefit that the Western world can derive from this culture. Western scholars are gradually realizing how important Aboriginal knowledge may be to the future survival of our world. Not only is it important that Aboriginal cultures are preserved and encouraged, but it is also important that they are recognized as the domain of Aboriginal peoples and not subverted by the dominant culture.

Two international conferences since the mid-1970s have drawn attention to the right of Aboriginal peoples to the preservation of their cultures in the face of cognitive imperialism. The World Conference on Indigenous People in 1978 "endorse[d] the right of Indigenous Peoples to maintain their traditional structure of economy and culture, including their own language."[5] In 1989, a United Nations seminar on the effects of racism and racial discrimination on the social and economic relations between Indigenous peoples and states concluded that global racism was taking on the new form of state theories of cultural, rather than biological, superiority, resulting in rejection of the legitimacy or viability of the values and institutions of Indigenous peoples.[6]

Ironically, although the value of Indigenous culture is devalued by cognitive imperialism, the dominant society has a tendency to take elements of traditional Aboriginal knowledge out of context and claim them for itself. In 1993, the chairperson of the Working Group on Indigenous Populations, Dr. Erica-Irene Daes, prepared a report condemning the widespread

and continued exploitation of traditional knowledge and culture by Eurocentric institutions and scholars.[7] She described this as the final stage of colonialism, following the exhaustion of Indigenous peoples' tangible assets. Daes argues for the urgency of taking international action to protect the dignity, privacy, and identity of Indigenous peoples without waiting for the adoption of the declaration. The principles laid out by the working group acknowledge that the heritage of an Indigenous people is a complete knowledge system with its own concepts of epistemology, philosophy, language, and scientific and logical validity that needs protection from Eurocentric exploitation. In the 1990s, designated by the United Nations as the International Decade of the World's Indigenous Peoples, the Working Group on Indigenous Populations and related activities are developing an understanding of and a cure for cultural racism and are furthering the immediate, practical processes of cultural restoration in decolonized states.[8]

Confronting cultural racism in Canada is a difficult task because cultural racism cannot be contained to any one portion of the state. It is a systemic form of racism that cannot be dealt with in schools through classroom supplements or add-on courses. Confronting the problem requires a holistic understanding of modern thought and the purpose of education.

Curriculum, Colonialism, and Incoherence

Although the notion of "one best educational system" has been largely discredited, the notion that there is "one best remedy" for our educational ills has not. Modern society is still looking for and frequently is offered simple cures for these ills, one-ingredient prescriptions that claim to be panaceas. But there is no cure-all, no educational antibiotic to be administered externally by injection into the state to cure the modern ills.

To understand how education in Canada continues to suppress or exterminate Aboriginal consciousness, one has to understand modern thought. The existing body of research, which normally provides reference points for new research, must be examined and reassessed. This is no small task. Few Canadians understand the relationship of modern thought to the educational system. Most educators assume that modern thought is an accurate description of reality, and this assumption is at the centre of the modern curriculum. Yet modern thought establishes an artificial and imaginary realm. The immigrants left their own societies and entered tribal Canada. In our Aboriginal homeland, they began to develop a society that they imagined into being through laws and regulations. The affirmation and continuation of this imaginary realm are supplied through the provincial educational system. This imagined immigrant society is distinctive from Aboriginal societies, whose customary rules are grounded in the laws of nature.

The purpose of education is to transmit culture to new generations. But culture remains elusive; it is implicitly summed up by skills and shared traditions. Since there is no agreement about transmitting culture, the real purpose of education is to affirm the political and social status quo. The task of education in Canada is to explain the immigrant's broad privileges and wealth in another's homeland. The curriculum has to justify immigrant privileges in Aboriginal America. In the past, the immigrants relied on the racism built into their political system to justify their privileges. Since the United Nations human rights declarations and covenants in the 1990s, these foundational standards have been universally rejected, and the necessary justification to sustain privilege has moved into the educational and cultural arenas.

In every educational circumstance, much of what is learned depends on the context in which it is learned. Within the context of public school education, one can identify a few basic preconceptions about reality that exercise an overwhelming influence over education in this country. The modern Canadian educational structure has its theoretical ambitions pinned to the development of a supposed science of history and society. This supposed science is based on false concepts of race and evolutionary thought; however, in the modern curriculum, these frameworks are taught as if Canadians were mere puppets of them and of the forces that generate and sustain them.

The supposed science of history and society presents humans as the product of an evolutionary or cultural logic on the one hand and of deep-seated, unalterable economic, organizational, or psychological constraints on the other. Educational institutions insist that abandoning this way of viewing the world would lead humans to theoretical nihilism and destroy the established social order. Educational theory does not argue that society can be remade or reimagined; instead, it postulates that, without recognizing this evolutionary logic and these practical constraints, humans and society will lose intellectual guidance. As a result, education must affirm the existing social order and its theory of control. Other forms of culture or social life are recognized in the curriculum as expressions of a different way of being human within the evolutionary logic or practical constraints.

The modern political theory of democracy, on the other hand, argues that humans can completely override these institutional arrangements. Modern experience in constitutional debates and in legislation with these arrangements shows that often these frameworks are put aside. Canadians think and act, incongruously and surprisingly, as if institutional arrangements or frameworks are not for real, as if they merely pretend to obey them while awaiting an opportunity to defy them. They can disrupt these established arrangements; they can replace them, if not all at once, then piece by piece.

Following the recent work done under the auspices of the United Nations, theorists of modern society in Canada have been forced to acknowledge that current social arrangements do not reflect a higher rational or practical necessity. Instead, modern political theory establishes immigrant society as a form of society that can be reinvented and reformulated at will. Modern educational theory is thus in a predicament. It is based on justifying and perpetuating the status quo, yet it has to acknowledge the recent shift in thinking that immigrant society is an invented society that can be recast. In defending immigrant society, it can no longer rely on discarded theories of racial or cultural superiority, but it cannot refer to an overarching set of objective values for justification either. Aboriginal societies reflect the patterns of nature; they are grounded in the world around them. In contrast to this grounding of Aboriginal society in an order outside itself, there exists no theory of Canadian immigrant society that reflects social order as an eternal pattern of human nature or social harmony. The contrast between the political theory of modern society and educational theory shows how fragile these arrangements and ideas are in daily life.

Schools affirm the status quo by talking of "training men and women the age needs." Who determines what the age needs? If there are some sorts of people every age needs, then there should be permanence in education. This training helps to preserve class structures and selects the elite rather than sorting everyone out according to their innate capacities. This sorting also passes family or parental responsibility on to the state, leading to a disintegration of the family for the abstraction of the society.

What is apparent to Aboriginal peoples is the need for a serious and far-reaching examination of the assumptions inherent in modern educational theory. How these assumptions create the moral and intellectual foundations of modern society and culture has to be studied and written about by Aboriginal people to allow space for Aboriginal consciousness, language, and identity to flourish without ethnocentric or racist interpretation. The current educational shortcomings may or may not be in the curriculum, or in finance, or in testing, or in community involvement, but no one will ever know this – nor the changes necessary for improvement – without a deeper philosophical analysis of modern thought and educational practices.

Decolonizing Education and Cultural Restoration

When most non-Aboriginal people think of why they would support the maintenance of Aboriginal consciousness and language in modern education, they view it as enabling Aboriginal students to compete successfully with non-Aboriginal students in the imagined immigrant society. Educators argue that school systems can maintain Aboriginal identity, culture,

and languages by making a conscious effort to teach the children how to act in the modern classroom. They do not know or understand the cognitive shock they would be forced to endure if Aboriginal consciousness and language were to be respected, affirmed, and encouraged to flourish in the modern classroom.

Cognitive imperialism is a form of cognitive manipulation used to disclaim other knowledge bases and values. Validated through one's knowledge base and empowered through public education, it has been the means by which whole groups of people have been denied existence and have had their wealth confiscated. Cognitive imperialism denies people their language and cultural integrity by maintaining the legitimacy of only one language, one culture, and one frame of reference.

As a result of cognitive imperialism, cultural minorities have been led to believe that their poverty and impotence are a result of their race. The modern solution to their despair has been to describe this causal connection in numerous reports. The gift of modern knowledge has been the ideology of oppression, which negates the process of knowledge as a process of inquiry to explore new solutions. This ideology seeks to change the consciousness of the oppressed, not change the situation that oppressed them.

Whether Aboriginal or black or other visible minority in Canada, a similarity in treatment and themes of denial and oppression have resounded in society and through educational practices. In her book *Invisibility in Academe*, Adrienne Rich describes the result: "When someone with the authority of a teacher, say, describes the world and you are not in it, there is a moment of psychic disequilibrium as if you looked into a mirror and saw nothing."[9]

In the Canadian educational system today, Aboriginal people continue to be invisible.[10] Occasional pictures in books are the only images of our participation in the educational world. The content of these books, however, does not represent our worldview. Aboriginal people have had to endure a "planting out" of our systems when students were boarded in white homes to learn proper behaviour and acceptable skills for working in lower-class occupations. They have had to submit to child sexual and psychological abuse and boarding schools from age five to sixteen. The cultural imperialistic curriculum in these schools has degraded and demoralized cultural minority students, assigned them to transitional classes, failed them, and then accused them of lacking motivation, attention, or spirit.

As we approach the twenty-first century, we need to take a look at where we have been and where we are going. First we must become painfully aware of what has happened to children and to Aboriginal people across Canada, and then we must seek to find ways to resolve those problems. We must find resources to enable all children to have the rights outlined

in the *Canadian Charter of Rights and Freedoms* and the United Nations *Convention on the Rights of the Child.*

Aboriginal languages are the basic media for the transmission and survival of Aboriginal consciousness, cultures, literatures, histories, religions, political institutions, and values. They provide distinctive perspectives on and understandings of the world, which educational research has ignored. The suppression or extermination of this consciousness in education through the destruction of Aboriginal languages is inconsistent with the modern constitutional rights of Aboriginal peoples.

Aboriginal languages are the means of communication for the full range of human experiences, and they are critical to the survival of the culture and political integrity of any people.[11] These languages are a direct and powerful means of understanding the legacy of tribal knowledge. They provide the deep and lasting cognitive bonds that affect all aspects of Aboriginal life. Through sharing a language, Aboriginal people create a shared belief in how the world works and what constitutes proper action. The sharing of these common ideals creates a collective cognitive experience for tribal societies that is understood as tribal epistemology.

Where Aboriginal knowledge survives, it is transmitted through Aboriginal language. There is clear and convincing evidence that student achievement and performance in school and pride in Aboriginal communities and heritages are directly tied to respect for and support of the students' Aboriginal languages.[12] Although it is clearly in the interests of the educational system to encourage the full academic and personal achievements of Aboriginal students, absolutely nothing has been done by the federal or provincial governments in Canada to remedy this educational problem. Nothing has been done to preserve, protect, and promote the rights and freedoms of Aboriginal people to use, practise, and develop Aboriginal languages in Canada. Canadian lawmakers and educators have overlooked the right of Aboriginal languages to exist as a medium of instruction in the schools, failed to recognize the official status of Aboriginal languages for conducting Aboriginal business, and failed to encourage educational institutions to allow the same academic credit for proficiency in Aboriginal languages as for proficiency in foreign languages. In contrast, the United States[13] and the United Nations[14] have passed legislation recognizing the right of Aboriginal peoples to use their traditional languages.

Many Aboriginal students still speak their Aboriginal languages, but there are no courses and extremely limited materials for helping them to make the transition to the working languages of Canada. These students, labelled "at risk," are relegated to the lower levels of academic achievement, where most remain. Limited ability in English (or French) impedes the progress of many minority children throughout Canada.[15] Teaching English (or French) as a second language must be unilaterally implemented

in all schools where the students' language is different from the school's language.

Instead of requiring Aboriginal students to submit to a third language (French in English-speaking Canada and English in French-speaking Canada), they should have the opportunity to explore their first language in a provincially accredited course in elementary and secondary school, as well as to find appropriate ways to explore their understandings and expand their knowledge and usage of their second language of English or French. Being required to learn French or English as a third language, without a good handle on their first or second language, imposes yet another major hurdle that impedes Aboriginal students from achieving educational equity.

Books and materials in provincial public schools do not accurately depict the history and cultural diversity of Canada. Although some provinces have made great strides in correcting the blatant racism found in texts, the truth is still obscured in favour of a more rational and polished early existence in Canada. Beautiful images of Aboriginal peoples in Native regalia cannot be allowed to subvert the historical truths that publishers wish not to discuss. Polished texts obscure Aboriginal history, cultures, and languages while perpetuating the myth of an empty land in the New World that was ripe for discovery by European explorers. Kits and thematic units prepared by public education in some areas of Canada depict a prehistoric life of Aboriginal peoples, complete with teepees, skins, animal bones, rock tools, and arrowheads. Aboriginal peoples are depicted as primitives, gone after the arrival of the early settlers or working their way toward assimilation in urban areas.

Provincial public education has denied our people the right to speak to the issues of the past, to explain and understand the courses of action that we have had to take in these periods of adversity, and to be honoured for those choices. It is our heritage that we were given the right and the responsibility to pass on to our children. As yet, we have not been allowed the dignity to choose what is important to pass on through the public schools.

All First Nations and provincial schools require new teaching materials that depict, accurately and adequately, the culture, history, heritage, worldviews, and philosophies of Aboriginal peoples. Currently, only a few schools are producing materials in Aboriginal languages: most Aboriginal language programs publish their own. Book companies are reluctant to publish language materials that reach only a small group of people; however, the need has been established in Canada for the reevaluation of curriculum content in the schools and for a concerted effort to integrate Aboriginal knowledge into it. We need to encourage book companies to enlist other language groups into their book productions. Encouraging

various Aboriginal communities to offer English texts so that they can decide if the content can be appropriately translated at a lower cost is an additional incentive to have materials in the Aboriginal languages.

Elders are the critical link to Aboriginal epistemology through the Aboriginal languages. The last vestiges of Aboriginal languages exist in pockets of the Aboriginal population. There they are secured by certain families in a collective community consciousness. By introducing language and cultural education in First Nations-operated schools, Aboriginal people are attempting to retain and sustain their languages, cultures, and tribal knowledge through the assistance of elders and a bare-bones curriculum development program.

Some First Nations schools have provided flexibility and openness to new ideas and have used Aboriginal pedagogy to bridge epistemologies. Taking schooling out into the bush and bringing elders into the classroom are two ways in which First Nations schools have enriched the knowledge not only of students but also of teachers.[16] This flexible approach helps to spread tribal knowledge, but it has sometimes been at a cost to some part of the compulsory public school curriculum. As one area is enriched, some other area of the regular school curriculum is affected. The result is that Aboriginal students sometimes do not have the same cumulative knowledge as their non-Aboriginal counterparts, just as the non-Aboriginal students do not have the cumulative knowledge of their Aboriginal counterparts.

To maintain its flexibility, community-controlled Aboriginal education must remain outside the arena of provincial administrative regulations. Another reason for this distance is to ensure that a central administration does not profit from the progressive ideas developed in such educational milieus. For instance, the acceptance of tribal knowledge by some scientists and scholars, including David Bohm, David Peat, David Suzuki, Rupert Ross, and others, and the elevation of tribal epistemologies in research and roundtables and think tanks will have the profound effect of pushing modern knowledge to new questions and ways of thinking about problems and solutions.[17] The ownership of these ideas must remain with Aboriginal people. We must nurture this growth, guide it with our elders and tribal scholars, and find ways to share tribal epistemology beyond history and culture.

The real justification for including Aboriginal knowledge in the modern curriculum is not so that Aboriginal students can compete with non-Aboriginal students in an imagined world. It is, rather, that immigrant society is sorely in need of what Aboriginal knowledge has to offer. We are witnessing throughout the world the weaknesses in knowledge based on science and technology. It is costing us our air, our water, our earth; our very lives are at stake. No longer are we able to turn to science to rid us of the mistakes of the past or to clean up our planet for the future of our

children. Our children's future planet is not secure, and we have contributed to its insecurity by using the knowledge and skills that we received in public schools. Not only have we found that we need to make new decisions about our lifestyles to maintain the planet, but we are also becoming increasingly aware that the limitations of modern knowledge have placed our collective survival in jeopardy.

The public school curriculum is limiting the knowledge base of our children. They are being denied access to knowledge bases that they need to sustain themselves and the planet in the future. To deny that tribal epistemology exists and serves a lasting purpose is to deprive Aboriginal children of their inheritance, as well as to perpetuate the belief that different cultures have nothing to offer but exotic food and dance or a shallow first chapter in the story of what is to come. To allow tribal epistemology to die through the loss of the Aboriginal languages is to allow another world of knowledge to die, one that could help to sustain us. As Aboriginal peoples of this land, we have the knowledge to enable us to survive and flourish in our own homeland. Our stories of ancient times tell us how. Our languages provide those instructions.

With the recent development of First Nations schooling, we have once again resolved to involve the elders and our life ways in our development as human beings. We have begun by utilizing Aboriginal languages to teach the sacred knowledge of our ancestors. Our curriculum is based on the language, thematically taught, and aligned to the cycles, relationships, and rhythms of our existence. In this way, we are beginning to provide the balanced spectrum of education that we were denied under earlier federal policies of assimilation.

Western education has much to gain by viewing the world through the eyes and languages of Aboriginal peoples. The earth and its resources must be viewed through the lens of tribal knowledge if we are to understand how to protect the universe. Rituals and ceremonies that cleanse and heal, maintaining the balances, must be respected and honoured. Western science has promoted the development of modern society, which has initiated the best and worst of development from environmental and economic perspectives. Today we are faced with how we are to survive the global disasters created by our scientific ingenuity, as well as how we can bridge knowledge gaps created by the diversity of people and thought. Aboriginal languages and education can be the means to opening the paradigmatic doors of contemporary public education. Creating a balance between two worldviews is the great challenge facing modern educators.

Developing Legislation to Protect Constitutional Rights

Because modern society has no idea about the worldview within Aboriginal consciousness, the best way to encourage inclusion of this worldview

in the modern curriculum is through a comprehensive federal act. Under the existing constitutional rights of Aboriginal people, the federal government must enact legislation to provide an adequate quantity and quality of educational services based on Aboriginal consciousness, as well as equal access for Aboriginal people to an education distinct from the needs of other groups or peoples in Canada.

While legislation appears to be an obvious solution to the problem, this course of action has not been proposed in the recommendations put forward by the Assembly of First Nations in *Toward Rebirth of First Nations Languages* or in the *House of Commons Standing Committee on Aboriginal Affairs Report* on Aboriginal literacy and empowerment. Both of these groups suggest consultation, task forces, and institutional arrangements, which I endorse. I also endorse the spirit and intent of their recommendations. Still, these consultations, task forces, and institutional arrangements must lead to a federal act implementing our existing rights in modern society. Such a federal act is a more permanent framework for understanding the problem and carrying out solutions.

Such an act should declare community-based education as an existing Aboriginal and treaty right that must be fully complied with and supported. A delivery system must be developed to facilitate the flow of service and program funds in the most direct and immediate manner to the local program level with a minimum of delay and administration. Such an act must recognize the viability of funding community-based educational institutions as conduits of all aspects of Aboriginal education.

Aboriginal languages are irreplaceable resources that require protection and support. In particular, Aboriginal languages require official status in Canada, constitutional recognition, and accompanying legislative protection. In addition, provincial and federal schools should provide credit within the school system for Aboriginal language study.

Experience has shown, however, that it is not enough to formulate policy that recognizes the viability of community-based educational institutions for Aboriginal people in an act. Funding and administrative policies must ensure that weighing criteria exist for preserving and developing Aboriginal consciousness and languages in those educational institutions. There are more than enough modern thought–based schools and classrooms in Canada; the problem is to create an Aboriginal language–based curriculum. No politician, administrator, or educator should be able to destroy Aboriginal consciousness or language because of other priorities. Thus, explicit funding and policies must ensure that First Nations politicians or administrators cannot confiscate funding designated for the preservation of Aboriginal consciousness or languages for other temporal schemes. This is the lesson of our history with education.

Aboriginal communities should be encouraged to assume full control of

their education with adequate resources and funding to create an educational system that will develop Aboriginal consciousness through the development of Aboriginal language, culture, and identity. Where Aboriginal communities have instituted language policies in educational systems, these policies should be recognized and acknowledged by the federal government, and financial resources should be available to develop these policies and link these systems to other agencies and services that permit the development of languages.

Such an act must establish guidelines and funding incentives that will ensure that preserving and developing Aboriginal consciousness and languages is not viewed as a lesser part of the curriculum. Literacy is a Canadian resource that Aboriginal students must develop in their own languages before they are required to learn English. Funds must be provided to make Aboriginal literacy viable for schools to incorporate into their early childhood educational programs, in particular in the development of books and materials in the Aboriginal languages.

The act should encourage and require grantees to set aside a certain percentage of grant funds for in-service training and staff development programs on Aboriginal consciousness and languages to understand the scope and implication of the differences from modern thought. The existing network of provincial programs must be revamped to target program monies into enhancing Aboriginal consciousness and languages in all levels of the curriculum. The federal government should provide adequate resources to First Nations to ensure the development of language structures, curriculum materials, First Nations language teachers, resource centres, and immersion programs.

A network of regional curriculum centres for Aboriginal languages is justifiable. The regional centres would offer support for curriculum development with the assistance of local language informants and elders. Curriculum centres should be developed on a regional base suited to Aboriginal people so that they do not have to leave their communities for extended periods of time. Centres should be able to evaluate the established curriculum and work out solutions. The centres would offer curriculum developers and educational resources for the development of books by Aboriginal thinkers, as well as offer printing services at a reasonable rate. Some books may be accepted by other language groups in the region or nationally and, where appropriate, could be translated and printed, offering advantages such as lower rates due to the large number of books printed.

These centres should fund writing workshops and support writers who embrace Aboriginal thought and knowledge and apply it to methods of teaching. They should support and fund the research and writing of Aboriginal pedagogy and language curriculum and teaching. They should raise

the consciousness of the Canadian public about the positive value to all society of inclusive education as opposed to the current exclusionary model. They should provide information to communities about the stages of language loss and the restorative process that they may use to guide the growth of a healthy language base. These centres should develop and/or encourage curriculum advisory boards or committees composed of elders in the community who will guide the development of curriculum and the development of language research for educational purposes.

Such an act must waive the requirement for teaching credentials and overcome other barriers to the employment of Aboriginal elders who speak their Aboriginal languages in federal or provincial schools. Elders in Aboriginal communities are the custodians of endangered Aboriginal languages, and they must have dignity and an acknowledgment of the value of their services. Elders require the support of other elders and flexibility in timing and scheduling. They should be provided with these necessary amenities.

It seems obvious that elders and others who can pass on Aboriginal identity, languages, and culture should be directly involved in the modern educational system. Yet seldom has any government confronted the educational biases in modern thought or educational practice that exclude them from this role. A modern legislative solution to this problem is found in the *Native American Language Act.*[18] Section 104(s) declares that it is the policy of the United States to "allow exceptions to teacher certification requirements for Federal programs, and programs funded in whole or in part by the Federal Government, for instruction in Native American languages when such teacher certification requirements hinder the employment of qualified teachers who teach in Native American languages, and to encourage State and territorial governments to make similar exceptions."

Aboriginal languages cannot be isolated in the way that politics or economics can be isolated in modern thought. Advocates of cultural studies argue that no person from another worldview can learn about other cultures except by being there and listening. (This is called "fieldwork.") Languages are said to be learned, not genetically encoded. Learning any language requires time and patience – one cannot simply use one's imagination to invent other cultural worlds, methods, and perceptions. Human imagination is as culturally formed as are distinctive ways of weaving, performing a ritual, raising children, grieving, or healing. All these activities are specific to certain forms of life.

In this era, discussion of limited funding is merely another way to avoid implementing constitutional rights and human rights. Yet without funding, the future costs for developing a curriculum that includes Aboriginal knowledge and languages are horrific. A base formula must be established

to offer stable funding for Aboriginal education – funding at a level equal to provincial standards. The finances should be derived by implementing a procedure that identifies tax revenue already collected at the municipal, provincial, and federal levels, including money that normally flows into the existing tax revenue from treaty entitlements to the Crown, Aboriginal resources, and Aboriginal economic development activities.

This tax revenue has never been considered as having emanated from Aboriginal or treaty rights or from Indian reserves and communities, which in fact contribute a major portion of tax revenue to governments. After the federal government has identified and isolated dollars from a tax study and estimates have been made of these dollars, the monies may be supplemented by federal appropriations.

The act should encourage Aboriginal youth to obtain technical and professional levels of education once they have had the chance to learn the history of their own nations. When they perceive that education can have a positive impact on their own lives and those of their people; when there are Aboriginal role models who reflect the best values of their nations and who nurture culture and language development in their communities; and when good economic opportunities are created so that they can remain in their communities – all this can reflect on the existing body of Aboriginal knowledge. Still, each one of these solutions requires major changes.

Little classroom research has been done on the effects of teaching students about their culture, history, and languages, as well as about oppression, racism, and differences in worldviews, but consciousness-raising classes and courses at the elementary and junior high school levels, and at the college and university levels, have brought to the surface new hopes and dreams and have raised the aspirations and educational successes of Aboriginal students. Our people are slowly coming to understand that poverty and oppression are not their fault and are not the result of their faulty language, consciousness, or culture. They have begun to understand that poverty and oppression are tools created by modern society to maintain the status quo and to foster and legitimize racism and class divisions. As band schools offer courses in Aboriginal language and thought, and as economic opportunities are made available to Aboriginal peoples on reserves through education, racism and its residual effects in the non-Native community and family are being exposed.

First Nations government is a critical element in this development. First Nations must institute policies of hiring Aboriginal people whose first language is an Indigenous language and who will encourage its function and use in the workplace. If a language has little function in the daily lives of people, it will die. Leaders of the First Nations must inspire the youth to acquire an education so that they can benefit from increased

responsibilities. The leaders must also inspire the youth to develop their skills for the nation and their valued language and culture. The First Nations must allow their own educated Aboriginal people to assume responsible positions in their community development, positions that nurture respect and honour, instead of passing these jobs to non-Aboriginal people or to family members with lesser qualifications. The strength of tribalism lies in our collective values, which must be fostered toward a collective consciousness as opposed to individual gain. Schools and community leaders must seek to nurture among the youth these traditional attitudes of collective community as they seek to develop their nation's growth. As the collective gains, so also do its parts. Collective healing in our community of the pains of the past and present will shape the attitudes of the youth. They must understand their past and the context of their present to embark on a new vision of the future.

Protecting and Respecting Indigenous Knowledge

Graham Hingangaroa Smith

During the 1996 International Summer Institute at the University of Saskatchewan, I listened intently to the speakers and discussions and then organized my thoughts in order to respond interactively with issues previously raised. While the topic addressed at the institute generally kept faith with the theme of respecting and protecting Indigenous knowledge, I deliberately broadened my presentation to reflect upon some of the critical issues that had been raised by different speakers in the institute. This chapter closely reflects the original contribution made at the institute, which was presented in the traditional Maori form of oral presentation, *whaikoreo.* The appropriate *mihi* ritual introduction was performed, the words were spoken from the heart, the "truth" spoken by the speaker was laid out before the people for validation, the speech was delivered orally, and it was concluded with a traditional *waiata* or song. The presentation has been altered minimally to conform to printed conventions.

In this chapter, I will attempt to do three things. First, I want to deal with the protection of Indigenous knowledge within the context of the institute: that is, I want to respond to some specific challenges that came from voices gathered at the institute. Second, I want to explore what I call the "new formations of colonization" and look at one example in particular: the way in which Indigenous knowledge has become "commodified" as a result of the development of an emphasis on free-market economic forces. Third, I want to relate some of the specific strategies of resistance that are being developed within our context in New Zealand. In particular, I would like to describe the Maori case study as a possible example for other Indigenous communities to consider. I offer this example not to assert the definitive answer to the problems raised by colonization but to offer insights into what is and what is not working for us. You, of course, must decide for yourselves what is relevant and useful for your own situations. The key thing that I hope will interest people is the transformative

processes we chose to adopt. This particular discussion is not so much about the structure of our interventions as it is about the processes we used to put those interventions in place. This, I think, is one of the ironies of Indigenous struggle: it is the actual process of struggle that makes us strong and committed and that helps us to consolidate why we are struggling. That is, struggle constantly forces us to identify and review what we stand for and what we stand against.

Seven Challenges Raised by the Summer Institute

The first challenge I want to respond to is what I call the challenge to Indigenous people to engage in positive, proactive initiatives rather than resorting to reactive modes of action. This proactive type of action can be illustrated in the tensions within the following dichotomies: the difference between having a fence at the top of the cliff and an ambulance at the bottom; the difference between prevention and cure; the difference between seeing oneself as responsible for Indigenous problems as opposed to understanding the wider societal structures; the difference between biological explanations and sociological explanations with respect to social and cultural differences. I am not suggesting that these positions are always absolute opposites; however, my view is that we Indigenous peoples should be concerned with accentuating preemptive and proactive actions rather than being sidetracked into being overly concerned with reactive responses. In Freire's terminology, we must "name the world for ourselves." While we should acknowledge that there are multiple sites where the struggle against oppression and exploitation might be taken up, Indigenous peoples must set the agenda for change themselves, not simply react to an agenda that has been laid out for us by others. With respect, I have felt a little uncomfortable with some of the discussion that has taken place at this institute when it has clearly come from a reactive mode of thinking. I would encourage the members of this institute to reflect carefully on the difference between being proactive and being reactive.

I would like to revisit some of the points made by Poka Laenui, who argued for the development and adoption of five steps of decolonization. My concern with this focus is that we might again be spending too much time in a reactive mode. The point here is the extent to which we are drawn into engaging with and justifying ourselves to the dominant society. I believe that such a process puts the colonizer at the centre, and thereby we become co-opted into reproducing (albeit unintentionally) our own oppression. While there is an important place for critical deconstruction of colonization (and I do not wish to diminish the powerful and valuable words offered by Poka Laenui), my concern is to concentrate our limited energies and resources on what it is that we want.

This latter point can be illustrated from the context out of which I've

PREFACE

by Vine Deloria, Jr.

Formal Indian education in America stretches all the way from reservation preschools in rural Native communities to prestigious urban universities far away from Indian cultural centers. The educational journey of modern Indian people is one spanning two distinct value systems and worldviews. It is an adventure in which the Native American sacred view must inevitably encounter the material and pragmatic focus of the larger American society. In that meeting ground lies an opportunity for the two cultures to both teach and learn from each other.

Power and Place examines the issues facing Native American students as they progress from grade school through college and on into the professions. Subject matter as diverse as the school systems of the Five Civilized Tribes in the early 1800s to what Albert Einstein's theory of relativity *really* means is found on these pages. Native people navigating American systems of higher education must absorb a great deal of factual content, and they must also place that knowledge into the context of their own tribal and community traditions. For American Indian students the scientific method and the Western worldview coexist with Native spirituality and a deep connection with the earth.

This collection of fifteen essays on Indian Education is at once philosophic, practical, and visionary. Beginning with an essay on American Indian metaphysics and progressing to a bold, uplifting scenario for an Indian future grounded in education, *Power and Place* offers a concise reference for administrators, educators, students, and community leaders involved with Indian education.

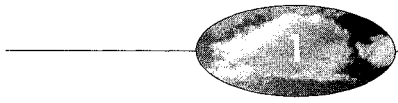
PREFACE

PRELUDE TO A DIALOGUE

by Daniel Wildcat

Let's begin with the big picture, because at the most basic level that is precisely what Vine Deloria, Jr., addresses in *Power and Place*. Those familiar with Deloria's work over the last four decades know his appraisal of why we, Indians, are still such a problem for America's dominant social institutions—for example, religion, politics, education, economics, and so on. In short, we do not fit comfortably or conveniently within Western civilization. This is not a regret. It is an affirmation—a living testimony to the resilience of American Indian cultures. If there is another group of people in America who have faced all the forces this society and its government could bring to bear in destroying their identity and fundamentally reshaping them in the image of the dominant society, I would like to meet them. Consequently, these essays are a criticism of the formal and official institutions of Indian education. Additionally, and more importantly, I believe, they constitute an explicit effort to open discussion about what a truly American Indian or what I would call an *indigenized,* educational practice would look like.

This book is proposing nothing less than an indigenization of our educational system. By *indigenization* I mean the act of making our educational philosophy, pedagogy, and system our own, making the effort to explicitly explore ways of knowing and systems of knowledge that have been actively repressed for five centuries. Make no mistake about it, what Deloria is proposing is radical and exciting. *Power and Place* introduces an agenda for much hard work—intellectual, social, and political—that can only be accomplished within institutions that we build based on our own indigenous North American insights and, most fundamentally, metaphysics.



AMERICAN INDIAN METAPHYSICS

V. Deloria

A PRELUDE TO UNDERSTANDING INDIAN EDUCATION

For many centuries whites scorned the knowledge of American Indians, regarding whatever the people said as gross, savage superstition and insisting that their own view of the world, a complex mixture of folklore, religious doctrine, and Greek natural sciences, was the highest intellectual achievement of our species. This posture of arrogance produced some classic chapters in the history of the Western Hemisphere: Ponce de Leon wandering around the southeastern United States vainly searching for the fountain of youth, Swedish immigrants on the Delaware River importing food for thirty years because they could not grow anything in this country, and the Donner Party resorting to cannibalism because of their fear of the local Indians.

In recent years there has been an awakening to the fact that Indian tribes possessed considerable knowledge about the natural world. Unfortunately, much of this appreciation has come too late to enable anyone, white or Indian, to recapture some of the most important information on the lands, plants, and animals of the continent. In a parallel but unrelated development, Indian religious traditions are now of major interest to whites, whose own religious traditions have either vanished or been swamped in reactionary fundamentalism. Fluctuating between a recognition of Indians' practical knowledge about the world and outright admiration for their sense of the religious is unsettling and

nonproductive; it does not attribute to Indians any consistency, nor does it suggest that their views of the natural world and religious reality had any more correspondence and compatibility than do Western religion and its science. Instead of talking of an Indian "science" or even an Indian "religion," we should focus our attention on the metaphysics possessed by most American Indian tribes and derive from this central perspective the information and beliefs that naturally flowed from it.

Metaphysics has had a difficult time regaining its intellectual respectability in Western circles. Its conclusions were greatly abused by generations of Europeans who committed what Alfred North Whitehead called the "fallacy of misplaced concreteness," which is to say that, after they reached the conclusions to which their premises had led them, they came to believe they had accurately described ultimate reality. Metaphysics need not bear the burden of its past, however, if we understand it as simply that set of first principles we must possess in order to make sense of the world in which we live. In this sense the Indian knowledge of the natural world, of the human world, and of whatever realities exist beyond our senses has a consistency that far surpasses anything devised by Western civilization.

The best description of Indian metaphysics was the realization that the world, and all its possible experiences, constituted a social reality, a fabric of life in which everything had the possibility of intimate knowing relationships because, ultimately, everything was related. This world was a unified world, a far cry from the disjointed sterile and emotionless world painted by Western science. Even though we can translate the realities of the Indian social world into concepts familiar to us from the Western scientific context, such as space, time, and energy, we must surrender most of the meaning in the Indian world when we do so. The Indian world can be said to consist of two basic experiential dimensions that, taken together, provided a sufficient means of making sense of the world. These two concepts were place and power, the latter perhaps better defined as spiritual power or life force. Familiarity with the personality of objects and entities of the natural world

enabled Indians to discern immediately where each living being had its proper place and what kinds of experiences that place allowed, encouraged, and suggested. And knowing places enabled people to relate to the living entities inhabiting it.

Western scientists frequently suggest that the Indian way of looking at the world lacked precision because it was neither capable of nor interested in creating abstract concepts or using mathematical descriptions of nature. But, as Carl Jung pointed out with respect to the so-called primitive mind, once a person knew the places of things, a mere glance was sufficient to replace counting and, in most instances, was more accurate. The Indian mind was considerably more interested in learning the psychological characteristics of things than in describing their morphological structure. Hence, in some instances when defining common personality traits that people and animals shared, the Indian seemed to be talking nonsense. He or she appeared to be combining aspects of things that, at first glance, could not and should not be together. Today, as Western science edges ever closer to acknowledging the intangible, spiritual quality of matter and the intelligence of animals, the Indian view appears increasingly more sophisticated.

Indian students today are confronted with the monolith of Western science when they leave the reservation to attend college. In most introductory courses their culture and traditions are derided as mere remnants of a superstitious, stone-age mentality that could not understand or distinguish between the simplest of propositions. Additionally, they are taught that science is an objective and precise task performed by specialists who carefully weigh the propositions that come before them. Nothing could be further from the truth. Western science traditionally represents the consensus of the established scientists who almost always reject new ideas out of hand and spend their time gathering evidence to bolster outmoded paradigms. Much of the progress made by Western science has been made by amateurs and martyrs who have been disparaged and cursed in their lifetime, only to be canonized by a new generation that has learned to accept the smallest of changes with more grace than their parents and teachers.

Indian students are further misled by outrageous claims made by science, which suggest that the various fields of inquiry, if taken together, represent the sum total of human knowledge. In fact, almost all of Western science is reductionist in nature and seeks to force natural experience and knowledge into predetermined categories that ultimately fail to describe or explain anything. The whole process of Western science is that of finding common denominators that can describe large amounts of data in the most general terms, rejecting anything that refuses easy classification as "anomalous," existing outside the generally accepted labels and, therefore, not to be given standing or serious attention. This way of gathering information about the world—and ourselves—is, of course, absurd.

One of the most painful experiences for American Indian students is to come into conflict with the teachings of science that purport to explain phenomena already explained by tribal knowledge and tradition. The assumption of the Western educational system is that the information dispensed by colleges is always correct, and that the beliefs and teachings of the tribe are always wrong. Rarely is this the case. The teachings of the tribe are almost always more complete, but they are oriented toward a far greater understanding of reality than is scientific knowledge. And precise tribal knowledge almost always has a better predictability factor than does modern science, which generally operates in sophisticated tautologies that seek only to confirm preexisting identities.

We live in an industrial, technological world in which a knowledge of science is often the key to employment, and in many cases is essential to understanding how the larger society views and uses the natural world, including, unfortunately, people and animals. Western science has no moral basis and is entirely incapable of resolving human problems except by the device of making humans act more and more like machines. Therefore, Indian students, as they study science and engineering, should take time and make the effort to regain a firm knowledge of traditional tribal lore. Even if many of the stories seem impossible under existing scientific explanation of phenomena, Indian students should not easily

discard what their tribes have traditionally believed. There is most assuredly a profound knowledge present in many things that the tribes have preserved.

Richard Ford's article "Science in Native America" is a good representative piece recognizing the knowledge of Indians. It fairly surveys the various aspects of knowledge that Indians had and gives reasonable explanations of some of the ways in which our ancestors understood natural phenomena. Considering the present state of things, it is important for scholars such as Ford to begin to help us break the ice of ignorance and neglect that has been thrust upon our traditions for more than half a millennium. Without the voices of respected white scholars, there is little chance that we can get sufficient attention from the scientific establishment in order to plead our own case. But we must remember that every article attempting to discuss this problem should be understood as a call for each of us to enter into the exchange of knowledge. In this sense, Ford calls us as Native Americans to become more truly scientific—to offer our knowledge to the larger benefit of our species.

We must not, however, rely on the assistance of sympathetic non-Indian thinkers for guidance, as they often do not see the kinds of relationships that traditional Indian knowledge reveals. The current tendency of younger Indian scholars is to find where the tangent points exist with Western science and to proclaim, quite rightly, that Indians arrived at the same conclusions using a much different epistemology or metaphysics. Recognizing these points where communication is possible is but halfway to the goal. We may grant that the energy described by quantum physics appears to be identical to the mysterious power that almost all tribes accepted as the primary constituent of the universe. But what does this conclusion say about the theories of disease, powers of spiritual leaders, or interspecies communications with sympathetic birds and animals? Surely when we reach these conclusions we should see more clearly how Indians then accommodated their ways of living to this knowledge.

Most adventures in metaphysics attempt to fix upon a few basic concepts and, using these abstract ideas, explain the remainder of

the experiential world in those terms. Indians use a peculiar way of maintaining a metaphysical stance that can best be termed as "suspended judgment." People did not feel it obligatory that they reach a logical conclusion or that they could summarize the world of experience in a few words and sentences. Black Elk, after telling John Neihardt the story of the reception of the sacred Pipe, said, "Whether it happened so or not, I do not know. But if you think about it, you will see that it is true." The hallmark of the true Indian philosopher was the ability to hold in suspended judgment the experiences he or she had enjoyed or was told, and to file away that bit of knowledge until the time when more data of closely related content came his or her way.

Indian students, therefore, should consider themselves to be standing in the shoes of their grandparents as metaphysicians. While specific answers are required within the context of Western science, we should remember that these answers are only a temporary statement that is subject to rejection or further refinement at any time. If the non-Indian or even Indian teacher or professor absolutely insists that a certain conclusion is true, remember the grievous sin of the Western mind: misplaced concreteness—the desire to absolutize what are but tenuous conclusions. Students should further remember that while the Indian knowledge is designed to relate to other kinds of experience and knowledge, Western science does not necessarily form a unity. In the reduction of knowledge of phenomena to a sterile, abstract concept, much is lost that cannot be retrieved. By maintaining the personal involvement typical of wise Indian elders, the students should be able to maintain themselves as practical and competent metaphysicians.

Indigenizing Education: Playing to Our Strengths

D. Wildcat

Power and Place constitutes a declaration of American Indian intellectual sovereignty and self-determination. It is essentially a tribal intellectual and moral mandate requiring action, unless we want our current educational system to be like our contemporary political structures and practices, which all too often merely reflect the dominant society's institutions. Consequently, the decision to begin a discussion of American Indian education with a consideration of metaphysics is challenging and well-founded.

Even a cursory examination of the numerous problems facing modern technological societies and the failure of modern education systems to find solutions to these problems, which are essentially moral and ethical in character, suggests something is fundamentally amiss in the dominant education systems of the United States. The conflict between Western science and religion, and the inability of the vast majority of Western thinkers to find a common ground or consistent intellectual framework, speak directly to the central problem with Western metaphysics: the failure to produce a coherent worldview encompassing the processes of the world and how we humans find meaning in those processes.

The late Carl Sagan recognized this problem in his posthumously published work *Billions and Billions: Thoughts on Life and Death at the Brink of the Millennium.* Sagan described and reported on the truce or, I am tempted to say, treaty, reached between Western science and religion. But his and other scientists' immersion in

Western metaphysics, as indicated in their appeal "Preserving and Cherishing the Earth: An Appeal for Joint Commitment in Science and Religion," is symptomatic of the schizophrenic nature of Western metaphysics. American Indians know from experience that forming an alliance or making a treaty does not address irreconcilable differences in worldviews. Furthermore, such an alliance is of little help if the problems of the earth are largely exacerbated by both the Western institution of religion and that of science, as Deloria has persuasively argued in *God Is Red*, *The Metaphysics of Modern Existence*, and most recently in *Spirit and Reason*.

The institutions of Western science and religion are like partners in a dysfunctional marriage: caught up in a relationship of codependency. The good news is that within both institutions some individuals and groups are seeking changes. Especially in science, a whole new generation of researchers is moving from long-standing scientific models or theories (to be discussed shortly) to approaches for understanding the world that sound increasingly like the wisdom conveyed in many traditional American Indian stories, ceremonies, and practices. There are some affinities or convergences between cutting-edge Western science—for example, Cajete's *Look to the Mountain*, Suzuki's *Wisdom of the Elders*, and Thomas's *Tribe of Tiger* to name a few—and traditional experiential knowledge, or what has recently been called traditional ecological knowledge. Increasing evidence suggests that there are good reasons for American Indian students not to discard knowledge traditionally held by their tribes—knowledge at once ecological, moral, practical, and most certainly philosophical. The very fact that these words or categories were not used to describe this knowledge tells us a great deal about holistic thinking, its sources, and the kinds of knowledge such thinking produces.

WHAT MUST CHANGE

This book is for teachers, parents, students, and leaders who recognize that something of great value existed in the "old ways." We must not romanticize the past—everything was not perfect. But if we want to truly exercise self-determination, there is no

better place to start than with an effort to give our children an inheritance too many generations of American Indians were outright denied or have struggled mightily to maintain: identity within tribal cultures we were actively engaged in, as opposed to existence within a culture of indoctrination facilitated most effectively through U.S. government education programs.

It is critical to understand that Deloria's essays are not primarily about raising standards or improving test scores; rather they constitute a reasonable call to consider the advantages of building an educational practice on a foundation of American Indian metaphysics that "is a unified worldview acknowledging a complex totality in the world both physical and spiritual." This undertaking will not be easy, and we do need allies.

There is much work to be done and need for serious dialogue in comparing what is described as the Western metaphysics of space, time, and energy to the American Indian metaphysics of place and power. A true dialogue is long overdue. With respect to morality, the dialogue is easily started with the explicit rejection of what archconservative William Bennett has called the need to fix or find the "moral compass." Beginning a dialogue with a map, so to speak, of Western civilization's metaphysical landscape is critical, for it is distorted and consequently its moral compass is askew. Unlike William Bennett's reformist solution to the problems facing American education—going back to the core values of Western civilization—Deloria argues that the very tradition and system of knowledge Bennett wants Americans reconnected to is actually the problem. Consequently, we must begin a discussion of education in America with the metaphysical assumptions of Western civilization implicit in and underlying modern notions of curriculum and pedagogy, given that so little attention is paid to the topic today.

The problem with Indian education in America is really the problem of education in America, regardless of whether recipients of the education are, figuratively speaking, red, yellow, black, or white. Of course, the historically racist character of American education cannot and should not be minimized. Rather the point ought to be made that the early formulation of Indian education,

as articulated by its architects, should have been seen as the "miner's canary," warning of problems with the underlying assumptions implicit in Western civilization and its system of education.

For all of the fuss about innovation in educational methods, curriculum, and pedagogy today, it is worth noting that, with respect to higher education, the basic organization of the institution, the division of subjects, and teaching methods have changed little since the establishment of the first colleges and universities in Europe during the twelfth and thirteenth centuries. Curriculum, at all levels of American education, bears the largest imprint of Western metaphysics. It is easy to see the influence of Aristotle's categorizing of experience and knowledge at work in how we divide and teach subjects. The medieval division of the seven liberal arts into the trivium (grammar, logic, and rhetoric) and the quadrivium (geometry, astronomy, arithmetic, and music) conforms with Aristotle's philosophic division of subjects. The natural sciences, as we now recognize them, were not added until the eighteenth and nineteenth centuries. Aristotle's legacy within Western metaphysics, especially as it continues to shape Western notions of education, cannot be underestimated.

Higher education in America is one of the most conservative Western cultural institutions in America. The fact that obtaining a higher education is a widely accepted goal in America suggests that elementary, middle, and secondary schools are critical in preparing students to succeed in an institution more representative of Western metaphysics than any other. Therefore, the hope for American Indian education lies first in the explicit identification of features of the Western tradition or worldview that produce many of the problems we are immersed in today; and second, in the active reconstruction of indigenous metaphysical systems, which, I believe, result in experiential systems of learning.

WESTERN SCIENCE: MATERIALISM AND MACHINE METAPHYSICS

The first task can be accomplished by articulating the main features of the Western tradition and then counterpoising key features of

American Indian or indigenous North American metaphysics. For example, most of science, continues to reduce reality to a physical world. Consequently, knowledge itself becomes reduced to generalizable principles by which atoms, genes, or "things" appear to act. The method of inquiry, the methodology of science, is reduced to essentially taking things apart—dissection, whether on a lab table or in a controlled experiment. In spite of new research in the areas of ecology, complexity, the phenomenon of chaos, the process of emergence, and much of cutting-edge physics, science as taught in most schools is reductionist—in terms of what counts as reality, knowledge, and the appropriate methods for acquiring knowledge.

If one doubts this characterization, one need only look at the talented ecologist E. O. Wilson's commentary for the sesquicentennial of the American Association for the Advancement of Science, "Integrated Science and the Coming Century of the Environment." Wilson reduces life itself to genetic mechanisms, although this reductionism does not keep him from concluding, "The unavoidable compliment of reductionism is synthesis." But a synthesis at what level, based on what metaphysical assumptions? Wilson's answer is clear: a unified system of knowledge in the natural and social sciences as well as the humanities will be integrated at the level of biology and chemistry. The problem of understanding life is merely a question of measurement, of developing the tools (technology) for unlocking the mysteries of life found in the microscopic particles (parts or pieces) of genes, and telescopic exploration into the birth of galaxies. The popular and published works of Wilson and neo-Darwinist Richard Dawkins, of *The Selfish Gene* fame, suggest the humanities, the social sciences, and psychology itself are reducible to chemical and biological, in other words, genetic structure.

Another complementary and lingering feature of Western thought, albeit one increasingly under attack, is the idea of the world as machine. The mechanistic worldview continues to be applied to many of the physical sciences and biology and, as stated above, very quickly results in a methodology that is essentially

dissective in character. Proponents of this "popular mechanics" view of the world in the biological and physical sciences share an optimistic faith in the belief that once the instruments and tools (technology) are developed that will allow us to observe and measure the smallest pieces of the world, that is, genetic codes and subatomic particles, we will be able to understand the world. This view is strangely "comforting" to all who strive to arrive at objective knowledge by taking their selves out of the picture, so to speak, by avoiding our own selves' emotions and feelings, attachments and dislikes, which arguably determine more of our everyday lives in the world than biochemical processes identified in laboratories.

Let's be clear: certain "things" can be understood using the metaphysics of time, space, and energy. However, a great deal of what we experience cannot be explained within the metaphysics of Western science, and that is the critical point. An entire realm of *human experience in the world* is marginalized, declared unknowable, and, consequently, left out of serious consideration. This reality cannot fit in the objective experimental box of mechanical cause and effect, and no tool or technology will change this situation unless we merely say that all there really is to the world is mechanics (in the structural sense) and tools. Western notions of reality and corresponding ideas of knowledge are not far from this cold "scientific" assessment.

Indigenous Metaphysics

Compare the scientific worldview to widely shared tribal views in which humans understand themselves to be but one small part of an immense complex living system, something like Lovelock's Gaia Hypothesis. This hypothesis offers a holistic worldview in the most profound sense, where attention to relations and processes is much more important, at least initially, than attention to the parts of our experience. The point should be obvious: we, human beings, in all our rich diversity, are intimately connected and related to, in fact dependent on, the other living beings, land, air, and water of the earth's biosphere. Our continued existence as part of the biology of

the planet is inextricably bound up with the existence and welfare of the other living beings and places of the earth: beings and places, understood as persons possessing power, not objects.

Traditional American Indian cultural practices actively acknowledge and engage the power that permeates the many persons of the earth in places recognized as sacred not by human proclamation or declaration, but by experience in those places. And it is experience that shapes indigenous education and necessitates the awareness of self as crucial in order for knowledge to be attained. In American Indian metaphysics, unlike the dominant system of Western metaphysics, awareness of one's self is the beginning of learning, and it certainly precedes the times most of us can think back to or remember. Child and cognitive psychologists now agree that most of the learning we do as human beings happens before we are five years old. A study of child development from an indigenous standpoint would lead to insights that popular causal models cannot. Deloria's formulation that power and place equal personality is ripe for exploration in the study of human development.

Among so much sadness and dysfunctionality in our world today, it is at once sobering and energizing to think of what we might accomplish by giving our children something our parents and grandparents stubbornly held on to but were never given the opportunity to openly embrace: a way of living that found lessons on humility, generosity, and hope in the world—hope not for something in the distant future but hope in the sense of acting with the confidence and expectation that something good will happen. Ask any child psychologist—such a condition is not romantic, but crucial for the full development of healthy adults.

A good deal of the ills surrounding us today are the fault of a society where children learn life lessons that make their formal education often seem meaningless. After all, most of what we know is *not* a result of explicit pedagogy or teaching; it is learned through living. Many human beings seem so caught up in their machines and technology that they have forgotten or lost the very real sense of what it means to live: to make choices that enrich life as opposed to making existence more comfortable.

Science has accomplished much in the latter case and, as Deloria notes, little in the former case: "Western science has no moral basis and is entirely incapable of resolving human problems except by the device of making humans act more and more like machines." "Making humans act more and more like machines"—this may be the most modern of reductionisms. It also explicitly illustrates an increasingly impoverished notion of experience and reality, and one that, thankfully, increasing numbers of human beings are questioning. It is hard to understand something if one is always controlling and taking it apart.

Fortunately, a growing number of modern ecologists, environmental scientists, biological scientists, and geographers now readily accept the wisdom that Chief Seattle spoke to nearly 150 years ago: "We are all related ... whatever befalls the earth befalls man." The concepts of the food chain, ecosystem management, population dynamics, and a host of cycling processes are, at one level, scientific expressions of the traditional American Indian wisdom Chief Seattle spoke to so eloquently. At this easily observable and documentable level, science seems to be moving closer to traditional American Indian wisdom.

At the most fundamental level this interconnectedness and relatedness of human beings to the earth provides the first principle for our rich spirituality. A spirituality that is literally grounded in our experience of the natural world as full of creation's power; a spirituality that denies the dichotomies that most often define Western religions. This is not romanticism; it is acknowledgment of a living people's experience, and something science too often anesthetizes its students and practitioners to.

PLAYING TO OUR STRENGTHS

It is at the level of experience that our traditional and ancestral indigenous scholars have left us the richest legacy—insights of the processual, interconnected, and interrelated nature of the phenomenal world; insights too often precluded by indoctrination in the metaphysics of Western science and, more generally, the modern Western worldview. At the heart of *Power and Place* is the suggestion

that before we all become specialized mechanics of different aspects of the phenomenal (so-called objective) world, we seriously explore and attempt to recollect a way of knowing where interpretation or meaning (subjective) is integrated in the realm or reality of experience.

Few thinkers have written about the objective-versus-subjective and nature-versus-human dichotomies of Western thought as perceptively as Alan Watts, a scholar of Eastern thought, in the introduction to his book *Nature, Man, and Woman.* Watts notes that Western humankind's faith in intelligence has led many to "think we know" how the world works, and consequently, to presume we have some right to control the organization of life itself. He states:

> This is an astonishing jump to conclusions for a being who knows so little about himself, and who will even admit that such sciences of the intelligence as psychology and neurology are not beyond the stage of preliminary dabbling. For if we do not know even how we manage to be conscious and intelligent, it is most rash to assume that we know what the role of conscious intelligence will be, and still more that it is competent to order the world. (p. 2)

In Western thought scientific theories of reality, knowledge, and methods for knowing are logically consistent. The problem is that they constrain, even preclude, any discussion of our human experience and life as a part of processes involving power(s), which are irreducible to discrete objects or things.

Convergences

There is reason to be cautiously optimistic. The relatively new concept of emergence as used in ecology and physics may capture how personality, as defined by Deloria, develops in specific places possessing power. Emergence refers to a model of change or development where change is not reducible to a discrete factor or factors, but rather the interaction of multiple factors or causes that are understood as processual in character as opposed to mechanical. I am of the opinion, as are a number of scholars and scientists, both

indigenous and nonindigenous, that when everything is said and done the concepts of complexity, self-organization, ecology, and even evolution (as reformulated in primarily a space-dependent process as opposed to a time-dependent model) are actually ideas that are part of ancient indigenous intellectual traditions in North America. I like to tell modern nonindigenous scientists that I am glad to see that their modern science is finally catching up with very ancient indigenous wisdom. This at least always gets their attention! Although philosophers of science have pointed out various problems with the dominant Western view and a fair number of scientists would acknowledge those problems, the vast majority still do science the old-fashioned way. As my Salish friend Jaune Quick-To-See-Smith summarizes, Western scientists theorize a hypothesis (a cause and effect), design an experimental process—which is by design far removed from the world we live in—and produce a result or a finding that too often is then understood as "fact."

Nevertheless, the worldview or paradigm shift now underway in cutting-edge physics (chaos theory, nonlinear models of development and change) and biology (complexity, emergent properties, bio- and phytoremediation, etc.) is predicated on the recognition that the old Western metaphysics on which science was built results in certain kinds of knowledge, but not all knowledge. Most important, the old Western metaphysics of time, space, and energy never allows one to get the "big picture" of the world. The essays in this book are advocating a holistic worldview, one resulting from experience in the earth's living systems. Ultimately, *Power and Place* advocates big-picture worldviews containing metaphysical systems that, most significantly, integrate the physical and spiritual dimensions Western civilization presents as opposed to each other.

American Indians are natural systems thinkers, as Indian entrepreneur Rebecca Adamson has remarked, because even today many American Indians seem to intuitively perceive the interrelatedness of problems and recognize that solutions required to solve them must be holistic in nature. The strong affinity or convergence between what I call the new complex view of science and American Indian metaphysical traditions is worth exploring; both

are at odds with the old mechanical and naive physical views of the world. At a certain point it seems the phenomenal world was bound to assert its presence on what might best be described as Western intellectual asceticism—that is theoretical abstraction disconnected from experience in the world.

Indigenous Life Lessons

God Is Red was the first book to really trace the deep roots of the ongoing conflict between Western civilization and American Indian worldviews to the Judeo-Christian tradition and its overwhelming influence on Western thought. It seems reasonable today to question whether Western science itself has unconsciously carried a considerable amount of baggage from its early roots in religious institutions. Simply think of the degree to which theory, paradigm, and model construction in Western science and, sadly, in education itself, develop not based on—but in spite of—human experience and worldly evidence, and the historical extrapolation from religious asceticism to scientific asceticism seems appropriate.

The ultimate irony for the followers of Enlightenment ideals of liberty, reason, and justice is that the rationality they have most fully developed is of a mechanical and technical nature. The practices and products of Western science have, intentionally or not, had the net effect of making "humans act more and more like machines," and why should we be surprised? All of the genuine enthusiasm for the final mapping of the human genome is an ex post facto demonstration of the extent to which modern science is preoccupied with mechanics. If life itself is viewed mechanically, why should humans be any exception?

Welcome to the brave new world—not Huxley's book, but the citadels of contemporary DNA science. Orwell's *1984* had it half right: Big Brother need not worry about watching you, nor you worry about being watched by Big Brother. So long as He is sure you are watching him. Imagine the influence of a culture that induces members to passively watch—the news, advertisements, and TV sitcoms. We do indeed live in an industrial, technological world, and many of us have now reached the place where it

seems important to ask why so many suffer emotionally, economically, physically, and spiritually. Education ought not be reduced to mechanics. Today we must play to our strengths. Indeed, what we need are indigenous life lessons, and that is what *Power and Place* explores: indigenous life lessons emergent from experience in the world.

BEGINNING AN HONEST DIALOGUE

It is easy to criticize any system of thought or culture, especially the less direct experience one has of the lives of the people possessing those ideas or that culture. I hope these essays will not be read as a bashing of Western civilization, but rather as the beginning of a long-overdue honest dialogue. With respect to culture, a person can have only the most superficial understanding of a people, especially their culture, if it is based primarily on the written word and only limited direct experience of their everyday lives. It is not surprising, therefore, that with only a few exceptions members of the larger, essentially Western, or immigrant, American culture have great difficulty understanding American Indian or indigenous North American peoples and their cultures.

Of course when the same logic is applied and the circumstances are reversed, most American Indians are better prepared to understand and critique the Western tradition because they, like it or not, have had a five-centuries-long history of being pushed and pulled into the dominant culture, although the culture they experienced in the boarding schools could hardly be called normal or ordinary—even by Western standards. Indeed, the legacy of government and parochial boarding-school experiences explains a significant degree of the dysfunctionality found in American Indian institutions, communities, and homes and has also unintentionally formed the catalyst for some of the most hopeful developments to emerge for American Indians in the last half century.

Today most American Indians, such as they have received a formal education and, until very recently, employment, have done so in the context of Western-inspired institutions. Amazingly some have been able to hold on to many of their indigenous tribal

beliefs, values, and practices alive within their Native communities and reservations. The general point is that American Indian educators, in particular, unlike their non-Native counterparts, are better prepared and well suited by experience to critically look at the deep roots of Western-inspired institutions and practices. Because of their bi- and often multicultural experience we can and should explore creative ideas and ways of establishing healthier Indian communities and sovereign Indian nations.

Let us go even a step further. If "we talk and you listen," as Deloria suggested three decades ago, non-Natives might even learn something useful. Indigenous people obviously have benefited from some of the technological innovations developed by Western scientists. Unfortunately, the arrogance or faith instilled by Western civilization's claim to ownership of Universal Truth has, until now, dissuaded Americans from seriously listening to what American Indians have to say. Their loss is, I believe, great.

For those non-Indians who choose to listen, the following is intended as an invitation to discussion, even exploration of some ground literally and figuratively, seldom covered today. Few adults in the United States learn and work in institutions formed on principles outside of or distinct from Western civilization; this includes most American Indians. Almost all Indian education studies, reports, and commissions have described, analyzed, and bemoaned a Western-inspired institution built on curriculum, methodologies, and pedagogy consistent with the Western worldview. This much-studied educational system was and, sadly, remains too often directed toward cultural assimilation into the dominant society. Fortunately, some American Indians still live and understand the world indigenously. Circumstances—political, economic, technological, and spiritual—have brought many in America today to places where a reintroduction or resurgence of Indian education in America can seriously be entertained. We have come to places in modern industrial and postindustrial societies where experiences are suggesting we might have valuable lessons to learn by exploring what once existed throughout this hemisphere: indigenous education systems.

POWER AND PLACE EQUAL PERSONALITY

V. Deloria

Western science resolves itself into certain "laws" that describe the natural world. These laws are makeshift descriptions of the manner in which physical reality appears to operate, but they are often regarded by Western scientists as inviolable. Phenomena that fall outside the prescribed patterns of behavior are said to be "anomalies," which can be disregarded when explaining how the physical universe functions. Eventually, of course, the Western scientist must deal with the so-called anomalies. These phenomena form an increasingly large body of knowledge and facts that cannot be explained using the acceptable paradigm into which the rest of scientific knowledge is deposited.

American Indian knowledge of the world does not suffer this structural handicap. While tribal peoples did not have a detailed conception of the whole planet in the sense that Western scientists presently do, they did have a very accurate knowledge of the lands they inhabited and the plants, animals, and other life-forms that shared their environment. It is also becoming increasingly clear that they had a fairly comprehensive knowledge of the heavens, with their own sets of constellations and stories.

The boundaries of American Indian knowledge were those of respect, not of orthodoxy. For instance, certain stories about the stars could not be told when the constellations in question were overhead. Some other kinds of stories involving animals, plants, and spirits could only be told at a particular time of year or in a specific place. There were no anomalies because Indians retained the ability to wonder at the behavior of nature, and they remembered even the

most abstruse things with the hope that one day the relationship of these things to existing knowledge would become clear.

The key to understanding Indian knowledge of the world is to remember that the emphasis was on the particular, not on general laws and explanations of how things worked. Consequently, when we hear the elders tell about things, we must remember that they are basically reporting on their experiences or on the experiences of their elders. Indians as a rule do not try to bring existing bits of knowledge into categories and rubrics that can be used to do further investigation and experimentation with nature. The Indian system requires a prodigious memory and a willingness to remain humble in spite of one's great knowledge.

Although the rank-and-file professors may reject this rather cumbersome method of obtaining knowledge, it has been recognized by some important thinkers as being equal to the reductionist procedure. Percy W. Bridgman, one of the giants in physics in this century, made this remark in his book *The Way Things Are:*

> I may have observed all men, including Socrates, and found that they were mortal, and summarized by researches in the statement "all men are mortal," which I then filed away in my mind for future use. Later when I may have forgotten all the details of my former research, I may find a rational basis for charging Socrates for annuity which I am selling him, and my assurance that Socrates is mortal, which I get from my mental file, guides me in setting my price. The syllogism thus has economic value for me in this situation. The unlettered American Indian, however, confronted by the same situation, would doubtless meet it by recalling that he had once verified that Socrates in particular was mortal. (p. 91)

So we have different paths to the same conclusions.

Keeping the particular in mind as the ultimate reference point of Indian knowledge, we can pass into a discussion of some of the principles of the Indian forms of knowledge. Here power and place are dominant concepts—power being the living energy that

inhabits and/or composes the universe, and place being the relationship of things to each other. It is much easier, in discussing Indian principles, to put these basic ideas into a simple equation: Power and place produce personality. This equation simply means that the universe is alive, but it also contains within it the very important suggestion that the universe is personal and, therefore, must be approached in a personal manner. And this insight holds true because Indians are interested in the particular, which of necessity must be personal and incapable of expansion and projection to hold true universally.

The personal nature of the universe demands that each and every entity in it seek and sustain personal relationships. Here, the Indian theory of relativity is much more comprehensive than the corresponding theory articulated by Einstein and his fellow scientists. The broader Indian idea of relationship, in a universe that is very personal and particular, suggests that all relationships have a moral content. For that reason, Indian knowledge of the universe was never separated from other sacred knowledge about ultimate spiritual realities.

The spiritual aspect of knowledge about the world taught the people that relationships must not be left incomplete. There are many stories about how the world came to be, and the common themes running through them are the completion of relationships and the determination of how this world should function. Such tales seem far removed from the considerations of science, particularly as Indian students are taught science in today's universities. However, when the tribal concepts are translated into scientific language, they make a good deal of sense. Completing the relationship focuses the individual's attention on the results of his or her actions. Thus, the Indian people were concerned about the products of what they did, and they sought to anticipate and consider all possible effects of their actions.

And on Appropriateness

The corresponding question faced by American Indians when contemplating action is whether or not the proposed action is

appropriate. Appropriateness includes the moral dimension of respect for the part of nature that will be used or affected in our action. Thus, killing an animal or catching a fish involved paying respect to the species and the individual animal or fish that such action had disturbed. Harvesting plants also involved paying respect to the plants. These actions were necessary because of the recognition that the universe was built upon constructive and cooperative relationships that had to be maintained. Thus, ceremonies such as the First Salmon and Buffalo Dance and the Strawberry Festivals and the Corn Dances celebrated and completed relationships properly or ensured their continuance for future generations.

We can view this different perspective in yet another way that will speak more directly to Indian students studying Western science. Very early, at least beginning with Greek speculation on the nature of the world, the Western peoples seemed to have accepted a strange binary system of reasoning in which things are compared primarily according to their size and shape. Out of this perspective came the natural sciences as we have them today. Eventually distinctions were made primarily on the basis of shape, and from this tendency came the great theory of evolution that now reigns in the West. All our knowledge of the natural world within the Western framework derives from a crude comparison between skeletons of animals. Very little knowledge exists about the animals themselves except relative bone structures. We only speculate on how they see the world, think, and understand emotional experiences. Increasingly, studies show them to have as complete an emotional/intellectual life as we do.

American Indians seem to have considered this kind of thinking at one time because there are tribal stories comparing humans to various animals. The stories always emphasized that while humans cannot see as well as hawks, they can see; they are not as strong as the bear, but they are strong; not as fast as the deer, but they can run; and so forth. However, when these comparisons are carefully analyzed, one finds that both physical and psychological characteristics are described. Indians derived their knowledge of birds

and animals from actual experiences, and therefore physical structure meant little to them as they anticipated encountering these creatures in the future and needed to know how they behaved for hunting and protection purposes. Thus Charles Eastman was taught that when approached by a bear or mountain lion, one should pick up a stick immediately so that the animal would think he was armed and dangerous.

When using plants as both medicines and foods, Indians were very careful to use the plant appropriately. By maintaining the integrity of the plant within the relationship, Indians discovered many important facts about the natural world that non-Indians only came upon later. The Senecas, for example, knew that corn, squash, and beans were the three Sisters of the Earth, and because they had a place in the world and were compatible spirits, the Indians always planted them together. Only recently have non-Indians, after decades of laboratory research, discovered that the three plants make a natural nitrogen cycle that keeps land fertile and productive.

Plants, because they have their own life cycles, taught Indians about time. George Will and George Hyde, in their book *Corn Among the Indians of the Upper Missouri*, point out that it was the practice of the agricultural tribes to plant their corn, hoe it a few times, and then depart for the western mountains on their summer buffalo hunt. When a certain plant in the west began to change its color, the hunters knew it was time to return home to harvest their corn. This knowledge about corn and the manner in which its growth cycle correlated with that of the plants of the mountains some 500 miles away was very sophisticated and involved the idea of time as something more complex than mere chronology. Time was also growth of all beings toward maturity.

Star Knowledge

Much Indian knowledge involved the technique of reproducing the cosmos in miniature and invoking spiritual change, which would be followed by physical change. Hardly a tribe exists that did not construct its dwellings after some particular model of the

universe. The principle involved was that whatever is above must be reflected below. This principle enabled the people to correlate their actions with the larger movements of the universe. Wherever possible the larger cosmos was represented and reproduced to provide a context in which ceremonies could occur. Thus, people did not feel alone; they participated in cosmic rhythms.

Star knowledge was among the most secretive and sophisticated of all the information that the Indians possessed. Today archeoastronomers are finding all kinds of correlations between Indian practices and modern astronomical knowledge. Very complex star maps painted on buckskin hides or chiseled on canyon walls give evidence that Indians were astute observers of the heavens, and their ceremonial activities were often based on the movement of the heavens. A good deal of Indian star knowledge continues to exist, but religious prohibitions and restrictions still limit the propagation of this information. Some star knowledge goes very far back into the past when the sky looked different. The Sioux said there was once a bright star in the middle of the Big Dipper. Today we can suggest that a black hole does properly exist there.

THE PRINCIPLE OF CORRELATION

Star knowledge gives us an additional principle of Indian information gathering. That principle is correspondence, or correlation. Being interested in the psychological behavior of things in the world and attributing personality to all things, Indians began to observe and remember how and when things happened together. The result was that they made connections between things that had no sequential relationships. There was, consequently, no firm belief in cause and effect, which plays such an important role in Western science and thinking. But Indians were well aware that when a certain sequence of things began, certain other elements or events would also occur.

A kind of predictability was present in Indian knowledge of the natural world. Many ceremonies that are used to find things, heal, or predict the future rely upon this kind of correlation between and among entities in the world. The so-called medicine powers

and medicine bundles represented this kind of correlative understanding of how different things were related to each other. Correlation is responsible, for example, for designating the bear as a medicine animal, owls as forecasting death or illness, and snakes as anticipating thunderstorms.

This kind of knowledge is both tribal- and environmental-specific. In diagnosing illness, for example, medicine people might search for the cause of sickness by questioning their patients on a variety of apparently unrelated experiences. They would be searching for the linkages that experience had taught them existed in these situations. Here again, there was considerable emphasis on the heavens. One need only examine the admonitions of different tribes with respect to shooting stars, different configurations of the moon, eclipses, and unusual cloud formations to understand how correlational knowledge provided unique ways of adjusting to the natural world.

A More Realistic Knowledge

The Indian method of observation produces a more realistic knowledge in the sense that, given the anticipated customary course of events, the Indian knowledge can predict what will probably occur. Western science seeks to harness nature to perform certain tasks. But there are limited resources in the natural world, and artificial and wasteful use depletes the resources more rapidly than would otherwise occur naturally. The acknowledgment that power and place produce personality means not only that the natural world is personal but that its perceived relationships are always ethical. For that reason, Indian accumulation of information is directly opposed to the Western scientific method of investigation, because it is primarily observation. Indians look for messages in nature, but they do not force nature to perform functions that it does not naturally do.

Indian students can expect to have a certain amount of difficulty in adjusting to the scientific way of doing things. They will most certainly miss the Indian concern with ethical questions and the sense of being personally involved in the functioning of the natural world. But they can overcome this feeling and bring

to science a great variety of insights about the world derived from their own tribal backgrounds and traditions. They must always keep in mind that traditional knowledge of their people was derived from centuries, perhaps millennia, of experience. Thus, stories that seem incredible when compared with scientific findings may indeed represent that unique event that occurs once a century and is not likely to be repeated. Western knowledge, on the other hand, is so well controlled by doctrine that it often denies experiences that could provide important data for consideration.

By adopting the old Indian concern with the products of actions, students can get a much better perspective on what they are doing and how best to accomplish their goals. By maintaining a continuing respect for the beliefs and practices of their tribes, students can begin to see the world through the eyes of their ancestors and translate the best knowledge of the world into acceptable modern scientific terminology.

Most important, however, are the contributions being made by American Indian scientists. With their expertise, we can better frame our own ethical and religious concerns and make more constructive choices in the use of existing Indian physical and human resources. It is this linkage between science and the community that we must nurture and encourage. We must carry the message that the universe is indeed a personal one. It may, indeed, be a spiritual universe that has taken on physical form and not a universe of matter that has accidentally produced personality.

Understanding the Crisis in American Education

D. Wildcat

Maybe we do live in an information age. In fact, it would seem reasonable to say we are witnessing an information revolution, and as heretical as this may sound, it may be a large part of the most disturbing problems we see surrounding us today. The so-called Information Highway may be a curious phenomenon, but it is amazing that almost no one stops to inquire as to where it is taking us. I heard an elder once remark, "If you don't know where you are going, any road will get you there." This modest insight may sum up better than any National Indian Education reports, panels, or committees the crisis of not just Indian education today, but education in America.

Today what counts as knowledge in mainstream education is too often short-term memorization of "facts." What counts as understanding is specialization in a narrow topic within a field or discipline. Understanding is so narrowly framed that it is often difficult for the specialists, let alone students, to effectively connect or relate their knowledge and understanding to the everyday lives of nonscientists. Because people desire just the "facts" without any understanding of the relations and connections between the "facts" and the rest of the world, we have the search-engine model of education. Faster, more powerful, and increasingly smaller computers, though great at processing data and performing quantitative analysis, cannot tell us what the data mean.

We are drowning in information, the bits and pieces of dot.com minutiae that more often than not are advertisements and amusements; swimming in knowledge (the organized insights into

highly specialized aspects of the phenomenal world—significant parts of our experience), albeit at various depths; and dying of thirst for what Deloria calls understanding and I would call wisdom, a "big picture," a worldview in which information and knowledge are integrated meaningfully. Deloria's discussion of American Indian notions of knowledge and understanding reminds us that ultimately, understanding or wisdom ought to be the goal of education.

Lest this point be misunderstood, computers, the World Wide Web, and technology are not necessarily the problem. All of the above are quite simply tools—material and technological aspects of modern industrial societies. However, unlike prior technological innovations in human history, whose applications and implications seemed relatively obvious within specific environments (e.g., the bow, the block and tackle, the saddle and stirrup, etc.), information technology today seems little understood in terms of environmental and cultural contexts. Although one might think information technology, especially in light of its service toward what is often referred to as globalization, cannot possibly serve indigenous peoples and their places. However, the Global Learning and Observations to Benefit the Environment Project, an experiential and inquiry-based educational use of the World Wide Web, suggests there might be reason for some optimism. Imagine indigenous schoolchildren from Malaysia, the Altai mountains of Siberia, and the desert Southwest going out in their homelands and experientially learning about their environments, collecting their own "data," and learning how to analyze their data by doing, as opposed to being taught about, science. More importantly, the Internet and World Wide Web may in fact give indigenous peoples around the world the opportunity to compare notes on what is happening in their homelands and, even more significantly, discuss what their observations mean.

The heart of the problems facing Indian education in America is found in the largely abstract metaphysics of time, space, and energy. Western metaphysics yields a very different conception of reality than an experiential American Indian metaphysics of place and

power. One crucial difference in the two metaphysics is that the Western concepts presume to objectively describe the world at the expense of taking for granted, or at least leaving undeveloped, issues and questions regarding the nature of reality—that is, what Deloria calls the personality of the human beings doing the conceptualizing. It is the philosophical equivalent of a radar scan for which the subject, the conceptualizer and intellectual model-builder, is off the screen and not even registering as a blip.

It is symptomatic of the problems of modern Western thought, and specifically science, that one has to look back to Socrates, over two millennia before Immanuel Kant, G.F.W. Hegel, Ralph Waldo Emerson, William James, and John Dewey place the problem of human consciousness and spirit back into the debate between idealist and realist metaphysics. Only when modern Western psychology, social psychology, and sociology are born is the problem of personhood or the subject picked up on the metaphysical radar of Western science. This fact alone is very symbolic of the major weakness of the Western metaphysics of time, space, and energy. The Western metaphysics of science makes identification of things and some basic interactions relatively easy to identify; however, it provides almost no "enlightenment" regarding living relationships, processes between subjects, and the formation of what Deloria calls personalities—be they plants, animals, or geologic and geographic features of the world where we reside.

Deloria's proposal that we explore an indigenous (in this case American Indian) metaphysics must be among the first projects American Indian educators undertake if we are to not only decolonize, but also actively "indigenize" and truly make Native educational institutions our own. American Indians have a long history of rejecting abstract theologies and metaphysical systems in place of experiential systems properly called indigenous—indigenous in the sense that people historically and culturally connected to places can and do draw on power located in those places. Stated simply, *indigenous* means "to be of a place." The oratories of Tecumseh, Ten Bears, Sitting Bull, and Chief Joseph, to name but a few great leaders, speak eloquently to this point.

Indigenous people represent a culture emergent from a place, and they actively draw on the power of that place physically and spiritually. Indigenism, as discussed here, is a body of thought advocating and elaborating diverse cultures in their broadest sense—for example, behavior, beliefs, values, symbols, and material products—emergent from diverse places. To indigenize an action or object is the act of making something of a place. The active process of making culture in its broadest sense of a place is called indigenization.

Cajete's work *Look to the Mountain* should be required reading for all teachers wanting to indigenize their pedagogy and curriculum and provide a framework for students to explore meaning in their life experiences. Western scientists and engineers are good at identifying the pieces, parts, and things in the world. This is commonly what we refer to as knowledge, "a set of technical beliefs [and, I would add, skills] which, upon mastering, admit the pupil to the social and economic structures of the larger society." Jacques Ellul's observation of nearly four decades ago in *The Technological Society*, that even the modern way of thinking has become technical or technology-shaped, today seems prescient.

Institutions of the larger society provide little support for the emotional and spiritual development of individuals. Tocqueville remarked in the 1830s that he was amazed that a society so deeply committed to diversity of opinion and free thought had so little of either. He also identified the real danger in American democracy as the tendency for Americans to become so preoccupied with their individual economic gain that little time remained for direct participation in public life or community. He seems to have been on target, for in American education the purpose seems less and less about shaping responsible and respectful persons and more about, as Deloria says, the "training of professionals."

The absence in formal education today of the discussion of meaning—or awareness of the emergence of meaning—in our lives shows the success of a metaphysics that uncritically and for the most part unconsciously shapes education for all Americans. And, as Deloria points out, science will leave the questions of meaning

to those institutions that appear to scientists as the embodiment of fuzzy or unclear thinking: the discipline of psychology and/or the social institution of religion. Understood in the context of Western metaphysics as portrayed by Deloria, it is easy to understand the necessary separation in modern Western thought between science, and religion and psychology (in all but its most reductionist biochemical versions).

The deep opposition in Western thought between science and religion is the most critical and fundamental obstacle to integrating modern science and American Indian wisdom born of an experiential metaphysics. Our ancient Native understanding begins with the necessary task—the problematic—of establishing what Deloria calls our personality: who we are. Learning comes early in indigenous institutions, not through lectures but through experience: customs, habits, and practices. The primary lesson learned is and was that knowledge and understanding come from our relatives, the other "persons" or "beings" we have relationships with and depend on in order to live. And it is through these relationships, physical and psychological, indeed spiritual, that human beings begin to understand who, why, and even to some degree what we are. A value-free, neutral, objective science of things cannot give us that, and it is this discovery of meaning through very complex relationships that is the hallmark of American Indian education.

Given Western metaphysical systems, as Deloria has described them, it is fitting and predictable that many learned persons in Western civilization today are concerned about finding a solution to the energy crisis they created. Make no mistake about it, technology alone is neither the problem nor the solution. The real issue is how we live in modern industrial societies. Yet it is obvious that the citizens of modern industrial and/or postindustrial societies are lacking the wherewithal to solve the problem.

The problem is *not* finding, renewing, conserving, or producing more energy, and the solution is not another cutting-edge technology. From the standpoint of an American Indian metaphysics of place and power, the problem is not about something called energy,

but more realistically about power and the places we live—basically, how we live. We should not underestimate the deep-seated roots of the problem. Where do we start? At the beginning. This was the approach Deloria took nearly four decades ago with the publication of *God Is Red,* and, I believe, remains the best approach. We need a generation or two of articulate American Indian philosophers, scientists, and engineers learning rather than being taught lessons our elders can demonstrate for us—right where they live.

I believe science is moving from a mechanistic reductionist model to a holistic nonlinear or complexity, model, science view. Consequently, it seems reasonable to speak of a convergence of new scientific theories and understanding with what I would call indigenous North American worldviews and intellectual traditions. The hypothesis I challenge scientists, engineers, historians of science, and ethnographers to explore is the extent to which much of the so-called new knowledge and understanding of complexity, nonlinear systems, and emergence resides in American Indian tribal customs, habits, and social organization: the way we lived and live. Here the use of a concept of habitude seems worth consideration. Although *A Dictionary of Modern English Usage* may see the word *habitude* as superfluous and synonymous with *habit,* I believe its use justified when considered as an attitude or awareness of a deep system of experiential relations on which the world is building or living. The key here is recognizing that experience is the undeveloped and untheorized site where the divisions between subjective and objective, material and spiritual, and an entire series of dichotomies disappear.

To many of us who are part of tribes with clan systems, an obvious example of what I mean by *habitude* is the understanding one acquired as a part of a clan-based social system: knowledge first and later an understanding that the clan system not only indicated a certain tribal human organization, but also actually existed as a symbolic representation of the ecology and environment that we human beings were and are a part of. Learning through custom and habit, a tribe's clan structures and societal roles and responsibilities conveyed a significant amount of knowledge. It is not only possible to figuratively lay out the clans of various tribes—for example,

the plants, animals, features of the natural world, and material objects represented in clan names, totems, and interclan relations—and actually produce a report about where and how people lived, it is necessary to do so in order to understand the comprehensive nature of their geographic and ecological knowledge.

A good example from the southeastern United States would be a comparison of the Cherokee clan system to the Euchee clan system. The Euchee share a large number of clans with the Seminole, but we both have a clan that the mountainous Cherokee do not possess. Knowledge of where the Seminole and Euchee historically resided solves the puzzle. The Seminole, living in the rich wetlands of south and central Florida, and the Euchee, who settled along the shores of the Savannah River but hunted throughout the Southeast and into northern Florida, have alligator clans, and the Cherokee do not. Considering where both tribes lived it is clear why the Seminole and Euchee acknowledge an important relationship with an animal species that the Cherokee do not.

Looking at the interfaces between our indigenous customs, habits, and ceremonies and our identity, spiritual being, and the natural world, it is clear that a rich repository of knowledge exists that suburban commuters cannot download from the internet. The general public has so divorced their lives from places, environments, and living ecosystems that it is easy to understand the ignorant questions often asked about American Indians—for example, "What is the American Indian religion?" Well, for whom, which American Indians, where? Yes, the Euchee lived on a river, but we did not have a Salmon Ceremony; Native people of the eastern Chesapeake Bay region never had Buffalo Ceremonies.

It is obvious when we consider the symbolic aspects of our cultures, ceremonial life, and even the social organization—the clan systems and special societies we created in our tribal communities—that these all contained accurate empirical information about how our ancestors lived in relationships with real ecosystems and environments.

In fact, I would suggest that there is knowledge contained in these cultural practices that modern science cannot acquire using

a mechanistic and dissective approach, especially when the Western idea of universal objective truth reduces itself to abstract mathematical formulas. Western science is very good at that. But contrast this knowledge system and its product to one where knowledge claims literally emerge from a place—an experience in the world. This kind of knowledge will be fundamentally different from the knowledge produced through laboratory experiment or dissection.

You see and hear things by being in a forest, on a river, or at an ocean coastline; you gain real experiential knowledge that you cannot see by looking at the beings that live in those environments under a microscope or in a laboratory experiment. You experience places and learn, if attentive about processes and relationships in those places.

When we start examining issues of complexity, emergence, the principles of self-organization, the biological phenomena of morphological or structural change within species, all of that knowledge is perfectly and completely consistent with indigenous worldviews. Our ancestors understood that the world is a dynamic and living place. I am not aware of any Native traditions that do not as a part of their oral histories accept that changes have occurred over time, often in a very short time sequence, catastrophic and otherwise. Some are more formal about this than others—Hopi and Diné traditions have very explicit discussions about the different stages of creation that have occurred. The fundamental notion is that the world and its entire biosphere is a dynamic living system.

This insight of course leads to the recognition that traditional ecological knowledge culture (e.g., language, tools, clothing, technology, etc.) in nonindustrial or nonmodern societies is emergent from specific places of the planet. Throughout Africa, Asia, the Pan-Pacific Rim, and to the homelands of our brothers and sisters in Central and South America, traditional Native peoples possess personalities and culture born of places. The power we possess as Potawatomi, Ute, Abanaki, Salish, Lummi—as indigenous peoples—is found in places even today. The power we still possess, although it is constantly threatened and in many peoples greatly impoverished, expresses itself in an attitude of humility and moral

integrity still found most often in our elders. Not only wisdom sits in places, as Keith Basso reminds us in his work on the Western Apache, but so does power and personality.

This realization offers a powerful way of talking about the manner in which biological diversity and cultural diversity are intimately connected. It requires recognition that culture is an emergent property—that is, a reality resulting from a complex process containing a multitude of interactions. In short, cultures have causes, but not the kind most biologists or social scientists can easily test in a laboratory or replicate in linear causal models. Because the world we inhabit is a very diverse place, we ought to understand what nearly all American Indian worldviews readily acknowledge: cultural diversity is not an issue of political correctness but is a geographic, historical, and biological reality.

Recognizing this point highlights the most devastating feature of the Western worldview in its general character and practical application: the destructive notion already forming by the time Cristobal Colon (Columbus) arrived in the Caribbean Islands that Europeans possessed the Truth and that it was their job to make sure all people they met on the planet were shown the Truth. This confidence, initially buttressed by the domination of the Church, that Western civilization represented the highest development of humankind was central to the Western worldview. The mandate to do things the way they did, pray the way they did, and virtually live the way they did was and, sadly, remains symptomatic of the extent to which the Western worldview of learned Europeans was already an abstract time-based ideology. They literally could not understand any history other than their own because their history became and was understood as The World History.

If one understands this Western self-conscious faith in (1) abstract universal truths and (2) the European moral duty to remake the world (in accordance with these truths) in their own image, then the incredible force of these ideas explains much of human history for the last 500 years. The worldview shaped by this twofold faith precluded recognition of knowledge, understanding, and power residing in places. It informs the practices of colonialism

yesterday and today, and it suggests just how important cultural diversity is to the life of the planet and its people.

Before Hegel, the preeminent modern idealist, developed his idea of world spirit, Kant had written two telling essays: "Idea of a Universal History with a Cosmopolitan Intent" and "What Is Enlightenment?" Both essays signal very clearly the profoundly interior nature of the world Kant lived in and the extent to which reason (i.e., rationality), history, progress, and enlightenment itself were understood as embodied in the world and reflected in the modern Western worldview. The manifestation of European Enlightenment idealism in the institutions of Western Europe had a very dark side, one that Nietzsche, Dewey, Marx, and the Frankfort School of critical theorists all saw in one respect or another, but that indigenous peoples all over the world experienced.

Again it matters little if you were (are) in Asia, Africa, South America, or Malaysia. The treatment of Native peoples around the world is an ex post facto demonstration of the Western linear idea of history, where Western Europeans understood themselves to be at the cutting-edge of history with everybody else requiring instruction to be brought "up to speed." This idea, so informative of European colonialism, was and is pure ideology, and if turnabout is fair play, the best example of what we Indians would call modern Western "mythology."

Western European colonizers were not tolerant of people who refused their instruction. This is a still living history—it is not a contentious claim. By the time of the American and French Revolutions, those few Europeans receiving a formal education had been taught that their way of living signaled the highest development of human potential as could exist in this world. While such talk has ended in this age of political correctness, the walk has not. Western-inspired institutions continue to walk (behave) the old Western way. Just ask indigenous peoples throughout the world, who are often fighting to keep from being trampled over.

It is not enough to simply collect oral histories, study the language, learn the toolmaking procedures, and know the arts and

crafts of our indigenous societies. All of this is being done and ought to be done, but we must explore experientially living in the world. Unless we incorporate features of our cultures into a holistic and integrated indigenous process of education, what we have produced is most likely "educational tokenism."

What we still possess, amazingly, not as individuals but as members of tribes, not nation-states, is big-picture wisdom born of experience, not pedagogical indoctrination. The work ahead of us is at once exciting and daunting. The task is daunting, for to a great extent we must undertake something our ancestors never had the necessity, opportunity, or wherewithal to undertake: an explicit discussion about the metaphysical foundation underlying our diverse indigenous worldviews. The work is exciting because it plays to our strengths: customs, habits, values, and how we live as indigenous people, not in some romanticized ideal or abstract past, but in the world. Power and place equal personality: Deloria's formulation is founded on experience in the world. A good place to begin Indian education in America is with the lived experiences of peoples who have resided in places long enough to know and remember what it means to be Native to a place.

KNOWING AND UNDERSTANDING

V. Deloria

Modern American education is a major domestic industry. With the collapse of the cold war, education may well become the industry of the American future. Indeed, in the 2000 election both candidates stressed education. Because education significantly impacts Indian communities and has exerted great influence among Indians from the very beginning of European contact, it is our duty to draw back from the incessant efforts to program educational opportunities, and evaluate what we are doing and where we are going in this field. It should come as no surprise to people in Indian communities that in recent months one report on Indian community colleges has been released, and plans have been announced to conduct yet another study on what is happening in Indian education. We seem to occupy the curious position of being pilot projects and experimental subjects for one group of educators, and the last communities to receive educational benefits as determined by another set of educators, primarily administrators. So the time has come to try to make sense of what education has been, presently is, and conceivably might be for American Indians.

The Western scientist has been personified, by Western peoples themselves, as Dr. Faustus, Dr. Frankenstein, and Dr. Strangelove—the person who steps outside the boundary of acceptable behavior and becomes a monster and a threat to humankind. One of the pressing ethical questions of today, with regard to genetics and atomic research, is whether when we think we can do something, we are then obligated to do it. The real question should be whether what we propose is ethical in the larger sense, not whether or not we

can do something. This missing element of the ethical is a value that can only be properly understood in the Indian context.

European civilization has a determined and continuing desire to spread its view of the world to non-European countries. Within a generation of the conquest of Mexico, the Spanish had founded schools in Mexico City for the education of indigenous youths. An important part of mission activities for the next 300 years was the education of both young people and adults in the Christian religion and the niceties of European customs. French colonial policy dictated a kind of education in which prominent families within the Indian tribe and the French colonial families exchanged children for a short period of time. This was to ensure that customs would be properly understood and civility between the two groups would not be violated by thoughtless or ignorant actions.

English education, represented first by benevolent members of the aristocracy who gave funds to support Indian schools, and later embodied in the U.S. government's encouragement of mission activities among the frontier tribes, represented, and still represents, an effort to effect a complete transformation of beliefs and behaviors of Indians. Education in the English-American context resembles indoctrination more than it does other forms of teaching because it insists on implanting a particular body of knowledge and a specific view of the world, which often does not correspond to the life experiences that people have or might be expected to encounter. With some modifications, and with a considerable reduction in the intensity of educational discipline, the education that Indians receive today is the highly distilled product of Christian/European scientific and political encounters with the world and is undergirded by specific but generally unarticulated principles of interpretation. Because the product is so refined and concise, education has become something different and apart from the lives of people and is seen as a set of technical beliefs, which, upon mastering, admit the pupil to the social and economic structures of the larger society. Nowhere is this process more evident than in science and engineering, fields in which an increasing number of American Indian students are now studying.

Education today trains professionals but it does not produce people. It is, indeed, not expected to produce personality growth, in spite of elaborate and poetic claims made by some educators. We need only look at the conflict, confusion, and controversy over prayer in schools, sex education, and the study of non-Western societies and civilizations to see that the goal of modern education is to produce people trained to function within an institutional setting as a contributing part of a vast socioeconomic machine. The dissolution of the field of ethics into a bewildering set of subfields of professional ethics further suggests that questions of personality and personal values must wait until the individual has achieved some measure of professional standing.

This condition, the separation of knowledge into professional expertise and personal growth, is an insurmountable barrier for many Indian students. It creates severe emotional problems as the students seek to sort out the proper principles from these two isolated parts of human experience. The problem arises because in traditional Indian society there is no separation; there is, in fact, a reversal of the sequencer in which non-Indian education occurs: in traditional society the goal is to ensure personal growth and then to develop professional expertise. Even the most severely eroded Indian community today still has a substantial fragment of the old ways left, and these ways are to be found in the Indian family. Even the badly shattered families preserve enough elements of kinship so that whatever the experiences of the young, there is a sense that life has some unifying principles that can be discerned through experience and that guide behavior. This feeling, and it is a strong emotional feeling toward the world that transcends beliefs and information, continues to gnaw at American Indians throughout their lives.

It is singularly instructive to move away from Western educational values and theories and survey the educational practices of the old Indians. Not only does one get a sense of emotional stability, which indeed might be simply the impact of nostalgia, but viewing the way the old people educated themselves and their young gives a person a sense that education is more than the process

of imparting and receiving information. Indeed, that it is the very purpose of human society, and human societies cannot really flower until they understand the parameters of possibilities that the human personality contains.

The old ways of educating affirmed the basic principle that human personality was derived from accepting the responsibility to be a contributing member of a society. Kinship and clan were built upon the idea that individuals owed each other certain kinds of behaviors, and that if each individual performed his or her task properly, society as a whole would function. Because everyone was related to everyone else in some specific manner, by giving to others within the society, a person was enabled to receive what was necessary to survive and prosper. The worst punishment, of course, was banishment, as it meant that the individual had been placed beyond the boundaries of organized life.

The family was not, however, the nuclear family of modern-day America, nor was it even the modern Indian family, which has, in addition to its blood-related members, an FBI undercover agent, an anthropologist, a movie maker, and a white psychologist looking for a spiritual experience. The family was rather a multigenerational complex of people, and clan and kinship responsibilities extended beyond the grave and far into the future. Remembering a distant ancestor's name and achievements might be equally as important as feeding a visiting cousin or showing a niece how to sew and cook. Children were greatly beloved by most tribes, and this feeling gave evidence that the future was as important as the present or past, a fact that policy makers and treaty signers have deliberately chosen to ignore as part of the Indian perspective on life.

Little emphasized, but equally important for the formation of personality, was the group of other forms of life that had come down over the centuries as part of the larger family. Neoshamanism today pretends that one need only go into a sweat lodge or trance and find a "power animal." Many people, Indians and non-Indians, are consequently wandering around today with images of power panthers in the backs of their minds. But there seems to

have been a series of very early covenants between certain human families and specific birds, fish, grazing animals, predatory animals, and reptiles. One need only view the several generations of Indian families with some precision to understand that very specific animals will appear in vision quests, sweat lodges, trances, and psychic experiences over and over again. For some reason these animals are connected to the families over a prolonged period of time and offer their assistance and guidance during times of crisis during each generation of humans.

Birds, animals, plants, and reptiles do not appear as isolated individuals anymore than humans appear in that guise. Consequently, the appearance of one animal suggests that the related set of other forms of life is nearby, is willing to provide assistance, and a particular role to play in the growth of human personality. In the traditional format there is no such thing as isolation from the rest of creation, and the fact of this relatedness provides a basic context within which education in the growth of personality and the acquisition of technical skills can occur. There is, of course, a different set of other forms of life for each human family, and so dominance and worthlessness do not form the boundaries between the human species and other forms of life.

Education in the traditional setting occurs by example and not as a process of indoctrination. That is to say, elders are the best living examples of what the end product of education and life experiences should be. We sometimes forget that life is exceedingly hard and that none of us accomplishes everything we could possibly do, or even many of the things we intended to do. The elder exemplifies both the good and the bad experiences of life, and in witnessing their failures as much as their successes we are cushioned in our despair of disappointment and bolstered in our exuberance of success. But a distinction should be made here between tribal and nontribal peoples. For some obscure reason, nontribal peoples tend to judge their heroes much more harshly than do tribal peoples. Tribal peoples expect a life of perfection and thereby partially deify their elders. At least they once did. Today, watching the ethical failures of the non-Indian politician, sports hero, and television preacher, it is

not difficult to conclude that nontribal peoples have no sense of morality and integrity at all.

The final ingredient of traditional tribal education is that accomplishments are regarded as the accomplishments of the family and are not attributed to the world around us. We share our failures and successes so that we know who we are and so that we have confidence when we do things. Traditional knowledge enables us to see our place and our responsibility within the movement of history as it is experienced by the community. Formal American education, on the other hand, helps us to understand how things work, and knowing how things work and being able to make them work are the marks of a professional person in this society. It is critically important that we do not confuse these two kinds of knowledge or exchange the roles they play in our lives. The major shortcoming in American institutional life is that most people cannot distinguish these two ways of knowing; and for many Americans there is no personal sense of knowing who they are, so professionalism always overrules the concern for persons.

Today we see a great revival of traditional practices in many tribes. Younger people are bringing back crafts, songs and dances, and religious ceremonies to make them the center of their lives. These restorations are important symbols of a sense of community, but they must be accompanied by hard and clear thinking that can distinguish what is valuable in the old ways from the behavior we are expected to practice as members of the larger American society. In this movement it is very important for younger Indians to take the lead in restoring the sense of family, clan, and community responsibility that undergird the traditional practices. In doing so, the next generation of Indians will be able to bring order and stability to Indian communities, not because of their professional expertise but because of their personal examples.

The Schizophrenic Nature of Western Metaphysics

D. Wildcat

In order to clearly "distinguish what is valuable in the old ways from the behavior we are expected to practice as members of the larger American society," American Indians must elaborate our own indigenous systems of metaphysics and contrast them with the dominant metaphysics of Western civilization. Failure to deal with the problem of practices and values at their roots or foundations will result in serious confusion later.

The best way to illustrate the fundamental difference between a Western metaphysics and an indigenous North American metaphysics is to begin with the most vexing issue confronting Western-influenced societies: the irreconcilable duality between facts and values, most often discussed as the science-versus-religion conflict. We are flooded with media reports of the conflicts daily—for example, the evolution controversy, human cloning, abortion, development of biological and nuclear weaponry, use of animals in medical research, product safety testing, and so on. What is the source of these conflicts?

Experiential Metaphysics in the World

An American Indian response, I would argue, would identify the source of many of these conflicts in the failure of Western metaphysics to produce an integrated big picture of human experience in the world as opposed to a big picture of the world. The distinction between an indigenous metaphysics of human beings in the

world versus a Western metaphysics of the world is crucial. The latter requires a level of abstraction beyond human experience, while the former requires abstract concept formation in the service of experience.

The "metaphysics of the world" is nothing less than the transference and unconscious resurrection of the medieval "God problem" as the modern Western problem of the certainty of human knowledge. Medieval scholastic philosophers successfully demonstrated through logic that God must be omnipresent, omniscient, and omnipotent. In the seventeenth and eighteenth centuries logic was of little use in addressing growing doubt among Western intellectuals of the existence of God, although logic was increasingly demonstrated as useful to humans in their attempts to control and use nature. Today the irreconcilable conflict between meaning/values and knowledge/facts in Western metaphysics is obvious. This is clearly demonstrated in the inability of Western legal institutions to grasp American Indian and Alaska Native claims that some places on the planet possess a degree of sacredness that precludes treatment as real estate, private property, or public lands. Nowhere is the schizophrenic nature of Western metaphysics more obvious than in the current lack of religious freedom for many indigenous people in America.

The poverty of religious freedom is evidenced in recent U.S. Supreme Court decisions that increasingly reduce religion to a set of deeply held beliefs unrelated to where people live and how they live. At the very moment people around the world are awakened to the fact that our planet is one complex web of ecological systems resplendent with biological and cultural diversity, the group of people most representative of cultural and ethnic diversity in the United States—American Indians and Alaska Natives—are implored to explain their widely shared understanding that the earth is sacred. It is ironic that the most diverse peoples of the Americas are now placed in a position where we are required to explain, document, and provide evidence for our spiritual and religious traditions in order to protect religious ceremonies and practices that ensure the very biological diversity that our spiritual traditions rest on.

This turn of events is not surprising given the dominant Western view that religion is not of this world—in other words, natural but an other-worldly (supernatural) phenomenon. Since long before the passage of the American Indian Religious Freedom Act in 1978, American Indians and Alaska Natives have been fighting to defend the notion—no, the practical reality—that religious experiences are in a profound sense a part of the power that "sits in places." We reject abstract theologies and metaphysical systems in the place of experiential systems properly called indigenous or emergent from a place.

What explains the tremendous divide between our experiential traditions and Western theological abstractions? Two very different metaphysical systems: Native systems, where explanation is often discussed in terms of experiential correspondence and understood as irreducible to simple mechanical causality, versus the now dominant Western metaphysical system, where the logic of causality established by David Hume nearly three centuries ago mandates empirical generalizations of mechanical cause-and-effect relationships.

The Problem with Descartes and Hume

The conflict between science and religion in the Western tradition is indicative of the schizophrenic nature of Western metaphysics. An American Indian metaphysics has the advantage of designating science and religion not as mutually exclusive realms of experience or areas of human interest, but as fundamental questions of knowledge and understanding found on a "continuum of experience." It is not an overstatement to see Descartes's deductive, even mathematical, rationalism and Hume's systematic empiricism as flip sides of the same coin. Both point to a world encountered by learned European minds as being without spirit or power in a tangible phenomenal sense. Although Descartes's rationalism seems to emphasize the human mind or, as one modern philosopher remarked, place a "ghost in the machine," this does not discount the basic point that his clear and distinct ideas are only appertained within a human mind that is understood as a logical machine.

Teaching American Indian and Alaska Native students Descartes's *Meditations on First Philosophy* and *Discourse on Method of Rightly Conducting Reason and Reaching the Truth in the Sciences* is difficult because the problem he poses is foreign to the general metaphysical foundation of indigenous North American worldviews. To doubt one's own existence seems not only unreasonable but suggestive of serious illness within indigenous worldviews. The famous "I think, therefore I am" is an ex post facto truism not only at the level of logic but at the level of experience too. That Descartes found it necessary to logically prove something that could be accepted by virtue of experience only indicates the extent to which experience in the world became increasingly problematic for the Western psyche.

Descartes's focus on subject-centered, self-conscious awareness is interesting and peculiar. Subjective awareness and consciousness would seem a good bridge to an exploration of human experience in a broader context. However, what I will call Descartes's extreme logical interiorizing of awareness in his "I think, therefore I am" precludes any such exploration. Existence in a Cartesian worldview is so intellectually abstract relative to experience that we might suggest Descartes initiates a modern tradition of experiential agnosticism—that is, experience as unknowable—in Western thought. What may be even more amazing and ironic is that Hume's radically empiricist version of human experience and existence produces a similar agnostic view of experience, albeit from a completely opposite point of departure.

Hume's response to the increasingly problematic nature of experience in the world was set out in *A Treatise of Human Nature,* and later in a reworking of part one of that work known as *An Enquiry Concerning Human Understanding*. Hume's notion that ultimately all knowledge comes from sense impressions results in his claim that causality is nothing more than a constant combination between perceived objects called causes and effects. In fact, he consistently and quite radically claims that any so-called natural laws of causality are little more than empirical generalizations based on custom and habit. He denies there exists any necessary

relation or connection between objects. Not surprisingly, Native students often remark that after Hume's inquiry all that remains for certain are uncertain beliefs and no knowledge.

Hume's *Enquiry* is rightly recognized as the benchmark for modern skepticism, but from the standpoint of an American Indian metaphysics, Hume's thought is fatally flawed by the reduction of experience to impressions of objects and their more vague relations. Not surprisingly, Hume's attitude toward God and miracles is skepticism, as both by definition within Hume's philosophical epistemology (system of knowledge) are outside the realm of knowledge—irreducible to impressions. If one reduces experience to impressions of objects, then much of what challenges our understanding in the world will be unintelligible. Hume demonstrated that empiricism and rationalism both result in reasoned skepticism, but to what end? The obvious point is that Hume's "miracles" confront him as nothing more than mysteries or events without explanation at the present time or beyond reason. It would indeed be an improvement if scientists today read and understood Hume, for at least some modesty regarding their own knowledge claims would certainly ensue.

Unfortunately, the part of Hume's thought that was most lasting was his simple construction of cause and effect and the reduction of all causal relationships to the constant conjunction of objects. These two ideas have certainly served the mechanics-illustrated view of life well.

The problem with seventeenth- and eighteenth-century rationalism and empiricism is that both left undeveloped (or one might even say avoided) the realm of experience and, consequently, the realm of power. An alternative to Hume's empiricism (and inevitable skepticism) and Descartes's rationalism is a reconstruction of American Indian metaphysics suggested by Deloria: a reconstruction that overcomes the Western dualisms of knowledge versus beliefs, and science versus religion. The difficult task for many of us first-generation "academic" intellectuals —Euchee, Lakota, Salish, or otherwise—is to recognize that the wisdom we want to explore is born of experience. In addition, for those *traditional*

scholars or elders deeply imbued with this understanding, self-conscious discussion or analysis of their so-called metaphysical systems would be difficult at best and may rightly seem foolish or dangerous—possibly both.

Fortunately, we academically trained Native scholars have an advantage. If we avoid the traps of Western metaphysical schizophrenia, we can explore indigenous systems of thought by becoming attentive to how our traditional scholars or elders continue to live. The incredible gulf between Western and indigenous metaphysics is best summed up as follows: in the Western context metaphysics became a study for philosophers; in indigenous communities metaphysics would be understood as the basis for living well—attentively, respectfully, and responsibly—in this world.

Religious Beliefs Versus Scientific Knowledge

As we enter the twenty-first century, the fact that Native students are often confused by the question "What is the difference between knowledge and beliefs?" is hopeful. For unlike many non-Indian students today who think their beliefs, as such, excuse them from having any intelligible discussion in support of these beliefs or correspondence with reality, American Indians and Alaska Natives still seem to grasp that beliefs are most fundamentally about what we know and understand.

A very good friend and scholar in the Western tradition, George Kaull, used to constantly say, "Faith is believing something you know ain't so," and, "Religion is the problem!" As a student of the Western tradition, I understood his point: for if knowledge becomes reducible to materialist mechanics, and those experiences and most deeply felt aspects of our existence are irreducible to such mechanical explanations, then religion (broadly understood as encompassing such aspects and experiences of our existence) becomes a realm of faith: unknowable and unexplainable.

Indigenous American Indian religions exist independent of this metaphysical burden. While explainability seems necessary in

rationalist accounts of religion, it makes religion merely a large set of potentially infinite, abstract logical systems. So what one begins to know about religion in the Western tradition is a philosophical system or theology. Faith becomes critical and necessary when one wants to know how these elaborate abstract systems correspond or operate in the world, for there exists within the dominant Western metaphysics no way of knowing—in other words, Descartes's doubt or Hume's skepticism.

American Indian, essentially tribal, religious traditions offer a stark contrast to the metaphysical schizophrenia submerged deep in the Western tradition. First, rationalist explanation is unnecessary if one depends on experience. This does not make the discussion of religion easy, it merely suggests that what we can discuss is limited, not just by tribal tradition, but by its very nature (reality). Indigenous people might agree with Hume, although for much different reasons, that the most meaningful aspects of religion are unexplainable by either the rationalist or the empiricist mandates of Western metaphysics. However, in the continuum of experience, indigenous people depend on experiential verification, not logical proof.

It is not the least bit personally or communally troubling to indigenous peoples that all of our human experiences, especially "religious" experiences, are not reducible to objects or logic. William James's *The Varieties of Religious Experience* debunked what he called "medical materialism" over a century ago, and his basic critique of scientific explanations of religious experiences still holds up. Experience remains the unexplored metaphysical terrain of the twenty-first century. And it is likely that the best scouts will be Indians—not by virtue of superior "intellect" as commonly understood, but simply because there remains among many of us a predisposition to live in the world as opposed to living on, above, or in control of the world.

Sam Deloria gave an excellent illustration of the fundamental difference in Western and indigenous worldviews during a presentation at Haskell Indian Nations University. He commented that one of the difficulties in having our traditional elders testify before

Congress on issues relating to "religion" or "religious freedom" was the immediate miscommunication that ensued. When asked by committee members to speak about their religion, elders would often respond by telling committee members that they did not have a "religion." They were absolutely right, but their stance was predictably confusing to congressional committee members, who were in no position to understand what our traditional scholars and spiritual leaders were telling them.

Osage theologian George Tinker summarizes the basis for this communication problem quite well:

> Most adherents of traditional American Indian ways characteristically deny that their people ever engaged in any religion at all. Rather, these spokespeople insist, their whole culture and social structure was and still is infused with a spirituality that cannot be separated from the rest of the community's life at any point. Whereas outsiders may identify a single ritual as the "religion" of a particular people, the people themselves will likely see that ceremony as merely an extension of their day-to-day existence, all parts of which are expressed within ceremonial parameters and shall be seen as "religious."

The sacredness of life was felt, acknowledged, and expressed throughout one's activities in the world.

It is difficult to say exactly why experience in the world became so frightful to civilized Western humankind. *God Is Red* made a good case: the problems ensued shortly after the life of Jesus was no longer seen as the life of a single community member in a very specific place on the planet, but as the outline for an abstract, worldwide, theology-based religion. But other events seem to have played a role too, including rapid technological advancement, development of the modern nation-state (or reemergence thereof), and incredible social and biological catastrophe in the fifteenth century. It seems plausible that Kirkpatrick Sale's judgment

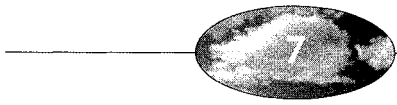
in *The Conquest of Paradise* of the voyages of Cristobal Colon may be right: Columbus was not so much trying to discover a new land but escape a declining, chaos-ridden old land.

The distrust of experience is nowhere more evident, as we have seen, than in the philosophy of Descartes, who logically introduces God as a kind of insurance policy for reality. And the fear of experience in the world may have been the motive for the greatly diminished conception of experience in Locke's and Hume's empiricism. Nevertheless, Descartes's rationalism offers little hope of resolving the dual personality of Western metaphysics, as abstract logic affords establishment of as many gods as human beings can think up.

Humankind may indeed have a gift for thinking things up, creativity, imagination, and inventiveness, but human societies and the earth's ecosystems seem threatened by a human creativity and imagination that has literally and figuratively lost touch with the earth. My friend George Kaull came to believe late in life that science also had a share of the "problem" he used to ascribe to religion. If faith is "believing things you know ain't so," a good number of scientists are guilty.

The silence of the sciences about the most pressing problems of our world today is indicative of the schizophrenic nature of the metaphysics underlying much of their modern practices. Descartes's rationalism and Hume's empiricism are flip sides of the same coin, a worldview in which humans presume themselves to be the measure of all things. Unfortunately, neither tackles the real question—so what of humankind, what of this unit of measure, so to speak?

The problem with Western science (both rationalist and empiricist denominations) reminds me of what the great pitcher Satchel Page told a young player seeking advice. To paraphrase: "Remember, it's not what you don't know that gets you in trouble, it's what you know that just ain't so that causes problems."



TRADITIONAL TECHNOLOGY

V. Deloria

Education today is wholly oriented toward science and secularism. At the core of every curriculum is the belief that we can look at phenomena with a completely rational and objective eye and find abstract principles underlying all behavior, from atoms to masses of people. This perspective implies, of course, that the natural world and its inhabitants are completely materialistic, and that even the most profound sentiments can be understood as electrical impulses in the brain or as certain kinds of chemical reactions. We have arrived at this state of affairs through the application of a methodology of reductionism, a tendency to divide, subdivide, and subdivide again in order to find the constituents of an entity or event.

The reductionist view of the world is further enhanced by the spectacular success of modern technology. Natural forces are being brought under human control, and cosmic energies bring us both power and entertainment. If a person were to chart out the relationships of the various academic disciplines, the resulting outline might find physics and mathematics as coequal partners at the top of a pyramid of knowledge with chemistry, biology, psychology, and eventually the humanities as imperfect subsets or special cases of the application of physics to selected phenomena. This outline has dominated most of this century, but recent theoretical developments are now beginning to call this simplistic perspective to account. The Gaia Hypothesis, among other new theories, suggests that we should begin to look at things organically and that we might indeed be a minor episode in a larger scheme of life. Whether this hypothesis proves fruitful enough to

become a dominant paradigm in the social/scientific future is beside the point. The issue today is that we are no longer bound to use mechanistic models exclusively to tell us how to think about the world.

The knowledge and technology of tribal peoples, primitive peoples, and ancient humans does not really appear in the modern scientific scheme, unless it is to be found within the minor articulations of the concept of cultural evolution hidden in the backwaters of anthropology, sociology, and history. This knowledge that served our ancestors so well emerges from time to time when modern scientists advocate a novel interpretation of data and, in order to claim some historical roots for their ideas—as new ideas are forbidden in academia— ancient or tribal peoples are cited as societies who once used certain practices or held certain beliefs. But the presentation of the ideas is usually accompanied by the patronizing view that although tribals and primitives did originate the idea or the practice, they could not have possibly understood its significance.

What would be some of the aspects of traditional technology? Foremost would be establishing relationships with the larger cosmic rhythms and following those cycles. It is not simply correlating the growth of corn with the maturing of mountain plants as earlier mentioned. The Tohono O'odham regulated their harvest of desert plants according to the passage of star formations so that other creatures could use the desert plants when it was best for them, humans standing aside while they did so, after which humans could harvest what they needed. Technology would be the burning of woods and grasses to ensure proper growth and elimination of the buildup of undergrowth that would cause catastrophic fires. Traditional technology involved knowing when to harvest plants and how to approach them. Sand cherries would be sour if picked when the wind was blowing from humans to plants and sweet when it blew from plants to humans.

Immense knowledge of horses was possessed by many tribes. An old tradition says that the Nez Perce created the Appaloosa by putting mud compacts on pregnant mares where they wanted spots to

be on the colts when they were born. Bows made from different kinds of wood produced different effects, and consequently people had to wait until the different woods could be harvested for bows. Teas and poultices made from herbs had to be harvested at the right time or they would not have the proper potency. Watching birds approach and use trees and shrubs enabled people to learn the correct time for harvesting. Medicine rocks abounded and certain kinds of crystals were used for divining future events. Watching how animals related to each other often showed the best ways to approach various animals. Almost everything in nature gave lessons on how the human should most profitably live.

Indian students who come from traditional homes have considerable difficulty assimilating the practices and beliefs they learned as children with the modernist attitude of science. And for Indian students who grew up in urban areas and whose experience in reservation communities is limited to sporadic summertime visits, an even greater difficulty in assimilating this attitude exists. These students often believe certain things about tribal knowledge and techniques as a matter of faith because their experiences are very limited. But they want to recapture as much knowledge of their own tribal past and practices as possible, so the problem becomes an emotional as well as an intellectual dilemma.

A good deal of the traditional knowledge was placed in a family context so that it was not difficult to remember. Thus animals and plants were believed to be not simply peoples but families within that peoplehood. It was therefore possible to establish intimate relationships with specific plants and animals and gain the precise knowledge that they possessed about the world. Although much of that knowledge has been lost with the confinement of our peoples to small reservations, it is still possible for the next generation of Indians to regain much information that we once had. Through precise observation and through ceremonies, we can once again connect with the lives and minds of the other entities of the creation.

Today numerous new studies suggest that many species have their own languages. Birds, prairie dogs, beavers, bears, and others

are now given credit for having a substantial mental and emotional life. One might even project that they have their philosophies as we have ours. It would be foolish to deny that possibility when purchasing tapes of whale songs at our local New Age store. Now, these creatures often spoke to our grandparents in our language and also taught them some of their language. Imitating birds and animals was not simply an entertainment talent but spoke of the intimacy of organic life in a way that Western science may take decades to understand. So at many points where the West relies on doctrinal explanations, traditional Indian knowledge can provide both ideas and data to bridge the gulf and expand human understanding.

CREATION STORIES

If one should track backward into the past of most tribal groups to find how things originated, one would quickly discover that specific instructions were given to the old people regarding plants, animals, birds and reptiles, and stones, as well as the technology for living in community with them. These instructions came in dreams, visions, and unusual incidents, and more often than not the relationship with plants and animals was a result of interspecies communications. The primary focus of creation stories of many tribes placed human beings as among the last creatures who were created and as the youngest of the living families. We were given the ability to do many things, but not specific wisdom about the world. So our job was to learn from other, older beings and to pattern ourselves after their behavior. We were to gather knowledge, not dispense it. Western science really traces itself backward to the Garden of Eden scenario in which humans are also last created, but it is believed that they are given mastery over the rest of the world. Humans are, in the Western scheme of things, the source of knowledge and information, but they are also isolated from the rest of creation by standing alone at the top of the pyramid.

Because we gather knowledge from older beings who have the wisdom of the world within their grasp, we must maintain a relationship with the rest of creation. Consequently, the clan and kinship systems that guided the social organization of the world were

not only modeled after observed behavior of other beings, but also sought to preserve the idea of relationships of the natural world within the technology that arose as a result of our learning experiences. Western science learned its lessons from observation and then from experimentation with the entities of the natural world. There was no sense of community because humans had been placed too far above the rest of creation, and there was no hesitancy among Western people to use the rest of creation in any manner it could conceive. But the price of using others as objects was that absolute values had to be maintained, and space, time, and matter became absolute concepts within Western science. Both science and its reductionist methods remained absolute as long as these ideas were regarded as absolute.

In a fundamental sense, which many people in science do not yet recognize, the theories of Albert Einstein created tremendous gaps in the Western scientific scheme. Einstein's work challenged the absolute status of space, time, and matter, and his major contribution was to reduce the absolute nature of these ideas to a relative status; he introduced the context into modern science in a way that could not easily be refuted. But the importance of relativity for traditional thinking is that it began to shift the focus from the absolute materialistic framework science had constructed to an idea that things are related. Not many people in the academic community have yet applied this idea to the world as a totality, and certainly many of them would rebel at the idea that science is shifting significantly toward a tribal understanding of the world. They continue to believe that relativity means that there are no absolutes. In fact it means that things are related in some fundamental ways that had previously been excluded. There may not be as many anomalies and coincidences as we have previously supposed.

Many tribes described relationships in terms of correspondence between two things ordinarily thought to be distinct, isolated, or unrelated. The old saying in religious ceremonies, "as above so it is on earth," is such a correspondence; so is the gathering of things for equipping medicine bags, for making drums, weapons, household goods, and clothing, and for creating altars and blessing

dwellings. In each of these activities a variety of materials are used, and they are said to "represent" certain things. *Represent* here is not taken as a symbolic gesture, but usually to mean that the power and knowledge of these things are actually present in the creation of something new.

WISDOM AND VISION
ACKNOWLEDGING THE LIFE AND POWER IN ALL THINGS

Today we have the artifacts of every tribe lining the shelves of museums and being described as great primitive art. And, indeed, if we think of these artifacts only as useful utensils and implements, apart from the tribal context, they may be simple instruments, extensions of people's limbs and desires as Robert Ardrey once edified describing weapons and tools. The important part of the relationship, however, was that all things were alive, and consequently their own power and wisdom was incorporated with them wherever they were represented. Modern humans use weapons, tools, and instruments to extend the capabilities of their own selves, and they use these things mechanically. Tribal people in using their instruments did not simply extend the scope of their own capabilities, but enhanced their abilities through the addition of the powers inherent in the relationships they had with other living things.

Today we attend colleges and universities in order to learn the principles of how things work and how to use instruments properly. Tribal people learned these things in religious ceremonies, depending on the intensity and scope of the vision a person received, or the frequency with which spirits informed him or her concerning the proper attitude to take when exercising certain powers. Thus, it was a holistic understanding that undergirded tribal technology, and use of the technology was vision-specific. That is to say, the knowledge the old ones attached to their technology demanded that they use their powers sparingly and on the proper occasions. A person could not indiscriminately use powers as we casually use our instruments today. This lesson is important because today with modern technology we tend to believe that we can apply it on a

rather indiscriminate basis, and we are learning that often we do not really understand the side effects such use creates.

The old anthropology and history of religious schools used to paint tribal peoples as a superstitious lot who cringed in fear of the natural elements and made up simplistic explanations for all things they did not understand in an effort to create some kind of science for themselves. Modern science tends to use two kinds of questions to examine the world: (1) "How does it work?" and (2) "What use is it?" These questions are natural for a people who think the world is constructed to serve their purposes. The old people might have used these two questions in their effort to understand the world, but it is certain that they always asked an additional question: "What does it mean?"

HEALING THE LACK OF BALANCE

The old people, surveying a landscape, had such a familiarity with the world that they could immediately see what was not in its place. If they discerned anything that seemed to be out of its natural order—a nocturnal animal in the daytime, unusual clouds or weather conditions, or a change of the plants—they went to work immediately to discover what this change meant. Many observers have said that this ability to perceive anomalies meant that the people could see when nature was out of balance, and I certainly would not quarrel with this characterization. When the people saw an imbalance, their understanding of the natural ordering of cosmic energies informed them that their responsibility was to initiate ceremonies that would help bring about balance once again.

Eventually it was recognized that the world had a moral being and that disruptions among human societies created disharmony in the rest of the world. This belief corresponded to modern professional ethics but differed from them in that the whole tribal society was involved in healing the lack of balance. Today it is only the professional who sees the imbalance, and the general society comes to believe that the scientist can create the technology needed to bring balance back again. Thus, in spite of a clearly deteriorating

physical world brought about by industrial society, we still think in mechanical, technological terms when we discuss restoration of what we have disrupted. Because no one actually "sees" quantum waves, what is quantum physics except scientific mysticism?

Traditional technology may seem outdated to many Indian students now undertaking a scientific education. If so, they are not getting the full story from historians and apologists of science. It is said that Albert Einstein had holistic and sometimes substantial visions of the world, and that he spent most of his life looking for the proper mathematics to describe what he had experienced. One need only look at the many instances in which noted scientists had visions or dreams that solved the problem they were confronting. The world in which we live, at its very foundations, is unified and cannot be reduced by techniques and rationality. Where traditional Indians and modern science are quite different is in what they do with their knowledge after they have obtained it. Traditional people preserve the whole vision, and scientists generally reduce the experience to its alleged constituent parts and inherent principles. These principles then become orthodoxy and stumbling blocks to future generations.

A great gulf exists between these two ways of handling knowledge. Science *forces* secrets from nature by experimentation, and the results of the experiments are thought to be knowledge. The traditional peoples *accepted* secrets from the rest of creation. Science leaves anomalies, whereas the unexplained in traditional technology is held as a mystery—accepted, revered, but not discarded as useless. Science operates in fits and starts because the anomalies of one generation often become the orthodoxy of the next generation—witness the continental drift theories, catastrophism, and the fictional theories about the Bering Strait.

GIVING TRADITIONAL TECHNOLOGY A CAREFUL LOOK

Indian students would do well to understand the traditional approach to learning about the world in addition to taking the scientific courses to gain entrance to professions. They should be

prepared in their work, as students and later as professional people, to answer the question "What does it mean?" in addition to answering any other questions that as professional people they will be expected to answer. Traditional technology can be extremely useful because it always reminds us that we must take our cue about the world from the experiences and evidence that the world gives us. We may elicit and force secrets from nature, but nature is only answering the specific questions we ask it. It is not giving us the whole story as it would if it were specifically involved in the communication of knowledge. What is given willingly is much more valuable than what is demanded as a matter of force.

Because many Indian students will be working for their tribes once they receive their professional degrees, it would benefit them to give traditional technology a careful look. Tribal lands and resources have always been used on a sustained-yield basis, and this attitude is in distinct contrast to the American propensity to exhaust resources for short-term gains. Modern technology might indeed be useful in repairing the damages already done to tribal lands so that the lands can once again be put on a traditional use pattern and become productive. And even this possibility can be learned from the world as it responds to ceremonies and human societies who understand their place in the larger cosmos. As science progresses, so do the ceremonies, and as we look ahead there is considerably more to be gained by combining insights than by ignoring them.

Technological Homelessness

D. Wildcat

The United States is a nation of homeless people. A modest estimate would place three-fourths of U.S. citizens in a condition of homelessness: a technology-induced condition of homelessness. I am not talking about the desperate situation of the far too many Americans without any real means to provide for a domicile or residence with a definite address. These individuals and families have real problems, though their lack of housing, ironically, might be straightforwardly addressed and solved to a great extent given a little moral courage and political will. No, the problem of homelessness demanding attention concerns the vast majority of Americans today living in houses, condos, and apartments, residences with addresses, who have taken advantage of our society's modern education systems and technologies and still feel lost, disconnected, ungrounded, or what we call homeless.

By *homeless,* I mean without a home as the *American Heritage Dictionary* secondarily defines *home:* "an environment or haven of shelter, of happiness and love." In industrial and postindustrial societies, human beings, especially in U.S. suburbs, live less in shelters than bunkers, strategic enclaves where they do not so much live as primarily sleep. Happiness and sleep among those "with means" in America are only a pharmaceutical prescription away, and for those "without means" happiness is predictably defined by success in attaining the material wealth a great many of the unhappy "with means" possess. As for love, the line of a popular song states, "What's love got to do with it?" As it turns out, for many, very little.

It is disturbing to have to point these facts out, especially because we are surrounded by them daily. Alexis de Tocqueville, almost two centuries ago, feared for democracy in America because he saw Americans so preoccupied with material success that they had little time for participation in democracy. Only three decades after Tocqueville's assessment, Suquamish leader Seattle noted that human beings seemed to have lost the knowledge of how to live. By the middle of the nineteenth century Americans were already in a struggle for survival. The irony is obvious: we have learned more about the manipulation of the physical or material elements of the world for our human comfort and convenience, and yet American workers are experiencing increasing rates of anxiety, depression, and stress. Not surprisingly, in the last decade American workers have surpassed the Japanese in time spent working. The United States is now the longest-working advanced industrial nation in the world.

The economy may be good for some or even many, but good for what, or good at what? The answer is simple: making money. It is often quoted that after the successful detonation of the atomic bomb (the preeminent example of technological achievement in a scientistic worldview), Einstein lamented that everything had changed but the way human beings think. There is nothing new in the judgment that industrialization and manufacture have disproportionately benefited a few financially, and in terms of material comfort and convenience benefited many, although inequitably. But at what cost to ourselves and our ecological communities? Indices and rates of mental illness are all up, especially when one includes those illnesses labeled neuroses. Ironically, it appears we may have bought more with the materialist mantra of comfort than we bargained for—a significant amount of discomfort to our spirits.

In the Western tradition the critique of industrialization has largely been over the control and management of the system of production, and consequently, the distribution of the industrial economy's benefits. Apart from a neglected anarchist moral critique and a recent strain of criticism referred to as neo-Luddism,

only a few have questioned the overall effects of technology on the human condition and on how we live, and what it means to be a human being.

I wish all young Indian students would read Stan Steiner's *The New Indians.* It documents a history too few Indian students today know. They should at least read the foreword, in which Steiner recounts the following incident. In the 1960s Vine Deloria, Jr. was invited to a civil rights fund-raiser to see how things were done. As the event was winding down the topic of Red Power was raised, and the featured keynote speaker laughed and quickly dismissed the notion, to which Deloria replied:

> Red Power will win. We are no longer fighting for physical survival. We are fighting for ideological survival. Our ideas will overcome your ideas. We are going to cut the country's whole value system to shreds.
>
> It isn't important that there are only 500,000 of us Indians. What is important is that we have a superior way of life. We Indians have a more human philosophy of life. We Indians will show this country how to act human. Someday this country will revise its constitution, its laws, in terms of human beings, instead of property. If Red Power is to be a power in this country it is because it is ideological.

When told again that Indians should be fighting for equality and civil rights, not Red Power, Deloria continued:

> We do. But that isn't the question. The question is, What is the nature of life? It isn't what you eat, or whether you eat, or who you vote for, or whether you vote, or not. What is the ultimate value of a man's life? That is the question.

To linear thinkers the above statements may seem out of place in a discussion of technology, but they are the most fundamental questions to be considered as we think of the development and use of technology: to what ultimate end or purpose are these tools?

Education today must now undertake a serious examination of these questions, and there is no better place to begin than classrooms in American Indian communities. Here, there still exists an experiential metaphysics and worldview that approaches technology as essentially a question of nature and how we human beings live with and in nature.

For the sake of clarification, I submit that two very different understandings of technology are the issue. A deeply seated (metaphysically based) Western view of technology as science applied to industrial (manufacture) and commercial objectives, versus a (metaphysically based) American Indian, or rather indigenous, view of technology as practices and toolmaking to enhance our living in and with nature. The Western conception and practices of technology are bound up in essentially human-centered materialism: the doctrine that physical well-being and worldly possessions constitute the greatest good and highest value in life. Indigenous conceptions and practices of technology are embedded in a way of living life that is inclusive of spiritual, physical, emotional, and intellectual dimensions emergent in the world or, more accurately, particular places in the world.

We cannot afford to minimize or soft-sell the situation in which we find ourselves. The problems we most likely, and certainly our children and grandchildren, will face are monumental: environmental degradation, technological imperialism, consumerism for consumerism's sake (what Thorstein Veblen called conspicuous consumption), and increasing social dysfunction. Yet there is reason to be cautiously optimistic, because we have literally reached a place, or I should say places, in the modern world where the plethora of problems that surround us are rising to level where they cannot be ignored.

Nevertheless, there is hope for our children because, in spite of what some of humankind has sought to improve and control in the natural world, tremendous beauty and wisdom are still around us. The challenge of indigenous education is to expand the ability of children to experience the world—the world they are a part of as their home, an environment or refuge of happiness (with hard

work) and love (with respect). We can and must educate a generation of children who find home in the landscapes and ecologies they inhabit.

As we make great strides in ecological knowledge at the beginning of the twenty-first century, the problem human beings face today is simply summed up by the following question: "What exactly is the ecological niche of human beings?" Although scientists have painstakingly sought to classify and analyze all the other lifeforms on our planet, it strikes me as odd that they have spent so little time considering just what our (human beings') "niche" might be.

Many of us human beings have sought to distinguish ourselves from the rest of nature, but to what end, what purpose? Human beings in modern Western civilization have historically identified culture as the primary feature distinguishing us from other animals. Specifically, toolmaking, or technology, and language have until very recently been thought to clearly demarcate us, humans, from them, other animals. Some of us have found great solace in thinking of ourselves, with our culture, as above other animals and the natural world in general.

It is this human "cultural context" that must be placed in a broader understanding of natural "history" if we are to understand ourselves; and within culture, technology must be carefully scrutinized. Indigenous American Indian traditions, we believe, are our best guides for reassessing technology, for they represent practical ways of seeing technology as a part of nature.

It is difficult for many adults in modern American industrial or postindustrial society to understand that the natural world—and to be precise, local ecosystems—ought to play a major role in determining the technologies we employ. The examples are so obvious in hindsight—I repeat, in hindsight—that we would do well to pause before we leap headlong into the bioengineering utopia we are presently being promised.

Living close to the confluence of the Kansas and Missouri rivers for the last three decades, it has been interesting to watch people's reaction in the 1990s to having, within the span of several years,

two 500-hundred-year floods. Dams and levees, while good for urban development and large agribusiness, are overall ill-conceived given the degradation to riparian ecosystems and water quality, not to mention the flood damage and costs to the federal government.

Dakota anthropologist Bea Medicine has discussed the destruction to sustainable Dakota agricultural practices that ensued with the damming of the Missouri River on the Standing Rock Sioux reservation. Wisely, the Dakota farmed in the rich river bottoms but set up their villages above them. They knew better than to set up villages on the river's edge, although in fair weather there was no obstacle to camping there. No synthetic fertilizers were needed, for when the floods came as they surely would, the soil would be enriched and replenished. Likewise, there were no damages to human-made dams, levees, and domiciles.

My friend and colleague Cynthia Annette, a riparian ecologist, likes to say, "Rivers have memories." No matter where we (humans) want them to go, they remember ancient paths. The Dakota knew this and chose to live in a manner that respected the Missouri River's memory. The counterpoint to this understanding is the U.S. Army Corps of Engineers, who have never met a river they could not dam. Compared to genetic engineering, building dams and levees to control rivers ought to be relatively easy, but rivers are hard to control. All the variables that combined to produce the incredible flooding, we are now told, could not have been predicted. In short, nature and the rivers had their way. The notion that technology can translate into control of nature is, as stated earlier, nothing more than—to borrow a phrase, if turnabout is fair play—a mythology, although a very modern one.

TECHNOLOGY IN THE BIG PICTURE

"Bridging Gaps in Technology and Culture." This was the theme at the 1998 Hazardous Waste Research Conference, where I suggested to scientists and engineers they address this problem by first acknowledging a complex set of interrelations in a formula I called TC3. Technology, community, communication, and culture

are intimately related. Try to imagine any one of the four existing among human beings without the other three—you cannot. I summarized this relationship for scientists and engineers as the TC3 formula.

Haskell Environmental Research Studies Center programs and projects over the last five years have reminded me of the importance of the TC3 formula because unfortunately, most Americans live as if this relationship is unknown. That we speak of gaps in or between technology and culture is crucial, for it is symptomatic of a serious obstacle to understanding. These gaps obscure the reality that technology is a part of culture as are the forms that community and communication assume. Still, the recognition that gaps exist suggests the issue is far from academic. Rather, the issue strikes at the core of how we ought to think about technology and what education and environmental research ought to be about today: the way we live and our respect for the places where we live (our homes and communities). The advantage of Deloria's power-and-place-equal-personality equation is that when applied to technology, it forces one to frame technology in the big picture.

Many scholars, scientists, and engineers are engaged in problem solving and research as if TC3 were unimportant. Disciplinary boundaries and professional specialization force many to work in conceptual boxes, and we increasingly live literally in isolated/insulated physical boxes. The result is a natural and social forgetfulness about the way in which technology, community, communication, and culture are related. Collectively our human ancestors may very well have possessed a wisdom modern human societies desperately need—a wisdom not produced by superior "intelligence" or rationality, but born of direct experience and subsequent reflection. The wisdom resides in the recognition that the modern dichotomy between human/social issues versus technology/technical issues is a false one, an invidious distinction. Technology and humanity are as inseparable as human beings are from their natural environments.

Reading human history, one is impressed by the extent to which it is full of humankind's self-declared superiority. However, most

recent entries appear to revolve around technological achievements. For good reason: human evolution has resulted in an attribute that is anything but physical or adaptive as it is ordinarily conveyed in beginning biology courses. Our uniqueness, as a species, is found in the ability to use technology to live in environments that would otherwise be largely uninhabitable by humans and the societies on which we depend.

Our capacity to manipulate environmental elements to compensate for our physiological awkwardness is what nature has given us two-legged persons to work with to secure our lives. It appears natural selection has not selected us for a particular niche or place on the planet, but has selected traits that have allowed human beings, with the use of technology, to adapt to different places and environments on our Mother Earth.

Central among those traits is our sociability or social nature. Unlike the social dimension found in many animals—for example, big cats, wolves, bears, dolphins, and of course higher primates—our physiological awkwardness dictates a necessity for toolmaking and manipulation absent among other animal species. This is less a sign of human superiority than a sign of biological difference. In my mind this explains why in our traditional indigenous ways of speaking and praying we so often describe ourselves as pitiful beings. Humans depend on many good relations and relatives to live and survive in this world—hardly superstition, just ecological fact. Nature, nurture, and technology are intimately connected.

Our American Indian societies understood this profoundly important point: our evolutionary past has not made human beings superior but merely different. We identify our culture or social spheres as what distinguishes us from other biological life, but with respect to other animals this is less a case of absolute uniqueness than an issue of degree. Elizabeth Marshall Thomas has demonstrated this in her wonderful book *Tribe of the Tiger*. Yet it is the degree to which our social behavior revolves around the development of technology that distinguishes us from other animals and explains why we should consider technology as central to human nature and history. We ought to give up on our modern notions of

human superiority, lest our technological "successes," as typically measured, become our defeat and the destruction of our home—the earth's biosphere—and many of the relatives we share it with.

From primitive toolmaking to the advent of modern machinery, our primary goal was to fashion material culture—clothing, shelter, utensils, and so on—that provided a social and cultural adaptation to environments and places. Throughout most of human history, places and environments shaped and limited the kinds of cultures humans created. Places, technologies, and cultures were inextricably connected.

Deloria's power-and-place-equal-personality equation, or P3 formula, makes for a spatial metaphysics of experience. The TC3 expression, technology, community, communication, and culture, is an attempt to identify the natural cultural feature of human beingness. P3 and TC3 are not rigorous mathematical expressions; rather, I think of both as symbolic expressions that can serve as mnemonic devices that preclude thinking of technology, or for that matter any of the key features of human culture, as outside of nature.

Our biologically and geographically diverse natural environments shaped how we lived—our livelihood activities, shelters, clothing, and much of our symbolic nonmaterial culture. Keith Basso's book *Wisdom Sits in Places* brilliantly documents the extent to which Western Apache history is less about time than places, or what might be called a sense of place.

New technologies have given humans the ability to reshape environments and geographies to accommodate comfort and convenience. And we are increasingly preoccupied with the physical rearrangement, manipulation, or engineering of natural environments. John Locke set out the rationale for this mode of living 300 years ago. In Locke's philosophy the rest of nature existed ultimately for humankind's benefit and convenience. It was a short step to reason that if natural environments do not meet our human standards of comfort, convenience, and aesthetic beauty, we ought to change them to do so.

Modern technology allows us to do precisely this, but at what cost? I believe the cost is a growing absence of a sense of place

for human communities and correspondingly modern culture, which are literally "groundless." Thirty years ago Vine Deloria, Jr., described modern societies as rushing to create an "Artificial Universe." Vine Deloria may be one of the few nontechnical scholars unsurprised by discussions about artificial intelligence, globalization, and virtual "realities," "communities," "persons," and so forth. Human beings fail to experience the world as our ancestors did, and as many of my living indigenous elders do, because our technologies increasingly insulate us from direct experience and the acquisition of experiential knowledge from natural environments.

Automobiles, television, air conditioning, and computers, to pick four obvious examples, result in human convenience, entertainment, comfort, and escape from incredible drudgery. But I interact less directly and physically in time and space with other human beings and the natural environment because of the ease, comfort, privacy or relative isolation with which I can use these technologies. Technology, in general, has reshaped most people's everyday lives, often in measurably positive ways. But here is the irony: as we disengage technology from communities (which include plants, animals, and geographic/geologic features) with a sense of place, and thereby create cultures and forms of communication that are relatively abstract, we unconsciously destroy conditions for our human survival and threaten the lives of many other plants and animals with whom we share this biosphere.

I am not anti-technology; my human nature dictates otherwise. But my nature also requires community (nurture), and currently we pose the quest for community and new technologies as if they were mutually exclusive endeavors. They are not. This knowledge ought to give us reason to pause, not because of fear for what technologies literally do, but out of concern for their residual effects: the unintended byproducts of our human use of the technology.

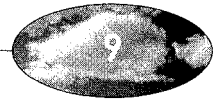
Fortunately, there is some promise in the fact that we are beginning to have powerful allies in the dominant and mainstream system of education. Leading educators, child psychologists, and psychiatrists recently endorsed a report by the Alliance for Child-

hood, "Fool's Gold: A Critical Look at Computers in Childhood," and signed a petition suggesting "an immediate moratorium on the further introduction of computers in early childhood and elementary education."

It might be hoped that adults take notice of what extended computer-time does to them. A study by scientists at Carnegie Mellon University found that as individuals increased time on computers, they also increased feelings of loneliness and depression. What does it tell us when the high-tech interconnectivity of "webs" and "nets" leaves us feeling disconnected? It tells us that technology is potentially impoverishing and harmful to the soul, to our spiritual and interior lives that are formed by the number of good relations we acknowledge and maintain.

If we human beings begin our understanding of the natural world with the big picture, we must acknowledge our relatively recent arrival to our Mother Earth's biosphere. The result ought to be a kind of biological modesty, for many of our biosphere community members have been here much longer than we have. In the minds of many scientists, such as Richard Leaky, some of our biosphere neighbors may outlive us. Our traditional indigenous cultures are literally grounded in the geographies and natural environments to which we are historically connected. In fact, history itself, and our worldviews, philosophy, and material culture, were and in varying degrees still are shaped by a sense of place. If human beings continue to live as if ecology and evolution have given us a privileged place in the natural order of things, our human history may very well be a footnote in the life story of our Mother Earth.

It would be an ancient coyote story writ large if the technology human beings used to ensure our physical and material comfort and convenience resulted in no place to live on this planet—an ultimate form of homelessness that resulted in our extinction. We can bridge the technology and culture gap if we are willing not only to acknowledge the TC3 relationship but also to change the way we live. Human survival and the survival of many of our relatives may depend on it.



TRANSITIONAL EDUCATION

V. Deloria

Education has a transitional function of moving individuals from one status or condition to another. In the old days we used to mark these transitions by giving the individual a new name, a name that would more accurately summarize his or her achievements. Today we award certificates, diplomas, and degrees to mark each step the student takes. But education itself is transitional. New theories and concepts are continually intruding into established patterns of teaching and institutional organization so that the experience of education changes radically from generation to generation. For American Indians there is an additional element to be considered, because Indian school systems are at best transitory. There is no predictability in the actions of Congress that would reassure the people that a decent education will always be available to them. Indian education is conceived to be a temporary expedient for the purpose of bringing Indians out of their primitive state to the higher levels of civilization. Presumably, when this ill-defined status is reached there will be no more use for special programs in Indian education.

The goal of much of modern education seems to be socialization. That is to say, with some few exceptions, we are training people to present an acceptable profile to the corporate industrial world. Our undergraduate degrees actually certify that the student has a smattering of knowledge about a number of fields, is fairly well acquainted with one particular field, and can accommodate himself or herself to institutional life. We pretend otherwise, but this goal is what we actually have in mind. Indian education is some-

what unique in that it has always been premised upon the idea of assimilation without regard to socialization. From the very beginning, first missionaries and later government teachers sought to erase the cultural backgrounds of Indian children with the naive belief that once a vacuum was created, Western social mores and beliefs would naturally rush in to replace long-standing tribal practices and customs.

A review of Indian education programs of the past three decades will demonstrate that they have been based upon very bad expectations. In 1960 there were approximately 2,000 Indians in higher education, financed primarily by private scholarship funds and individual and family efforts. In 2000 best estimates show that we have something like 70,000 Indians in various forms of higher education, financed by a bewildering variety of sources, including colleges and universities, private groups, state scholarships, and several forms of federal assistance. In spite of our continual complaints, it should be obvious that Indian education has made some major progress since 1960, and that while funds are hard to come by for many students, the overall picture appears very bright.

Yet we are all discontented with what is happening in Indian education and we cannot quite put our finger on why. The majority of funds in Title IV and other programs have concentrated on the sciences and administration and management, and yet, as we look around at both reservation programs and the distribution of Indians in private industry, we find little evidence that the efforts of the last forty years have made a difference. We still need many Indian educational administrators, we have a pressing need for management personnel, and we still have great difficulty finding Indians working in industry. Reservation and border-town schools appear to be falling even farther behind the national norms, and many schools are simply thinly disguised holding pens to keep the young people institutionalized during the day until they reach a certain age when we can demand that they behave like adults. The outbreak of devil worship on some reservations and the growing drug problems on others demonstrate the inadequacy of the present situation.

So What Problem Are We Actually Facing and How Do We Deal with It?

Education has generally been misunderstood by its practitioners. It is defined as both process and content, and it is exceedingly difficult to tell from educational behavior and philosophy whether or not the educator is making the proper distinctions. We can divide Indian education into two basic periods: the period of content and the period of process. From the beginning of the Republic, in fact from the beginning of contact, education was primarily a matter of providing content, new ways of thinking of things and new facts. From the Meriam Report of 1928 until the present we have been living in the age of process—which is to say, we have been more concerned with *how* children learn than with *what* they learn. During the past forty years we have been exclusively concerned with how they learn and have almost studiously avoided asking what it is they are learning.

This situation is particularly difficult for students who are studying science because, in most respects, science is content and not process. Consequently, after educating Indian young people in schools that stress learning experiences, we suddenly place upon them the demand that they accommodate themselves to the scientific enterprise—which is to say, build scientific expertise on a secondary education that has very little content. The student has no choice except to attempt to learn the scientific curriculum as well as gain background in the mass of conflicting ideas that now passes for Western civilization. When the social adjustment from Indian community-based culture to non-Indian urban networking culture has to be made at the same time, many students adopt a very rigid posture concerning personal, group, and community values. Too often they model themselves after the professionals in their academic field or their institutional situation. This adjustment then forces them outside their Indian circle and greatly inhibits their ability to draw from their own tribal traditions the lessons that could be profitably learned regarding both science and the social world in which they

live. That we are producing any Indians in science at all is a tribute to the perseverance of this generation of Indian young people.

Where then do we start to make changes in Indian education so that we can deal with the problems we perceive? Perhaps the first step we can take is to admit that education is transitional and that it has both a beginning and an end. Indian education must certainly begin within the Indian community, be it a reservation, small town, or urban setting. Recent legislation, most notably the Indian Education Act, has attempted to deal with this, beginning by requiring that schools receiving federal funds have Indians on their school boards and advisory committees. Here Indians were placed within the process of education but not allowed to determine its content. In Indian survival schools, Indians were allowed to determine the content but were generally isolated from the process of education. Consequently, few schools at the primary and secondary levels have been able to do very much about improving education as a whole.

When we look closely at the idea of a transitional process, we must note that the goal or result should have been contained within the beginning and should flow directly out of it as the potential to be realized. The old Indians saw this necessity at once. The famous saying of Sitting Bull, basically that the people should take what is good of the white person and reject what is bad, assumed from the start that Indians would begin in, and always have recourse to, their own communities and cultural traditions. The missing element here, or rather the conclusion that we always avoid drawing, is the context in which education occurs. Context is also the beginning; it is not only the place to start, it is the channel within which all other developments must occur. Modern Indian education too often looks at the present poverty context of Indian communities and then devises programs that are supposed to deal with and overcome the handicaps that present conditions contain. Thus we have educational programs for every conceivable kind of social and community handicap and disability. But the products of these programs are often worse for the wear, and the best students emerging from them represent but a very small percentage of the total student population.

Compensatory programs fail because they take the Indian context as the immediate conditions under which Indians live. This analysis is a common characteristic of the Western way of thinking, but it is certainly not a traditional Indian way of thought, nor is it the manner in which many Indian parents conceive of education or of their lives. In politics we always speak about the coming generations, and anthologies are filled with clever sayings and quotations about the lands of our grandparents and the next generation of Indians. The essence of these sayings is a view of the world that encompasses many generations of people. That is to say, the proper context of Indian education should be whatever existing conditions are plus the traditional manner in which the tribe has faced its difficulties. In other words, the proper context is the history and culture of the tribe, regardless of the present location of its membership.

We do not have good present examples of how Indian education has worked when the context defined both the content and the process of education, but the school systems of the Five Civilized Tribes certainly functioned in this manner—and they functioned very well indeed. Tribal college graduates could generally speak their own language and English, and they had a reading knowledge of a European language. These were school systems designed by the tribes themselves, funded by the tribes through annuity accounts in the federal treasury, and staffed and operated by tribal governments. The Creek school system invented the school warrant system of finance that was adopted by a good many of the non-Indian school districts in the western states in succeeding years. Additionally, the Five Tribes had seminaries that educated the young women of the tribe and orphanages to take care of the homeless children.

We have part of the message of the Five Tribes educational system today—tribal control—but we do not have the tribal concern to make education the primary function of the tribal government. In those days tribal officials made an annual visit to each school in the tribal system. Students were expected to recite what they had learned in order to demonstrate that they had mastered the content of what was taught. Scholarships for higher education were not handed out on a tribal membership basis. Students had to earn

tribal support after their secondary school days were completed. At graduation whole families came to the school and listened to the students demonstrate their knowledge of the various subjects they had studied. The old tribal custom of reciting deeds done on war parties was translated wholly into a recitation of schoolwork completed. School graduations were the big social event of the year. When we try to summarize the basic philosophy of these schools, we find that there was a general belief that education was something for the tribe, not for the individual. School became an integral part of tribal customs. It was not something imposed on the people.

It is not possible for tribes to fund their own schools today. Indeed, most American communities do not support their own schools but receive federal, state, county, and private financial assistance so that, to a certain degree, no school district in the United States has the financial freedom to determine either the process or the content of its education. Funding is not the issue, however. The issue is providing the context in which what is taught and the processes by which it is taught make sense. Here tribes have a very decided advantage over non-Indian school districts. An individual is a tribal member all his or her life, and consequently the tribe always has a central core constituency of people who represent the individual's interest. Non-Indian communities, on the other hand, are hardly what a person could truly call communities. Apart from small towns that have a greater resemblance to Indian tribes than to other non-Indian communities, most American cities and suburbs are merely places through which people travel. It is an exceedingly rare non-Indian who lives in the same town where his or her grandparents spent their adult lives. As a result, non-Indian communities are themselves in transition. That is to say, they lack context, and consequently their educational programs are increasingly educating fewer and fewer people.

Without a context, science quickly becomes a technology, the application of theory to practical use without so much as a thought about the consequences of the application. This process has been determining the fate of American communities for most

of this century, but now with increasing scientific knowledge we are coming to the end of the period when we can thoughtlessly apply science. In the next decade we will see a massive backlash by ordinary citizens against the use of technology for corporate and private profit, in defiance of the health and living conditions of people in affected areas. A quick reading of any magazine or newsletter devoted to ecological issues, civil rights, animal rights, or agricultural concerns will reveal the scope of the modern reform movement. In short, for the first time since the beginning of the American industrial revolution, which probably began in the 1880s, Americans are now trying to build a context in which the content of education will have some value.

Indian education can exercise an enormous amount of influence in the future if we can place it once again within the tribal context. Almost every book now published by the New Age movement is crammed full of sayings by Indians to the effect that the earth's resources are limited, to the effect that people should have priority, and to the effect that there is an important spiritual dimension to human life, that human life has definite meaning that transcends the technological world in which we find ourselves. All of this attention is merely the exploration by non-Indians of windows into the Indian understanding of the universe. There is a deeply held belief that by appropriating a few wise sayings of Indians, long-standing problems brought about by the misuse of science and greedy capitalism can be solved. But merely appropriating ideas only provides slogans, not understanding.

Until the present time, the theory underlying Indian education was that it would provide a transitional process for turning the Indian child into an acceptable citizen. Education thus moved from an Indian context into a condition where the original context, the Anglo-Saxon Protestant world, was itself eroding because it was adopting an education of process and not content. If we now see the fallacy in this process and redefine Indian education as an internal Indian institution, an educational process that moves within the Indian context and does not try to avoid or escape this context, then our education will substantially improve. It will originate as

part of the tribal perspective about life and pick up additional information on its return to Indian life.

Establishing the Indian context, in view of the absence of clearly defined tribal goals and philosophies, can be easily done by present Indian students. The primary question they should ask themselves is whether or not what they are learning will have some meaning to tribal people. And the answer, at first glance, will be a resounding "No." We presently do not know how to bring knowledge and information back to the tribe because we have not paid sufficient attention to the history and culture of our people. We have been deluded into thinking that there is no applicability of information on behalf of the tribe or no possibility of making our knowledge meaningful. So we must use what we learn about the scientific understanding of the world to ask questions of our people about how our ancestors understood the world, remembering that the tribe exists over many generations and possesses a cumulative knowledge that transcends any particular generation.

The answers that we will receive, when we ask elders and when we read recorded accounts of beliefs and practices, will often seem strange and many times irreconcilable with our scientific knowledge. But we must not use the scientific method to determine the truth or falsity of our comparison. We must learn to place the difference within the tribal context and there reconcile conflicting points of view. As Indians we know some things because we have the cumulative testimony of our people. We *think* we know other things because we are taught in school that they are true. The proper transition in Indian education should be the creative tension that occurs when we compare and reconcile these two perspectives.

Indigenizing Politics and Ethics: A Realist Theory

D. Wildcat

Transitional education challenges us to establish a "creative tension" as we compare and reconcile, where possible, Western scientific knowledge and information with our own cumulative tribal wisdom. As we prepare to think about political sovereignty as an educational initiative, I can think of no better creative tension to explore than that between Western political models and an indigenous American Indian conception of politics and ethics.

American public policy making and administration are informed by a whole set of principles and concepts entrenched in the worldview of Western civilization. They are based on principles, categories, and relationships that are unconscious and seldom questioned. Unless we explore practical public policy issues facing American Indians from entirely different worldview or, more specifically, from a widely shared foundation (what Deloria calls metaphysics) of indigenous North American worldviews, we will continue to make many social problems worse. And we will continue to fall short of democratic promises far removed from classical social contract theory. Public policy makers, managers, scientists, and the general public might gain much by developing policies and practices for human societies based on an indigenous model of politics and ethics, which builds on an American Indian metaphysics of place and power.

The indigenous theory of public policy making and administration offered here comes from what I will call a protoscientific

understanding of the natural world: an understanding based on human experience and empirical trial and error found in "the cumulative testimony of our people." In order to understand this indigenously grounded theory of politics and ethics, three key premises must be explored and understood.

First, public policy issues in Native worldviews involve consideration for the rights or we might say more accurately, following Deloria, the "personalities" of plants, animals, and the physical features of the natural world—for example, land, air, and water—as well as our relationships among our humankind. This is not a naive or romantic premise, for if considered with the full force of its implications, it will be understood as signaling a profound shift in awareness. In the eyes of most modern peoples immersed in America's modern industrial consumer society, it will, according to their Western worldview, entail an "irrational" sacrifice on the part of humankind. Of course, seen through the eyes of traditional Native peoples, today's governmental policies, especially natural resource and energy policies, seem unwise or unsustainable at best and at their worst comparable to a biological holocaust.

Second, the goals of this indigenous theory are practical and utilitarian in a sense akin to Aristotle's *summum bonum;* however, as emphasized above, the framework for the measurement of the *summum bonum,* or the "greatest good," is not human society but the ecosystem or natural environment that forms one's political and ethical community in the broadest sense. In short, the Native view advocates an understanding of the public sphere, which includes many persons, including many other-than-human persons. In fact, it seems to me that Deloria's proposal to understand place and power as the central features of an American Indian metaphysics perfectly grounds the theory I am offering for exploration.

Third, and contrary to many misinterpretations of Native worldviews, nearly all indigenous North American worldviews that I am familiar with consider the world as dynamic, not static. These views acknowledge the biological and physical principles of emergence—especially in their accounts of creation—which on the whole are much less anthropocentric and much more ecological

and evolutionary (albeit in a sense not reducible to popular genetic models) than classical Western accounts of creation, whether Greek, Roman, or Judeo-Christian.

The ideas presented here are the collective cultural wisdom of the many indigenous peoples I have had the good fortune to study with and, most importantly, live with during my last sixteen years at Haskell Indian Nations University. I am merely synthesizing what has become obvious to me and many other American Indian scholars: that a foundation for an indigenous practice and theory of politics and ethics exists. Fortunately, at a general conceptual level this indigenous foundation for politics and ethics can be conveyed by comparison with what easily counts as the foundation of Western political theory and ethics: Aristotle's *Politics* and *The Nicomachean Ethics.*

Aristotle's Politics and Ethics

Two key insights shape Aristotle's thought: first, the recognition that humans are by nature political animals; and second, the understanding that ethics are the result of custom and habit. Politics, for Aristotle, is understood as the study of social arrangements, whereby individual human virtues are developed to their fullest. Inquiry into ethics is defined by Aristotle as the study of the greatest good within social arrangements or relationships. Aristotle's genius is in the implicit linking of politics to ethics.

Aristotle correctly recognizes that human beings are by nature political, or social, animals, but this does not imply that human beings are "by nature" ethical in their behavior. If not born ethical actors, Aristotle rightly concludes one's ethics will be a result of learning through experience in a community—through inculcation by custom and habit. On this point, Aristotle's reliance on the formation of values and beliefs through societal experience, as opposed to a system of ethical values produced through teaching or preaching, has a great affinity with American Indian thinking about the source of ethics. *God Is Red* pointed out that the strength of American Indian value systems, including ethics, is

found in the context of their "communities"—the natural environments from which they emerge. Aristotle's emphasis on the state, custom and habit, and the greatest good provides the basis for a comparison to an American Indian or indigenous conception of politics and ethics.

In Aristotle's logic all things move toward their natural end, that end being the full development of the essence of that thing: the revealing of its real nature. He contends the essence of being human involves our ability to reason. However, because this ability to reason (to make choices) regarding what we ought to do is only fully developed in the context of society, it is necessary that the study of ethics leads to the study of politics. Aristotle believed that a human being, either unable to live in or without need of society, "must be either a beast or a god: he is not a part of a state. A social instinct is implanted in all men by nature.... For man, when perfected is the best of animals, but when separated from law and justice, he is the worst of all" (*Politics*, Book I).

Human nature leads to the creation of society, but the form that society takes is not determined by the nature of human beings. If it were, we would not see the diversity of social arrangements and phenomena throughout the world we today identify as culture.

Aristotle's recognition of diversity in human virtue and various forms of the state also facilitates a comparison to American Indian politics and ethics. Aristotle's empiricism leads him to pose both human virtue and the structure of the state as complex totalities reflective of each other. He never loses sight of the fact that virtue for human beings is manifold, with many different forms and specific practices composing the totality of what is understood as virtuous.

His treatment of virtue as complex allows him to see the state as the institutional embodiment of the greatest good—the *summum bonum*. For the greatest combination or sum of virtues making up the *summum bonum* can only be found in the state, which exists to allow all individuals to fulfill their virtue to the fullest, whether they be slave, servant, soldier, or musician. A virtuous leader and a good state are those that allow every individual person to develop their unique share of virtue to the fullest for accomplishment of the greatest good.

Nevertheless, Aristotle does suggest a hierarchy of values. He clearly determines the virtue of a ruler superior to the subject, and likewise, freeman compared to slave, adult male compared to female and child. He also indicates slaves are slaves by nature and rulers are rulers by nature. Aristotle's worldview is not one with equal opportunity with respect to virtue. While his theory is at its weakest in the manner in which the complex totality of virtue is hierarchically divided, his idea that human virtue is complex and his hierarchical prejudices are clearly explained by the empiricism he adopts in lieu of following Plato's idealism.

Aristotle recognizes that each individual possesses some share or part of virtue, not some universal abstract conception of virtue. As no individual possesses identical or all shares of the complex totality that constitute human virtue, society becomes the site where human beingness is most fully recognized. Because communities, and ultimately states, arise from the nature of human beings, it follows that the structures of communities and states must necessarily reflect the complex and diverse totality of human virtue. Aristotle believes "the good" exists in every person realizing his or her essence or true nature. Because every human being has a different share of virtue, which can only be realized in society, then the organization of society ought to be directed toward all members of society, each and every person, realizing their respective virtue(s) to the fullest. In Aristotle's mind the function of the state must be to allow every person to realize her or his virtue to the fullest. Ethics and politics are inextricably bound together.

Aristotle's naturalistic moral element is implicit throughout his discussion of politics. The leadership of a society or state, regardless of whether it be the leadership of one, a few, or the many, ought to work toward the goal of realizing virtue in its full, manifold, complex totality—a complex and diverse totality of human virtues. Failure of the state to accomplish this goal merely reflects the corruption of human activities and organization.

In Aristotle's mind there is no single or ideal form of the state like Plato's *Republic*. Instead, numerous forms, good and bad, of the state exist, but in all cases the distinction between the good and the

bad state is made according to the ability of the state and its leaders to allow all human beings therein to realize their share or part of virtue to the fullest. The distinction between a good state structure and its leader(s), and a corrupt state structure and its political leader(s), rises and falls with the ability of both leader and structure to allow all humans in society to develop their virtue to the fullest. Ethics and politics are inextricably linked in Aristotle's thought.

The key elements to Aristotle's political and ethical theory are human beings, the state, and the *summum bonum.* One can and ought to read Aristotle's reference to the "state" as government. Aristotle's experience in fourth-century Greece explains why he understood the state as the highest good of all. The city-state was the largest and most extensive social institution in Greece. Its formal creation of law and respect for custom and habit created the natural social environment for human development. Consequently, Aristotle sees the state as the institution "which embraces all the rest, aims at good in a greater degree than any other, and at the highest good" (*Politics,* Book I).

Aristotle recognizes that people require a social existence to be most fully human. He recognizes that social experience, primarily through custom and habit, plays a substantial role in shaping one's values and beliefs. Although born political, that is, social, animals, our ethics or lack thereof will necessarily be products of the society and political institutions that shape us. Therefore, the study of ethics—morality—entails the examination of the social arrangements and relations in which we find human beings. Although Aristotle's basic logic is similar to that underpinning indigenous North American politics and ethics, the terms of his theory are significantly different from indigenous theory.

A Comparison of Aristotle's Ideas to Indigenous Thought

Traditional Native thought agrees with Aristotle's linkage between an individual's ethical development and one's community. However, unlike Aristotle's treatment of the "state" or community, which

consists exclusively of human beings, traditional Native thinkers include as a part of their political communities many other-than-human persons, including persons that swim, winged persons, four-legged persons, and so on. In short, while Western thought, following Aristotle's lead, defines politics and ethics as exclusively human issues and endeavors, Native thought and, more importantly, practices have defined politics and ethics as involving a much broader conception of persons. This point is obvious in the stories, oral traditions, and ceremonies and social life of Native peoples. Many of our languages even offer evidence in support of this claim.

In their earliest interactions with the Iroquois, French Jesuits recorded that the Iroquois seemed confused with respect to who or what constituted a person. The confusion was the Jesuits', not the Iroquois'. The Iroquois understood the concept of person, or personhood, to include plants, animals, and other natural features of their environment, and their language expressed this understanding. As a result, when they considered their moral and political community, it was perfectly reasonable to include the non- or other-than-human persons—plants, animals, and some other natural phenomena—as community members.

This very ancient idea is the basis of an implicit environmental ethos, an ethos that leads one to fundamentally different notions about how we ought to relate to the environment, apply technology, and generally live with the earth. The worldview attendant to this ethos requires one to speak of a moral sphere that goes beyond merely thinking that morality is about the relationships you and I have as human beings. Morality and politics have to do with a reality that involves relationships we have with other-than-human persons of the biosphere and the ecology we (human beings) are a part of.

Morality and politics require that we acquaint ourselves with the many personalities we interact with daily. Natural resource "managers," public policy makers, scientists, and the general public can gain much by developing policies and practices informed by this key feature of indigenous North American worldviews. The best illustration of how Native peoples include many other natural objects

and living beings as members of their community is found in Native clan systems and totems. It is frustrating to constantly hear non-Native peoples speaking romantically of the Indians' "closeness to nature" or "love of nature." The relationship is more profound than most people can imagine, and the implications of this relationship will imply uncomfortable consequences for many. To be Wolf, Bear, or Deer clan means that you are kin to these other persons. These are known and understood as your relatives. As Onondaga elder Oren Lyons remarked during the twenty-fifth-anniversary Earth Day celebration in Washington, D.C.: "We don't call a tree a resource, we don't call the fish a resource. We don't call the bison a resource. We call them our relatives. But the general population uses the term resources, so you want to be careful of that term—resources for just you?"

A radical shift in awareness and behavior occurs when one no longer considers nature as full of resources but of relatives. Like all kinship relations certain obligations and rights are assumed with membership in a clan. The customs, habits, obligations, and rights that correspond with clan and special societies in our tribes served to constantly remind us of the complex community that shapes our identity and ensures our continued existence.

As Native peoples our clan identities and numerous ceremonies exist to, among other things, reinforce this awareness of our relatedness and connection to these other beings. We persons, inclusive of plant and animal persons and the human beings, are all related and connected. These are the so-called new insights of evolution, ecology, and environmental science, and they are the very ancient wisdom of our traditional elders or true indigenous scholars.

Because in nearly all of our Native creation stories animal and plant persons existed before human persons, these kin exist as our elders. These animal and plant elders, as much as our human elders, are our guides. They are members of our community. Aristotle proposed that our values—guiding how we ought to live—are learned from our fellow community members. From an indigenous perspective Aristotle's basic reasoning was right, but his notion of community and its members was wrong.

Native people would argue that it makes no sense to limit the notion of politics and ethics to only human beings. How we human beings live will indeed reflect the communities we belong to; however, by limiting the definition of *persons* to human beings, Aristotle created a false and far too narrow sense of community and corresponding spheres of political and moral life. The inclusion of other living beings and natural objects into a category of persons, which includes human beings, requires a notion of politics and ethics inclusive of these other community members.

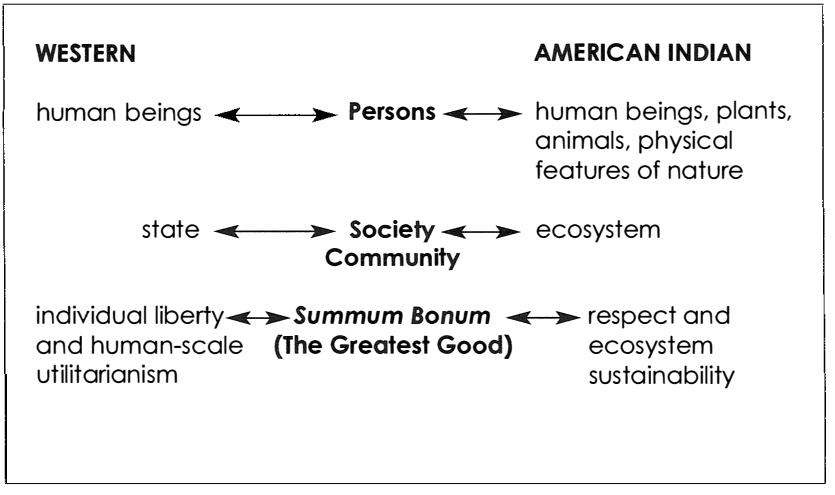
The comparison to Aristotle can be further extended. Aristotle recognized that it took human beings with many different parts of virtue to make a community. Artists, builders, farmers, designers, and so on are all required to make a strong community. Each person has what I have chosen to call a different share of virtue. Today we often speak of personal/professional strengths and weaknesses—Aristotle's point is obvious: we are not all good at the same thing. All of us are much better at doing some things than others; in Aristotle's mind this is natural and to be expected. The manner in which Aristotle develops this idea to create a hierarchically divided sense of virtue is necessarily limited given the incompleteness and partiality of his observations.

As a result of Aristotle's limited experience he inevitably speaks of different virtues as more virtuous than others. However, if Aristotle's notion of virtue is treated as a complex totality, a concept with manifold parts, it seems to me that what is right about Aristotle's reasoning can be kept and what is wrong can be discarded.

Aristotle's argument seems reasonable, but he stopped short of seeing the big picture, as figure 1 illustrates. Replace the key elements of Aristotle's theory, humans beings, society, and the *summum bonum,* with American Indian conceptions of persons, ecosystems, and ecosystem sustainability or health, and you have a complex living system of politics and ethics.

According to Aristotle, it is the political and moral sphere of human existence that distinguishes human life from the rest of the natural life on earth. Aristotle was right to see the good state and the good leader(s) as those that allowed members to develop their

FIGURE 1—A Comparison: Aristotelian (Western) and Indigenous Politics and Ethics.



particular or shares of virtue to the fullest. However, from a Native standpoint, Aristotle stops short of grasping the big picture in a more accurate and immediate way. He too narrowly defines persons and community, or more properly the state. In so doing he poses a view of the greatest good that fairly ensures the environmental mess human beings have created. By excluding the many other-than-human persons of the natural world from active full participation in determination of the greatest good, ecological catastrophe seems guaranteed.

Whether intentional or not the result of this single idea has been to create a worldview where humans are thought to be above the rest of nature (superior by virtue of the fact that human evolution has resulted in our species possessing an intraspecies adaptive ability to reason), an idea that has brought us to the brink of a global ecological crisis by reducing the question, the very idea, of the *summum bonum* to be about relationships among human beings.

An indigenous conception of the *summum bonum* is rich and complex when compared to Aristotle's fairly simple conception of it. By

analogy, the Iroquoian concept of personhood and community, as concisely summarized by John Mohawk in "Animal Natives Right to Survive," entails a concept of the greatest good that includes the four-legged persons, the winged persons, the persons that swim, and the plant persons. It is, in fact, more complex. The Iroquoian concept of the greatest good requires that human beings have more relationships, interdependencies, and persons to be attentive to when considering how to act—from a moral and political viewpoint—to realize the *summum bonum*. (John Mohawk, 1988).

I propose it is precisely this experiential insight that allows comparison to indigenous notions of relatedness and connectedness. Although a virtual cottage industry has developed among some scholars seeking to debunk any claim that Native peoples were unlike their recently arrived European neighbors in their interaction with their natural environment, it seems to me many have missed the crucial point. Our ancestors possessed technology, and they certainly used it to affect their environment. However, their use of technology was guided by an underlying premise that Bacon, Locke, Newton, and most modern engineers would have found incredible: our natural environments contain many more persons than our human selves, and these other-than-human persons are members of our political and ethical "community" and require respect.

Experience shaped Aristotle's and Native peoples' conceptions of politics and ethics. Aristotle's careful observations of human society led him to abandon a single ideal form of the state for a general theory that allowed for the particularity and diversity of various human situations and conditions. He concluded that the state was the highest expression of virtue because it constituted the site where the fullest expression of virtue could occur. The ethical dimension of the state was found in its character as the active and healthy combination of all virtues, or what I have called the manifold shares or parts of virtue as a complex totality. Indigenous thought suggests power does reside in the places and personalities that surround us. Consequently, possessing the power to do the right thing depends on understanding the entire ecosystem as the community in which virtue can be fully recognized in its complex totality.

Modern ecology and indigenous models of politics and ethics have much in common: they are both about the complex relationships between living organisms and their environments. Indigenous thought has, in my mind, one key advantage: it sees the ecosystem as the appropriate site for the study of politics and ethics. The error of Aristotle's thinking, and the great error of subsequent Western thinking about politics and ethics, is that it mistakenly and artificially takes human beings out of the community that in the most direct physical and spiritual sense our existence and identity depend on.

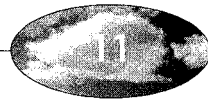
Not surprisingly, many non-Native environmentalists and ecologists have made the connection between biology, environment, and the very important questions about how we ought to live. What passes today as the science of ecology is nothing more than a restatement of very old Native North American concepts. Unfortunately, once again this has been treated as a great discovery—a little like the discovery of "America" some 500 years ago. To Native peoples this knowledge is not new, it is very ancient.

Although the scientific treatment of reality and the concepts that describe it are to some extent different, the knowledge of the physical attributes and relationships held by many traditional Natives is equivalent, if not superior, to the knowledge held by modern ecologists. It is superior primarily in the sense that traditional indigenous scholars operate minus the ideology that humans are somehow in their "unique" nature destined to live above the rest of the natural world.

The ideas offered here should not be misconstrued as suggesting (1) a carte blanche return to previous nonmodern ways of living or (2) a condemnation of all things modern, for it is neither. The suggestion is to evaluate the ideas independent of a simplistically abstract (in fact, idealist) linear view of history that sees Western civilization (including some of its "scientistic" practices) at the front or leading edge of history, with all other cultures behind and retarded, or behind and hoping to catch up.

A traditional American Indian view of politics and ethics facilitates understanding of a view of history that accords space or place

at least as much importance in a conception of history as that given to time and chronology in Western civilization. What is thereby gained is an entire body of collective tribal experience—a foundation, really—that can serve to literally ground an education for life or living: a foundation shaping practices and thought that are more applicable to the issues we face on the planet today than the dominant Western model of politics and ethics, because it contains an inherent or implicit environmental ethos.



Property and Self-Government As Educational Initiatives

V. Deloria

Indian students tend to look at education as a formal institutional experience. Core courses, graduation requirements, and electives when taken in sufficient quantities produce degrees and certificates. We are then authorized to perform certain functions in the adult world or become qualified to move on to the next level of educational complexity and attainment. In recent decades practical experience, the summer and semester internship and on-the-job training have begun to supplement formal academic studies, and the development of the paraprofessional in a number of areas offers a temporary resting place for those who are still uncertain of the attractiveness of the profession. Substantial education begins when the student, well trained in a profession, actually begins to perform professional tasks. At that point the accumulated experiences of applying abstract knowledge and principles to real-life problems and duties provides the final educational opportunity. We learn as we live and bring ideas and actions together.

In America the practical side of learning is taken for granted and in most instances is regarded as a higher activity than mere book learning. That is why we say that things are "academic" when we mean that they are essentially useless and have a certain degree of novelty. But the glorification of the self-made person, the worship of the school of hard knocks, and the demand that leadership have practical experience in identifiable fields mean that we cherish what we have been able to accumulate in the way of practical

wisdom much more than we admire abstract thinking and precise intellectual analysis.

Students in higher education should become aware of the high premium that American society places on practical knowledge because it constitutes the hidden side of federal policy, and it is seen by most policy makers as a realistic alternative to formal academic training and services. Tracing federal efforts to provide academic training for American Indian children is not difficult. Educational experiments leap out of the pages of books and reports and are always described in highly emotional language. From the initial overture of English colonists in Virginia through the Meriam Report to the modern Kennedy Report, formal academic training is touted as the salvation of Indians and as the primary vehicle for assimilating Indians into the American mass society. But we have to dig carefully to see the other side of the coin, to see the multitude of times when Congress, frustrated at dealing with Indian problems, simply washed its hands of the whole thing and declared that Indians could learn by doing things for themselves. James Watt was not radically different from impatient bureaucrats of two centuries ago when it came to understanding the benefits of a practical education.

Looking at the history of federal policy, we can identify two areas in which Congress frequently refused to deal with complexities and instead advocated policies that would force Indians, whether they were prepared or not, to learn to live in American society using only their experiences as a guide. The two areas are the use and ownership of property and the efforts to establish a modicum of self-government. The guiding principle behind federal policy in these two areas is that Indians must be placed in a situation in which they have to confront and solve certain kinds of abstract and practical problems. Two entirely predictable results are produced by these policy changes. Indians sometimes succeed far beyond the expectations of Congress. If they are very successful it produces intense jealousy among neighboring whites and fear among federal bureaucrats, and then steps are taken to limit the potential of the program or it is terminated altogether. If the Indi-

an adjustment does not make sense in the white person's terms, even if the Indians are pleased with the results, then the program is declared a failure. But the responsibility for the failure is placed on the Indian response, not on the rationality of the policy proposal in the first place.

We can easily illustrate the operation of these principles in the history of federal policy. First, however, we should examine the nature of practical education, as it is that practical aspect of things that non-Indian policy makers take for granted and upon which they rely even when all indications are that the direction policy takes will be a disaster. Practical education is the application of the abstract principle to conditions of real life. It is also the means of discovering principles for predicting future events based upon a vast reservoir of experiences of the same or similar events. While wholly academic knowledge is predictable, because we arrange it in a manner so that it will be predictable, knowledge gained through experience cannot be controlled. We learn both good and bad things from life, and consequently policy that naively believes that by creating conditions under which people learn through experience can have but one result—and that one a beneficial product—is not good policy. The flaw in the policy is that we cannot control the end product, and therefore we should not rely upon an abstract knowledge unless it has become such a part of community life that it is also practical knowledge. Let us now take a few examples from Indian history and see how practical knowledge or education has been a part of policy and what has happened to it.

Examples from Indian History

In the early colonial days in Massachusetts, missionaries spent considerable time seeking converts among the tribes. People accepting Christianity were encouraged to adopt colonists' dress and habits, leave their families and communities, and take up residence in what came to be known as "Praying Towns." Sometimes, of course, whole families would convert, and occasionally bands and villages would make the transition to Christian life. It wasn't long before Massachusetts had a number of Praying Towns that were

organized as regular townships with the same social and political institutions as other subdivisions of the Commonwealth. In making the transition—that is to say, in creating a town government, church, market, and all of the other institutions that New England life required—Indians learned both good and bad things from the whites around them. The result was that while some Indian towns functioned as well as their white neighbors, others did not. Shortcomings were blamed on the Indian character, and consequently Massachusetts introduced a trusteeship over the Indian towns. By the 1870s they had virtually eliminated self-government for the Indians of the state. Political status and property rights were essentially eliminated and the justification for divesting the Indians of these things was basically that they had learned the wrong lessons in the classroom of life.

The Removal Policy demonstrates even more clearly the relationship between practical education and political status and property rights. It was exceedingly difficult for federal representatives to deal with the tribes west of the Appalachians in the post–Revolutionary War period. So the tribes were told that if they adopted forms of government comparable to those used by the states and the federal government, it would facilitate the process of diplomacy and enable the federal government to provide services and protection for the tribes on a much more efficient basis. We can trace modifications of forms of government in almost every tribe who had dealings with the United States in the early decades of the nineteenth century. No changes are as clear as those adopted by the Cherokees, who sought to create a modern government and largely succeeded.

Presumably the success of the Cherokees in transforming their traditional ways into modern political institutions should have been sufficient to ensure them protection of their political status and property rights. However, the Cherokees were too successful. The local whites coveted the Cherokee lands, and eventually the state of Georgia simply moved its people in on those lands. When the problem reached the Supreme Court, it chose to define the Cherokees as a people in "tutelage," a people still on the verge of

national existence but lacking the practical education and experience to make a successful transition. The Cherokees, and subsequently all Indian tribes thereafter, were described as "wards" of the government, as people who lacked sufficient education and maturity to make their own decisions.

As a result of the Removal Policy a large number of tribes were moved to Kansas and Oklahoma, the hope being that once beyond the reach of bad whites, the tribes could make a successful transition to civilized life. The Kansas Indians, learning through the school of hard knocks, became moderately successful in farming and adopted so many of the characteristics of their white neighbors that the state of Kansas believed they were no longer Indians and sought to tax them. The Supreme Court said no, and beginning with the Civil War and continuing a decade afterward, the Kansas tribes were pressured to sell their Kansas lands, most of which had been allotted, and move to Oklahoma where they would be given lands in communal status once again. The practical knowledge that they had acquired in Kansas was discounted by Congress because it had produced unexpected results. Thirty years later the tribes were again forced to take their lands in severalty so that they could once more learn from practical experience how to manage farming-sized tracts of land.

The pattern only becomes stronger as we approach contemporary times. The General Allotment Act was justified on the basis that the Indians needed to learn how to manage their property. In 1891, only four years after the passage of the act, it was amended to allow the secretary of the interior to manage allotments on behalf of the individuals. Presumably he was a more apt pupil—or perhaps needed the experience more. The Indian Reorganization Act of 1934 was touted as a great experiment in self-government. This in spite of the fact that the tribes had governed themselves adequately for thousands of years and had at least managed to preserve something of a homeland using the makeshift governments organized by the federal government in the 1870s and 1880s. Coincident with the allotment of lands and the support for self-government came changes in the federal government's educational programs.

Off-reservation boarding schools were being established in precisely the years that reservations were being allotted. During the Indian Reorganization Act, a loan fund was established to encourage Indians to attend college and advanced vocational and trade schools. By the time of the New Deal, educational programs both supported the existing trends in policy and forecast the future of policy direction.

In the 1950s termination became the dominant federal policy, and it was supposed to "free" Indians from unnecessary federal restrictions and allow them to use their property in the same manner as other American citizens. No sane capitalist, however, would have sold a large virgin standing forest as the Klamaths were forced to do, and no white businessperson would have agreed to use his or her sawmill as the sole tax base for a county as the Menominees were required to do. Additionally, and here is where the theory of termination was revealed as totally bankrupt, both the Klamaths and Menominees were placed under private trustees so that the practical experience they were supposed to receive from termination became, once again, an education that their trustees enjoyed to the detriment of the tribes.

Termination of the various tribes coincided with the push to relocate individual Indians and their families to western and midwestern urban centers. Relocation and vocational training were the major emphases of the federal government until the mid-1960s, when, because the program was such an embarrassment to the federal government, it was retitled "Employment Assistance" and relegated to a minor item in the Bureau of Indian Affairs' budget. In terms of both formal academic and the more practical vocational education, the 1950s demonstrated that an intimate link existed between what was offered to Indians in the way of educational programs and desperate attempts by Congress to make the natural resources of the reservation lands available to white Americans and to reduce tribal government to nearly an advisory capacity.

RECENT EVENTS AND PROGRAMS

The last four decades are very interesting when examined in this larger historical pattern. Events and programs have moved so fast

that there is no longer a time lag between manipulation of property and tribal status and the promulgation of additional educational programs. Indian tribes were supposed to absorb simultaneously the policy of self-determination, rapid development of reservation lands, and rapid changes in educational programs. The result was a rare intersection in which educational programs were narrowed to produce administrators and managers, with a smattering of science and professional fields factored in. Among the problems created in this massive change were the shifting reservoir of resources available to the tribes to develop programs, the educational requirements necessary to operate programs, and the absence of a time lag between the conception and operation of programs.

Many economic development programs were funded under the guise of vocational training; other economic programs had to be recast as vocational training because of a lack of Indian experience in certain fields. Eligibility for employment in some programs depended wholly on academic achievements, and Indians with degrees in forestry and other hard sciences often found themselves operating educational programs or trying to administer complicated umbrella development programs. Evaluations of programs funded with federal dollars often began at about the same time that the programs themselves started, making it impossible to judge what effects the program actually would have on the reservations. Not only were conditions extremely confusing, but under Ronald Reagan, George Bush, and Bill Clinton, federal funding was reduced drastically, making it imperative that Indian tribes find alternative sources of funding for economic development, tribal government, and education. As we begin the new century, many tribes can be described as existing at ground zero, reduced to providing the very minimal programs their communities need to exist.

Although many tribal leaders take a pessimistic view of the present situation, when we see modern conditions in a historical perspective we can see that there is reason for considerable optimism. It is no longer possible for Congress to announce a new program of changing the status of tribal governments or tribal

property with the naive hope that through practical education Indians will be able to accomplish some nebulous goal of assimilating into American society. Indeed, the new federalism, even if it is to remain but an unfounded slogan, clearly shows that the tendency of Congress is to devise new methods whereby Indians can define their paths for the future. Blithe views of the efficacy of private property no longer prevail, and even though recent Supreme Court decisions have tended to limit the scope of tribal powers, the legislative trend is clearly to vest more programs, powers, and responsibilities in tribal governments.

THE MODERN EDUCATIONAL EXPERIENCE

What is the relevance of connecting practical education, as seen in policy changes of the past, with modern educational problems? And what further insights can be gained by today's college-age Indian students in viewing, in this much longer historical perspective, the educational programs in which they are engaged? What does the relationship of practical, ill-conceived education and formal academic training have to tell us about the immediate prospects of jobs for graduating Indian students? These questions and many others now surround the modern educational experience. Taken together they suggest that we look at professional education in an entirely different manner. The professional education, particularly that education in the hard sciences and computers, has basically replaced practical education because the lack of lag time between when a policy is initiated and when it is supposed to be operating has been reduced to practically zero. We need expertise in order to consider programs. For the first time in Indian history we can place practical, on-the-job training after the authorization of policy changes.

Indians with professional expertise must now be prepared to offer their tribes predictive scenarios based upon their professional training. The degree to which an Indian professional can succeed with any tribal program will be measured by the number of possible scenarios with which he or she presents the tribe. It will then

be the task of the tribe to choose among possible competing scenarios. Tribes will have to choose from alternatives based upon their analysis of existing resources and level of education. Even more important, however, is that much of modern scientific thought, particularly that dealing with the environment, closely parallels traditional perspectives on how lands, peoples, and resources should be used. The absence of a time lag between articulation of policy and the mustering of resources to carry it out suggests that for the first time in history there can and must be Indian input into program planning.

Some planners may argue that there has always been Indian input in reservation development plans, but this argument is difficult to sustain. While the Bureau of Indian Affairs was busy expanding the number of Indian college students during the early 1960s, Congress was significantly expanding the potential for tribes to lease their lands for ninety-nine years, and the bureau was pressuring tribes to develop massive programs to exploit natural resources of the reservations. Although the gap between professionally trained Indians and tribal activities was lessening during this period, it was certainly not in any sense being coordinated in order to produce maximum or even any sensible results. The uranium mining and strip-mining programs of the 1960s and 1970s probably could not occur today on many Indian reservations because professional expertise has caught up to or is only slightly behind proposed projects.

Indian students working with tribal development programs will notice a slight but important shift in emphasis in tribal perspectives. They will no longer be expected to provide direction for tribal programs, but they will be expected to provide a significant amount of technical information so that tribal councils can make proper decisions. We can characterize modern Indian students as fulfilling the function of scouts in the old hunting culture. They did not direct tribal activities as much as they provided information upon which the community could act. Indian education from colonial days until very recently was conceived as producing individuals who could and would lead their people into American society's

economic mainstream. While many of today's programs are still phrased in those terms, they are not the conditions under which Indian professionals will be helpful to their tribes in the future.

We can learn an additional important lesson from this longer perspective on practical education. Any future effort by Congress to manipulate either the use of reservation natural resources or the political status of tribes will almost certainly produce a massive reaction in the field of education. Perhaps the newer studies of Indian education will be triggered by the rapid expansion of gambling activities on reservations or by the drastic budget cuts of recent years. What we must always remember is that education does not stand alone among other Indian and congressional activities. It is always an intimate part of policy considerations, and educated Indians must at all times be aware of events taking place in noneducational fields.

The relationship between education and lands and political status is an area of cultural conflict that has not been resolved in this half millennium of contact between Indians and other peoples. All education, formal academic education and practical educational learning experiences, exists in the gulf between Indians and other peoples and their perspectives on the nature of the world. There would be no use for formal education if worldviews were more similar. But if the white majority has chosen education as the field in which the difference in cultural perspective must be worked out, then Indians have to be particularly alert as to the nature of education and what non-Indians seek to accomplish with it. Whatever Indians are asked to do must be done from within the traditional Indian perspective, from a critical examination of the nature of the task, and with the understanding that professional expertise is but a specific body of knowledge existing within the gulf between the two cultures.

Indian students must therefore look at their professional education not simply from its set of coherent internal logics that make the professional field unique but also from two additional perspectives. How does what we receive in our educational experience impact the preservation and sensible use of our lands, and how does

it affect the continuing existence of our tribes? These questions must always be asked during the educational years of training. There will not often be good answers because of the difficulty in applying abstract information to existing human communities. Nevertheless, Indian students will find a much more rewarding educational experience if they raise these questions in every educational context in which they find themselves.

Practical Professional Indigenous Education

D. Wildcat

Deloria raises a number of issues that should be considered by Indian students and teachers alike if we are to advance tribal interests through education in general, and specifically "professional" education. Three issues I want to expand on are as follows. First, what kind of institution can create professionals with indigenous values and beliefs? Second, how can we use the disappearance "of a lag time between articulation of policy and the mustering of resources to carry it out" to the advantage of education and self-determination? And third, given what I will call the "damned if you do and damned if you don't" consequence of federal educational initiatives, how do you ensure that the goals or ends of tribal initiatives are practical?

Practical Indigenous professionals

What kind of professionals do we need in "Indian Country?" The necessary condition is that they receive the requisite technical knowledge, skills, and abilities to advise Indian communities on an array of possible solutions and scenarios to address specific problems/issues. However, this is not a sufficient condition to meet the tribal needs of culturally distinct indigenous peoples. Any tribal councilperson or politically engaged tribal member can testify to the fact that often when non-Indian professionals are hired to do things for tribes, the clash in underlying worldviews—that is, indigenous-versus-Western conflict—makes accomplishment of tribal goals difficult, if not impossible.

The problem of professional expertise in institutions of higher education is that "expertise" is thought of as culture-free or value-neutral. It is true that most American Indian students feel they are "caught between two cultures" throughout their technical and professional education, but I would argue that professional and technical education in fact is not "a specific body of knowledge existing within the gulf between two cultures." Rather, professional education and the resulting "expertise" are implicitly value-laden and reflective of the schizophrenic metaphysics of Western society.

We can fairly easily describe the attributes we want American Indian professionals to have and identify the questions we hope they will keep foremost in their minds. Also, there can be little doubt that students in science, engineering, and business programs often feel caught between two cultures. I have seen students confront these professional programs with considerable disorientation. In fact, there is no greater ex post facto demonstration of the existence of indigenous cultures than the dominant Western culture in America; nor is there a better demonstration of the schizophrenic nature of the world that modern Western institutions, and especially educational institutions, create and advocate. According to one dictionary, *schizophrenia* is defined as "a psychotic disorder characterized by loss of contact with environment and by disintegration of personality." An introduction into most American institutions of higher education should predictably result in disorientation to any person who understands their personality as emergent from a specific environment or *place.*

How do we address this profound experiential disorientation? I suggest we create our own indigenous institutions to prepare American Indian professionals. Some will say we have those institutions, we have the tribal colleges. Yes, we do, and they are often working miracles in spite of the limited resources they possess. But the overhead costs—equipment, supplies, facilities, and so on—of operating science and engineering programs are much higher than for liberal arts programs. Also, given the size of reservation populations served by the tribal colleges and the already limited resources for existing programs, it is simply unfeasible for

each tribal college to implement and develop programs resulting in their own science/engineering degrees. Typically this leaves two options to tribes and/or their colleges: (1) working with majority institutions (state universities) to create bridge programs, Two Plus Two or Two Plus Three programs that address the "academic" needs of Indian students who will matriculate to the majority institution to acquire their degree by completing coursework they cannot get at the tribal college, or (2) sending their students to colleges and universities with support programs to assist American Indian students in successful matriculation to majority institutions.

Both options are inadequate, for they fail to confront in a meaningful manner the root of the struggle Indian students face. Deloria, maybe more than any other scholar living today, has positioned the questions about self-determination and sovereignty in the most radical context possible: the real world or, if you want a technical description, a phenomenological critical realism.

Deloria is correct to refer to a disorientation resulting from the conflict between cultures, not worlds; we must avoid the error of talking about life in two different worlds or realities. Sorry, postmodernist and critical deconstructionist, but as I read Deloria, I find his point for almost four decades has been to suggest in the broadest sense that questions about our indigenous education, and for that matter the future of humanity itself, revolve precisely around who we are and how we choose to live in the world. We American Indians have done ourselves a great disservice by speaking of "living in two worlds"—the Western or dominant American culture and our own tribal indigenous cultures.

The needs that both typical options address are almost exclusively academic or intellectual. Do not misunderstand my point. Reasoning skills and intellectual needs are real, what I called the necessary condition for indigenous professionalization, but they are insufficient in and of themselves and possibly counterproductive in creating professionals with a complex integrated or holistic indigenous understanding of our lives in the world. The above options fail to address the question of how scientific and technical

knowledge are understood as a part of a large living system of which we human beings are but one small part.

The problem with the typical options Indian students must choose from is that, as usual, that they miss the point—the big picture. At the University of Kansas Red Power Conference in the fall of 2000, Ladonna Harris made the point emphatically: "We do not live in two worlds. If you try to do that you will be schizophrenic." We are surrounded by a society of metaphysical schizophrenics: people who do not see the phenomenal world for what it is—a living, complex reality with multiple dimensions. A good number of these metaphysical schizophrenics are scientists and engineers who have, with considerable harm to their person (or personality) as human beings, convinced themselves that their feelings or emotions have no place in their objective science. This is the metaphysics of the world writ large.

AN INDIGENOUS INSTITUTE OF SCIENCE AND TECHNOLOGY IN CULTURE

I would propose American Indian leaders, students, and professionals get together to examine practical consideration of how American Indians and Alaska Natives might create our own MIT—Massachusetts Institute of Technology. We can call it whatever we like, but the goal would be practical indigenous professionalism: technology with an indigenous personality.

I expect all kinds of objections. Some will fear an institute of pan-Indian culture and technology, others will worry about funding and control, and still others may suggest technical issues are distinct from cultural questions. Nevertheless, the reality in Indian country today is most of our tribes are depending—no, dependent—on the advice of non-Indian scientists and engineers who work with conceptual blind spots relative to our indigenous worldviews.

We desperately need indigenous scientists and engineers, but not in the mold of those produced by the dominant educational institutions of the United States. Can we create our own indigenous institutes of science and technology in culture? I think a cur-

sory look at the moneymaking activities among some tribes suggests the answer is yes. But will we? This remains to be seen, but I hope so. It would require a strategic long-term, multi- or intertribal effort for an institution the likes of which has never been seen. Given the never-ending rounds of seminars for strategic planning, empowerment, and creative problem solving that foundations and organizations are constantly holding in Indian country, I have no doubt about our ability to create a plan.

The challenge, and opportunity, really, is to develop a network of indigenous philanthropy, something that only recently has it made sense to talk about, which can ensure a substantial period of infrastructure building. The cost will be high in dollars; however, the cost of not creating indigenous institutions to our peoples and the places where we live will be exponentially higher.

Sobering is the only way I can describe my reaction after attending two environmental justice conferences recently. If one contemplates the enormity of the problems facing rural and urban minority communities, including those of indigenous peoples, in the United States and throughout the world, one certainly comes away sobered. But hopefully one is reinvigorated too, with a dedication to finding creative ways to solve environmental problems we human beings have produced—not intentionally, but by virtue of a relatively abstract universal worldview where first, humans are the measure of all things, and second, an Aristotelian compartmentalizing and categorizing of human experience prejudices exploration of human experience itself.

Basic research, technology transfer, reliable information, bioremediation (ecology-based as opposed to genetics-oriented) technologies, and ultimately community service—all of these can be accomplished by creating an institution that prepares and provides indigenized professional education: practices supportive of cultural diversity emergent out of the diverse geographies and ecologies of the places we call home. We have a long history of being given bad advice, and we are paying the price today. If we are going to make mistakes—and we will—let them be our mistakes. Much of the technology we see being used today has been developed to

address environmental cleanup activities; our actions are essentially reactive in character.

On a recent visit to a sister institution, something struck me as we watched the demonstration of a state-of-the-art technology developed to address accidents involving the release of deadly airborne chemicals. Much of what scientist, engineers, and businesspeople work on today is cleanup. My colleague and Potawatomi ecologist George Godfrey has talked often about the creation of a cadre of American Indian environmental scientists and engineers who would achieve success and a status comparable to the highly praised American Indian "smoke-jumpers" in the U.S. Forest Service.

INDIGENIZING PROFESSIONAL INTERNSHIPS

We have plenty of environmental "fires" to put out in our communities, and we need well-trained American Indian professionals to do so. Here then is precisely the place where we use the disappearance of lag time between policy development and mustering of resources to realize policy goals to the advantage of practical indigenous professionalism. Our young scientists, engineers, and entrepreneurs would serve required yearlong internships in communities, working on problems people are facing. This will not be easy; the level of coordination and direction from professionals will be time-intensive. However, the much ballyhooed technology of the Internet and World Wide Web could actually serve to have students working on problems in real places, in communities, where beliefs, values, and practices count for something. This experiential learning will accomplish what case studies or "virtual" realities can merely suggest: the world is more complex than our models and neat conceptual categories lead us to believe.

Community service ought to be expected, and I can think of no better service than holistic learning experiences in which students learn that the best solution to a problem will be power-, place-, and personality-specific. The irony in doing so is that the experience itself overcomes the greatest obstacle to the biological, environmental (ecological), and cultural diversity on the planet: an abstract system of analytical education that rivals the heights of

medieval scholastic education. In fact, serious consideration ought to be given to reinstituting community service (something that occurs naturally in nonmodern societies) through all the grades of education. Such activities would indeed be practical and, with a little thought to who we are as tribal peoples, indigenizing.

We can take advantage of the disappearing "time lag between the conception and operation of programs" by situating professional programs in our communities. It is a disservice to everyone to continue to think "experts" go off to school somewhere and then come back with the all the answers. Now, everyone will say, we all know that, the real world just does not work that way. Okay, then why do we continue to "educate" in exactly that manner? If we create professional internships for scientists, engineers, and business professionals, the world they live in would engender practical, creative insights into the largely artificial disciplinary boxes our institutions of higher education perpetuate.

The knowledge human beings all over this planet once possessed was of places; modern technologies have certainly reduced the "time constraints" of distance. But what time is it? It depends on where you are. Once we disabuse ourselves of the abstract and essentially linear universal notion of world historical time, as Deloria critiqued three decades ago in "Thinking in Time and Space" in *God Is Red,* we may indeed reexamine our histories in a light much different than the current progress-of-civilization model. In our human lifetimes (appointment books, clocks, schedules, and calendars) we have disconnected ourselves from natural histories much larger than ourselves and with the aid technology forgotten what geographies and natural environments have to give us: unique cultural identities in the place of an increasingly homogenized global consumer identity. Western civilization, as the vanguard of globalization, seems to have forgotten this valuable gift that indigenous cultures have not.

No Longer "Damned" Up

Deloria has put his finger on the problem with federal Indian initiatives in general. It matters little whether the issues were oriented toward property, self-government, or education, as the cultural gulf

between the majority of Americans and American Indians was so great that success, even if assessed by essentially Western measures, and failure, which was always seen in the eyes of federal lawmakers as an issue of *not* measuring up, inevitably meant we were, colloquially speaking, "damned if we do and damned if we don't."

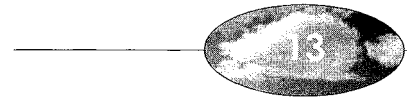
The modest but meaningful gains that our indigenous nations have made in self-determination mean that we have choices our ancestors did not. As my friend and colleague Michael Yellowbird frames the situation: although we have moved from a colonial situation, the question remains, are we intellectually colonized, have our worldviews, so to speak, been colonized? Our children today and grandchildren tomorrow will soon find out.

Can we escape the "damned if we do and damned if we don't" maxim? Only if we set our own goals by our own set of measures, which is much easier said than done. We have been subject to so many experiments, pilot programs, and policy initiatives that the first obstacle is to get over a knee-jerk aversion to sitting down to identify goals and objectives, and discussing ways to meet them. We can do it, but long years of experience taught us that "our" goals inevitably meant their goals. Consequently, many of us are immediately suspicious the moment discussion of such things comes up.

An even more fundamental problem is that we have been struggling for existence itself for so long that too many of us have had little time to explore precisely what are our particular tribe's measures of success. Fortunately, we have elders who retain the wisdom and who have much to teach, although not necessarily through pedagogy but through living. We also have large numbers of indigenous professionals and scholars who know what was missing in their formal education. We have allies as we enter the twenty-first century—increasing numbers of young people and more than a few of their teachers who are struggling to find more meaningful ways of learning and living.

One measure of indigenous success, I believe, would be a generation of professionals who understand the world as not revolving around humankind, but rather humankind as surrounded by relatives,

including other-than-human persons. Oren Lyons, Onadoga elder, remarked at the twenty-fifth anniversary of Earth Day that the difference between American Indian and Western views of nature is that while European immigrants looked at nature and saw resources, we looked around and saw relatives. Indigenous professionals who live in the world with relatives and focus on relations would be very different than professionals who study resources (objects) and focus on control. This would be progress, not as it is typically thought of today, but as a sign that a return to questions about living, as opposed to struggling for existence, is still possible and more crucially necessary.



Higher Education and Self-Determination

V. Deloria

During the 1950s Congress authorized a program of rapid termination of federal trust responsibilities for American Indians. The policy was ill-conceived, seeking to reduce federal expenditures that were minimal, and badly executed, allowing private banks to exercise a restrictive supervision over the assets of tribes who lost their federal eligibility. Virtually no development of tribal assets occurred during this period, and educational programs were generally oriented toward vocational training and relocation of Indian families to designated urban areas. With the New Frontier and the Great Society programs came a radical redirection of Indian programs. Economic development was stressed and the federal government began to provide scholarship funds for Indians in higher education.

We have been living in the era of self-determination since about 1966, and, although appropriations suffered immensely during the Reagan and older Bush years, the trend of policy has firmly supported preserving tribal life and enhancing the powers of tribal self-government. The two major thrusts of federal policy from the very beginning have been the education of the next generation of Indians in the ways of the white people and the exploitation and/or development of the reservation resources. Today the government seems intent on stressing the economic aspect of Indian life to the detriment of its educational component, a policy exceedingly shortsighted in view of the continuing economic crisis of the United States and the limited resources Indian reservations actually contain.

Self-determination grew like a weed over the past four decades, and it never was clearly defined at the onset of the era. It was a concept that originally surfaced in international relations to describe the desire of formerly colonized peoples to break free from their European oppressors and take control over their own lives. These peoples were, for the most part, geographically distinct and distant from their former colonial masters, and consequently independence, while painful, seemed more logical because the connections established by colonizing powers seemed and were wholly artificial. Indian tribes, with the possible exception of western and north-slope Alaskan villages, have always been viewed as internal to the United States and hence part of its domestic problems. That the Supreme Court has continually characterized Indian tribes as foreign to the United States in cultural and political traditions is difficult for most people to understand, so they make little effort to do so and prefer to consider Indians as simply another racial minority, albeit one with considerably fascinating habits.

Self-determination inevitably had to take on a different meaning when applied to Indian tribes and reservations. And as the original goal of the Kennedy and Johnson administrations was to delay termination of federal services until such time as tribes achieved some measure of economic parity with their white neighbors, self-determination in the Indian context basically has meant that Indians can administer their own programs in lieu of federal bureaucrats. Education was conceived as the handmaiden of development. One need only look at the fields in which Title IV fellowships are being given to understand that federal higher education programs were meant to train a generation of people who could function as low-level bureaucrats in drastically underfunded programs—programs intended only to keep Indians active and fearful of losing their extra federal funding.

Two major emphases characterized Indian economic development. Tribes were encouraged to allow major American corporations to control their energy resources in exchange for a few token jobs and a small income. Employment programs were designed to provide temporary wage labor in fringe industries that were them-

selves in danger of disappearing. Some wage industries, such as the moccasin factory at Pine Ridge, attempted to exploit the public stereotypes of Indians, and others, such as recreational ventures, placed the Indian workers in the permanent status of servants to a rich non-Indian clientele. Administration and management have thus become the favorite programs of the federal government and private foundations, the belief being that Indians feel more comfortable in performing menial jobs or watching their forests and coal reserves being exhausted if some token Indians are involved.

Unfortunately, administration and management have never been areas in which Indians have excelled. These types of jobs require that people be viewed as objects and that masses of people be moved and manipulated at will in order that programs achieve maximum efficiency. This kind of attitude and behavior is the antithesis of Indians' ways as is the fact that management and administration are always dressed up in "people" language to make them more palatable. Many Indians did not realize that the programs they were administering were designed to manipulate people, and they unintentionally transformed administrative procedures to fit Indian expectations. The result was that program efficiency declined, and some programs fell apart even while an increasing number of people were being served. Many programs considered as failures from the non-Indian perspective have been outstanding successes when considered from the Indian side of the ledger, even if they have given bureaucrats ulcers.

Indian education of the past four decades has done more than train Indian program chiefs, however. While Indians have been penetrating the institutions of higher learning, the substance and procedures of these institutions have also been affecting Indians. Indians have found even the most sophisticated academic disciplines and professional schools woefully inadequate. This is because the fragmentation of knowledge that is represented by today's modern university does not allow for a complete understanding of a problem or of a phenomenon. Every professor and professional must qualify his or her statements on reality and truth with the admonition that their observations are being made from a

legal, political, sociological, anthropological, or other perspective. These statements then are true if confined to the specific discipline and methodology by which they are formed. That they represent little else may escape the professor or professional, but it does not escape the Indian student, who often dismisses theory, doctrine, or interpretation when it does not ring true to his or her experience.

The revolt against social sciences is not simply a few Indian activists criticizing anthropologists and the suspicion with which Indians in science and engineering view theories in their fields. Rather, the problem is the credibility and applicability of Western knowledge in the Indian context. The objections are easily understood. Western technology largely depletes resources or substitutes a monocultural approach to a complex natural system. We tend to hide this fact by talking about production rather than extraction, but this linguistic acrobatics is not sufficient to escape Indian critique. Social science in the Western context describes human behavior in such restrictive terminology that it really describes very little except the methodology acceptable to the present generation of academics and researchers. While an increasing number of Indian students are mastering the language and theoretical frameworks of Western knowledge, there remain the feelings of incompleteness and inadequacy about what has been learned.

More importantly, whatever information is obtained in higher education must, in the Indian context, have some direct bearing on human individual and communal experience. In contrast, in the non-Indian context the knowledge must simply provide a means of identification of the experience or phenomenon. It helps to deal with specific examples to illustrate the point. A Western observer faced with the question of how and why certain species of birds make their nests is liable to conclude that it is "instinct." And this identification of course tells us nothing whatsoever, but it does foreclose further inquiry because a question has been answered.

In the Indian context the answer would involve a highly complicated description of the personality of the bird species, be it eagle, meadowlark, or sparrow; and the observed behavior of the bird would provide information on time of year, weather, absence

or presence of related plants and animals, and perhaps even some indication of the age and experience of the particular bird. In this comparison Indian knowledge provides a predictive context in which certain prophetic statements can be made. Western science, for all its insistence on reproduction of behavior and test conditions and predictability of future activities, provides us with very little that is useful.

Indian knowledge is designed to make statements that adequately describe the experience or phenomenon. That is to say, they include everything that is known about the experience even if no firm conclusions are reached. There are many instances in the oral traditions of the tribe in which, after reviewing everything that is known about a certain thing, the storyteller simply states that what he or she has said was passed down by elders or that he or she marveled at the phenomenon and was unable to explain it further. It is permissible within the Indian context to admit that something mysterious remains after all is said and done. Western science seems incapable of admitting that anything mysterious can exist or that any kind of behavior or experience can remain outside its ability to explain. Often in the Western context the answer is derived by the process of elimination. Thus with the theory of evolution, it is accepted primarily because other explanations are not popular or are distasteful.

Western engineering presents a special case. Its validity depends primarily on its ability to force nature to perform certain tasks that we believe are useful to human beings. Its knowledge derives from physical experiments, and more recently on complicated mathematical formulas that predict certain kinds of phenomena if certain kinds of things are done under conditions controlled by human beings. There is no question that if engineers restrict our understanding of the world to particular things we want to do, and set up the conditions under which they must occur, the results are spectacular. But does the engineer really understand nature or the natural world? Does he or she not simply force natural entities to do specific tasks and provide a theoretical explanation for what has happened? In forcing nature to behave in certain controlled ways,

have we not set in motion other forces that nature must make manifest so that the demands of the experiment can be met?

Today there is no question that our society is approaching the brink of an ecological meltdown. We have identified certain aspects of our forceful interferences with nature and have come to believe these things to be the cause of the deterioration we have observed. We have no way of knowing how things relate to deterioration because our context is too small. Would the widespread use of electricity, for example, have anything to do with the ozone problem? Does increased radiation have anything to do with the rapid disappearance of amphibians around the world? Is cancer a function of crowding people together, or is AIDS a function of chemically treated foods and chemical disposal into domestic water supplies? When we begin to ask questions that try to bring byproducts of our technology into new combinations so that we can test effects and do further investigations, we are virtually helpless because we have no good context within which to ask the questions that should be asked. In this society, we must spend immense amounts of time and energy simply identifying the proper questions.

When Indian students take all of the knowledge received in colleges and universities, along with certifications for professional work and perhaps even for managerial activities, they are led to believe that Indians are prepared to exercise self-determination because educated Indians are now able to begin to compete with the non-Indian world for funds, resources, and rights. But we must ask ourselves, where is the self-determination? What is it that we Indians as selves and communities are determining? We will find that we are basically agreeing to model our lives, values, and experiences along non-Indian lines. Now, the argument can be made that because we are geographically within the United States, we must conform to its values, procedures, and institutions. At least we must do so if we are to measure success according to the same standards and criteria. And all of our education informs us that these standards are nationally acceptable and may indeed even be universal throughout the cosmos.

It is increasingly apparent, however, that the myths of Western civilization are also the cause of its rapid degeneration, so that it is hazardous to measure ourselves according to those standards. As a nation we no longer produce wealth as much as we borrow from the future. If an individual really wants to make money he or she would do better to master complicated tax laws than to start a new business. Professors stand more chance of getting their ideas accepted if they are immensely popular with their peers than if they actually have something to contribute. The possible existence of a Supreme Being is a great embarrassment to religious people. Poor people are or should be incubators and organ donors for rich people. Wisdom consists of frequent appearances on television shows. Athletes need not be skillful, but they must win regardless of the circumstances. Any form of change in any other country can be regarded as a threat to the United States—and of course all forms of progressive change within the United States are perceived as threats to its security. It is exceedingly difficult to distinguish between American moral values and bumper sticker slogans.

The practical reality of these insights provides both the criteria for public success and the uncomfortable feeling among educated Indians that something is missing. Most Indians do not see themselves and their relatives within the popular American truisms, and they are greatly embarrassed when other people force them to acknowledge that these criteria really are accepted by a majority of Americans. Minimally, Western mythology describes a society that is not even polite. That is the key to understanding how to transcend the attitudes and perspectives of non-Indian education, so that Indians can determine for themselves and by themselves what they want to be, even if they are wholly within the confines of American society.

When we talk of the old days and old ways, we frequently give special emphasis to the manner in which people treated each other, the sense of propriety, gentility, and confidence that the elders had. Being polite springs primarily from a sense of confidence in one's self and one's knowledge about the world. Indian

narration of knowledge about the world fell into a particular format, and out of a plenitude of data, the speaker would choose the set of facts most pertinent to the explanation. He or she would formulate the story so that it ended on a proper note—*oh han* as the Sioux say. Now, a person cannot bring a teaching to a close, invoke the right response in the listener so that the information is taken seriously, and have some impact without closing off the discussion on a proper note. Real knowledge creates politeness in the personality, and one can see this trait in many wise non-Indians. It is, in fact, their foremost personality trait.

In the past four decades, while the movement for self-determination was proceeding, we have witnessed a drastic decline in politeness and civility in Indian communities. Indian meetings are many times difficult to attend because they consist of little more than people clamoring for attention and people busy impressing each other. The outstanding characteristic of Indian students today is the emergence of politeness as a personality trait. Science and engineering students more than others now seem to possess this most precious of all the old traditional personality traits. Here we may have an indication that the current generation of Indian youth is moving beyond the boundaries established for non-Indian self-determination, and now this generation stands ready to bring something entirely new to the process of applying Western scientific knowledge to Indian problems.

If this observation is correct, then we will witness some very unusual things happening in Indian communities in the future. Indians who are now working at the professional level, particularly in science and engineering, will work their way through corporate and academic institutions and begin appearing as independent consultants and owners of small, technologically oriented businesses working in ecological restoration and conservation areas. Research institutes headed by Indians will begin to appear on certain college and university campuses doing complex research projects. Almost all of this first generation of Indians will be active in traditional religious practices, even though many of them will be living away from their reservations. One or two of these people

will write extremely sophisticated papers and books that will be highly regarded in their professions.

Indian students in colleges and universities will begin to combine majors, putting together unlikely and unpredictable fields. They will have some degree of difficulty doing so because of the departments' inability to reconcile the students' interest within traditional Western disciplinary relationships. An increasing number of Indian students will choose very specific new majors that represent non-Indian efforts to do interdisciplinary work and that are almost entirely outside the fields being chosen by present Indian students. Indian graduate students will be doing very sophisticated dissertations, and in hard sciences, highly innovative research projects.

Indian community colleges will begin to show an increasing non-Indian enrollment, some people being nonresidents who come to these schools specifically to study with certain tribal elders. The number of four-year community colleges will dramatically increase, and community colleges themselves will begin to appear on the national scene in scholarly conferences and meetings. Most of the larger community colleges will have their own publishing and TV production programs, and some of them will be producing programs for national educational television. Some faculty at reservation community colleges will begin thriving consultant businesses because state and private universities far from the reservation will want to establish working relationships with the tribes. Community colleges will play an increasingly influential role in tribal economic and political problems and programs.

Tribal governments will develop new ways to organize the reservation communities and will develop specific programs for a wide variety of land uses. Tribal governments will have a considerably larger role in determining high school curricula, and some reservation high schools will have entirely new formats for study and graduation. Formal and informal networks of elders will begin to resolve some of the reservation problems, radically changing the kinds of topics that tribal councils are asked to handle. New and smaller communities will be built in different parts of the reserva-

tion, eliminating the concentrations at agency towns and having new kinds of local governing powers. Self-determination will not be an issue because people will be doing it in forms that even they will not recognize.

Although it appears easy to make vague predictions concerning the future of Indians and education, none of these ideas is an ad hoc concept. Rather, everything flows from the original idea of education acting as the motivational force in self-determination. The policy makers four decades ago *assumed* education would radically change Indian young people while also assuming that they would hold, as a constant, the value of returning to their tribes to take the lead in development projects. Higher education really was thought to be higher than the knowledge and experiences that Indians brought from their homes and communities. Higher education might have been more complicated, but it was too departmentalized, and consequently the chinks in the armor were all too apparent and left most Indian students with a feeling of having an incomplete knowledge. Unable to bring academic knowledge to its proper unity, more and more students are now supplementing the shortcoming of Western thought by placing it in the context of their own tribal traditions.

Once the process of supplementation began, it would naturally follow that individuals would begin to compare specific items of Western knowledge with similar beliefs derived wholly from the traditions of their tribes. We see this process now emerging as an identifiable intellectual position of this generation of Indians. It will take a considerable period of time for a new theoretical posture to be developed by this generation, but some individuals are well on their way to doing so. As a new perspective is formed, individual Indians who have moved completely through the institutional structures will take all conceptions of Indians beyond the ability of Western ideas to compete, and this conceptual shift will focus attention on the cultural knowledge of the community colleges. Once community colleges articulate a new conception of what it means to be an Indian and an Indian community, the rest of the shift is apparent and predictable.

In a previous essay I discussed the fact that much of American education is really just training and indoctrination into the Western view of the world. Basically this view is held together by the sincerity of its followers. It does not have an internal consistency of its own except in general methodological patterns whereby information is classified. Indians, over the long run, are exceedingly hard to train because they get easily bored with the routine of things. Once they have understood and mastered a task it seems like a waste of time to simply repeat an activity. So for an increasing number of Indians the training received at institutions of higher learning only raises fundamental questions that are never answered to their satisfaction.

We can visualize the effects of education on Indians as follows. Non-Indians live within a worldview that separates and isolates and mistakes labeling and identification for knowledge. Indians were presumed to be within this condition except they were slower on the uptake and not nearly as bright as non-Indians. In truth Indians were completely outside the system and within their own worldview. Initiating an accelerated educational system for Indians was intended to bring Indians up to the parity of middle-class non-Indians. In fact, this system has pulled Indians into the Western worldview, and some of the brighter ones are now emerging on the other side, having transversed the Western body of knowledge completely. Once this path has been established, it is almost a certainty that the rest of the Indian community will walk right on through the Western worldview and emerge on the other side also. And it is imperative that we do so. Only in that way can we transcend the half millennium of culture shock brought about by the confrontation with Western civilization. When we leave the culture shock behind we will be masters of our own fate again and able to determine for ourselves what kind of lives we will lead.

THE QUESTION OF SELF-DETERMINATION

D. Wildcat

WHAT IS SELF-DETERMINATION?

Locating education within the framework of self-determination is critical, for Deloria is asking the question seldom asked: "What do we, indigenous peoples of the Americas, mean by self-determination?" If we accept the standards and criteria of mainstream education in America and its fundamental Western claim of universal and objective applicability to the world and the cosmos itself, then, whether we are aware of it or not, we have accepted the metaphysical assumptions and premises that lead to a good number of problems Western society seems unable to address. American Indians are now in the position to, as Deloria states, "compete with the non-Indian world for funds, resources, and rights," and he continues, "We must ask ourselves, where is the self-determination? What is it that we as selves and communities are determining? We will find that we are basically agreeing to model our lives, values, and experiences along non-Indian lines."

I think many of our ancestors and present elders would see good and bad in the proposition that we culturally conform to the dominant values, procedures, and institutions of the United States. But before we grab hold of the obvious improvement in terms of physical and material comforts, we must assess our experience in the big picture of life. Once we acknowledge this larger, more complex context, we will see that the issues are not about what is practical in some normative cultural context, but about the nature of reality itself.

It is not surprising that in modern American society economic initiatives inevitably overshadow education programs. Education as an institution reflects the values of the larger society, and the only thing historically distinguishing so-called Indian education from mainstream education is the direct and blatant regimen in which culture was instilled. Today the notion that educational "progress" is identified with economic measures is so widely accepted that the business of education has become business. Many neoliberal economists even argue that the marketplace will democratize backward, nondemocratic peoples and instill in them the values of liberty and justice for all—making individuals, in the words of Milton Freidman, "free to choose," or more correctly, as friend and sociologist Dean Braa used to say, "free to lose." Our challenge as we enter the twenty-first century is to ensure that as we focus on gains, we do not forget about what we might lose as indigenous peoples in undertaking certain activities.

SELF-DETERMINATION IN THE ABSTRACT

The question "What is self-determination?" is the easiest question in the world to answer in the abstract, and, for the most part, that is precisely how it has been answered. In the abstract we can say self-determination is when one freely chooses to act or think a certain way. That accepted, here is the rub for Western political thought: where does authority reside? Or, as John Dewey observed in *Human Nature and Conflict,* the question of choice arises and the issue of morality comes into existence naturally. Yet even among the most brilliant and compassionate scientists of the last two centuries, the extent to which morality and values are seen to lie outside of nature is but one more example of humankind's mistaken notion that we are ultimately segregated in one very crucial aspect from the entirety of nature.

The idea that morality and values cannot be found in nature is one of the single most erroneous notions Western civilization and modern science have produced and one of the major reasons American Indian students often find science uninviting. Even

conceding that nature has indeed equipped humankind with more choice behaviorally than other animals, and certainly plants, this cultural or nurture aspect of human existence is not a repudiation of our natural propensities; rather, it is an affirmation that morality itself is a natural product. It does no good to invoke the old nature-versus-nurture or nature-versus-culture (social) dichotomy, for what it exposes is less valuable than what it obscures: that humankind's heavy dependence on culture, nurturing, or socialization is natural—given by nature.

I would suggest it is more accurate and useful to think of our cultural or social behavior as instinctive, albeit in a nonreductionist manner. In short, human beings have no choice about choice. The invocation of instinct as a product of nature, and morality as a product of culture, is unhelpful when looking at the question of morality, since it in essence assigns nature—the world itself—a mechanical character. It reduces humankind's natural character to instinct—biological mechanism. This reduction of "natural" humans to instinct is not surprising but certainly enlightening, for it again illustrates the extent to which humankind's self-proclaimed moral autonomy from nature is dependent on a reductionism that is at its core mechanical, naively empirical, and teleologically closed—precluding the possibility of change.

Predictably, once the majority of human behavior (that which most humans acknowledge involves choice) is given an autonomous realm or space in which to operate, we enter the postmodernist room full of mirrors, where any attempt to talk about reality or what is real dissolves into digressions on meaning and multiple realities. While I appreciate the postmodernist critique of modernist thought and its unmasking of the arbitrariness of Western civilization, I fundamentally reject its antirealist conclusions. Postmodernists examined modern, essentially Western, theories of the real world, and finding them wanting, simply discarded the phenomenal world and kept theory.

The postmodernist rejection of an objective reality or truth is predictable and well within the intellectual heritage of Western thought. However, its embracing of a purely cultural determination

of reality leaves the door open to a cultural relativism and an antirealist position relative to knowledge. The point missed by modernist theories immersed in the Western tradition and postmodernist theories rebelling against the Western tradition is that both forget their ideas are about something, and that something is experience in the world. Try as humans might to put knowledge in boxes—the experimental method, abstract categories, subjectivistic lockboxes, and so on—we are still left with the large remainder of daily experience. A substantial amount of the wisdom of our indigenous ancestors is still with us in the experience of places too often now taken for granted.

Power and Place is a proposal to reflect on critical issues about experience and what we can learn in the larger experiential realm of existence. The issues and questions raised are to a large extent avoided today in formal educational settings: questions about the nature of the world and our human place in the world. They are the important questions, the ones that reductionist science and a Western metaphysics of the world cannot answer. The most fundamental of these questions is, "How shall we live?" and this question is at its core a moral question encompassing power, place, personality, and, ultimately, self-determination.

Indigenous Self-Determination

Indigenous self-determination begins with attentiveness to the relations around us, whether they be typically understood as economic, political, ecological, or spiritual. The everyday experiential world of casinos, manufacturing, so-called natural resource management, and all of the business decisions tribal governments make are central to self-determination. They are central because we are just as free to lose as we are free to choose. We indigenous peoples lose if we make choices without considering the consequences to our unique tribal identities as indigenous peoples emergent from diverse places of this planet. Thankfully, most American Indians still recognize the fact that spiritual questions are inextricably bound up with practical questions, everyday issues,

although we may be struggling to make sense of how to meaningfully integrate both when surrounded by a society that so successfully segregates and compartmentalizes human actions and experiences in the world. If all of humankind would seriously undertake to reconnect to places in the practical way their ancestors once did—and many indigenous people still do—we might be much better off.

There is no way to get around the fact that Indian education in America has been and, one might argue, continues to exist as the handmaiden of assimilation. The assimilation of differently minded indigenous people into the dominant, essentially Western Culture, and I mean culture with a big *C*—the values, beliefs, customs, habits, practices, technology, and languages of Western civilization—has been up to now Indian education. That education is an assimilation process ought to be intrinsically troubling to anyone with democratic values.

I have little problem with people's deciding how to bring their children into their own society and culture. The Pennsylvania Amish maintain their own education system and have even gained the protection of the U.S. Supreme Court to do so. Families have a recognized right within certain guidelines to home-school. In short, democracy suggests people have a right to educate children in accordance with their societal values and beliefs. Why should we expect anything less in our Native communities?

Problems inevitably begin when someone else determines what religion or education ought to be for a particular people's children. In addition, these fundamentally democratic issues become more complicated if groups of people find themselves, for whatever reason, living in a more multicultural human environment. The more heterogeneous the human cultural context, the more difficult it is to declare what core values and beliefs ought to be inculcated through education of children—the future members of a given society. Yet this multicultural reality, more than any argument or ideology, ought to underscore the current challenge in education. Diversity, multicultural society, postmodern critiques of hegemonic, that is, totalizing and universalizing, ideologies—such topics

predominate many discussions in education today. The endless debates in and criticism of higher education serve as a de facto demonstration of how pointless this intellectual industry will be unless the debates about curriculum become literally "grounded," contextualized to the environments and places we call home. Human cultures until very recently were emergent out of places; they were literally grounded in the experience of nature in particular places on the planet. If we indigenize or reindigenize self-determination, then it will entail a reordering of values and signal an effort to live in a manner respective of the power, places, and persons surrounding us.

POWER

Power, "the living energy that inhabits and or composes the universe," is what moves us as human beings—all of the connections or relations that form the immediate environment or that small part of the world each of us inhabits. While energy in physical mechanics is quantifiable, Deloria's concept of power is nonquantifiable. Power is a qualitative dimension shaping our thoughts, desires, habits, actions, and institutions that operates to a great extent without us thinking about it. In ordinary language we can call power amorphous, for it takes many forms, some overt and some latent. We are conscious of the former, while the latter lie dormant and have an existence of (to) which we are not initially conscious. We can also describe power as diffuse, for it surrounds us as an *atmosphere of influences,* including the very practical economic influences in the world. Power is quite literally flowing around and into us; if we are properly attentive, power can be used by us.

An indigenous North American metaphysics would agree with the formulation that knowledge is power, but object to the narrow Western idea of knowledge and the anthropocentric, human-centered notion of power. Like the concept of personhood, American Indians and Alaska Natives have a much broader notion of knowledge one that includes knowledge born of direct experience of what I call the atmosphere of influences. Deloria's likening of American Indian metaphysics to a social reality is

helpful, for it directs us properly to the character of this atmosphere of influences. Social reality is not what one narrowly thinks of as social; instead, to follow Deloria's suggestion, "social" is as close as we might presently get to describing the substantive character or reality of power. Like society itself, the power allowed as social by most human beings, with the exception of a few intellectuals called methodological individualists, is readily acknowledged in its observable effects. We know society has forces we call social because we experience them and not only see, but also feel, their effects. The nature of social reality has certainly dogged philosophers of science and some serious social scientists. I would suggest that they consider the problem of social reality as only one part of a much larger and more serious exploration of the "nature" of reality in general. To say as Karl Marx first did, and as many sociologists since have said, that we are simultaneously products of and producers of society and history, is a way of saying our human lives are part of a life process we are engaged in—not by choice, but as a consequence of our living existence.

I find it easy to accept that the environment Marx experienced made it relatively simple to see life as a struggle for existence primarily shaped by an economic class struggle. However, it is not romanticism to suggest that Seattle, Ten Bears, Chief Joseph, and many other American Indian leaders of the nineteenth century lived in environments where the notion of a "struggle for existence" never crossed their mind—although concern for living well did. Although it is fashionable today to bash any defense of a tribal aesthetics of cooperation with nature as romantic, I find it difficult to discount the impressions of so many non-Native persons, from conquistadores to Harvard anthropologists, who, in spite of incredibly ethnocentric, if not racist, assessments of our ancestors, all saw indigenous North American societies possessing something they found admirable and lacking in their own Western societies: generosity and a social well-being. Cristobal Colon (Columbus) himself marveled at the goodness of the Taino Indians during his first visit to the Caribbean Islands, and William Howells in *The Heathens* even acknowledged:

> American citizens live in an advanced and comfortable nation, yet great numbers of them feel insecure and uncertain, either individually or in groups, to the point of bitter unhappiness.... Primitive people have long ago put into practical religious forms many things that your countrymen are trying to find for themselves in lectures and books on the good society or how to find happiness or on what is wrong with them.

Good societies, happiness, and individual well-being—or to quote directly from Colon's diary entries of December 24 and December 25, 1492, "They [the Indians] are very gentle and without knowledge of what is evil nor do they murder or steal," and "They love their neighbors as themselves": not bad accomplishments for "savage heathens." Unfortunately, these qualities were not much valued by Colon and many of the Europeans who followed him. The very character of the first interactions between the Caribbean Natives and their strange visitors from Europe remains indicative of the fact that both peoples held very different worldviews. Given what we know of European history, I think most persons would prefer to arrive as strangers at the doorsteps of people like the tribal Taino as opposed to the doorsteps of the civilized Europeans.

We can acknowledge that North America had its own hierarchical states or societies centuries before Cristobol Colon arrived. One of the largest within the geographical boundaries of the present United States, Cahokia, collapsed before A.D. 1100, as did most of the great mound cultures of the Southeast United States and the great Mayan states of Central America. What exactly happened is still open to much research, but in the case of the Mound Builders and the Mayans, I would say, to borrow a popular phrase, "Been there! Done that!" The fact that there seemed no great effort to rebuild these indigenous empires after their collapse suggests to me that some American Indians learned a lesson in self-determination that Western historians embracing a pseudo-evolutionary, or linear, view of world history will find problematic. If, as many North American indigenous worldviews suggest, social

organization and culture *ought* to emerge out of our environment—understood as constitutive of an ecological, political and necessarily ethical community—it may be that the earliest state structures in North America demonstrated an incongruity with the environments where they developed. History always occurs in places and never on abstract timelines.

Place

Most American intellectuals and educators continue to talk exclusively about history and cultural issues as if they were disengaged or relatively autonomous from the other features, or as I prefer to acknowledge, the other persons or relatives of our ecological and environmental communities. Much of what I have elaborated in my essays goes back to a three-decades-old insight found in *God Is Red:*

> When the domestic ideology is divided according to American Indian and Western European immigrant, however, the fundamental difference is one of great philosophical importance. American Indians hold their lands—place—as having the highest possible meaning, and all their statements are made with this reference point in mind.... When one group [American Indian] is concerned with the philosophical problem of space and the other [Western European immigrant] with the philosophical problem of time, the statements of either group do not make much sense when transferred from one context to the other without the proper consideration of what is happening.

If we seriously add "places" in their ecological, and fundamentally indigenous, sense to the consideration of ideologies, it brings the purely "cultural" problems as conceived by the metaphysics of dominant "American' society into even starker relief. For the cultural wars among those operating in the Western metaphysics of time, space, and energy seem little more than abstract disagreements between antiseptic ideologies—strange visions

about human life and culture disengaged or alienated from the land and places.

By reducing success, progress, and self-determination to cutthroat economic measures, we create a Culture (with a big *C*) possessing little value for community among our own species, let alone a broader experience of community, one inclusive of other persons in our immediate world. Deloria is correct to find that meaning in a place is crucial if we are to improve the human condition on this planet, and I believe we will inevitably make progress once we give up the invidious distinctions and dichotomies that have haunted modern Western thought, including nature versus culture (nurture), conservation versus development, and science versus religion (values).

The question of self-determination from the standpoint of an American Indian practice of education is essentially a question of the degree to which individuals and communities are actively engaged in making their future—not in the abstract but in places and in what Dewey called the "lived-in" present. For we are all involved in a living process—some are merely less conscious or, I prefer to say, less aware than others about the future they are enabling through their present activity.

Place or space is concrete and palpable. It is in a profound sense where one discovers his or her self, what Deloria calls personality, as opposed to the casual sense of where one just happens to find one's self. Place is not merely the relationship of things, resources, or objects, it is the site where dynamic processes of interaction occur—where processes between other living beings or other-than-human persons occur. At this point it seems worth noting that history as spatial relations offers a view of change wherein one might think of change as timeless, or at least not time-dependent but space-dependent. Change is understood in a nonmechanistic relational- and process-dependent manner, with processes understood as changes in spatial relations and constellations of power. Thankfully, physics and the life sciences are beginning to acknowledge that the old mechanical and time-dependent view of our lives in this world allowed us to do certain things,

manipulate and build things; humans can indeed send people to the moon and have them safely return.

In terms of acting or behaving with a moral intelligence, our human successes have been less than impressive. I believe this is in large part because our pride in controlling/manipulating small "elements" and understanding some processes have made us good at doing some things, but facilitated our losing sight of the big picture and the necessity of asking what things mean. Some will respond, why worry about meaning if one knows how to do things, if one knows how things work? One answer seems incontrovertible: modern or postmodern humankind knows little about how meaning works and consequently little about our human selves.

We live in places today marked by it seems two extremes in human behavior: those who turn almost exclusively inward to find "themselves" and those who define and give meaning to their lives through the outward acquisition of things. One seeks another world in which meaning can be found, and the other decides to literally buy or make his or her world. Both behaviors are odd to tribal persons who find meaning in the world and recognize through experience that they are of a people and place.

Personality

I understand Deloria's idea of personality as the substantive embodiment, the unique realization, of all the relations and power we embody. Because each of us is someplace and, but for a few exceptions, never in exactly the same place as anybody else, our personalities are unique. Our phenomenal existence entails a spatial dimension and variations in power relations with other persons in the world. Therefore, *personality* as Deloria uses the term is a metaphysical concept, fundamentally different from the popular science view that what and who we are can be reduced to genetics or biochemical mechanisms. In the current reductionist genetic model of "personalities," the critical interaction between environment and personality is all but lost. Even at the most general and abstract level of contemporary evolutionary theory the concept of species masks the uniqueness of individuals.

What I mean can be understood by anyone who has had the long-term friendship of a dog, cat, bird, or "individual" of another species. We (each of us having such a friendship) know our other-than-human person is an individual, different from others of the same kind or breed. Why? Because we know them as persons: we learn through experience their personality. "Pets," however, are a special case given their social circumstances. Anyone attentive to animal groups living outside of human control for an extended period begins to distinguish unique personalities of individuals in the herd or social group. American Indian traditions suggest many of our peoples fully understood how much our own human personalities depended on what could be learned from the other-than-human persons in the world. Our personalities or selves, what Carl Jung called "anima" and Paul Tournier called "persons," as individuals within communities, require this recognition and interaction lest we become merely another demographic minority.

In a world of human-created "virtual" persons, places, and communities, as well as biologically engineered plants and animals, humans seem prepared to become not merely the measure of all things but the creators of the "brave new world" Aldous Huxley foresaw in his cautionary novel by that name. And like Huxley's *Brave New World,* there is one thing missing in the human-created ethernet world of virtual persons and artificial intelligence: a spiritual reality residing in persons and places unmanufactured and not engineered by human-the-creator. A spiritual reality permeates the world we experience, and incredible power exists in places where human creations do not get in the way or become the primary focus of our attention. This is not an argument, as my Comanche friend and colleague Ray Pierotti likes to emphasize, to take humans out of nature or for the maintenance of a pristine wilderness, a Garden of Eden, so to speak. Quite the contrary, it is a declaration that among the atmosphere of influences we move through daily, some powerful and unique influences exist in places not dominated by humankind. One need not read New Age texts to understand this; a survey of the diversity and complexity of distinct human cultures that have

existed thus far and are daily threatened proves the point. The world is a diverse and complex reality. The best place to begin an understanding of this reality is with critical reflection regarding our experience. Self-determination requires reflection.

Critical Reflection

Self-determination is reflective in two senses. First, in the sense that we can never act consciously until we have arrived at an understanding of who we are—each of us in our own unique place in the world. Here the metaphysics of living in the world draws a clear distinction between itself and the metaphysics of the world whose attendant psychology finds human self-discovery in aesthetic retreat from the world. In many indigenous traditions there are indeed "places" where one might think individuals retreat from the world for reflection and even revelation. Such a conclusion would be false, however, for in these practices the intention is not escape from the world but to seek out a better connection in the world, a connection to influences—power—that cannot be casually acquired. Heightened awareness of this/these power(s) does indeed require self-conscious reflection; however, reflection, or even contemplation, is not focused on some abstract or ideal sense of self but, if you will, on a process of discovery.

And it is this process of discovery that brings us to the second reflective feature of the question of self-determination: the focus of our attention is to the relations and connections that influence who we are and are constitutive of our being, or what Deloria calls personality. Tribal traditions were not guided by a formal rule of law but by custom and habit. Browning Pipestem once asked Haskell students, "What is 'the law'?" After they struggled mightily with the question, he gave an excellent answer and one illustrative of indigenous traditions: "The law," he said with a pause, "is a contract—an agreement—between strangers." Modern legal theory, in fact the law, is to a large extent an abstract human construction. However, and here is the critical point, in modern societies and nation-states, it is necessarily more meaningfully congruent with vague ideologies than customs, habits, and ceremonies in a

land-based community of persons we know—experientially. Modern law is quite literally no respecter of real persons, but a definer and defender of persons in the abstract. That human beings in modern legal theories are philosophical constructions is an ex post facto demonstration that persons constructing laws no longer share an experiential place, as well as a demonstration of the evaporation of culture emergent from a place. In an indigenous practice of education informed by an experiential metaphysics, the focus of self-determination is on the manner in which our being and identity itself is constituted of the number of good relationships we are part of and actively maintain. Self-determination cannot be an individual question, for the reflective sense in which our selves are grounded in life among our relations and in the relationships surrounding us requires engagement with the community of persons, both human and other-than-human, when we determine what we ought to do, what choices we should make, and how we should be self-determining.

Such a notion is indeed complex if left entirely to rational calculation, but experience gives us a source for estimation that goes beyond rational calculation. Self-determination in the dominant Western society is essentially about calculation, and appropriately so, for it has emerged in a legal culture of abstractions, of abstract persons, with abstract rights or freedoms. In such a model of politics—law, rights, responsibilities (of which there are few, for the most part), and power—solving political questions is like solving a problem in mathematics, given the right terms and operations. Legal constructionists, sympathetic to the points made above, get quickly frustrated, for in acknowledging the complexity of political environments as experienced, they quickly give up on rational elaboration of such complex models. To use an analogy from the quantitative social sciences, once one factors in more than a couple of independent variables in a computer-generated regression model of causal variables, the interaction effects are such that it grows increasingly difficult to say precisely what the effect of any single variable is. Rational calculation gets interminably difficult and hence, so the argument goes, impractical. I could not agree more.

However, the problem is solved once one gives up on calculation and abstraction and instead redirects attention to experience through custom, habit, ceremony, and what I choose to call the development of a synthetic attentiveness. By synthetic attentiveness I mean a heightened sense of awareness that operates without thinking about it or paying attention to it. Synthetic attentiveness is the "I experience, therefore I am" indigenous response to Descartes's famous "I think, therefore I am." I have seen this keen awareness or synthetic attentiveness operate numerous times with traditional elders who demonstrate the amazing ability to be aware of events, processes, and activities surrounding them that most of us miss. Whether visiting a classroom, having a meeting with governmental officials, or being in wetlands or on a grassland prairie, I have often been surprised in discussions afterward by what these elders "noticed" without seeming to notice at all. This ability to what I will call process processes is not magical, and it only seems mysterious to those insistent on a rational schematic or mechanistic model to explain what happens. I can offer neither. I see no need to; rather, this processing of processes seems acquired by paying attention—by learning to be attentive to the world we live in.

The question of self-determination is one of degree: how engaged, connected, and attentive are we to our community? This will seem contradictory and paradoxical to Western-thinking students and teachers. The more attentive one is to their community, the more self-determining they can be; the less attentive, the more selfish and self-destructing they will be. Christopher Lasch struck a chord with many in his description of Western culture, and contemporary American culture in particular, as a *Culture of Narcissism*—a culture of self-love. I would merely extend Lasch's insightful commentary to the love of all things or objects embodying selfishness.

Metaphysics for Living

Indigenous metaphysics offers insights into many of the most troubling problems modern or postmodern societies face, by recognizing the world as having living physical and spiritual dimensions,

not as a fast and fixed thing. Space, places, ecosystems, and environments are not the "final frontier" waiting to be conquered and controlled by modern ideologies; rather, they constitute the context through which we escape the abstract relativism of postmodernist thought and find what it means to be self-determining.

American Indian metaphysics has the advantage of framing all questions of knowledge as fundamentally moral questions that literally reside in our everyday life. The way many of us live today makes it easy to compartmentalize different aspects of our life. The strength that Deloria has always found in American Indian metaphysics is their emergence from a way of life. As we think about what it means to exercise self-determination, we must *not avoid* examining so-called economic, political, and social aspects of our lives as part of larger moral questions and what it means to be indigenous today. It may very well be as the elder Dan in *Neither Wolf Nor Dog* told Kent Nerburn: living with honor is just as important, if not more important, than living with freedom. We are obsessed with freedoms, but freedom to do what? If we fail to ask these foundational questions in education, it seems disingenuous to complain about behavior later. So let us think about self-determination indigenously: about what living with honor means to Peoples still connected to places.

THE PERPETUAL EDUCATION REPORT

V. Deloria

This essay was originally written in 1992 at the beginning of the Clinton Administration. We never did hear very much about that educational report, and, after a fancy gathering in New Mexico at the start of Clinton's term, we never did hear much about anything. Now we have a new administration and—we can easily predict—a new education report.

In authorizing the report the secretary of education is following an age-old and revered tradition in Indian education: It is better to talk about education than to educate. The ink will hardly be dry on this report before another organization, or another federal agency, has the urge to investigate, and the cycle will begin again. From the Reverend Jedidiah Morse in the 1820s through Senator Kennedy to the present, the refrain is the same: "We are not doing anything, we need more money, and Indians need to be involved."

Why is it that, in spite of sincerity oozing from every pore in their bodies, investigators of Indian education reach the same dull, stifling, and uncreative conclusions? Educational professionals argue that the problems are always the same, that the federal government never has adequately funded its educational branches, and consequently each report is basically dealing with past and existing inadequacies. I don't buy it. Big-city school superintendents give the same argument, and when you give them additional funds, they add an incredible number of bureaucrats, cut classroom budgets,

dress up a few motivational programs, and begin laying the groundwork for a new bond issue. That Washington educators would do less is difficult to believe. Graduate schools of education across the nation teach these people that abusing the taxpayer is their *only* function.

The second most popular argument in Indian education is that Indians are really a different cultural set and therefore generate different kinds of problems. Cultural differences should have been reasonably clear in 1492 and by the early 1700s when formal educational efforts for Indians began. Someone should have started to think about what cultural difference meant. Certainly after almost three centuries people ought to be getting a grip on the nature of this cultural difference. But now, after 500-plus years of European contact, it should not come as any surprise that Indians really do represent an entirely different set of cultural beliefs and practices, even though many of the most profound differences have disappeared over the last century.

Each education report concludes with the proposition that the government has to do more to get Indians involved in education. In some instances involvement means organization of parent advisory groups, at other times Indian school boards; and occasionally we are told that it is sufficient to scold Indian parents so that they will act like white parents, a good many of whom are more delinquent than all the Indians put together. In practice, Indian involvement usually means bringing a large crowd of Indians together so they can listen to a panel of educators tell them that they should become more involved in education.

If there really are profound cultural differences, if Indian parents should be more involved in their children's education, and if more funds should be spent, what is it that dooms reform efforts when minimal programs are devised to meet these perceived needs? The thing that has always been missing in Indian education, and is still missing today, is Indians. In spite of the many advisory committees, national organizations, and graduate programs in education that purport to deal specifically with Indian education, we see nary a trace of Indianness in either efforts or results.

Such an argument must certainly offend the many Indians who serve on these committees and work in national educational organizations, but the truth is that when they join these groups and take on these responsibilities, they generally leave their Indian heritage behind and adopt the vocabulary and concepts of non-Indian educators and bureaucrats, following along like so many sheep. There is some sincerity in their efforts. Many of them feel that in adopting the technical language of modern education they are making Indian needs relevant to influential people who can help turn Indian education around. The sad fact is that in modern American education, frenetic activity is mistaken for ability and capability.

Indians do play an inhibiting role in the development of new ideas in education by insisting that any policy-making group have an Indian membership. This demand goes far back into the early 1960s, when it was necessary to insist on some Indian representation in the many task forces and investigating committees that were being formed to work on Indian poverty. But it is necessarily a useless concept and fruitless requirement if the Indians who are being appointed fail to represent Indian interests. A committee composed entirely of Indians who parrot the educational party line is perhaps worse than a committee composed wholly of non-Indians who have some glimmer of what problems are and how they can be addressed. Let us take the three identifiable issues, cultural difference, family involvement, and funding problems, and discuss how these concepts should be used to support changes in Indian education.

Cultural Differences

So many cultural differences exist between Indians and non-Indians that almost any cultural trait can be chosen to illustrate possible changes. For our purposes we will take the continuously observed fact that Indians are not competitive. This argument is not to say that Indians never compete but rather that aggressive public demonstrations of competition are regarded as crude behavior. American education is designed to encourage people to compete with their peer group and measures individuals against

each other. The system taken as a whole relies heavily upon the experiences and values of the middle class, and consequently test scores are based upon the worldviews that mainstream Protestant Americans believe to be true, whether they are in fact or not. Teachers frequently cite the lack of Indian competitiveness as a detriment to learning and seek ways to overcome Indian children's shyness.

If we really understood cultural differences and developed our educational programs to build upon the strengths of each culture, teachers would not be concerned with overcoming shyness, they would build on it. One need only read Charles Eastman's book *Indian Boyhood* to see how Indians handled peer-group pressures in education. The boys were asked to choose which of the birds was the best mother and were given time to formulate their answers. Each boy chose an appropriate characteristic of bird behavior and motherly concerns, made his argument, and was prepared to turn aside other evidence. Discussion was lively, something that would make any modern teacher envious, and each answer given was a sophisticated blending of the knowledge of birds and the interpretation of their behavior using human analogs. In a sense this was competition between the boys in picking the proper bird. In a larger sense, each boy's reasoning was given a measure of respect as he did demonstrate that he had chosen reasonable virtues from among the many he could identify.

Tribal elders today teach a good many techniques and tribal history using the same methods of instruction, and almost every comprehensive book on tribal histories and culture will have some space devoted to tribal teaching practices. Consequently, there is no excuse for avoiding traditional ways of teaching in favor of non-Indian techniques that have proven themselves failures. Using either the oral traditions or some of the written materials that are available, it would not be difficult to reconstitute a class of Indian children and instruct them in much more efficient ways. Storytelling with the further requirement of being able to recite the story accurately after hearing it several times would make the accumulation of knowledge fun again.

The Indian view of the world tends to see unities both in the structure of physical things and in the behavior of things, and we have recently been describing it as "holistic" in that it tries to present a comprehensive picture in which the parts and their value are less significant than the larger picture and its meaning. That is not to say that Indians could not deal with specific items of knowledge. Most Indian languages have a multitude of words to describe phenomena, and Indian words can easily be arranged to provide new words and concepts. In fact, Indian language can achieve more precision than English, even while conveying the emotional nuances necessary to make knowledge come alive and remain with the person.

Look at the curriculum that Indian children are asked to use. Knowledge of the world is divided up into separate categories that seem to be completely isolated from each other. So profound is this separation that most children, Indian and non-Indian, rebel when they are asked to write complete sentences in classes other than English, or to show any comprehension of mathematics in any course except mathematics and physics/engineering. We are asking children to divide the world into predetermined categories of explanation and training them to avoid seeing the complete picture of what is before their eyes. Efforts of the last three decades have been somewhat bizarre when this question is faced directly. Quite often the images familiar to Indians are used instead of traditional white, middle-class images, and this change in pictorial representation is supposed to cure the defect in the child's perspective. If the child wants to understand the whole, we simply dress up the parts in buckskin and pretend that we have answered the problem.

Family Involvement

The original intent of Indian education was to wean the child away from his or her family, community, relatives, clan, band, and tribe. People seriously believed that if an Indian child was brought within the purview of non-Indian education at an early age, the corruptive influences of Indian people would not affect them and

they would grow up to be "normal." That is to say, they would naturally adopt and exemplify all the values and perspectives of the non-Indian society. I remember meeting a high-level educator in the 1970s who was absolutely convinced that Navajo children would have automatically spoken English if they had been anywhere else than the reservation. These attitudes, while not completely eliminated, changed profoundly after the Meriam Report, which gave emphasis to building programs on the basis of what actually existed in the reservation communities.

If family involvement is so important, why is it that developments in the past four decades have made it impossible to connect the family and the school? During the New Deal there was a great emphasis on the reservation day schools. These schools were located wherever there was a significant concentration of people on the reservations, and they serviced a small population, often in one-room schoolhouses. Teachers lived in the local communities and knew the parents, grandparents, and families and participated in all local activities. Indeed, the schoolhouse, no matter how insignificant, was the center of local social activity. Families felt they were part of education because everyone who had anything to do with the schooling of their children was an important part of their community.

Today we have monstrously large school plants that resemble nothing so much as prisons. Indian children ride buses for hours each day to attend school. The enrollment in large consolidated schools is so big that discipline becomes a problem, and school activities, while certainly more plentiful and attractive, become exercises in mass movement. Large schools require an immense administrative staff, most of whom spend their time pushing forms from one desk to another or attending conferences to learn how to make administration even more complicated. Indian children are lost in these gigantic institutions, and to survive, we now see them organizing gangs on reservations. We have imported the urban environment; we have not brought education to the reservation at all.

For the past twenty years there has been a big emphasis on getting parents involved with this educational machine. Both the

tribes and federal educators have preached PTA and parent activities, and advisory committees on various programs and activities of the school have blossomed like runaway zucchini. With some rare exceptions, no provisions have been made to include grandparents and uncles and aunts, the people who traditionally took responsibility for much of the children's education. PTAs and other parent groups have been organized using entirely artificial criteria, primarily residence within a certain geographical area—as if people shared some mysterious social cement by geography alone.

The psychological burden of even attending a meeting in a big, formal, brick building is intimidating to many reservation parents. It calls back memories of their childhood and the summons to come to the agency, which always meant problems. Families are herded through large school plants every year at "welcome back to school" days, but the format used, the quick tour with smiling teachers defending their classroom doors, makes it clear to parents that they are outsiders and are not to appear at the school unless they are asked. Multiply this feeling by several thousand and you can experience the feelings of the Indian child the first several weeks of school.

The presence of consolidated schools makes reform in this area a difficult proposition at the present time. Changes in the educational system are probably dependent upon corresponding and prior changes in the tribal governments that vest more self-governing powers in local communities. In fact, the major reform that needs to be made on many reservations is a change of perceptions about what tribes and reservations are. They should be understood in their national character, which is to say, as instrumentalities expressing the national existence of the people and dealing with primarily outside forces and entities. Local communities should take on the characteristics of municipalities and formal village institutions that include local control of education and social activities.

Wherever possible local communities should begin to take control of primary and part of secondary education, even if it starts in one-room schoolhouses. Local control should emphasize control over curriculum, with teaching about tribal history, tribal customs

and traditions, and tribal language at the earliest possible age with maximum use of traditional people. The activity should be perceived as Indian or tribal. This emphasis is in contrast to the present orientation, which is that the participants are Indian, but that the kinds of activities they are asked to support are basically non-Indian in origin. A considerable part of the school activities, particularly including much of the testing, should be transformed into social/educational events of the community. When the Five Civilized Tribes operated their own school system, they used to have several days of formal recitation of what students had learned or were learning in school, and the communities played an integral role in judging whether or not the school system was educating their children.

We need not project futuristic plans that may never become feasible. A good way to begin involving families and communities would be to introduce two subjects to Indian primary and secondary education: family genealogies and tribal traditions. These two subjects provide a solid foundation for children's personal identity as well as serving as a context for teaching all manner of social skills and development of memory and recollection. In a world of large institutional restraints, knowledge of family and tribe would provide a significant set of skills to provide confidence in the child that he or she is part of an ongoing human experience. The best possible setting in which these kinds of teaching can take place is informally outside the school building, using a conversational method of instruction. If Indians presently involved in Indian education would but stop and think of their own knowledge of the world, they would realize that while they cannot remember anything of what they were taught in grade school, they have instant and highly accurate recall of stories they heard elders tell several decades ago in informal, casual settings.

FUNDING PROBLEMS

If ever there was a school superintendent who thought he or she had sufficient funds to operate during the school year, the world would have come to an end. Federal bureaucrats can stand in the

midst of incredibly wasteful expenditures and weep real tears about how inadequately they are funded. In addition to outright squandering of resources on administrative perks, conferences, and research projects, the federal Indian education budget reflects the contemporary institutional configuration on the reservations and in state school districts—neither of which allocates funds on a sensible basis. Funds derived from Johnson-O'Malley, PL 874, and the Indian Education Act are all seen as supplemental to existing state, local, and federal programs and budgets. Consequently, everything in the funding area is oblique to the purpose of education and is designed not specifically to educate Indians, but to ensure that the Bureau of Indian Affairs and local non-Indian school districts prosper. If Indian children happen to get an education in the process, fine.

With large consolidated schools, budgets reflect the size of the plant and operations, with teaching a minor component in the overall scheme of things. It is difficult to get national figures on various specific items of expenditure, but it would not be surprising if there were one administrator and/or staff person for each teacher actually in the classroom. With the increasing shortage of oil escalating the cost of fuel, busing children will now substantially distort the expenses of every school serving Indian children. It is impossible to estimate the cost of heating and cooling large buildings as opposed to smaller schoolhouses, but the differences must be significant.

Included in the funding area, although only of related importance, is the incredible amount of money being spent on various kinds of research in Indian education, including special supplementary programs of enrichment. With the exception of California and a few school districts scattered across the country, it is possible for a person to get a degree in "education," taking courses that are essentially method and theory classes in education, and having minimal course work in the subjects that are actually going to be taught. These credits are frequently survey courses that give a minimum knowledge of the subject. When these teachers try to teach students, they discover they have such a sparse background

that it is nearly impossible to hold students' interest. Thus, the cry goes out for better textbooks and curriculum. The problem is not the curriculum but the inadequate training of the teacher. So countless dollars are spent in research on curriculum, when better teacher educational requirements are actually needed.

Finally, the politics should be taken out of Indian education funding, particularly in the Title IV funds. It is not difficult to look at the Title IV awards, compare them with the politics of NACIE and NIEA—which have been the two leading Indian organizations involved in making educational policy as part of the movement toward self-determination in education—and understand what is happening. And a glance at the various universities that perennially receive large educational grants, but produce few graduates, will show the interfacing of the Indian and non-Indian educational old-boy network. The shifting of personnel within the Bureau of Indian Affairs school system will also provide a means of tracking Indian political decisions. As long as Indian education is a function of Indian national politics, we should not hear Indian educators complain too loudly about the failures of the federal government in this field.

A good argument can be made that the Indian educational network is now so entrenched that no reforms are possible. During the past three decades we have seen an endless parade of people occupy the major positions in Indian education. We are now at the point where we are recycling people—if the latest appointments are any indication of the state of affairs. Why is it that after nearly twenty-five years of producing Indian educational administrators, the short list for appointments always looks like the bimbo finalist list?

We define the problem in education as originating in the difference in cultural outlook. If this observation is really true, why do we have educators put in charge of correcting the problem? It might be far better to appoint a well-trained humanist instead of a recycled Indian politician. For all the fanfare we have had about putting Indians in charge of the bureau and Indian education, the best people we have seen in policy-making positions have been John Collier, a bohemian social worker, and Philleo Nash, a renegade

anthropologist. There is much to be said about putting someone in charge who knows about people and not another person who can manipulate rules and regulations to the satisfaction of Indian political cliques.

Indian education doesn't need another shallow report. In view of the impending collapse of American institutions, such as the family farm, local banks, and the housing market, it would appear that our society will be undergoing major disruptive changes for the next several decades. Because about half of the Indians live on the reservations, it may be necessary to move to some kind of subsistence economy if the people are going to survive the upcoming economic catastrophe. The financial choices in Indian education will become apparent. We will either continue to operate existing school systems with declining funds or start to make fundamental changes in how we educate children and allocate resources to do so.

Instead of boring us with another tedious recital of the failure of the federal government to educate Indians—which is embarrassingly obvious—the secretary of education would do well to find some way to confront the reality of Indian culture, community, and history and devise an educational program to meet this specific challenge. If traditional institutions, programs, and teaching have to be changed, so be it. After five centuries of contact, it does not seem too much to ask non-Indian educators and institutions to come to grips with the reality that is the American Indian.

Grande, Sandy
Red pedagogy: Native American social and political thought. Rowman & Littlefield, 2015.

Introduction

"The *guerrero del amor* becomes a warrior lover who understands struggle and battle as expressions of commitment, loyalty, sharing of self—a selflessness that is not sacrifice but fulfillment through collectivity."
—James & Gordon (2008)

The past ten years have ushered in extraordinary change. When I first wrote *Red Pedagogy*, the field of Native American and Indigenous studies was still emerging, critiques of capitalism were generally relegated to the radical left, and theorizations of the United States as empire were both forestalled and animated by the events of September 11. But as the vicissitudes of settler colonialism, amplified through neoliberalism, increasingly came to condition both life and death, so too has the counter-hegemonic blowback.

According to a recent study, the number of global protests against domination has steadily and significantly increased, moving from fifty-nine in 2006 to 112 protests in the first six months of 2013 alone. The Arab Spring, *Indignados*, Occupy Wall Street, and Idle No More movements, among others, helped to revive faith in direct action as an effective and integral component of resistance, perhaps emboldening more recent collective uprisings around #BlackLivesMatter and #ICantBreathe.

Such on-the-ground struggles have been anticipated and supported by corresponding surges in intellectual critique. Treatises on empire, imperialism, settler, and other colonialisms are no longer relegated to the margins of academic discourse and have become central to a variety of fields and disciplines. As a result, the landscape has shifted significantly since I wrote *Red Pedagogy*, with new and revived synergies between scholarship and activism pushing deeper considerations of the limits of liberal theories and discourses. More specifically, within Native American and Indigenous studies,[1] a new subfield of critical Indigenous studies (CIS) has emerged wherein CIS schol-

ars undertake (Western) critical theory as a means of "unmapping" the structures, processes, and discourses of settler colonialism at the same time they use it to disrupt and redirect the matrix of presuppositions that underlie it (Byrd, 2011).[2]

Such "unmappings" have compelled examinations of self-formation, governance, and political power; normative conceptions of justice; the articulation of Indigenous structures within the grammar of empire (i.e., sovereignty, nationhood, recognition); the dialectics between governance and economic systems (i.e., capitalism, socialism, nonmonetized systems of reciprocity); and the relationship between settler colonialism, patriarchy, and heteronormativity (Grande & Nichols, 2014).

In education, the relationship between on-the-ground struggles and the broader intellectual life of the field is more tenuous but strengthening. While anti-testing and anti-privatization movements (e.g., Opt Out and Save Our Schools) have proliferated in response to the intensification of neoliberal reform efforts aimed at restructuring schools to be "more conducive" to capital,[3] principal academic organizations and editorial outlets hold fast to liberal discourses and modes of educational research.[4] Such liberal stances of "neutrality" do more to legitimate than disrupt the fundamental assumptions of the reform agenda: that teachers are inadequate and public schools are failing. While the discipline of critical pedagogy remains a perennial site of contestation, it is still marginalized within the broader field of education. Although this could be an indicator of the continued hegemony of dominant educational discourses, it could also mean that what was once considered "radical" analyses from old-school leftists has become more integral to a more general grammar of critique shared among sub-fields and disciplines. In other words, if critical pedagogy has plateaued as a *discrete* field of study, it could be because a broader range of disciplines is undertaking its logics and analytics.

Perhaps the greatest divide between on-the-ground-struggle and research remains in the field of Native American education. The primary reasons for this are essentially the same as they were a decade ago: the relentless pressure to address the more immediate sociopolitical urgencies of communities is given precedence over engagement with theory (Grande, 2004, p. 2). Moreover, significant decreases in state and federal funding have imposed an even greater reliance on corporate funding sources (e.g., Gates, Walton, Teach for America) with neoliberal agendas attached. That being said, undertakings of critical theory are still more present that they were ten years ago, particularly in the articulation of Indigenous (and decolonial) research methodologies.[5]

LOVE'S LABORS LOST

Given recent developments, I am truly grateful to have this opportunity to revisit and (re)vision my work alongside a deeper field of critical Indigenous scholarship as well as in a moment when the violence of the settler state is more widely visible and questioned. That being said, when the idea of publishing a tenth anniversary edition was first presented to me, I was reticent. I wrote *Red Pedagogy* as a young scholar—and by young I don't mean in terms of age or professional rank but rather in terms of experience.[6] To be clear, my reticence is not about the quality of my words or ideas (I stand by them) but rather about the culture of academia in which they were undertaken—too fast and too soon. Over the past ten years, I have come to an even deeper realization of how academia objectifies knowledge (and authorship) as a pre-condition of its commodification and reification, both of which serve the broader project of corporatization.

More specifically, following the publication of *Red Pedagogy* I was quickly and unexpectedly positioned as an "authority" in the field, inundated by a profusion of invitations to speak in a variety of communities, most of which were not my own. Generally speaking, authority and public voice in Indigenous communities emerge alongside age and experience; the young are expected to cultivate listening skills while elders are ceded both the actual and metaphoric floor.

The basic understanding is that because history, experience, and (institutional) memory matter, "new" and young knowledge is to be met with caution and restraint while important "teachings" are learned from elders and ancestors whose voices serve as important fetters for the intemperance of youth. Thus, as I started to make the rounds of the academic circuit, I became increasingly troubled by the experience of being positioned to assume a voice-too-public-and-bold-for-its-experience. As I gathered my wits about me, I started to begin talks with an acknowledgments section that ended with the statement, "and to any elders present today, I ask your forgiveness for speaking so boldly and out of turn."

While such a gesture helped to assuage a modicum of discomfort, it did nothing to address the more structural and systematic erasures at play. In particular, as an arm of the settler state, one of the many ways that the academy refracts colonial logics is through the overvaluing of "young" and individual voices and the undervaluing of elder and collective voices.[7] And, in a system that overvalues "new" knowledge, fast productivity, and solitary thinking, paradigms of connection, mutuality, and collectivity are inevitably undermined.

The distinction between Indigenous and settler protocols around public voice (as well as author and authorship) mark the edges of the binary that colonial logics seek to eliminate: *the difference between subjectivities pro-*

duced in and through relationship to land and those produced under and through significations of property. Thus, in the following sections, I engage in a deeper theorization of the relationship between the academy and settler logics. More specifically, I apply the work of CIS scholars developing analyses of Indigenous-state relations to theorize the relationship between the academy and settler logics. Specifically, theorizations of the politics of *reconciliation, recognition,* and *refusal* are employed as frameworks for articulating the academy as a space where capitalist social relations and modes of production (particularly of knowledge) are reconstituted within the academy. Beginning with a short history, I discuss the role of *reconciliation-* and *recognition*-based politics in maintaining the hegemony of the settler academy as well as of *refusal* to help imagine alter-Native modes of participation.

THE PERILS OF ACADEMIC RECOGNITION AND RECONCILIATION

From the beginning, Euro-American cupidities were so enmeshed that every attempt to "civilize" was one to Christianize, and every effort to Christianize, one to capital-ize. At stake were not only the bounty of minds and souls for Christ but also the currency—the property—that the primitive accumulation of Red bodies signified for the state. Education became the nexus between these capitalist and religious missions, manifesting the campaign to "kill the Indian and save the man" under the auspices of schooling and the establishment of universities. It wasn't long before investment in Indian education became the subtext for the appropriation of Indian land.[8]

Axtell (1985) writes, "underwriting an educational institution with a potentially long corporate life" appealed to the settler class as they "who had never seen an Indian felt comfortable in contributing to schools that promised to solve America's native problem in a relatively inexpensive and appropriately civilized way" (p. 216). Ironically, despite centuries of state sanctioned programs to "civilize" Indians through schooling, a report issued in 1932 found that only fifty-two American Indian students had earned college degrees and fewer than five institutions offered scholarships to Native students (Szasz, 1974, p. 135).

While, on one level, this could be understood as an effect of Native resistance or refusal, my central concern here is the material cost of this calculus. Specifically, given the number of schools founded on Indian land, with Indian money, or monies earmarked for Indian services, the sheer paucity of Native students and graduates vividly illustrates the historical materialist relationship between the academy and Indigenous dispossession.

It wasn't until the late twentieth century that the university sought to *reconcile* this history by incrementally shifting its strategies and apparatuses

to "include" Native peoples, extending "opportunity" through liberal and assimilative discourses of respect, mutuality, and tolerance. The appeal of *reconciliatory* discourses is that they occlude the need and forestall demands for structural change through the strategic deployment of performative acts of "healing" and "unity." For example, an institution can effectively display an ethic of multicultural tolerance by celebrating Native American Heritage month while at the same time resisting more structural changes (i.e., hire more Native faculty or repatriate the Indigenous lands upon which the campus is undoubtedly constructed). Though perhaps preferred to explicit forms of exclusion, models of *reconciliation* are not only insufficient but ultimately serve as "transits" of settler authority and continued domination (Byrd, 2011). That is, they fail because they are "always already conceived through the prior disavowed and misremembered colonization of indigenous lands that cannot be ended by further inclusion or more participation" (Byrd, 2011, p. xxvi).

Similar to models of reconciliation are *recognition*-based models that "seek to overcome the colonial character" of Indigenous-settler (state) relations by "recognizing and affirming the value of Aboriginal cultural identities" and their distinctive forms of governance and political formation (Coulthard, 2003, p. 2). While still undergirded by the liberal discourses of the modernist state, self-determination enacted via the politics of recognition has effected some substantive outcomes, securing various entitlements for Native nations including land claims (e.g., *Joint Tribal Council of the Passamaquoddy Tribe v Morton*, 528 F.2d 370 1st Cir. 1975), reparations (e.g., *Cobell v Salazar*), and Indigenous "rights" (e.g., United Nations Declaration of the Rights of Indigenous Peoples).

Despite these achievements and the overall aim of *recognition* to fetter the damage of *non*recognition (or misrecognition as noted by Taylor, 2004), such models ultimately sustain colonial systems of power and undermine Indigenous sovereignty by keeping intact the asymmetric relations of power whereby the dominant agent (settler state) retains the authority to "recognize" the subjugated polity (Indigenous peoples).[9] Moreover, Wolfe (1999) cautions against the collateral and dilatory effects of "inducements" gained via the politics of recognition. He writes, "from the treaty era onwards Indigenous peoples have been subjected to a recurrent cycle of inducements" (e.g., allotments, citizenship, tribal enrollment) "each of which has sought to present domination as empowerment" and thereby assist Natives' consent to their own dispossession" (p. 259).

Coulthard (2007) similarly warns against the effects of inducements, particularly as they result in economic gains for individuals. He argues that when recognition is granted through mainstream forms of economic development, it inheres the potential for creating a "new elite of Aboriginal capital-

ists" whose "thirst for profit" comes to "outweigh their ancestral obligations" (p. 452).

As an arm of the settler state, the academy similarly traffics through a "cycle of inducements"—prestigious grants, awards, titles, and endowments—that proffer "domination as empowerment." The thirst for such forms of (academic) recognition drives a culture of competition and self-promotion that mirrors the broader "inducements" of settler colonialism and "seductions of empire" (Agathangelou, Bassichis, and Spira, 2008). The danger of academic inducement is not just the cultivation of individualism or creation of an "Aboriginal elite" but also the engendering of an academic arms race that misrepresents the (fast) production of knowledge as "progress" or worse as a transit for intellectual imperialism. Thus, as understood within the broader context of the settler project, academic recognition refracts the colonialist logics of "remove to replace" (slow for fast, old for new, aged for young), that ultimately serves to obscure the violence and material effects of epistemicide (Wolfe, 1999).

THE POSSIBILITIES OF ACADEMIC REFUSAL

In working past and through the aporias of reconciliation and recognition, scholars of CIS have advanced theorizations of *refusal*—a politics that Garland (2013) defines as "the negation of that which negates us" (p. 375). The logic of *refusal* is "less oriented around attaining an affirmative form of recognition from the settler-state and society, and more about critically revaluating, reconstructing and redeploying culture and tradition in ways that seek to prefigure . . . a radical alternative to the structural and psycho-affective facets of colonial domination" (Coulthard, 2007, p. 456).

For example, Gómez-Barris (2012) theorizes the hunger strikes staged by the Mapuche peoples for the return of their lands as acts of refusal: "As extreme bodily performance and political instantiation, the Mapuche starving body literally enacts the condition of precariousness, specifiying the meanings of social death for indigenous peoples living within a state of permanent war" (p. 120). Coulthard (2007) and Alfred and Corntassel (2005) similarly take up *refusal* as a pre-condition to (or in dialectical relationship with) the political project of Indigenous resurgence.

Within the field of Indigenous research, Simpson (2011) theorizes *refusal* and sovereignty at the "level of method and representation," exposing the colonialist underpinnings of the (academic) "demand to know" as an instantiation of settler logic. She posits *ethnographic refusal* as a stance/space wherein Indigenous subjects limit access to be known (p. 73). Mignolo (2011) and Quijano (1992) similarly take up *refusal* in relation to knowledge formation. Specifically, they assert Indigenous knowledge as a space of *epistemic disobedience* that is "delinked" from Western, liberal, capitalist understandings of "knowledge as production" or as a search for newness. They write, "Indigenous knowledges take us to a different place" and beginning—not just a "new temporality within the same space" but to an alternative site of "struggle and building" that represents an actual "paradigmatic break" (p. 45).

Understood as a radical assertion of sovereignty, the act of "refusal" is threatening to the settler state and thereby dangerous for the Indigenous subject—Native peoples worldwide continue to be "disappeared" or murdered at disproportionate rates. While the sanctions for "refusal" in the academy are not about life and death, "refusal" to comply with the normative publish-perish, tenure-promotion disciplinary strategies can lead to increased marginalization, exploitation, and job loss as well as decreased funding. And, in a system where Indigenous scholars comprise less than 1 percent of the professorate, such consequences not only bear hardships for individuals but also whole communities.

Nevertheless, the material gains accessed through reconciliatory and recognition agendas have even deeper costs and consequences. As Byrd (2011) reminds us, the colonization of Indigenous lands, bodies, and minds will not be ended by "further inclusion or more participation" (Byrd, 2011, p. xxvi). Indeed, particularly in this moment of a metastasizing settler state, I believe it is incumbent upon each and every one of us to refuse, reimagine, and rearticulate assimilative logics in all of their (low and high intensity) forms.

ACADEMIC SURVIVANCE

The inspirational work of critical scholars and community activists has compelled me to think hard about this anniversary edition, to carefully weigh the options. Undertaken as a form of recognition, it could take the form of a commemorative text, following the usual protocol of updating the core chapters while adding a new introduction and conclusion. Given the tenor of times and urgings of the field, this approach seemed counter-productive if not antithetical to the overall project. Alternatively, in the spirit of refusal, I could have simply turned down the opportunity, letting the text fade into respectable obscurity. While I seriously considered this option, the opportunity presented itself just as my mom (Ona) herself began to fade—and, something about the juxtaposition of these events seemed important—to not let go, to hold tightly, to come to terms.

Within this context, I decided to capture the moment as an opportunity to delink the tenth anniversary of *Red Pedagogy* from the politics of recognition and reimagine it as a project of both refusal and renewal. Specifically, in refusal of the solitary, "expert" voice, this edition presents a collectivity of

students and scholars, each of who are contributing from across a variety of fields and subject positions to the field of critical Indigenous studies. Moreover in refusal of an essentialist identity politics and as a means of refracting the diversity of voices that currently populate the field of critical Indigenous studies, essays were solicited from Indigenous and non-Indigenous scholars. Specifically, rather than write an updated and revised text that would capture the shifts in the field and the broader socio-political conditions of settler society and Indigenous communities, I decided to leave the original text intact, an invite scholars doing work in each area (i.e., history, governance, Indigenous feminism etc.) to write response essays that would, "engage, extend, critique, speak back to, and intensify the contents of the chapters and, thus, the book overall." The text of the original invitation read as follows:

> Part of my initial motivation for writing *Red Pedagogy* was to address the lack of interchange between critical theorists and Indigenous scholars, particularly in the field of education. I intended to start a conversation. This Anniversary Edition is an effort to model that conversation, demonstrating that the field is now deep and broad enough to sustain internal critique. In particular, while the text continues to reflect my major intellectual commitments, I wrote it straight out of graduate school and my thoughts have matured since then. Also, ten years ago, the field of critical Indigenous studies had yet to be established and now it is burgeoning and supported by a number of new organizations and journals. *The time is ripe for this work to be revisited.* My hope is that as a collective we can write in refusal of Manichean academic logic that either confuses condemnatory discourse or substitutes sycophantic praise for critique, committing instead to engage, extend, trouble, speak back to, and intensify the text, building a deep, sustained and critical dialogue that engages in the analysis of ideas. Toward this end, I offer up my own words and their understood limitations for your consideration and rigorous engagement.

I am honored that so many agreed to think alongside me. Gathering this particular assemblage has made me think of the potential of constituting a more permanent body, perhaps writing under and through a nom de guerre (similar to the Combahee River Collective). That is, if furthering Indigenous resurgence (not individual recognition) is indeed paramount, then the more radical refusal would be to write together as one, enacting a kind of Zapatismo scholarship, a balaclava politics of concealment, where the work of the collectivity transcends the one; voice, body, life. Until then, I offer this collectivity of Indigenous and non-Indigenous voices working to "unmap" the structures, processes and discourses of settler colonialism.

Responses begin with Miryam Yataco's preface-as-offering which customarily prepares the ground upon which we write. Prayers and acknowledgements typically precede work in Indigenous communities to ensure that it is undertaken in a blessing way. The first section of the text, the architecture or "bones" as Peter McLaren writes, is reinforced by the work of four established scholars. John Tippeconnic opens with a gracious but firm reminder that if the work of critical Indigenous studies is to matter, that scholars will need to make deeper and more sustained connections with those on the front lines of struggle, particularly students and teachers. John's contribution reflects ongoing conversations in the field that call attention to the need to work with communities, that raise questions about the need for interlocutors, and/or the responsibility of scholars to write for multiple audiences. Next, Alyosha Goldstein extends the discourse by re-mapping the "terrain of struggle" through a careful consideration of the more recent and important court cases that continue to frame (which is to say mitigate) Indigenous sovereignty and their subsequent analyses. In so doing, Goldstein reminds of the importance of grounding the undertaking of *settler colonialism* and *decolonization* (in both in theory and practice) in the "specificity, social etymology, and complex genealogies of the terms." The second chapter, "Competing Moral Visions: At the Crossroads of Democracy and Sovereignty," is first responded to by Audra Simpson who more deeply contextualizes the antagonisms. Her analysis, as well as her work more generally,[10] carefully maps the contours of the settler state and its logics, reminding us of the ways in which "sovereignty" is a distinctive political project that operates outside the bound of "inequality." Following this cogent analysis, long time cultural-worker, Peter McLaren speaks back to the text through his reassertion of the enduring significance of the social relations of production (and the political class conflicts taking place within these relations) as the central antagonism. In so doing he foregrounds a reassessment of the possibilities of Marx(ism) in creating a "socialist alternative . . . that might be useful for Indigenous educators."

Next, Greg Cajete and Donna Houston take up what might be considered the heart of the text: the question of land. In his essay, Cajete focuses the analysis, providing a pedagogical model for rethinking Western science through Indigenous ontologies. He submits that a "participatory" Native science is "desperately needed to balance the imbalance" that has manifested from the misapplication of modernist science. Donna Houston follows with a similar call for a "re-animation" of critical pedagogy through a deeper alignment with Indigenous struggles for land justice. In so doing, she calls attention to the important scholarship that has emerged within the field of critical pedagogy in response to the critiques of its anthropocentrism. Insofar as land is life (and identity) for Indigenous peoples, the next responses by Jodi Byrd and Leigh Patel take up the question of subjectivity; both extend the discourse through a more vigorous engagement with the normative categorizations inherent in settler logics. More specifically, Byrd, extends and reframes the discourse to account for the important interventions in the field of Native studies by queer and feminist scholars, theorizing how "heternormativity and heteropatriarchy work in tandem with racism and colonialism to further In-

digenous dispossession, loss of identity and culture." Patel provides insight to the distinctions and commonalities between the social movements of Indigenous peoples and undocumented subjects. She argues that the "blunt tools" of settler colonialism have failed to disrupt the core and deficient logics of the "innocence/guilt/legality/illegality" frameworks, looking instead to critical analyses of coloniality.

Rounding out this section is the work of Eve Tuck and Andrea Smith both of who make important interventions to the original texts' nascent engagement with feminist discourses and their relevance to the struggles of Native women and communities around issues of gender and (hetero)sexism. Tuck grounds her essay in the real-existing world of settler violence on the bodies of Native women. Her poignant references to the missing and murdered Indigenous women at the center of the #AmINext movement, is a sobering reminder that the bridges of liberal settler discourses continue to be written upon the backs of red and other women of color. Smith, a leading feminist-scholar-activist, writes a sharp essay that cogently addresses the perceived aporias of the first edition.

I would feel remiss if I didn't mention the current controversy regarding Smith's claims to Indigenous identity. As someone who is neither a citizen of the Cherokee nation, nor her relation, I don't see it as my place to comment on her identity but I am compelled to speak to the impact of the controversy on the field of Native studies. First, it should be clear that for this chapter, Eve Tuck was invited as the Indigenous voice and each chapter pairs an Indigenous and non-Indigenous voice. Second, I invited Andy based on the circulation and impact of her work. Her first book, *Conquest: Sexual Violence and American Indian Genocide* (2005), made a critical intervention, moving the field toward deeper analyses of the relationship between patriarchy and state sanctioned violence.

Scholars are just beginning to discuss whether and how the reading and analysis of Smith's work shifts if it was indeed written from the subject position and voice of a white woman. While it's not possible to speak to the whole of her work, I can comment on her contribution to this volume. Smith always remained a staunch advocate of (Indigenous) feminism, not just in terms of its politics or frames of analysis, but as a subject position. When I wrote *Red Pedagogy*, Native feminism (along with critical Indigenous studies) was not yet a vibrant field of study. Thus, when *Conquest* first emerged (it was published one year after *Red Pedagogy*) it pushed my thinking in productive ways. I continue to appreciate her analysis of sexual violence as a tool of settler colonialism and patriarchy as she rearticulates it in her response essay "The Indigenous Feminist Revolution." Though my critique in *Red Pedagogy* (2004) turned upon whether feminism grounded in liberal and statist, which, is to say settler logics, was a viable space for theorizing Indigenous formations, analyses and politics of gender and sexuality and I'm not sure her essay adequately addresses this assertion.

That being said, I now read Smith's defense of feminism *qua* feminism differently if indeed it is voiced from the subject position of a white woman. Particularly in this essay, Smith's support of Native women as feminists draws upon a troubling narrow range of antecedents (e.g., Rayna Green who has also been called into question for her claims to Cherokee identity). It is additionally curious that, writing ten years later, she does not call upon the brilliant works of Joanne Barker, Jodi Byrd, Sarah Deer, Jennifer Denetdale, Mishuana Goeman, Sarah Hunt, Lisa Kahaleole Hall, Dian Million, Dory Nason, Noenoe Silva, Audra Simpson, or Kim TallBear among many other contemporary Indigenous feminist scholars. While I still do not identify as a "feminist" for much the same reasons I don't identify as "Marxist" (though I find Marx critically important and useful), I continue to learn and be schooled by these amazing women and their commitment to Indigenous feminism. I also continue to support the broader effort to (re)center gender and sexuality in analyses of settler colonialism and Indigenous resurgence.

Next, in response to the original concluding chapter, Malia Villegas and Kevin Bruyneel raise substantive questions that aim to complicate and further the discourse and thereby the field of Native studies. Bruyneel urges a deeper consideration of the relationship between settler colonialism, white supremacy and anti-black racism. Given the recent emergence of the #BlackLivesMatter movement alongside the #AmINext and Idle No More movements, theorizations of these intersection may be the definitive task for the field. Malia Villegas, literally and figuratively, brings us home. Writing from the front lines of policymaking, she aims to bend the arc of Red Pedagogy toward a "stewardship framework" of self-governance, bringing the questions of, "in what way," and "toward what end" to the forefront.

The final section, "Teaching Red Pedagogy" is new to this edition and includes a mix of new and distinguished scholars as well as students from across a variety of disciplines. The section opens with Robert Stam and Ella Shohat's essay discussing the relevance of *Red Pedagogy* to their courses on colonial history, media, and discourse. As distinguished professors and authors of the classic text *Unthinking Eurocentrism* (1994), they enter into a "dialogue" with the text, making artful and seamless connections among questions of Indigeneity, coloniality, and Western philosophical thought. Mary Hermes, professor and lead researcher for the Ojibwe Conversational Archives at the University of Minnesota, discusses the implications of the text for language revitalization. She issues a careful reminder that while "grand narratives" may be helpful in framing the broader issues of language loss (i.e., epistemicide), the "real work" of language (re)acquisition requires specificity and community grounding. Sweeny Windchief, Tim San Pedro, and Jeremy Garcia write together as early career scholars who work closely

with Indigenous students and their communities. They raise questions about academic discourse and issues of accessibility, moving to "rehumanize" the road between theory and practice.

Floridalma Boj Lopez and Lakota Pochedly write insightfully about their graduate student encounters with *Red Pedagogy*. Lopez poses important questions about Indigenous (im)migrants and their relationship to "the original peoples of the places they inhabit." Such questions are reminiscent of (though arguably more politically charged than) Shona Jackson's work on Creole Indigenity (2012) and Dean Saranillo's on Asian settler colonialism (2013), rethinking the sociopolitical positionality of Indigenous (im)migrants in the United States.

Pochedly writes in reflection of her work with students with multitribal identities in the Oklahoma school system, raising similarly complex questions about teaching *Red Pedagogy* in a "multicultural" context. Together, their work extends the discourse on subjectivity in ways of increasing importance as the Indigenous population continues to shift. Finally, distinguished professor and author of the classic text *Imperial Eyes: Travel Writing and Transculturation* (1992) Mary Louise Pratt maps the central ontological tensions between Indigeneity and (settler) colonialism, refining and sharpening the edges of the "contact zone."

That such distinguished scholars and students would take up the text is truly humbling. However, for me, the greater significance is that intergenerational voices came together to form a scholarly collective, one that inheres its own possibility. That is, insofar as form suggests function, I have been thinking more about what it means for scholars committed to enacting a "politics on the boundaries" to form a collectivities of sovereignty; to exercise intellectual in support of Indigenous resurgence (Bruyneel, 2007). The aim of such collectives could be to cultivate spaces of thought and action that not only *refuse* forms of knowledge and knowledge-making contingent upon settler imperatives but also to conscientiously enact others grounded in Indigenous specificity and well-being. Together, we could work toward *academic survivance*, operating beyond (i.e., in refusal of) the bounds of mere survival and toward "an active presence" in society and the academy (Vizenor, 1993, p. 15).

In her end of days, Ona demanded never to be alone. She often called out my name, requiring that I not only make my presence known but also that I sit with her "skin to skin." I have come to understand these moments as radical assertions of connectivity borne through love and rage, the affective economies of both revolution and resurgence. I offer the following chapters in the spirit of Dylan Thomas, who reminds us to refuse to "go gently into that good night," but rather to collectively burn, "rage, and rage against the dying of the light."

NOTES

1. Over the passing decade, Native studies has burgeoned from a nascent to a major field of study supported by and through the newly established Native American and Indigenous Studies Association.

2. Scholars from across disciplines, tribes, nations, and subjectivities are coming to define CIS including key thinkers such as Kevin Bruyneel, Jodi Bryd, Glen Coulthard, Mishuana Goeman, Scott Morgensen, Mark Rifkin, Andrea Smith, Dean Saranillio, Aileen Moreton-Robinson, Robert Nichols, Noenoe Silva, Audra Simpson, Eve Tuck, Dale Turner, and Patrick Wolfe, to name just a few.

3. Reformists have adopted the Chicago-school Friedmanist logic of "crisis" in order to deploy strategies of school closure, displacement, and removal, to privatize public education (mainly by undermining unions and public participation). Such strategies are deployed universally but more intensively in poor and communities of color—the new palimpsest of manifest destiny.

4. As one indication, despite his spearheading of privatization schemes that undermine teachers, unions, and urban/high need schools, Secretary of Education Arne Duncan was invited by the American Educational Research Association to address the membership at its annual meeting in 2013. While there were some protest efforts, they did not represent the majority of the membership. Also, unlike other national organizations, the American Educational Research Association has not taken a public stand in defense of public education or teachers. In 2014, a new organization, the Network for Public Education, was launched, though it is made up mostly of practitioners, not scholars in the field.

5. Another promising development is the emergence of a new scholarly journal, *Decolonization: Indigeneity, Education & Society*.

6. To be clear, I wrote *Red Pedagogy* straight out of graduate school. It was the dissertation I *wasn't* allowed to write as a student and kept locked in a file on my desktop labeled, "The Book." It came to fruition during my year as a Ford Foundation post-doctoral fellow for which the American Indian Leadership Program at Penn State University graciously served as my "host institution" and Dr. John Tippeconnic as my mentor.

7. Indeed, success in the academy is contingent upon the production of single-authored, monographs that ostensibly contribute "original knowledge" to the field—with the greatest pressure to produce exerted *early* in one's career—instantiating capitalist desire for the young and new.

8. Harvard is a prime example. Founded in 1636 by "the Great and General Court of the Massachusetts Bay Colony," the college was established in name only. It didn't have a single building, teacher, or student until 1638 when John Harvard, a young minister of Charlestown, died leaving his library and a significant portion of his estate to the new institution. Even so, nearly two decades later, the fledgling institution was on the brink of bankruptcy. In a last ditch effort, then Harvard President Henry Dunster (re)engineered the College Charter (1650) to include the civilizing mission and thereby gain access to public and private funds available for such efforts (Wright, 1997). Dunster's scheme paid in dividends. The "trustees of the missionary fund" bestowed Harvard the necessary capital to build an "Indian College." It wasn't long, however, before the use of such funds aroused suspicion as the proposed building expanded to four times the estimated cost and not a single Indian student had been admitted (Wright, 1997, p. 74). Despite the absence of Indian students, Harvard officials saw no reason to let the new college stand vacant and filled its halls with expectant white students. Until its dismantlement in the 1690s, the "Indian College" at Harvard graduated only one Native student, Caleb Cheeshahteaumuck (Wampanoag).

9. A growing number of CIS scholars are engaging in analyses of the role of the politics of recognition in sustaining colonial power. For example, in *The Cunning of Recognition: Indigenous Alterities and the Making of Australian Multiculturalism*, Beth Povinelli (1998) examines the ways in which land title and other forms of Australian recognition of Aboriginal peoples ultimately furthered the reach of the contractual state. Working within a Canadian context, Glen Coulthard (2007) articulates the limits of recognition through the critical purchase of Fanon's work, arguing that colonial structures of dominance rest on their ability to entice

Indigenous peoples to come to *identify* with the profoundly *asymmetrical* and *non-reciprocal* forms of recognition either imposed or granted by the colonial state (p. 439).

10. See her award winning book, *Mohawk Interruptus: Political Life Across the Borders of Settler States* (Durham, NC: Duke University Press, 2014).

Mapping the Terrain of Struggle: From Genocide, Colonization, and Resistance to Red Power and Red Pedagogy

Sandy Grande

"The War for Indian Children will be won in the classroom."

—Wilma Mankiller

"The right to be indigenous is an essential prerequisite to developing and maintaining culturally appropriate and sustainable education for indigenous peoples."

—The Coolangatta Statement
on Indigenous Peoples' Rights in Education (1.5)

The miseducation of American Indians precedes the "birth" of this nation. From the time of invasion to the present day, the church and state have acted as coconspirators in the theft of Native America, robbing Indigenous peoples of their very right to be Indigenous.[1] In terms of education, the thievery began in 1611 when French Jesuits opened the first mission schools expressly aimed at educating Indian children "in the French manner"[2] (Noriega, 1992, p. 371). Not to be outdone, Spanish and British missionaries soon followed, developing full-service educational systems intent on "de-Indianizing" Native children. By the mid-eighteenth century Harvard University (1636), the College of William and Mary (1693), and Dartmouth College (1769) had all been established with the charge of "civilizing" and "Chris-

tianizing" Indians as an inherent part of their institutional missions. The American school was therefore a well-established weapon in the arsenal of American imperialism long before the first shots of the Revolutionary War were ever fired.

While it falls outside the bounds of this book to provide a thorough history of American Indian education, its importance is duly noted.[3] The following brief review of some significant moments in American Indian education is meant only to provide a rudimentary template from which to theorize the contemporary landscape. We begin with an examination of the historical relationship between American Indians and schooling, followed by a brief review of the literature on critical pedagogy. The reviews of the history of American Indian education and critical pedagogy are then interfaced, mapping the tensions and intersections between these analyses as a means of developing the framework for a Red pedagogy.

THE HISTORICAL RELATIONSHIP BETWEEN SCHOOLING AND AMERICAN INDIANS

Though the history of Indian education is mapped in a variety of ways (e.g., chronologically, thematically), it is delineated here in terms of eras that reflect the prevailing systems of power: (1) the period of missionary domination, from the sixteenth to the nineteenth centuries; (2) the period of federal government domination from the late nineteenth to the mid-twentieth centuries; and (3) the period of self-determination from the mid-twentieth century to the present (Szasz, 1999; Thompson, 1978).

Perhaps at no other time in U.S. history did the church and state work so hand in hand to advance the common project of white supremacy as it did during the period of missionary domination. During this era, missionary groups acted as the primary developers and administrators of schools while the federal government served as the not-so-silent partner, providing economic and political capital through policies such as the Civilization Fund.[4] In 1819, Secretary of War John Calhoun declared it was the duty of all employees in government-funded missions, particularly teachers, to promote U.S. policies aimed at "civilizing" Indians. In Calhoun's words, it was their job to "[i]mpress on the minds of the Indians the friendly and benevolent views of the government . . . and the advantages to . . . yielding to the policy of the government and cooperating with it in such measures as it may deem necessary for their civilization and happiness" (Layman, 1942, p. 123, cited in Reyhner and Eder, 1992, p. 40). Indeed, the work of teachers, church leaders, and missionaries were hardly distinguishable during this era; saving souls and colonizing minds became part and parcel of the same colonialist project.

While missions retained control well into the late nineteenth century, the period of federal government domination ideologically commenced with the passage of the Indian Removal Act in 1830.[5] The fallout from removal necessitated the appointment of a commissioner of Indian affairs, tellingly positioned in the U.S. Department of War. The collateral damage levied by removal, namely, the decimation of Indian economies via displacement, required a systematic effort to "reeducate" Indians to live "domesticated" lives. Thus, in addition to dealing with the removed tribes, the commissioner was charged with overseeing a retooled system of Indian education, one which emphasized vocational training as the new panacea for assimilating Indians to industrial society.

In the following decades, the church and state conspired in the development of a variety of "manual labor schools." In addition to providing vocational training, such schools introduced the concept of forced labor as part of Indian education, transforming the ostensibly "moral" project of civilizing Indians into a for-profit enterprise. Under this experiment, churches were endowed with hundreds of acres of land for Indian children to plow, maintain, and harvest. Many dioceses yielded high profits from the "free" labor, creating a windfall that ignited increased competition for federal funding. Ironically, the ensuing friction and discord among rival churches contributed to the repeal of the Civilization Fund (1873), bringing their reign of power to an end. The federal government stepped in to fill the void, ushering in a new era of federal control over Indian schools (Reyhner and Eder, 1992).

Building on the models established by manual labor and earlier boarding schools (e.g., Dartmouth and the Choctaw Academy), the government looked to define its own system of Indian education. Federal planners were weary of the established day school model, which "afforded Indian students too much proximity to their families and communities." Such access was deemed detrimental to the overall project of deculturalization (Noriega, 1992, p. 380), making the manual labor boarding school the model of choice. The infamous Carlisle Indian School (1879–1918) was the first of its kind in this new era of federal control.

By the turn of the century, the Bureau of Indian Affairs (BIA) was operating twenty-five such boarding schools in fifteen states. Administering the entire apparatus was the newly created education division of the BIA (Reyhner and Eder, 1989). Like earlier models, the "new" boarding schools were designed, first and foremost, to serve the purposes of the federal government and only secondarily the needs of American Indian students. Such imperialistic purposes were reflected in curriculums that included teaching allegiance to the U.S. government, exterminating the use of Native languages, and destroying Indian customs, particularly Native religions (Spring, 2001).

Though the above aims for Indian education were all integral components of the colonialist curriculum, perhaps the most important feature of boarding

schools was the inculcation of the industrial or "Protestant" work ethic. In his annual report in 1881, Commissioner of Indian Affairs Hiram Price argued that previous attempts to civilize Indians failed because they did not teach "the necessity of labor" (Spring, 1997, p. 173). He maintained that this ethic could only be taught by making Indians responsible for their own economic welfare, achievable through the cultivation of a proper appreciation for private property. Price specifically advocated for an allotment program that conferred Indians "a certain number of acres of land which they may call their own."[6] Richard Pratt, founder of the Carlisle Indian School, echoed the sentiments of the commissioner, attacking the tribal way of life as socialistic and contrary to the values of civilization. Indeed, Pratt laid the "failure" of Indian assimilation at the feet of missionary groups and their failure to "advocate the disintegration of tribes." In a letter to the commissioner of Indian affairs, he wrote: "Pandering to the tribe and its socialism as most of our Government and mission plans do is the principal reason why the Indians have not advanced more and are not advancing as rapidly as they ought to."[7] As such, Pratt made indoctrination to capitalist logic an explicit aim of Indian education.

The era of Indian boarding schools reigned from the nineteenth century through the early twentieth century. Such schools worked explicitly with the U.S. government to implement federal policies (i.e., allotment) servicing the campaign to "kill the Indian and save the man." The process began with the (often forcible) removal of young children from their homes and communities and transporting them to a geographically and ideologically foreign place. Upon arrival, children were subjected to English-only and Anglocentric curricula and to a cocurriculum that incorporated paramilitary structures of forced labor and "patriotic" propaganda. In addition, children were often undernourished and subjected to overcrowded living spaces that encouraged "the spread of tuberculosis and trachoma." Moreover, compulsory attendance laws made it virtually impossible for children to escape, exposing a hidden curriculum that not only advocated the termination of Indian-ness but also of Indians (Spring, 1997, p. 175).

By the turn of the century, the combined effects of rapidly increasing enrollments (due to compulsory attendance laws), a decrease in federal funding, a changing political tide, and a growing resistance among tribes began to encumber the boarding school experiment, rendering it too unwieldy for federal officials to maintain. Not only did the schools become political and economic liabilities, but also proved to be an ineffective means of achieving the government's aim of complete assimilation. As Noriega (1992, p. 383) reports, "despite the efforts of BIA officials, missionaries, and teachers to stamp them out, Indigenous languages, spiritual practices, and sociopolitical forms were not only continued by tribal elders, but transmitted from generation to generation." The century thus ended with a pervasive sense of futility

and failure regarding Indian education and with the government continuing to search for the next best solution to the "Indian problem." Despite the growing litany of failed experiments, belief in the virtue of forced assimilation persisted, continually compelling new strategies and tactics.

In 1906, Commissioner of Indian Affairs Francis Leupp initiated the next grand plan—the wholesale transfer of Indian students into public schools. In addition to saving the government from the ever-increasing cost of Indian education, the immersion of Indian children into public and predominantly white schools was seen as a strategic means of propelling the process of "Americanization." By 1912, there were more Indian children in public schools than government (BIA) schools, and by 1924, the "Committee of One Hundred Citizens" officially sanctioned Leupp's assessment of public education as the most efficient means by which to train Indians to "think white."[8]

The transition from boarding schools to public education was mounted in the wake of the Meriam Report in 1928, which not only dealt the final blow to the boarding school experiment but also levied the decisive political spark that launched the next era of "reform." Among other things, the report not only harshly criticized the existing educational policies of removing Indian children from their homes and communities, but criticized the institutional practices of forced manual labor and severe discipline as well. The report summarily states that the most fundamental need in Indian education was a "change in government attitude" (Spring, 1997, p. 176). In 1933, leading reformer and advocate of Indian "rights" John Collier became the commissioner of Indian affairs. He oversaw the implementation of many recommendations iterated in the Meriam Report, including the end of allotment, increased Indian religious freedom, and greater tribal self-government[9] (Reyhner and Eder, 1992). Also passed during Collier's tenure was the Johnson-O'Malley Act, which authorized payments to states or territories for the education of Indians in public institutions. Such reforms were prominent features of Collier's "Indian New Deal," the net impact of which significantly increased the number of Indian children being served by both federal (BIA) and public educational institutions.

Over time, the notion of reform popularized by Collier's "New Deal" fueled liberal sentiments to "free" the Indian from government control, particularly from the reservation system. During the so-called termination period (1945–1968),[10] the government sought to relocate Indians to urban areas, turning the responsibility for Indian education over to individual states (Reyhner and Eder, 1992). Despite its "liberatory" rhetoric, however, Margaret Connell Szasz (1999, p. 137) contends that the aim of termination was to support "any action that would assimilate the Indian into urban society."

Along with other aspects of termination, the educational implications of relocation were devastating. Hildegard Thompson, director of the branch of

education, criticized the lack of foresight in educational planning. For instance, in reference to the "termination" of the Paiutes, she stated, "We all recognize that the [termination of the Paiute] was enacted without too much preplanning with the Tribe" and that in the future "such programs and contracts should come in the preparation stage with the Tribe instead of at the termination time" (Szasz, 1994, p. 138). The experience of the Paiutes was not an isolated one, as the vast majority of tribes were ill-informed and unprepared for the myriad and pervasive effects of termination. Therefore, it was not long before this program was added to the pile of failed government experiments, brought down by its own inherent deficiencies and a growing tide of Indian resistance.

While resistance took many forms, Indians implicitly expressed their antipathy toward termination by refusing to enroll in the associated ill-conceived vocational training programs ostensibly designed for their benefit (read: ready labor exploitation). By the dawn of the civil rights movement, American Indians were more directly voicing their opposition to termination and other oppressive government policies. Such displays of resistance psychologically marked the beginning of the era of self-determination.

By the 1960s, tribes had developed a core leadership capable of articulating Indian rights and concerns (Reyhner and Eder, 1992, p. 54). In addition to their protests of existing federal policies, the new Indian leadership advocated an agenda of self-determination or the idea of "letting Indian people . . . determine their own destiny." The spirit of self-determination gave rise to a number of Indian organizations, including the National Indian Education Association in 1967, the Coalition of Indian Controlled School Boards in 1971, and the American Indian Movement in 1972. The political energy of such organizations helped galvanize efforts to establish tribally controlled schools such as the Rough Rock Demonstration School and Navajo Community College, founded in 1966 and 1968, respectively.

The efforts of Indian educators and leaders also prompted the publication of two major studies in Indian education: "Indian Education: A National Tragedy—A National Challenge" (U.S. Senate, 1969), commonly known as "The Kennedy Report" and "The National Study of American Indian Education" (Havighurst, 1970). These reports helped secure passage of the Indian Self-Determination and Education Act in 1975, which provided American Indians increased control over their children's education. Among other measures, the act authorized special funding for programs in reservation schools and, for the first time, off-reservation, urban schools. It also advocated for parent involvement in program planning, for the establishment of community-run schools, and for culturally relevant and bilingual curriculum materials (Reyhner and Eder, 1992, chapter 3; Szasz, 1999). A number of seminal political documents were also published during the era of self-determination, including the "Indian Nations at Risk" report in 1991, the "White House

Conference on Indian Education" report in 1992, the "Comprehensive Federal Indian Education Policy Statement" in 1997, and the "Executive Order on American Indian and Alaska Native Education" in 1998. In general, these reports indicate that while the past thirty years witnessed much progress in Indian education, the road ahead was replete with challenges, providing a litany of statistics that portend a grim picture for Indian education. Specifically, in addition to exhibiting the highest dropout and lowest achievement rates, American Indian and Alaska Native students were reported to endure Euro-centric curriculums, high faculty and staff turnover rates, underprepared teachers, limited access to relevant cultural library and learning resources, limited access to computers and other technologies, and overt and subtle forms of racism in schools. Such conditions were exacerbated by a general decline in federal spending, particularly for BIA schools and tribal colleges.

Above all, however, the reports testify to the fact that centuries of genocidal and assimilationist polices cannot be undone in a matter of years. The voices of prominent American Indian scholars, educators, and leaders are registered throughout, collectively asserting that systematic oppression, levied at the hands of the federal government, requires an equally systematic federal plan of affirmative action. In other words, an education for decolonization. The "Comprehensive Federal Indian Education Policy Statement," in particular, reflects the virtual consensus among leaders that school reform must be systematic and inclusive of all aspects of tribal life. The relationship between educational reform and the struggles to "preserve tribal homelands, governments, languages, cultures, economies, and social structures" is made explicit (National Indian Education Association and National Congress of American Indians, 1996, p. 3).

Ironically, though the Comprehensive Federal Indian Education Policy Statement is often referred to as a revolutionary document in the history of American Indian education, it ultimately states little that is either new or revolutionary. Rather, it merely rearticulates the scope of federal responsibility as defined in existing laws, treaties, and policies. Beginning with a directive for the "recognition and support of tribal sovereignty," the report details the responsibilities of various federal agencies to assist tribes in assuming "control of education programs and governance of Indian education" (National Indian Education Association/National Congress of American Indians, 1996, p. 4). It covers everything from the "support of native languages and cultures" to provisions for "Indian education outside of Indian country," and is contextualized in language that makes it definitively clear that the federal government must act in consultation with, and in service to, the tribes. Furthermore, it stipulates that this "government-to-government" relationship should be heeded as an inherent aspect of tribal sovereignty and not as a delegated privilege.

Due to its comprehensive nature, the Comprehensive Federal Indian Education Policy Statement served as the model for "The Executive Order on American Indian and Native Alaskan Education" issued in 1998 by the Clinton administration. Much of its original, somewhat strident, language was, however, lost in the translation from political statement to federal policy. In particular, the importance placed on the need for broad-based educational reform, institutionalized recognition of Indian sovereignty, and accountability of federal agencies to uphold their moral, legal, and fiscal responsibility to support Indian education was noticeably diminished. Nevertheless, the issuance of this executive order was a historic moment, symbolizing the efforts of contemporary American Indian leaders to not only insist on self-determination but also on the government's acknowledgment of this inherent right.

Indian Education in the Twenty-First Century

While at the beginning of the twenty-first century it is important to recognize that progress has been made, Indian students, in comparison to all others, are still the most disproportionately affected by poverty, low educational attainment, and limited access to educational opportunities (Beaulieu, 2000, p. 33). Their severely marginalized status is perhaps most evident in the overrepresentation of Native youth engaging in high-risk behaviors. A study conducted by the U.S. Department of Health and Human Services in 2001 (cited in Clarke, 2002) reported the following data regarding American Indian/Alaska Native youth aged twelve to seventeen:

- Illicit drug use is more than twice (22.2 percent) the national average (9.7 percent).
- Binge alcohol use is higher (13.8 percent) than the national average (10.3 percent).
- Heavy alcohol use is higher (3.8 percent) that the national average (2.5 percent).
- Motor vehicle and other accidents are the leading cause of death among American Indian/Alaska Native persons aged fifteen to twenty-four, whose death rate due to accidents is higher than the rate for the total U.S. population.
- Suicide is the second leading cause of death for American Indian/Alaska Native youth aged fifteen to twenty-four, and the overall suicide rate is 2.5 times higher than the combined rate for all races in the United States.

In recognition of the seeming sociocultural nature of these behaviors, some educators have advocated multicultural education for American Indian students (Butterfield, 1994; Hamme, 1996; Reyhner, 1992; St. Germaine, 1995; Wilson, 1991). According to Nieto (1995), multicultural education can be defined as "a process of comprehensive school reform and basic education for all students."

It challenges and rejects racism and other forms of discrimination in schools and society and accepts and affirms the pluralism (ethnic, racial, linguistic, religious, and gender, among others) that students, their communities, and teachers represent. Multicultural education permeates the curriculum and instructional strategies used in schools, as well as the interactions among teachers, students, and parents, and the very way that schools conceptualize the nature of teaching and learning.

While acknowledgment of the relationship between education and culture is important, unless the relationship between culture and the socioeconomic conditions within which it is produced is recognized, the so-called at-risk conditions common to peoples living under siege will persist. With regard to American Indians, this means understanding that "the Indian problem" is not a problem of children and families but rather, first and foremost, a problem that has been consciously and historically produced by and through the systems of colonization: a multidimensional force underwritten by Western Christianity, defined by white supremacy, and fueled by global capitalism.

Indian education was never simply about the desire to "civilize" or even deculturalize a people, but rather, from its very inception, it was a project designed to colonize Indian minds as a means of gaining access to Indian labor, land, and resources. Therefore, unless educational reform happens concurrently with analyses of the forces of colonialism, it can only serve as a deeply insufficient (if not negligent) bandage over the incessant wounds of imperialism. The call to engage Indian education reform from a macroperspective—one that emanates from a historical–material analysis of the relationship between U.S. society and Native communities—is not new. One of the more eloquent and passionate entreaties issued on behalf of the need for comprehensive reform was delivered by Mike Charleston (1994, p. 15) in the draft report of the Indian Nations at Risk task force entitled, "Toward True Native Education: A Treaty of 1992."[11] He begins:

> It is time for a new treaty, a Treaty of 1992, to end a shameful, secret war. For five hundred years, our tribal people have been resisting the siege of the non-Native societies that have developed in our native land. The war is over the continued existence of tribal societies of American Indians and Alaska Natives. We inherited the conflict from our ancestors. Our children face the consequences of this war today. Every tribal member has felt the bitter pangs of this relentless siege. It dominates our lives. It is killing our children. It is destroying our Native communities.

Charleston's piercing language, particularly the use of such metaphors as "war" and "siege" to describe the imperialistic relationship between the Unit-

ed States and tribal societies, indicates his understanding of the systemic and unrelenting nature of colonialism. In addition, while he rightfully places liability in the hands of the U.S. government, Charleston also acknowledges that change will only occur when Native and non-Native societies make the commitment to work together, referencing the importance of political solidarity and coalition-building.

Though the final published report of the task force is an obviously tempered version of Charleston's impassioned plea, it still manages to identify colonization as the central culprit in creating and maintaining the marginalized "at-risk" status of Native nations. Specifically, it begins from the standpoint that Native nations are at risk because:

- Schools have failed to nurture the intellectual development and academic performance of Native children.
- Schools have discouraged the use of Native languages in the classroom.
- Indian lands and resources are constantly besieged by outside forces interested in further reducing the original holdings of the Indians.
- Political relationships between tribes and the federal government fluctuate with the will of the U.S. Congress and decisions by the courts.

Though the relationship between schools and colonialist forces is only implied, the tacit correlation remains both pointed and powerful. In the end, both documents generated by the task force deliver the resounding message that school reform is merely one battleground in the "war" against colonialism. The central implication is that the struggle for self-determined schools must be engaged alongside other revolutionary struggles, specifically those that seek to end economic exploitation, political domination, and cultural dependency. Consequently, such are the aims of critical pedagogy.

CRITICAL PEDAGOGY AND ITS DISCONTENTS

Simply stated, critical pedagogy is that discourse that emerged when "critical theory encountered education" (Kincheloe and Steinberg, 1997). Typically envisioned as leftist or *beyond* multicultural education, the "theoretical genesis" of North American critical pedagogy is traced back to the work of Paulo Freire, John Dewey, and other social reconstructionists writing in the post-Depression years (McLaren, 2003a). According to Peter McLaren, leading exponents have always "cross-fertilized critical pedagogy with just about every transdisciplinary tradition imaginable, including theoretical forays into the Frankfurt School . . . [with] the work of Richard Rorty, Jacques Lacan, Jacques Derrida, and Michael Foucault" (2003, p. 66). With such transdisciplinary beginnings, it is not surprising that critical pedagogy has emerged, in

more recent years, as a kind of umbrella for a variety of educators and scholars working toward social justice and greater equity (Lather, 1998). As such, postmodern, post-structuralist, feminist, postcolonial, Marxist, and critical race theorists have all developed their own forms of critical pedagogy. Even so, there is a core of unifying principles and salient features that constitute the heart of the discipline.

According to McLaren (2003a), critical pedagogy is first and foremost an approach to schooling—teaching, policymaking, curriculum production—that emphasizes the political nature of education. "The antagonistic terrain of conflicting and competing discourses, oppositional and hegemonic cultural formations, and social relations linked to the larger capitalist social totality" forms the foundation of schooling (McLaren, 2003a, p. 66). As such, critical pedagogy aims to understand, reveal, and disrupt the mechanisms of oppression imposed by the established order, suturing the processes and aims of education to emancipatory goals.

Leading critical scholar Henry Giroux (2001, p. 3) emphasizes the emancipatory nature of critical pedagogy, asserting that, at base, critical pedagogy must be envisioned as "part of a broader ethical and political project wedded to furthering social and economic justice and making multicultural democracy operational." In terms of the pedagogical implications of such a project Giroux (2001, p. 20) writes:

> Critical pedagogy must address the challenge of providing students with the competencies they need to cultivate the capacity for critical judgment, to thoughtfully connect politics to social responsibility and expand their own sense of agency in order to curb the excesses of dominant power, to revitalize a sense of public commitment, and to expand democratic relations. Animated by a spirit of critique and possibility, critical pedagogy at its best attempts to provoke students to deliberate, resist, and cultivate a range of capacities that enable them to move beyond the world they already know without insisting on a fixed set of meanings.

Though such aims are often dismissed as idealistic, critical scholar Glenda Moss (2001, p. 11) found that "real" teachers, in "real" classrooms, are able to employ critical pedagogy. Specifically, she found that such teachers used "reflective-reflexive" skills to institute "changed practices that work for authentic participation of all members of the broader society." Buttressed by the work of others, Moss (2001) identified the following pedagogical practices to be common among critical educators: (1) they question whose beliefs, values, and interests are served by classroom content and practices, challenging the hidden curriculum that socializes students into the dominant culture; (2) they address social oppression as tied to race, gender, and class; and (3) they challenge the "banking" or transmission style of teaching as a learning ritual that maintains the status quo.

Though a modicum of consensus has been achieved among critical practitioners, the multifarious nature of critical pedagogy's theoretical foundation has bred intellectual tensions among critical scholars. Indeed, Patti Lather (1998, p. 487) maintains that "an ensemble of practices and discourses with competing claims of truth, typicality, and credibility" among critical scholars have always been present, especially between (postmodern/post-structuralist) feminist and (Marxist) critical scholars. Though at times petty and unproductive, the publicly aired differences and ongoing interchanges between such scholars—commenced by Elizabeth Ellsworth's critique (1989) of critical pedagogy as a white, male discourse—has helped to articulate one of the central fissures in the field. That is, whether the struggle for educational equity is primarily cultural or economic. The fulcrum upon which the conflict turns is Marxist theory.

Advocates of liberal forms of critical pedagogy—postmodernists, post-structuralists, and (liberal/postmodern) feminists—are suspicious of Marxism and indeed of any "grand narrative" that invokes the "masculinist voice" of abstraction and universalization (Lather, 1998, p. 488). They reject the extension of what they view as positivistic macrotheories or "grand narratives of legitimation" in favor of a microtheory and politics that deals with the nature of "difference" (Lyotard, 1984). The general cadence of such theories signals a movement away from the certainty and totalizing effects of grand narratives toward what Lather (1998, p. 488) refers to as "Jacques Derrida's 'ordeal of the undecidable' and its obligations to openness, passage and non-mastery." In such a theoretical space, writes Lather (1998, p. 495) "questions are constantly moving and one cannot define, finish, or close. . . . [It] is a praxis of not being so sure" (1998, p. 488). The aim of such postmodern/post-structural theories is to trouble and disrupt the masculinist or patriarchal presumptions of modernist theories and their universalizing projects, embracing instead a "praxis that moves away from the Marxist dream of 'cure, salvation, and redemption'" (Lather, 1998, p. 495).

Insofar as they theorize against "certainty," postmodernists tend to advocate a negative pedagogy, one more identifiable by what it stands against than what it stands for. The discomfort with asserting any one affirmative and universal claim stems from a (postmodern) sense of the world as being "too complex, the range of views too wide, and the diversity of concerns too differentiated to imagine that there can, any more, be some simple unanimity of goals or interests that unites [us all]" (Shapiro, 1995, p. 20). The implications of such a world for critical educators, according to Svi Shapiro, is to struggle "for a public discourse that privileges no one group of people; one that tries to speak to and include the experience, needs and hopes of a broad spectrum of people in our society" (1995, p. 32). In other words, postmodernists argue that the multiplicity of the millennial world necessitates a political imaginary that is as reflexive and indeterminate as the social imaginary.

As such, it isn't that postmodernists reject the validity of grand narratives (e.g., the anti-capitalist agenda of Marxist theories), but rather that they perceive them as too narrow and therefore insufficient for imagining a new social reality. As Shapiro writes: "[T]he politics that emerge from the fluidity and complexities of identity in contemporary America do not, it must be emphasized, negate those historically important struggles. . . . [O]ur goal is however, to offer an educational language—and later an agenda—that can be as inclusive as possible, to recognize the fullest possible range of human struggles and concerns" (1995, p. 29–30). In other words, postmodernists presume a "praxis of undecidability." That is, one that resists modernist impulses to privilege "containment over excess, thought over affect, structure over speed, linear causality over complexity, and intention over aggregate capacities" (Lather, 1998, p. 497). In so doing, they seek to replace the "one right story" of universalist discourses with a "nonreductive praxis that calls out a promise of a practice on shifting ground" (Lather, 1998, p. 497).

Despite the potential allure of theories that valorize difference and heterogeneity—particularly for peoples marginalized by the modernist project of white supremacy—not all critical scholars embrace the marriage of critical pedagogy to postmodern and post-structural theories. Marxist scholars have been especially critical of what they perceive as the abandonment of emancipatory agendas, in general, and of the struggle against capitalist exploitation, in particular. As McLaren (2003, p. 67) notes, in their effort to try to be everything to everyone, postmodern theorists have (re)cast the net of critical pedagogy so wide and so cavalierly that it has come to be associated with everything from "classroom furniture organized in a 'dialogue friendly' circle to 'feel-good' curricula designed to increase students' self-image." Moreover, insofar as postmodern and other progressive scholars have distanced themselves from the labor/capital problematic, they are construed by radical educators as advocating pro-capitalist forms of schooling. The central argument is that while post-al theories of education have undoubtedly advanced knowledge of the hidden trajectories of power, particularly within processes of representation and identity, they have been "woefully remiss in addressing the constitution of class formations and the machinations of capitalist social organization" (Scatamburlo-D'Annibale and McLaren, 2002, p. 4). In short, revolutionary theorists argue that postmodernism has been used to substitute the project of radical, social transformation with a politics of representation.

In the wake of the relentless march of capitalism, Marxist and other radical scholars view such a stance as grossly insufficient, if not negligent. They contend that to ignore the "totalizing effects" of capitalism and to reduce class to just another form of "difference" is to act as an accomplice to capitalist imperatives and desires. In other words, to remain "enamored with the 'cultural' and seemingly blind to the 'economic'" in this moment of late capitalism is not simply an act of ignoring, but one of complicity (Scatam-

burlo-D'Annibale and McLaren, 2002, p. 4–5). It requires turning a blind eye to the roughly 2.8 billion people (nearly half the world's population) living on less than two dollars a day (McQuaig, 2001, p. 27) and the 100 million people in the industrial world living below the poverty level (Scatamburlo-D'Annibale and McLaren, 2002).[12] Radical educators view such statistics as clear indicators that the inherent contradictions of capitalism are "taking us further away from democratic accountability" and closer toward what "Rosa Luxemborg referred to as an age of 'barbarism'" (McLaren and Farahmandpur, 2001, p. 277). Thus, from the vantage point of revolutionary critical scholars, we do not simply need an education for equity and social justice, but rather an anti-capitalist education for economic democracy.

Advocates of radical forms of critical pedagogy thus insist on a theory and praxis of schooling with an unabashed emancipatory intent, one that is future-centered and forward looking to a time when "wage labor disappears with class society itself" (McLaren, 2003a, p. 80). In accordance with these aims, critical scholars have developed a "revolutionary critical pedagogy" (Allman, 2001)—the synthesis of contemporary Marxist scholarship with a rematerialized critical pedagogy. Leading advocates of revolutionary critical pedagogy include Paula Allman (who penned the term) and Peter McLaren, as well as Mike Cole, Terry Eagleton, Ramin Farahmandpur, Dave Hill, Jane Kenway, Helen Raduntz, Glen Rikowski, and Valerie Scatamburlo-D'Annibale. Others whose work has greatly influenced the formation of revolutionary critical pedagogy include Teresa Ebert, Paulo Friere, Martha Gimenez, Antonio Gramsci, Henry Giroux, Rosemary Hennessy, Chrys Ingraham, Karl Marx, and Ellen Meskins Wood.

While each of these scholars emphasizes different aspects of the discourse, they all remain committed to a core of abiding principles that formulate the foundation of revolutionary critical pedagogy: (1) to recognize that capitalism, despite its power, is a "historically produced social relation that can be challenged (most forcefully by those exploited by it)" (McLaren and Farahmandpur, 2001, p. 272); (2) to foreground historical–materialist analysis that "provides critical pedagogy with a theory of the material basis of social life rooted in historical social relations" and assigns primacy to uncovering the structures of class conflict and the effects produced by the social division of labor (McLaren, 2002, p. 26)[13]; and (3) to reimagine Marxist theory in the interests of the critical educational project. As McLaren and Farahmandpur write, "Marxist revolutionary theory must be flexible enough to reinvent itself . . . [and] is not set forth here as a universal truth but as a weapon of interpretation" (2001, p. 301–02).

Beyond the theoretical commitments of revolutionary critical pedagogy, some practical implications have also been established. In order to prepare students "to glimpse humanity's possible future beyond the horizon of capital" (Allman, 2001, p. 219), McLaren and Farahmandpur (2001, p. 299) submit that revolutionary students and educators must "question how knowledge is related historically, culturally, (and) institutionally to the process of production and consumption," and ask: How is knowledge produced? Who produces it? How is it appropriated? Who consumes it? How is it consumed? With such questions formulating the base, McLaren (2003, p. xvii) defines the following foundational principles of revolutionary critical pedagogy that parallels Deborah Brandt's (1991) five pillars of popular education.[14]

1. A revolutionary critical pedagogy must be a *collective process*, that involves utilizing a Frierian dialogical learning approach.
2. A revolutionary critical pedagogy must be *critical*; that is, by locating the underlying causes of class exploitation and economic oppression within the social, political, and economic infrastructure of capitalist social relations of production.
3. A revolutionary critical pedagogy is profoundly *systematic* in the sense that it is guided by Marx's dialectical method of inquiry, which begins with the "real concrete" circumstances of the oppressed masses and moves toward a classification, conceptualization, analysis, and breaking down of the concrete social world into units of abstractions to get at the essence of social phenomena. It then reconstructs and makes the social world intelligible by transforming and translating theory into concrete social and political action.
4. A revolutionary critical pedagogy is *participatory*, involving building coalitions among community members, grassroots movements, church organizations, and labor unions.
5. A revolutionary critical pedagogy is a *creative process* incorporating elements of popular culture (i.e., drama, music, oral history, narratives) as educational tools to politicize and revolutionize working-class consciousness.

Whereas McLaren (2003) outlines the academic principles of revolutionary critical pedagogy, Allman (2001, p. 177–86) defines the more visceral, motivating principles or "vital powers" necessary in the struggle for social justice. McLaren (2002, p. 31) recounts these principles as those of:

> mutual respect, humility, openness, trust and co-operation; a commitment to learn to "read the world" critically and expending the effort necessary to bring about social transformation; vigilance with regard to one's own process of self transformation and adherence to the principles and aims of the group; adopting an "ethics of authenticity" as a guiding principle; internalizing social justice as passion; acquiring critical, creative, and hopeful thinking; transforming the self through transforming the social relations of learning and teaching; establishing democracy as a fundamental way of life; developing critical curiosity;

and deepening one's solidarity and commitment to self and social transformation and the project of humanization.

Such principles are clearly relevant to American Indian students and educators and their need for pedagogies of disruption, intervention, affirmative action, hope, and possibility.

Insofar as the project for colonialist education has been imbricated with the social, economic, and political policies of U.S. imperialism, an education for decolonization must also make no claim to political neutrality and engage a method of analysis and social inquiry that troubles the capitalist, imperialist aims of unfettered competition, accumulation, and exploitation. Beyond an approach to schooling that underscores the political nature of education, American Indian students and educators also require a praxis that enables the dismantling of colonialist forces. They need a pedagogy that cultivates a sense of collective agency, both to curb the excesses of dominant power and to revitalize Indigenous communities.

These aims and imperatives of American Indian education not only illuminate the deep deficiencies of off-the-shelf brands of multiculturalism, which espouse the empty rhetoric of "respecting differences" and market synthetic pedagogies that reduce culture to the "celebration" of food, fad, and festivals, but also point to the relevance and necessity of critical pedagogies of Indigenous education. Indeed, revolutionary critical pedagogy's conception of culture as conditioned by material forces and of schooling as a site of struggle offers great potential for Indigenous peoples working toward pedagogies for self-determination.

AMERICAN INDIAN EDUCATION AND REVOLUTIONARY CRITICAL PEDAGOGY: TOWARD A NEW RED PEDAGOGY

In the end, though the history of American Indian education and, more broadly, the history of the relationship between the U.S. government and American Indian nations is often characterized as being one of cultural domination, a critical examination reveals the principal relationship as one of exploitation—that is, the imposed extraction of labor and natural resources for capital gain. For example, while the Indian Removal, Dawes, and Termination Acts can all be viewed as legislated attempts to destroy Indian culture, in the end they all provided greater access to Indian lands and resources and, as such, proffered the federal government a windfall in capital gains. Similarly, while manual labor and boarding schools attempted to extinguish Indianness by imposing culturally imperialistic curriculums, they also profited from child labor as well as helped to establish a permanent Indian proletariat.

Though the federal government is no longer as explicitly connected to schooling as it once was, exploitative relations between the U.S. government and American Indian nations persist. As such, the unambiguous anti-capitalist aims of revolutionary critical pedagogy make it more applicable to the imperatives of American Indian education than liberal/progressive forms. That being said, there are significant points of tension between the structures of revolutionary theory and the concerns of American Indian schools and communities.

The central tension is that revolutionary theorists, like other Western scholars, often fail to consider, and thus, theorize, the fundamental "difference" of American Indians and their dual status as U.S. citizens and members of sovereign "domestic dependent nations." Indeed, the myriad implications of this basic failure form the foundation of each subsequent chapter in this book. For instance, in chapter 2, this tension is discussed in terms of the implications of Marxist pedagogies (still contingent on Western notions of democracy) for Indigenous schools and communities. The question is, do Marxist pedagogies of emancipation sustain a geopolitical landscape any more receptive to the notion of Indigenous sovereignty than capitalist pedagogies? In chapter 3, the failure of radical scholars to consider that even in the socialist-democratic imaginary, the end game remains human liberation: a profoundly anthropocentric notion, rooted in a humanist tradition that presumes the superiority of human beings over the rest of nature. In other words, both Marxists and capitalists view land and natural resources as commodities to be exploited, in the first instance, by capitalists for personal gain, and in the second, by Marxists for the good of all.

In chapter 4, the tension is discussed in terms of its implications for the construction of American Indian subjectivity. Specifically, while the theorizations of feminist, postmodern, and post-structural scholars are essential to understanding the complex layers of American Indian subjectivity, their displacement of a "politics grounded in the mobilization of forces against the material sources of political and economic marginalization" is deeply problematic (Scatamburlo-D'Annibale and McLaren, 2002, p. 7). Indeed, the historical–material realities of American Indian schools and communities require emancipatory pedagogies that retain clear and explicit emancipatory agendas. Finally, in chapter 5, the failure of "mainstream" feminists to recognize that most American Indian women view their lives as shaped, first and foremost, by the historical–material conditions of colonization and not some "universal" patriarchy is discussed. By insisting on gender as the primary conceptual framework from which to interpret inequality, such theorists not only blur the actual structures of power but also obfuscate feminism's implication in the projects of colonization and global capitalism. Thus, as previously stated, it is critical to question how the experiences and historical–material realities of Indigenous peoples are reshaped and transformed when articulated through the epistemic frames of Western theory, whether liberal or revolutionary. As American Indian scholar and educator Greg Ca-

jete (1994, p. 3) notes, Indian people must question the effects of contemporary educational theories on the collective cultural, psychological, and ecological viability of Indigenous communities.

Further examination of the tensions and intersections between American Indian education and revolutionary forms of critical pedagogy unfolds in the subsequent chapters. This analysis takes seriously the assertions of McLaren and Farahmandpur, who note, "no theory can fully anticipate or account for the consequences of its application but remains a living aperture through which specific histories are made visible and intelligible" (2001, p. 301). The quest for a new Red pedagogy is, thus, at base, a search for the ways in which American Indian education can be deepened by its engagement with critical educational theory and for critical theory to be deepened by Indian education. While a Red pedagogy privileges "revolutionary critical pedagogy" as a mode of inquiry, it does not simply appropriate or absorb its language and epistemic frames, but rather employs its vision as one of many starting points for rethinking Indigenous praxis. The aim is "to diversify the theoretical itineraries" of both Indigenous and critical educators so that new questions and perspectives can be generated (McLaren, 2002, p. 29).

Finally, what distinguishes Red pedagogy is its basis in hope. Not the future-centered hope of the Western imagination, but rather, a hope that lives in contingency with the past—one that trusts the beliefs and understandings of our ancestors as well as the power of traditional knowledge. A Red pedagogy is, thus, as much about belief and acquiescence as it is about questioning and empowerment, about respecting the space of tradition as it intersects with the linear time frames of the (post)modern world. Most of all, it is a hope that believes in the strength and resiliency of Indigenous peoples and communities, recognizing that their struggles are not about inclusion and enfranchisement to the "new world order" but, rather, are part of the Indigenous project of sovereignty and indigenization. It reminds us that Indigenous peoples have always been peoples of resistance, standing in defiance of the vapid emptiness of the bourgeois life.

This is the spirit that guides the ensuing engagement between critical theory and American Indian education. The hope is for a Red pedagogy that not only helps sustain the lifeways of Indigenous peoples but also provides an explanatory framework that helps us understand the complex and intersecting vectors of power shaping the historical–material conditions of Indigenous schools and communities. A logical place to begin this journey of understanding is at the point of "encounter," examining the various dimensions of conflict and contradiction between the sovereign peoples of the Americas and the colonizers, asking the question: Can democracy be built upon the bloody soils of genocide?

NOTES

1. I use the phrase "right to be Indigenous" with the same intent and manner as it is used in the "Coolangatta Statement on Indigenous Peoples' Rights in Education," that is, a right that embraces Indigenous peoples' language, culture, traditions, and spirituality, including the right to self-determination.

2. Specifically, the Jesuits provided academic instruction in French language and customs, and vocational training in the areas of animal husbandry, carpentry, and handicrafts.

3. Perhaps as a reflection of the relegated role of Native Americans, the literature is replete with histories of Indian education. For example, see Szasz (1998; 1999), Reyhner and Eder (1989), and Fuchs and Havighurst (1972), among numerous other seminal articles.

4. According to Szasz (1999, p. 270), in 1819, the first year in which Congress voted for a fund for "civilization" of the Indian, total expenditures did not exceed $10,000; by 1880, congressional appropriations reached $130,000 and continued to rise exponentially through the following decade. Also, in addition to congressional funding, many treaties incorporated "provisions" for such educational and civilization purposes, with some incorporated at the request of tribes who began to associate survival with access to Anglo education (Reyhner and Eder, 1992).

5. The Indian Removal Act (chapter 48, 4 *Stat.* 411), passed May 26, 1830, by the Twenty-first Congress, provided for "an exchange of lands with any of the Indians residing in any of the states and territories, and for their removal west of the river Mississippi." Passage of this act set in motion the mass forced relocations of the Creek, Cherokee, Choctaw, Chickasaw, and Seminole, among other Eastern nations. In the words of Churchill and Morris (1992), "the idea was to 'clear' the native population from the entire region east of the Mississippi, opening it up for the exclusive use and occupancy of Euroamericans and their Black slaves."

6. "Indian Commissioner Price on Civilizing Indians, October 24, 1881," in *Documents of United States Indian Policy*, as quoted in Spring (2001, p. 173).

7. Quoted in Joel Spring's *The American School: 1642–2000* (1997, p. 173).

8. U.S. House of Representatives, Committee of One Hundred, *The Indian Problem: Resolution of the Committee of One Hundred Appointed by the Secretary of the Interior and Review of the Indian Problem*, as cited in Noriega (1992).

9. Such reforms were implemented as part of the Indian Reorganization Act, commonly known as the Wheeler-Howard Act.

10. The termination policy was embodied in House Concurrent Resolution No. 108, passed August 1, 1953. It reads:Whereas it is the policy of Congress, as rapidly as possible, to make Indians within the territorial limits of the United States subject to the same laws and entitled to the same privileges and responsibilities as are applicable to other citizens of the United States, and to grant them all of the rights and prerogatives pertaining to American citizenship; and Whereas the Indians within the territorial limits of the United States should assume their full responsibilities as American citizens; Now, therefore, be it Resolved by the House of Representatives (the Senate concurring), That it is declared to be the sense of Congress that, at the earliest possible time, all of the Indian tribes and the individual members thereof located within the States of California, Florida, New York, and Texas, and all of the following named Indian tribes and individual members thereof, should be freed from Federal supervision and control and from all disabilities and limitations specially applicable to Indians. (U.S. Congress, 1953, 67 Stat. B132)

11. According to Deputy Project Director of the Task Force Gaye Leia King, Dr. Charleston's version was not submitted as the final report as "the majority of the (task force) members believed that Mike's preliminary draft was too harsh and would offend most people." Moreover, she notes that the political climate of the times determined the "need to critically strategize on the content of the report" in order to ensure its release to the public (King, 1994).

12. Even more problematic is the fact that casualties continue to mount. For example, in 2001, there were 1.3 million more poor people in the United States than in 2000.

13. Unlike other contemporary narratives that focus on one form of oppression or another, Scatamburlo-D'Annibale and McLaren (2002, p. 14) note that the power of historical materialism resides in "its ability to reveal (a) how forms of oppression based on categories of differ-

ence do not possess relative autonomy from class relations but rather constitute the ways in which oppression is lived/experienced within a class based system and (b) how all forms of social oppression function within an overlapping capitalist system."

14. These principles are articulated by Farahmandpur (2003, p. xvii) in the foreword of McLaren's seminal text *Life in Schools*.

Critical Theory, Red Pedagogy, and Indigenous Knowledge: The Missing Links to Improving Education

Response 1

John Tippeconnic III

> "The first and foremost need in Indian education is a change in the point of view."
>
> —Meriam Report, 1928

> "American Indian tribes and Alaska Native communities are nations at risk. Our schools have failed to nurture the intellectual development and academic performance of many Native children."
>
> —Indian Nations At Risk Task Force, 1991

When asked to contribute to the tenth anniversary edition of *Red Pedagogy*, I felt honored to be a part of the seminal scholarly work that has made a difference in reframing and applying theory, critical pedagogy, and critical thinking to education since it was published in 2004. I am an educator, part Cherokee, and a member of the Comanche Nation. My experience has been primarily in education systems at the school, federal, and higher education levels, including tribal colleges.

I have been a participant and observer of Indian education for a long time. One conclusion is evident: tribal nations and communities are different and any effort to address education must be based on the local context. My comments below are based in practical experience with the hope that critical theory and *Red Pedagogy* will someday make a significant difference in how American Indian[1] students are educated.

Sandy Grande clearly and emphatically states that the connection among critical theory, American Indian intellectuals, and American Indian education is needed so we can discover, renew, or further develop and apply critical thinking as a way to improve schooling for Indigenous students, and to use theory and critical pedagogy when examining why too many students continue to struggle and fail in contemporary schooling. And, to think about what is missing in the numerous past and current studies and reform efforts that attempt to improve education so "no child is left behind," and why schools fail too many Indigenous students and deny them the fundamental right to an education. In essence, critical pedagogy leads us to ask questions like: What is the purpose of formal education in schools? Who is in control of education? What are students learning in classrooms? How has colonization impacted education? And, how do we decolonize education?[2]

Formal education within the enclosed walls of schools continues to be a forceful weapon used by dominant powers to create boundaries to control and mold the minds of youth and adults, to eradicate or weaken their Indigenous identity, and to assimilate them into mainstream society. Various American Indian policies (including self-determination), acts of Congress, court decisions, and approaches over time to educate American Indians has resulted, today, in the failure of the education enterprise to prepare students that are successful in life as grounded tribal citizens, knowledgeable in their Indigenous ways, and with the necessary reading, writing, math, and science skills to have a good life, to think critically, and to make changes to maintain, to revitalize, and to sustain what it means to be an American Indian person now and into the future.

I have been involved in the education of American Indians and Alaska Natives for over forty years and have experienced the frustrations, discouragement, hope, small victories, loss of hope, and anger as to why we have not been more successful in educating Indigenous students, especially at the kindergarten through twelfth-grade level. Yes, there are more students who are very successful and graduate from high schools and colleges than ever before. However, there are far too many students who struggle and are not successful. The challenge in Indian education today is similar to those of years past, mainly to decolonize Western education by taking control of schools with Indigenous traditional knowledge as the foundation for teaching and learning.

INDIAN EDUCATION STRUGGLES CONTINUE

There have been changes in the education of American Indians and Alaska Natives and the connection between education and critical pedagogy is stronger since *Red Pedagogy* was published in 2004. Self-determination remains the federal policy, although in education, the results today are not what we hoped for in the 1960s and 1970s. After Indian education was declared a "national tragedy and a national challenge,"[3] Indian control of education, with Rough Rock Demonstration School on Navajo as the model, was recognized as an alternative to public and Bureau of Indian Affairs education with the hope that Indian education would be improved. McKinley, Bayne, and Nimicht (1970, p. 22) expressed the importance of controlling education by stating, "If a community is to control its own destiny, it must have control of its children." Indian control of education continues to be a strategy to improve Indian education.

Today, 125 of the 183, or 68 percent, of the Bureau of Indian Education (BIE) schools and dormitories are Indian controlled, an increase of only 5 schools since 2004.[4] The slow growth in the conversion of BIE-operated schools to Indian-controlled schools raises questions about whether there is real and total control, especially when the federal government controls funding and the curriculum through promoting and essentially mandating national standards. The best examples of Indian control are the tribal colleges and universities; since 2002, four tribal colleges have been established in Oklahoma.

In addition, since 2004, the number of students in BIE schools decreased from 47,909 to 41,000—with the majority of schools not meeting academic standards as measured by No Child Left Behind criteria.[5] This represents a crisis situation for students and their communities, but also for the future of the BIE federal school system at the kindergarten to twelfth-grade level. The dwindling student numbers and the poor quality of instruction threatens the end of BIE and in the process the erosion of tribal sovereign, the trust responsibility, and the federal responsibility in education.

Approximately 650,000 students attend public, BIE, charter, and private schools. Students attending public schools continue to increase while those in BIE-supported schools decrease. A large majority of students, around 93 percent, attend public schools while 41,000 are at BIE schools. A smaller number attend private and charter schools. An increasing number of American Indian students are attending public schools in urban areas where often they represent a small part of the student body and where there might be a number of tribes represented. The significance of this is that a vast majority of students are in public education where education is a state responsibility and sovereignty has limited, if any, authority and the voices of tribes and parents receive little consideration.

Changes in higher education include more students: the Chronicle of Higher Education[6] reports approximately 210,160 American Indians/Alaska Natives enrolled; there are also more tribal college students. Tuition and fees have increased and there has been a strong focus on the science, technology, engineering, and math fields. Student access, retention, and graduation re-

main challenges, with retention being the major issue.[7] The corporate or business model with its profit motive is on the rise in education where programs are expected to raise funds to sustain themselves and students are viewed as sources of revenue.

THE EDUCATION PEDAGOGY IS NOT RED

Teaching in public and BIE kindergarten to twelfth-grade schools has become more entrenched in standardization and embedded in one-size-fits-all direct instruction approaches where student test scores in reading, math, and science are accepted as the key measures of academic success; there is little flexibility to include culturally responsive pedagogy in schools. No Child Left Behind has not only narrowed the curriculum to reading, math, and science, but it has also had a negative impact on creativity and adapting education to local community needs. Common Core standards are now the rage; their implementation is likely to have the same results for Indigenous students.

The failure of schools and systems to educate American Indian students is well documented; the latest sources are the National Indian Education Studies and a recent report by The Education Trust. American Indian students continue to score lower in math and reading compared to non-Natives. Dropout rates remain high, attendance low, and parent involvement weak. The lack of strong academic programs at the kindergarten to twelfth-grade levels carries over to higher education, where many students are often not academically prepared to complete college-level work.

A major reason for this continuing tragedy and mounting crisis in Indian education is the strong resistance from the educational establishment to include critical theory in the discourse of educational reform. During my years in education, the consideration of critical theory and critical pedagogy were extremely rare in any efforts to develop strategies and programs to improve education for American Indian students. The approach usually was to take the established Western goals and strategies and "Indianize" them by adding acceptable references to Native languages and cultures.

Schools are so tightly structured and controlled that teachers, administrators, and others are consumed with immediate situations, they are in the moment reacting to demands, mandates, standards, and student academic achievement as measured by test scores. There is little time to be proactive and think critically about education.

Also, programs in mainstream colleges and universities that prepare educators are based on certification standards with little room for critical theory, critical pedagogy, and Indigenous knowledge. The purpose of education remains to assimilate Indigenous peoples into the mainstream without serious consideration to cultural, linguistic, values, and the devastating and disrespectful treatment of Indigenous peoples since colonization.

IDENTITY AND INCREASED COMPLEXITY

The complexity of Indian education has intensified over the past ten years and will become even more complicated in the future. Education is greatly influenced by political and economic agendas, social conditions, health disparities, legal issues, changing demographics, geographic location, the rapid grown in technology, and social media. Families and communities are also influenced by these factors and students bring their life experiences into classrooms, which make teaching and learning very complex.

A major reason for this complexity has to do with the identity of American Indians, both individually and collectively, as members of tribes. As Sandy Grande notes in *Red Pedagogy* (p. 92), the preoccupation with identity politics prevents a critical discourse on oppression and power. True, but the obsession with identity will continue as American Indians grow in numbers, become tribally and racially mixed, pursue tribal membership, and seek eligibility for real or perceived benefits for tribal members. Indian identity politics will continue to be divisive, especially in the distribution of goods and services, decision-making, and with political and economic agendas.

In education, individual tribal identity is a challenge for schools, especially schools with multitribal representation in their student bodies, often found in urban areas. It is difficult for such schools to focus on a particular tribal language or culture, and what usually happens is "common" Indian values are developed and used, which is okay, but does not get at a deep specificities and meaning of Indigenous identity.

MAKING THE CONNECTION

During the past ten years, there has been some movement to connect American Indian educators and critical theorists, and between critical theory and Indigenous education, although I do not think the connection has been strong. The connection primarily comes from Indigenous scholars in academe.[8] For example, I have noticed an increase in the use of Safety Zone Theory (Lomawaima and McCarty, 2006), Tribal Critical Race Theory (Brayboy, 2005), Indigenous methodologies (Smith, 1999), and Indigenous education (Battiste, 2013; Cajete, 1994) in academic publications and graduate student research.

Faculty in American Indian/Native American/Indigenous studies programs have taken the lead in making the connections; most embrace critical

theory and critical pedagogy in their scholarly work. The American Indian studies program at Arizona State University is a prime example. We developed an American Indian studies (AIS) paradigm[9] that is the foundation of our academic program. The paradigm states in part:

> AIS is grounded in the experiences of American Indian nations, peoples, communities, and organizations from American Indian perspectives. Its principles are rooted in the concepts of sovereignty and indigenousness. It recognizes that disparate worldviews, literatures, knowledge systems, political structures, and languages characterize Indian societies within the United States but that they share commonalities than link them with other indigenous peoples of the world. It acknowledges that colonialism has impacted the sovereignty, human rights, landholdings, religious freedom, health, welfare, and cultural integrity of Indian nations . . . and focuses on the protection and strengthening of Indian sovereignty, self-determination, self-sufficiency, and human rights . . . provides a curriculum for the intellectual, ethical, and social development of students so they will acquire a comprehensive and practical understanding of U.S. Indian law and policy, colonization/decolonization, and nation building.

It is expected that our students will emerge as critical thinkers who will make differences in their communities.

That being said, there remains a noticeable disconnect between critical theory and kindergarten to twelfth-grade education in public and BIE schools. If critical theory and *Red Pedagogy* have implications for school improvement, and I think they do, then the connection needs to be made with educators in schools. Critical theorists need to work with teachers, counselors, school administrators, school boards, educator training programs at colleges and universities, and policy makers at local, tribal, state, and national levels to apply their theories, pedagogies, and methodologies to promote and implement critical pedagogy in schools.

A DAUNTING TASK

The formal education of American Indians is at a crisis level; it is not acceptable to have schools fail a large number of students and get away with it. Such failure has been a recurring theme for years with little overall improvement with the inclusion of Indigenous knowledge as part of the regular curricula of schools still sparse. There is scarce, almost nonexistent acknowledgment and critical discussion among educators about the impact colonization has and continues to have in present day Indian education. As Marie Battiste (2013, p. 186) notes, attempts "to decolonize education and actively resist colonial paradigms is a complex and daunting task." If the overarching goal of *Red Pedagogy* is decolonization (p. 166), then the hope is that education of American Indian students can be fundamentally changed through the integration of critical theory, critical pedagogy, and sovereignty in the efforts to improve Indian education. The connection needs to be made.

NOTES

1. "American Indian," "Native American," and "Indigenous" are used interchangeably for the purposes of this chapter. It is acknowledged that there are differences in meaning and use.
2. *Decolonizing Education, Nourishing the Learning Spirit* (2013) by Marie Battiste is an excellent source when responding to this question.
3. Known as the Kennedy Report, published in 1969, the U.S. Senate Special Subcommittee on Indian Education conducted an investigation into the problems of education for American Indians and titled their report, *Indian Education: A National Tragedy-A National Challenge*.
4. The number of BIE schools was obtained from the Bureau of Indian Affairs annual budget request to Congress, known as the green books, found at http://www.bie.edu/Schools/index.htm.
5. The larger concern is the No Child Left Behind criteria and the resulting failing schools beyond BIE schools; even wealthy suburban schools are being deemed as "failing," which points to how unjust the criteria was, possibly revealing the actual rationale to privatize public education.
6. *The Chronicle of Higher Education* publishes an almanac of higher education annually that reports enrollment and other data. The enrollment information is taken from the August 31, 2012, edition.
7. Two recent books, *Beyond the Asterisk: Understanding Native Students in Higher Education* (2013) by Heather Shotton, Shelly Lowe, and Stephanie Waterman, and *Postsecondary Education for American Indian and Alaska Natives* (2012) by Bryan McKinley Jones Brayboy, Amy Fann, Angelina Castagno, and Jessica Solyom, address these issues in detail.
8. Scholars like Brian Brayboy, K. Tsianina Lomawaima, Teresa McCarty, Marie Battiste, Linda Tuhiwai Smith, Maria Villegas, Gregory Cajete, Elizabeth Cook-Lynn, and Tim Begaye are among the academic scholars leading the way.
9. See the article "An American Indian Studies Paradigm Statement" by James Riding In published in the Fall 2011 issue of *Wicazo Sa Review* for the full text of the AIS paradigm.

Colonialism Undone: Pedagogies of Entanglement

Response 2

Alyosha Goldstein

Colonialism in North America continues to be undone. It is unfinished and ongoing, yet is also subject to interruption, contestation, and disassembly by Indigenous peoples. As Sandy Grande so eloquently insists, the insurgent process of disruption and undoing entails "political/pedagogical strategies that go beyond simply resisting settler relations of power" and demands working "to redefine the epistemological underpinnings through which the colonial world order is maintained."[1]

The first chapter of *Red Pedagogy*, "Mapping the Terrain of Struggle," thus begins with the violence and didacticism of colonial ordering, as well as the dynamic persistence of Indigenous ways of knowing and living otherwise. While colonial cartographies seek to naturalize the ideologies of conquest, to control and confine Indigenous peoples, to enframe territory and enforce the boundaries of property, they nevertheless remain shaped in response to those people they aim to pacify and the places they claim to occupy.

Always a consequence of these constitutive antagonisms, colonial reason and its modes of governance are symptomatic of that which they disavow. In contrast to the unconditional and peremptory conventions of colonial spatial delineation, Mishuana Goeman argues that Native mapping often describes relations to place that are polyvocal and contingent, living in stories told and retold.[2] Despite its professed inevitability, settler colonialism in North America is a project of perpetual failure and immanent crisis. *Red Pedagogy* specifies what it means for Indigenous peoples to contend with the brutal

perseverance and entanglements of this failure, as well as its still virulent economies of dispossession.

Grande's opening chapter generatively sketches colonial predicaments that invite ongoing consideration. What are the material conditions under which Indigenous peoples enact and assert self-determination during the present moment? Under these conditions, why do anti-colonial pedagogies necessitate "a method of analysis and social inquiry [that] troubles the capitalist, imperialist aims of unfettered competition, accumulation, and exploitation" (p. 26)? How are circumstances of Native peoples living under U.S. occupation shaped in relation to what Lisa Marie Cacho describes as the "differential devaluation of racialized groups"[3] and discrepant colonial formations throughout the world? This chapter is intended to build upon the foundation provided in Grande's chapter, expanding upon some of the principal concepts and ideas and their enduring significance since *Red Pedagogy*'s original publication.

The current historical conjuncture is not simply the most recent moment in the continuous procession of Indigenous dispossession by U.S. empire and settler colonialism. Just as neoliberalism is not simply an extension of classical liberalism but is instead a reactive formation that aims to dismantle the conciliatory regulatory mechanisms of mid-twentieth century liberal capitalism in pursuit of the upward redistribution of wealth in the "Global North," Indigenous dispossession assumes specific tactical forms in response to present-day practices of and possibilities for indigenous self-determination. The intensified redeployment of colonial predation and necropolitical inclusion takes many forms, some of which manifestly accentuate the constitutive contradictions of neoliberal multiculturalism.

As a way of marking this continuance and its impact on Indigenous youth, one need only to consider the recent 2013 U.S. Supreme Court ruling in *Adoptive Couple v Baby Girl*. The highly controversial case effectively undermined key provisions of the Indian Child Welfare Act of 1978 and used a reactionary post–civil rights era discourse of racial preference and alleged "special rights" of tribal nations to undermine protective gains made by the 1978 law. Indeed, much like the recent U.S. legislation that discarded core aspects of the Voting Rights Act of 1965 by claiming that the racist practices that necessitated the law were now resolved, commentary in support of the 2013 Supreme Court ruling suggested that Indian Child Welfare Act was outdated, emphasizing that the legislation was "more than thirty years old." In the context of the ruling, efforts by organizations such as the National Indian Child Welfare Association and the Lakota People's Law Project to stop the ongoing theft and abuse of Indigenous children have shifted to address the particularities of contemporary U.S. colonial governmentality, specifically, "post-racial" assertions of white entitlement and retooled ideologies of anti-tribalism that aim to justify further erosion of Indigenous sovereignty.

In the neoliberal offensive of the past forty years, the uneasy historical entwining of Indigenous education, a particular version of self-determination, and the reduction of life to the calculus of market relations appear in at least two modes of containment and hegemonic realignment. On the one hand, neoliberal multiculturalism extends the simultaneous promise of autonomy and inclusion. On the other hand, an insistence on accountability for the conditions of colonial and racialized dispossession has been diverted to support standardized testing and assessment that accelerates inequities and devaluations under the aegis of settler normativity.

For instance, the anti-colonial movement for control of schooling by and for Native peoples—from the Navajo Nation's Rough Rock Demonstration School established in 1966 to the Red Power community survival schools to the Coalition of Indian Controlled School Boards to Deganawidah-Quetzalcoatl University—helped compel the Indian Self-Determination and Education Assistance Act of 1975. Yet, although the 1975 legislation established significant changes in federal Indian policy, its mandate for Indigenous self-governance devolved administrative authority to tribes in ways that did not fundamentally challenge the ultimate plenary power of congress.

Likewise, the U.S. settler state responded to grassroots pressure for more adequate investment in education for both impoverished communities of color and Indigenous peoples with the rhetoric of accountability set out in the means-tested disciplinary regime of No Child Left Behind—a regime that has only intensified since the original publication of *Red Pedagogy*.[4] As intimated by Grande, both trajectories partially build from and work to dismember preceding strategies for Indigenous liberation and sovereignty. Nevertheless, the colonial norms of recognition that seek, as Audra Simpson argues, to instantiate an Indigenous autonomy that "is exercisable only because recognition is conferred" are always also symptomatic of the pernicious "ambivalences of exigencies of settlement itself" and "the needs and desires of states that are new, that are in process, that are complicated, and struggling always not to fissure."[5]

Similarly, in response to the student movements of the 1970s and 1980s for ethnic studies and Native American self-determination, the U.S. educational system responded with inclusive pedagogies for minoritization and neoliberal multiculturalism. Indeed, the notion of "minority" here is precisely a consequence of the colonial attrition that has in fact minoritized peoples through circuits of conquest, displacement, and slavery. Roderick Ferguson points out that during this moment state and capital began to adopt a simultaneously affirmative and preemptory discourse of anti-racist diversity "through the regulated incorporation of minorities and minoritized intellectual and cultural production" so as "to forestall the redistribution of resources

to economically and racially disfranchised communities."[6] Although such forms of minoritization operate primarily through a logic of race that concertedly disavows colonial difference and Indigenous sovereignty, it is imperative nonetheless to attend to the tensions, entanglements, and disjunctures—what Jodi Byrd describes as "cacophony"—between subalternized racialized groups and Indigenous peoples that remain more complex than the normative lens of the U.S. state, educational system, and neoliberal multiculturalism allows.[7]

Since the 1970s, U.S. Indian policy affirming recognition of Indian self-determination has operated in tandem with new forms of economic disposability, social abandonment, and environmental plunder. As Grande observes, "Indian education was never simply about the desire to 'civilize' or even deculturalize a people, but rather, from its very inception, it was a project designed to colonize Indian minds as a means of gaining access to Indian labor, land, and resources" (p. 19). She makes clear that both contesting the possessive and extractive logics of colonization and creating the possibilities for a "new Red pedagogy" demand grappling with how Indigenous ways of being and knowing cannot be reduced to these conditions of material expropriation. At the same time, neither Euro-American forms of knowledge nor Indigenous forms of knowledge are thoroughly discrete[8]; instead, each are heterogeneous and—to various degrees—unevenly entwined, even if the arrogance of Euro-American knowledge production continues to disclaim its debts and culpability for the death worlds of logocentricism.

As *settler colonialism* and *decolonization* are increasingly invoked by non-Indigenous scholars and activists, it becomes especially important to engage the specificity, social etymology, and complex genealogies of each term. Decolonization is not an analogy for struggles against domination in general.[9] Decolonization is least helpful when used to suggest a binary relation to colonialism or the retrieval of a more authentic prior to colonial rule. Yet, as much as international law has codified decolonization as a series of mandates and protocols susceptible to the ongoing maintenance of neocolonial and imperial formations, it nevertheless serves to evoke other possible relations and refusals. As Grande contends, "'decolonization' (like democracy) is neither achievable nor definable, rendering it ephemeral as a goal, but perpetual as a process" (p. 166). Decolonization is thus a shifting configuration of strategies and actions, not an event, even as it is nonetheless eventful. Decolonization is a means without end. It is a creative response that necessarily exceeds legibility and reconciliation from the perspective of the conditions from which it arises.

The terrain of struggle mapped by *Red Pedagogy* a decade ago continues to exceed the political boundaries, militarized borders, and knowledge regimes of imperial nation-states. Scholars and activists have grounded their work in ways that both confront the imposed limitations and elisions of the state form and build anti-colonial alliances born of shared conditions of colonial possibility.[10] The practice of "red pedagogy" so forcefully charted by Grande entails the sustained and difficult labor of discerning and enacting these multiple forms of struggle in relation to one another without losing sight of their mutual frictions, tensions, and incommensurabilities.[11]

In this sense, the ethics of being accountable to one another as living radical relationality is itself the possibility of contesting and further disrupting the colonial conditions that continue to be undone. A declaration of radical hope and potentiality, *Red Pedagogy* theorizes with the insurgent forms of knowledge that arise from and sustain decolonization as a collective overcoming and becoming in perpetuity by Indigenous peoples. The urgency of this declaration only intensified in the ten years since *Red Pedagogy* was first published.

WHITESTREAM FEMINISM AND THE COLONIALIST PROJECT: A REVIEW OF CONTEMPORARY FEMINIST PEDAGOGY AND PRAXIS

Sandy Grande

Department of Education
Connecticut College

INTRODUCTION

I feel compelled to begin by stating that I am not a feminist — rather, I am Indígena.[1] Accordingly, this review begins at the intersection of my subjectivity as an indigenous woman and the contemporary feminist project. While, like other indigenous women, I recognize the invaluable contributions that feminists have made to both critical theory and praxis in education, I also believe their well-documented failure to engage race and acknowledge the complicity of white women in the history of domination positions "mainstream" feminism alongside other colonialist discourses. Indeed, the colonialist project could not have flourished without the participation of white women; therefore, as M. Annette Jaimes notes, some American Indian women continue to hold white feminists in disdain because they are perceived first and foremost as constituents of the same white supremacy and colonialism that oppresses all Indians.[2] Thus, like other indigenous women, I theorize and act in public life from a standpoint that presumes *decolonization* (not feminism) as the central political project. In contrast to dominant modes of feminist critique that locate women's oppression in the structures of patriarchy, the project of decolonization begins with the understanding that the collective oppression of indigenous women results primarily from colonialism — a multidimensional force underwritten by Western Christianity, defined by white supremacy, and fueled by global capitalism.

One of the central assertions of decolonization is that the heterogeneity of experience, though significant, does not preclude the power and existence of "grand narratives" (such as colonialism, global capitalism, and the Enlightenment). According to Henry Giroux, grand narratives provide for the historical and relational placement of different groups within some "common project."[3] Thus, while indigenous

1. Though indigenous women share with other women a position of marginality and the experience of structural subordination, I believe their distinct subjectivity as colonized people and members of tribal "domestic dependent nations" places the historical materiality of their lives more on par with indigenous men than with any other subcategory of woman.

2. M. Annette Jaimes, *The State of Native America: Genocide, Colonization, and Resistance* (Boston: South End Press, 1998), 311–344.

3. Henry Giroux, "Crossing the Boundaries of Educational Discourse: Modernism, Postmodernism, and Feminism," in *Education: Culture, Economy, Society*, eds. A.H. Halsey, Hugh Lauder, Phillip Brown, and Amy Stuart Wells (Oxford: Oxford University Press, 1997), 113–131.

women may differ in everything "from blood-quantum to skin color," they share a common experience of being historically and relationally placed within the "common project" of conquest and colonization.[4] Furthermore, this placement connects the lives and experiences of indigenous peoples (the colonized) to each other while it distinguishes them from whites (the colonizers).

Generally speaking, such "binaries" (colonizer/colonized) are anathema to "mainstream" feminism, dismissed as everything from essentialist and universalizing to masculinist and coercive.[5] Among other things, indigenous women view this dismissal as a convenient rhetorical device that not only relativizes difference but that also allows white women to deny their shared complicity in the colonialist project (including the benefits they reap from its mandates and imperatives). Indeed, rather than recognize their participation, "mainstream" feminists have historically presumed a universal sisterhood among all women, erasing important differences in power and social status. As a result, indigenous, "third-world," and other marginalized women have long taken issue with "mainstream" feminists, documenting their failure to acknowledge both the intersections of race, class, gender, and sexuality and the historic dispensations of whiteness.

As a result, what has long passed as "mainstream" feminism is perhaps more appropriately termed "whitestream" feminism — that is, a feminist discourse that is not only dominated by white women but also principally structured on the basis of white, middle-class experience; a discourse that serves their ethno-political interests and capital investments.[6] Other characteristics of whitestream feminism include a heavy dependence on postmodern/poststructuralist theories, a privileging of "academic feminism" over the feminist political project, and an undertheorizing of patriarchy as the universal oppression of all women — all features that have been critiqued by feminists of color and other radical scholars.[7]

Postmodern and poststructural theories have greatly contributed to the project of "radical democracy": by advancing our knowledge of the "hidden trajectories of power within the processes of representation"; the formation of subjectivity and

5. See Patti Lather, "Critical Pedagogy and Its Complicities: A Praxis of Stuck Places," *Educational Theory* 48, no. 4 (1998): 487–497.

6. Adapting from the feminist notion of "malestream," Canadian sociologist Claude Denis coined the term whitestream to connote the idea that, while society is not white in sociodemographic terms, it remains principally structured around the basis of white, Anglo-Saxon experience. See Claude Denis, *We Are Not You: First Nations and Canadian Modernity* (Toronto: Broadview Press, 1997). Leading proponents of whitestream feminism include Judith Butler, Drucilla Cornell, Gilles Deleuze, Jane Gallop, Elizabeth Grosz, Felix Guttari, Donna Haraway, and Patti Lather, among others.

7. The critique of whitestream feminism has been led by women of color, including Jacqui Alexander, Gloria Anzaldúa, Patricia Hill Collins, Angela Davis, Trinh Minh-ha, bell hooks, M. Annette Jaimes, Cherríe Moraga, Chandra Talpade Mohanty, Chela Sandoval, and Barbara Smith, among others.

SANDY GRANDE is Assistant Professor of education at Connecticut College, 270 Mohegan Ave., New London, CT 06320-4196. Her primary areas of scholarship are American Indian education, critical theory in education, and feminist theory in education.

identity; and the relations among "difference," language, and cultural configurations. Nevertheless, radical and revolutionary scholars have developed trenchant critiques of the failure of postmodern and poststructural theories to move beyond the discursive/cultural/textual and their displacement of "a politics grounded in the mobilization of forces against the material sources of political and economic marginalization."[8] Peter McLaren challenges the "questionable assumptions" and dangerous implications of such a discourse:

> [Postmodernists/poststructuralists] view symbolic exchange as taking place outside the domain of value; privilege structures of deference over structures of exploitation, and relations of exchange over relations of production; emphasize local narratives over grand narratives; encourage the coming to voice of the symbolically dispossessed over the transformation of existing social relations; reduce models of reality to historical fictions; abandon the assessment of the truth value of competing narratives; replace the idea that power is class-specific and historically bound with the idea that power is everywhere and nowhere — they end up advancing a philosophical commission that propagates hegemonic class rule and reestablishing the rule of the capitalist class.[9]

Feminist theories that operate under these assumptions have been defined by Teresa Ebert as "ludic feminism" — theories that, following dominant postmodern theories, rearticulate politics as almost exclusively a cultural politics of representation that not only replaces radical critique with "assumptions about linguistic play, difference, and the priority of discourse," but that also separates feminist theory from feminist struggle and practice.[10] In other words, ludic feminists redefine politics as a purely academic exercise. As bell hooks notes, unlike earlier forms of feminist theory, the contemporary production of feminist theory is sequestered behind the ivy walls of academia, where the growing social distance between whitestream academics and the lived experiences of "real-world" women has enabled "high status feminists" to build lucrative careers by theorizing the lives of "other" women — a situation that replicates the relation between colonizer and colonized.[11]

In addition to exacerbating the fissure between feminist theory and practice, the discursive tactics of postmodern/poststructuralist theories allow whitestream feminists to distort the material significance of their privileged position. Following Michel Foucault, whitestream feminists understand power as "diffuse, asystematic, contingent, and 'aleatory' — that is marked by chance and arbitrariness" rather than as something historically and materially determined.[12] In a discourse that reduces politics to a "language effect...aimed at changing cultural representations," it becomes possible to reduce the emancipatory project to one simply concerned with

"giving voice" to the "silenced desires" of (white) women — a pedagogy primarily concerned with how white women feel and whether they are free to express and act upon how they feel.[13] According to Ebert, this discourse routinely equates the pleasure and desires of "first-world," white, bourgeois women with those of "third-world" and other colonized women; by extension, in the realm of feeling, experience, and cultural representation, it becomes possible to equate "the oppressed" with the "distressed." Thus, just as the discursive tactics of postmodernism privilege the indeterminacy of the subject, they also construe power as indeterminate and diffuse.

Ironically, while whitestream feminists employ the postmodern indeterminacy of power to absolve themselves from the colonialist project, at the same time they revert to modernist readings of power in their assertions of patriarchy as a universal and totalizing system. Women of color have taken issue with this undertheorizing of patriarchy. On this point, hooks is worth quoting at length:

> [The universal assumption of patriarchy] is an argument that has led influential Western white women to feel that the feminist movement should be the central political agenda for females globally. Ideologically, thinking in this direction enables Western women, especially privileged white women, to suggest that racism and class exploitation are merely an offspring of the parent system: patriarchy. Within the feminist movement in the West, this has led to the assumption of resisting patriarchal domination as a more legitimate feminist action than resisting racism and other forms of domination. Such thinking prevails despite radical critiques made by black women and women of color who question this proposition. To speculate that an oppositional division between men and women existed in early human communities is to impose on the past, on these non-white groups, a worldview that fits all too neatly within contemporary feminist paradigms that name man as the enemy and woman as the victim.[14]

The critique that feminism is a field dominated by white women and whitestream theories has come to be viewed as a historical problem, a relic of the difficult transitional period between second- and third-wave feminism. Along with this relegation to history comes the implicit (or sometimes explicit) assertion that the argument, "feminism is a whitestream discourse," is passé, a well-rehearsed argument that no longer holds validity. The current plurality of "feminisms" operating in the field is often cited as evidence of the death of whitestream feminism. I agree that liberal, postmodern, Marxist, critical race, socialist, lesbian, womanist, and transnational feminisms, among others, do all occupy a proper and legitimate place in the feminist diaspora. But this apparent eclecticism can be deceiving.

In preparation for this review, I embarked on a tour of contemporary feminism; and while I found a remarkably diverse terrain, I also perceived an uneven playing field where whitestream feminists commandeer "the center" and women of color occupy the margins. Thus, while multiple feminisms clearly operate in the field, it seemed to me that a persistent whitestream discourse continues to define the public face of feminism. This implicit structure marks the feminist terrain as not simply "pluralistic" but, more critically, ghettoized — indicating that whitestream feminists merely perform multiplicity, continuing to resist any significant attenuation of the racial divide.

TEXTS AND CONTEXTS

Insofar as they reflect the profound plurality of the field, the texts at the center of this review provide a representative sample of the literature: Amanda Coffey and Sara Delamont's *Feminism and the Classroom Teacher*; Frances Maher and Janie Victoria Ward's *Gender and Teaching*; Frances Maher and Mary Kay Tetreault's *The Feminist Classroom*; and Kathleen Weiler's *Feminist Engagements*. Indeed, the only common theme that emerges among these books is the examination of the relation between women and education. Beyond that, they have little in common. For example, not all of the texts employ feminist analysis, and those that do engage different and even contradictory feminist theories.

As such, one of the primary aims of this analysis is to test my own perceptions by examining whether whitestream feminism has indeed given way to more complicated readings of gender and power that work not only to "include" the voices of women on the margin but also to incorporate their frames of intelligibility into feminist theory and practice. More specifically, given that the constructs of "race" and "whiteness" evolved in the context of colonialism and imperialism (which is to say the emergence of capitalism and industrialism), I look at whether the feminist project is theorized through a historical-materialist framework — that is, one that engages the intersection of race with questions of capitalism, labor, and economic power. I also look for a feminism that moves beyond textual analysis, providing "a pedagogy of critique that enables us to explain how exploitation operates in the everyday lives of people" for the express purpose of engaging in collective struggle to change exploitive relations.[15] A feminist discourse that engages all of these issues would provide hope and possibility to indigenous and other colonized women, serving as the basis for revolutionary theory and struggle and as the pedagogical home for the project of decolonization.

FEMINISM AND THE CLASSROOM TEACHER: RESEARCH PRAXIS AND PEDAGOGY[16]

SUMMARY. In this text, Coffey and Delamont draw together a "critical mass of literature" in order to "explore the relationships, histories and futures of feminism and teaching" (*FCT*, 2). While the authors draw most heavily on North American and British literature, they work to "employ a variety of research modes and theoretical perspectives...drawing together the polemical and empirical, the cited and the more diverse and scattered bodies of material," to serve as the basis for a feminist analysis of the "everyday realities" of the classroom teacher (*FCT*, 2).[17]

They begin the first chapter with a discussion of feminisms, postfeminisms, and postmodernism in order to situate "the place of feminist analysis in a postmodern

16. Amanda Coffey and Sara Delamont, *Feminism and the Classroom Teacher* (London and New York: Routledge Falmer, 2000). This book will be cited as *FCT* in the text for all subsequent references.

17. More specifically, the authors report that they use "liberal feminist theory" in their analysis of the myriad "imbalances" between men and women in teaching and "radical feminist theories" in their critique of "malestream" epistemologies dominating educational research.

intellectual climate"; in the following chapters they examine different aspects of teachers' work, including "the practical contingencies of the classroom," the "intellectual knowledge work of the teacher," the "teaching career path," and the "day-to-day biographies and experiences of teachers" (*FCT*, 2). Based on the evidence presented in these chapters, Coffey and Delamont conclude that women teachers continue to struggle in school systems defined by patriarchy, where prevailing notions of masculinity continue to dominate management strategies, disciplinary practices, the distribution of power, and the school curriculum.[18]

Moving from an analysis of the working life of teachers, the authors explore feminist contributions to the history of teaching, examining the material realities of the profession's "foremothers." Women teachers of "the pioneering days" are depicted as courageous early champions of both feminism and education, advocating for structural improvements and curricular innovations in schools. Following this era, women teachers are depicted as persisting and resisting through times of economic depression and ideological oppression, tirelessly campaigning for the extension of educational opportunity, equal pay, and an end to the "marriage bar" (*FCT*, 105). Coffey and Delamont conclude their historical analysis with an examination of the advent of coeducation and its negative effects on women's careers, asserting that the career structures of women were disrupted as men usurped top management and supervisory positions and thus displaced both women and women's authority.

In the final chapter of *Feminism and the Classroom Teacher*, the authors return to "the feminist project in education," addressing feminist epistemology and research praxis. In this analysis they "demystify" research as objective and neutral and recast it as socioculturally situated (that is, "personal, emotional, sensitive, [and] reflective"), concluding that "feminist research" is more determined by its application and context than by its method.[19]

ANALYSIS. Insofar as this text examines women, feminism, and the feminist project in essentialist terms (that is, where women and feminism are positioned in contrast to men and patriarchy), without any consciousness of how such constructs are informed by race, it sits squarely in the whitestream tradition. Indeed, Coffey and Delamont's examination of sexuality represents their only substantive effort to complicate gender.[20] Furthermore, while they examine issues of class, they do so in a manner that treats class as another form of individual difference, not as a historically determined social construct.

18. Due to this climate, the authors report "many self-identified feminist teachers resist being openly identified as feminist in the same way that lesbian teachers often resist or actively mute a lesbian label, fearing it 'dangerous' or a catalyst for further ridicule" (*FCT*, 73).

19. They note, for example, that even surveys in the positivistic tradition (once seen as the "antithesis" of feminist research) can be constructed in ways that provide valuable data for feminist research.

20. More specifically, the authors examine the different experiences of lesbian teachers, particularly their struggles with managing the disclosure of sexual identity, teaching sexuality, and "queering the curriculum."

For example, while the authors recognize the existence of a class-tiered system in education, they do not discuss the implications of such a system for a democratic society. Rather, they are only concerned with the mitigating effects of class structure on the careers and professional opportunities of individual (white) women. Their historical analysis of "the feminist influence" on working-class elementary schools and fee-paying secondary schools for middle- and upper-class girls exemplifies this problem: The schools are discussed only in terms of the role they played in opening avenues to higher education and professional training. According to Coffey and Delamont, middle-class schools created jobs that were "socially respectable and paid a sufficient salary for a woman to live independently without the economic support of her father, or a husband" (*FCT*, 95). In contrast, working-class schools were notable for their relatively poor employment opportunities and "harsh" working conditions. The authors bemoan that white middle-class women teaching in working-class schools were subjected to "Spartan" living accommodations and were expected to do "domestic" work:

> Teaching in the elite schools was hard work, but the salary and status made it a reasonable choice. The pupils and students taught, and their parents, came from a similar class and there were common values. The lives of those who taught the working classes were harder. Salaries were lower, saving less possible, the status lower, and the conditions of work much worse. Classes of forty, in dreadful buildings, with children who would smell, refuse discipline, and exhaust their teachers meant that staying in the job was a brave decision (*FCT*, 98).

Apparently, from the authors' perspective, a "feminist analysis" of the history of teaching looks only at the working conditions of white women and the impact of such conditions on their opportunities for social and economic mobility. Missing is any structural analysis of a capitalist system that exploits members of the working class or of a colonialist system that privileges white women and their desires for equality and social mobility over the democratic imperative of extending access and equity across class and racial groups. Instead, members of the working class appear only to represent undesirable ("smelly" and "undisciplined") impediments to the feminist pursuit for adequate careers and equal pay for equal work.

Moreover, by failing to mention the struggles of people of color to gain access to education, the authors disregard the concerns of racially disfranchised groups, treating them as immaterial to the employment opportunities of white, middle-class women teachers. One of the most egregious examples of privileging white women's experience appears in Coffey and Delamont's concluding thoughts on "the foremothers" of today's teachers: "the women who taught in the 'Wild West,' in the virgin territory of Australia, and in the pioneering girls' schools like Wycombe Abbey were heroines and deserve to be remembered, not least because of the struggles they overcame and the legacies they left" (*FCT*, 105). The use of such language as "Wild West" and "virgin territory" to describe Indian and Aboriginal territories in the United States and Australia reveals the authors' racist construction of indigenous peoples as either savage ("wild") or invisible. Moreover, their concomitant construction of the white teachers as "heroines" fails to account for the complicating fact that such women were first and foremost colonizers: middle- and upper-class missionaries working to "civilize" and claim indigenous lands, cultures, minds, and bodies.

Indeed, such women do "deserve to be remembered for the legacy they left" — a legacy that includes the deculturalization and colonization of indigenous lands and peoples.

Coffey and Delamont's work, therefore, epitomizes whitestream feminism. They not only fail to problematize gender by examining its intersections with race and class, but they also maintain the distortions and aporias of a whitestream logic that privileges the desires and fantasies of the dominant class over the experiences and concerns of the culturally marginalized and politically disfranchised.

GENDER AND TEACHING[21]

SUMMARY. In comparison, Maher and Ward theorize gender as a more complex and fluid category, one that engages race, class, and sexuality. They identify their theoretical approach as "radical social reconstructionist," taking into account the "larger cultural, social and political dynamics" of both school and society, and examining how such dynamics operate to marginalize poor, working-class, gay/lesbian, female, and nonwhite students.[22]

The authors examine this interplay in part I of the text by presenting four case studies, which are essentially classroom scenarios in which a teacher is forced to negotiate a situation that involves issues of race, class, gender, or sexuality.[23] The presentation of each case study is followed by "reader reactions" solicited from prospective and practicing teachers and administrators. These reactions are intended to represent "some of the many and diverse ways in which people both in and outside of school systems tend to act and deal" with issues of gender, race, class, and sexuality (*GT*, 110). Finally, Maher and Ward provide a summary and a set of follow-up questions to conclude each case study.

In part II of *Gender and Teaching*, the authors engage a broader theoretical discussion of gender in which "conservative," "liberal progressive," "women-centered," and "radical multicultural" frameworks are discussed as the prevailing "public arguments" that guide perspectives on gender and educational policy.[24] The case studies are then reconsidered through each of these frameworks. The discussion ends with a set of questions intended to encourage readers to consider the

21. Frances A. Maher and Janie Victoria Ward, *Gender and Teaching* (New Jersey and London: Lawrence Erlbaum Associates, 2002). This book will be cited as *GT* in the text for all subsequent references.

22. Though they recognize the interplay of gender, race, class, and sexuality, Maher and Ward clearly foreground gender as the central lens through which difference is negotiated. See, for example, *GT*, 110.

23. Case 1 portrays a "Hispanic" teacher faced with negotiating sexism within her own community and classroom; case 2 concerns two teachers with differences of opinion regarding the behavior of one African-American boy and the societal phenomenon of disproportionate numbers of black boys being referred to special education; case 3 focuses on recurring instances of sexual harassment and homophobia in one high school class; and case 4 explores "the gendered, racialized, and sociocultural aspects of the teaching profession."

24. To summarize, the conservative argument is defined as that which supports maintenance of women's "traditional" roles in the family and the importance of discipline, character building, and "the basics" in the classroom. This position simultaneously delegitimizes group identity, multiculturalism, and the ostensibly "water-downed curriculum" it engenders. The "liberal-progressive" argument is defined as that which promotes recognition of gender equality (not difference) as the central feature of democratic and

implications of each line of argument and to determine their own location on the ideological/political spectrum. Finally, in part III of the text, the authors define their own perspective, "radical social reconstructionist," which they describe as being most similar to the radical multiculturalist model with "admixtures of all the others" (*GT*, 110).

Overall, Maher and Ward recognize the importance of analyzing gender through its intersections with race, class, and sexuality, as well as the need to examine school as a site of social struggle where asymmetries of power are played out. They also stress how important it is for teachers to play an active role in reimagining school and society along democratic aims: "teachers must work to challenge the social inequalities that operate in each and every classroom...[making] sure the curriculum contains explicit references to inequality and resistance" (*GT*, 117).

ANALYSIS. Though Maher and Ward promote a radical politics of difference and social change, they ultimately adhere to a "liberal progressive" epistemological frame that privileges individual choice, objectivity, and impartiality over social transformation. At several points in the text they remind the reader that the book is simply a tool intended to assist the development of their own viewpoints. This approach is particularly apparent in the section where "public arguments" are articulated. First, a menu of arguments is provided with each being delineated as equally tantalizing and legitimate. Among the offerings is the "conservative" argument, which views feminists as anti-family, multiculturalism as the politics of victimhood, and schools as being taken over by "a host of anti-white, anti-male, anti-family, and anti-religion fanatics" (*GT*, 76). Next, the reader is invited to make their selections, guided by such questions as "What aspects of this viewpoint are appealing to you?" and "What aspects do you disagree with?" While this approach may encourage development of the reader's point of view, it also ignores the ways in which such liberal approaches to pedagogy, cloaked in veils of objectivity and rational discourse, contribute to the maintenance of dominant paradigms by presenting them as equally legitimate alternatives.

Marxist feminist Ebert argues that such discourse legitimates, among other things, "a pragmatic pluralism that tolerates exploitation as one possible free choice" and ultimately privileges the importance of individual choice over radical social transformation.[25] Thus, while Maher and Ward articulate a "radical politics of

student-centered education. Liberal-progressives resist the "male-versus-female trap" by focusing on the individual, working to right past discrimination through the equal inclusion of all voices. The "women-centered" argument is defined as that which recognizes the importance of gender differences and the need to give more attention to "women's perspectives on the world." Emphasis on "women's ways of knowing" and "women-centered classrooms" are advocated as a means of rethinking education in order to prepare students for the productive as well as reproductive aspects of society. Finally, the "radical multiculturalist" argument is positioned in contrast to all others: it rejects the conservative aim of preserving the economic and political status quo, the liberal focus on equality and individualism, and the essentialism inherent in women-centered pedagogies. Radical multiculturalists construct gender, race, class, and culture as interlocking categories of discrimination, oppression, and potential empowerment and advocate for equity in both school and society.

25. Ebert, *Ludic Feminism and After*, 17.

difference" that examines gender through its connections and intersections with the "structural dynamics and practices" of race, class, and culture, their presentation of material fails to assert this agenda as a democratic imperative. Rather, they position the need for social transformation as merely one option among many, including the maintenance of social control by the dominant class. While there is pedagogical value in engaging students in critical reflection and decision making, the authors should consider the costs of academic feminism, particularly if it comes at the expense of feminist struggle and social change.

Finally, their failure to analyze gender as one of many different power relations that emerge through the projects of global capitalism and colonization tethers their analysis to the imperatives of these projects. In other words, when not explicitly tied to a politics aimed at dismantling capitalism and decolonization, feminist struggles for equal access and power are suspect, covertly operating as struggles for equal access to material resources and for the power to consume and, ultimately, to dominate.

THE FEMINIST CLASSROOM: DYNAMICS OF GENDER, RACE, AND PRIVILEGE[26]

SUMMARY. This text is essentially an account of its authors' examination of feminist pedagogies in action. Specifically, Maher and Tetreault study practitioners working at several different institutions who have been identified by their feminist colleagues as "well known for their commitment to women's studies and to fine teaching" (*FC*, 4).[27] Next, they analyze the data through four analytic themes — mastery, voice, authority, and positionality — that cut across differences in pedagogical style as well as classroom and institutional demographics (*FC*, 22).[28]

In this second edition of *The Feminist Classroom*, Maher and Tetreault not only provide documentation and analysis of their original findings, but they also revisit their initial analysis, adding new reflections, insights, and commentary. In particular, they acknowledge that one of the major aporias of the first edition (as noted by readers and reviewers) was an insufficient analysis of race, especially in terms of how "the workings of unacknowledged whiteness" shapes classroom discourse: "like other white feminists [we] focused on the situations and experiences of women as

26. Frances A. Maher and Mary Kay Thompson Tetreault, *The Feminist Classroom: Dynamics of Gender, Race, and Privilege* (Lanham, Massachusetts: Rowman and Littlefield, 2001). This book will be cited as *FC* in the text for all subsequent references.

27. Initially, five schools with nationally visible projects in gender and women's studies were chosen: three liberal arts colleges (one of which was a historically black women's college), one research university, and one state university. A sixth school (San Francisco State University) was added midstream when the racial homogeneity of the initial five schools presented limitations to their study. The six schools included in their final sample were University of Arizona, Towson State, Lewis and Clark, Wheaton College, Spelman College, and San Francisco State.

28. Mastery refers to the myriad ways in which feminist praxis entails "struggle for control" (over construction of knowledge, research procedure, and methodology). Voice refers to student subjectivity and the power of voice to shape classroom knowledge. Authority is examined in terms of how the professors perceive and exercise authority in their classrooms and how the researchers perceive and exercise authority in the processes of their study. Positionality refers to the knower's sociocultural location in terms of "gender, race, class and other socially significant dimensions," and the ways in which this positionality influences the construction of knowledge.

victims of oppression," downplaying the complex relations of power presented by race (*FC*, 8). To address this issue, the authors have added a new chapter that focuses specifically on how assumptions of whiteness influence classroom discourse.

It should be noted that the authors' struggle to understand the implications of race are not mirrored in their treatment of sexuality. While the concerns of lesbian feminists and considerations of queer theory were not explicit aims of their analysis, such issues surfaced through the lives and narratives of participants who, in one form or another, struggled with sexuality and its impact on the formation of knowledge and classroom discourse. The authors also seemed to anticipate the effects of sexuality in ways that they did not anticipate (or even exhibit consciousness of) in their analysis of race.

Nevertheless, in *The Feminist Classroom* Maher and Tetreault work to articulate the distinctive challenges presented by the myriad and intersecting aspects of subjectivity and the error of constructing "woman" as a homogenous category, explicitly distancing themselves from forms of "cultural feminism" that engage such simplistic analyses.

ANALYSIS. While the authors demonstrate adeptness at *theorizing* the intersections of gender, they do not always synthesize their understandings into their conceptualization of feminist praxis. In the real world of classrooms, the authors tacitly adhere to a rather essentialist notion of feminist pedagogy, one that relies upon classroom practices that are student-centered, nonauthoritarian, and collaborative/cooperative in nature. Similarly, pedagogical practices that are decidedly teacher-centered, authoritarian, and individualistic are implicitly categorized as nonfeminist or patriarchal.

More significantly, while individual practitioners problematize the values of "student-centered," "nonauthoritarian," and "cooperative" as being raced and classed, these values are, by the end of the text, still assumed to be universal characteristics of "feminist" praxis and "women's" ways of knowing. While it could be argued that feminist pedagogy requires adherence to some abiding values and structures, Maher and Tetreault never make this argument explicit.[29] On the contrary, they persist in their construction of "the feminist classroom" as a space in constant flux, where all things are continually negotiated. The contradiction inherent in characterizing feminist pedagogy as both indeterminable and finite is not examined, particularly in terms of its implications for the political project of feminism and the ways in which postmodern feminisms may inhibit broad-based political action and social change.

The authors' failure to consider the connection between postmodern/academic forms of feminism and the political inertia of the feminist project is evident in their dismay over the current divide between generations of feminist scholars: "another clue about the unfinished business of feminism in the academy comes from

29. In other words, if feminist pedagogy is a space in which all approaches are equally valid, there would be nothing to distinguish it from nonfeminist forms of classroom teaching and organization.

observations our older informants made about the new generation of feminist scholars" (*FC*, 272). One of these observations was that younger faculty do not share the same commitment to feminism, instead "see[ing] feminism as a theoretical position, not a political agenda" (*FC*, 273).

While the political apathy of young feminists is indeed distressing, Maher and Tetreault, rather than thoroughly examining its origins, facilely indict the patriarchal nature of the institution and its resistance to change as the force behind young feminists' disenchantment with politics. The possibility that the "new generation" of feminists might be disenchanted with whitestream feminism's privileging of textual analysis over a politics of engagement is not even considered.

FEMINIST ENGAGEMENTS: READING, RESISTING, AND REVISIONING MALE THEORISTS IN EDUCATION AND CULTURAL STUDIES[30]

SUMMARY. This edited collection is significantly different from the other texts reviewed here in that it is primarily theoretical and aimed at defining the relation between feminist theory and the "intellectual heritage of men" (*FE*, 3). Editor Kathleen Weiler acknowledges that, while education feminists have been profoundly influenced by "classic male theorists" (such as John Dewey, Foucault, Paulo Freire, Antonio Gramsci, and Stuart Hall), the relation between feminist theory and "critical, democratic male theorists" is uneasy. At the outset, she poses the following critical question: "[though] our ultimate goals may be very similar...what do we take on if we imagine ourselves as the inheritors of these 'gender blind' theories and...apply them to our concerns as feminist women?" (*FE*, 3).

The text essentially unfolds as a collective response to this question, with different feminist scholars articulating their particular intellectual relation to male theorists. Though the authors define a wide variety of approaches, Weiler roughly categorizes their responses as follows: (1) those that employ "negative engagement" or use "critique as a point of departure for feminist analysis"; (2) those that engage "appropriation and application" or apply "the ideas of male theorists to feminist concerns with little or no critique"; and (3) those that employ "critical engagement" — that is, subject the conceptual frameworks of male theorists to feminist analysis — engaging in strategic readings that make use of the theories for "defined political goals" (*FE*, 5–6). Weiler recognizes the legitimacy of both "negative engagement" and "appropriation and application," but she clearly privileges critical feminist theory as the most potent approach, identifying it as the "stance most frequently taken by writers in the collection" (*FE*, 6).[31] According to Weiler, critical feminists are committed to "alliances across race and ethnic lines" and to putting forth complex readings of male antiracist theorists who articulate goals of liberation and human

31. In correspondence with Weiler's own estimate, five of the nine authors explicitly claim to write from a "critical feminist" perspective, indicating that the majority of authors work to disrupt the whitestream discourse.

rights in "powerful and poetic rhetoric" but ignore "women's concerns" in the process (*FE*, 6). Through this approach, they explore the dangers of "using a male intellectual tradition that has objectified or ignored women" as the theoretical foundation of a feminist critique of that same tradition. In addition, critical feminists perceive themselves as "speaking directly to white and heterosexual women about their blindness to their own privilege and their ignorance of the profundity of differences among women" (*FE*, 4–5).

ANALYSIS. Despite Weiler's initial proclamation, most of the essays in *Feminist Engagements* do not demonstrate consistent adherence to the principles of critical feminism. First of all, only two of the nine authors are women of color — one self-identified black-Jamaican woman and one African-American woman — indicating that critical feminists' "commitment across racial and ethnic lines" begins and ends at the black–white divide.[32] Moreover, while some of the white women address race in their essays, it is clear that the race question is relegated to the women of color. In other words, Cally L. Waite (who writes about W.E.B. Du Bois) and Annette Henry (who writes about Stuart Hall) have clearly been designated as the theorists of color "assigned" to write about black male theorists and to confront the question of black women and education. In addition to the theoretical deficiencies that result from examining race in terms of color and culture, the majority of contributors also fail to problematize race through its intersections with class and its connections to capitalist exploitation and colonization. Rather than examine gender–power relations through the historical and socioeconomic structures in which they are embedded, most of the authors extend an analysis grounded in simplistic readings of a universal and abstract "patriarchy." Thus, only two authors — Weiler and Jane Kenway — actually engage a "critical feminist" analysis as Weiler defined it in her introduction to the collection. Since these two essays represent the kind of (anti-whitestream) feminist discourse I am calling for, I provide a more detailed account and analysis or these works.

In her essay "Rereading Paulo Freire," Weiler begins by acknowledging feminism's grounding in both racist and patriarchal (Western) theories:

> The social and political goals of U.S. feminism were originally framed around liberal, Enlightenment conceptions of rights and justice for women; it has subsequently condemned patriarchal desires and practices using the Western discourses of psychoanalysis and poststructuralism. This grounding in the Western tradition has been a profound limitation for feminism, as the work of women of color and feminists outside the dominant Western tradition have so forcefully made clear (*FE*, 67).

Weiler goes on to acknowledge the dangers and limitations of feminist theories that operate on essentialist constructions of both men and women, noting that "such approaches tend dangerously toward recasting the same old story of Western patriarchy, in which rationality is the province of men, and feeling and nurturance that of women" (*FE*, 70).

32. While it could be argued that this divide is the most significant in terms of the intellectual history of U.S. feminism, such an argument is not provided, and the voices of Asian-American, Latina, indigenous, and other marginalized women are ultimately excluded in both theory and practice.

What makes Weiler's analysis unique, however, is that it moves beyond a mere critique of whitestream feminism and integrates a more complex analysis of racial and class difference into the foundation of her own theory. She begins by recognizing the privileges inherent to her own positionality (as a white middle-class woman) and examines the ways in which her "social and historical location" (as outside "the oppressed") shapes her work and, in this instance, her critique of Freire. She cautions against "women" positioning themselves "on the same side" as the oppressed without any regard for the differences in power and privilege among women: "the fallacy of assuming there is a single category — woman — hides the profound differences among women in terms of their race, class, nationality, and other aspects of their identities" (*FE*, 75).

Ultimately, the power of Weiler's critique lies in the parallels she draws between whitestream feminists' failure to theorize race and class and male liberatory theorists' failure to theorize gender. Unfortunately, her analysis loses some ground when she turns to the specifics of Freire's work, holding him accountable in a tone and manner that she does not take with her feminist colleagues. Nevertheless, Weiler extends a powerful critique of any form of liberatory scholarship that does not theorize the intersections of race, class, and gender — including feminism. Though she does not write specifically about the connection between liberatory political projects and the imperatives set in motion by global capitalism and colonialism, her work leaves open the possibility of engaging this analysis.

Where Weiler merely alludes to the importance of historical-materialist critique, Kenway expressly calls for critical feminists to undertake this project. In her essay "Remembering and Regenerating Gramsci," Kenway argues that a firm grounding in materialist analysis is essential to the feminist project. She notes that feminist scholars of the mid-1980s (such as Madeleine Arnot, Sandra Kessler, and Patti Lather) were committed to defining the ways Gramsci's work could inform feminism; she argues that, as a result, scholarship of this era developed a "nonclass reductionist reading of Gramsci" that blends "the small scale with broader questions about how the social order reproduces itself in complex and contested ways through education" (*FE*, 59). Kenway observes that, since the mid-1980s, partly due to the influence of postmodernism, Gramsci is no longer considered a "fashionable theorist" among feminists. She itemizes the ill effects postmodern discourse has had on emancipatory projects:

> This [postmodern] theoretical move has seen an eroded interest in the economy and social class, an intensified concern with discourse, difference, and subjectivity and with consumption rather than production. Throughout this period there has been much more interest in mini-narratives rather than metanarratives, multiple identities rather than political identities, positioning rather than repositioning, discourse rather than politics of discourse, performance rather than poverty, inscription rather than political mobilization and deconstruction rather than reconstruction. Culture has been much more the focus of analysis than the economy — even its cultural elements — and notions of difference and plurality have held sway over the trilogy that emerged in the 1980s of class, race and gender (*FE*, 60).

According to Kenway, the net effect of postmodern feminism is that a "politics of recognition" is privileged over the "politics of redistribution," signaling a retreat from engagement in "practical political activity" (*FE*, 59–60). She finds such a retreat

intolerable and seeks to reinvigorate feminist theory with "matters economic" and theories of difference with an understanding of subaltern groups as those subject to economic exploitation, marginalization, and deprivation (*FE*, 61).

Most important, however, Kenway insists on re-grounding feminist theory in historical-materialist analysis, maintaining that such a Gramscian view of feminism would require "serious empirical attention to the relationships among the ideological processes and economic and political arrangements of contemporary, globalized times" (*FE*, 61). More specifically, she calls for feminist studies that examine "present forms of economic colonization" and the new material conditions of alienation and exploitation that they engender. Such new forms of "feminist class analysis" would theorize the ways in which struggles over meaning and identity articulate with struggles over other resources, highlighting "the multiple registers of power and injustice" (*FE*, 61).

Above all, Kenway is confident that a renewed commitment to historical-materialist analysis would reinvigorate the feminist political project, rendering it "better prepared" to engage "the big issues" of our time (*FE*, 62). The advocacy of such an agenda places Kenway's analysis squarely at the intersection of race, class, and gender, as well as "on the same side" as analyses generated by women from subaltern groups. Unlike Weiler, who registers her unease with women positioning themselves "on the same side as" the oppressed, Kenway avoids enacting the presumptions of whiteness by developing an analysis that accounts for the complex intersections of power. In terms of its ability to theorize these intersections and to offer an analysis that accounts for the effects of colonialism and global capitalism, Kenway's essay not only stands apart from the rest of the articles in *Feminist Engagements* but also from the other texts examined for this review.

While Kenway's work represents the antithesis of whitestream feminism, Lather's "Ten Years Later, Yet Again: Critical Pedagogy and its Complicities" stands in stark contrast, (re)committing all of its original sins.[33] In her essay, Lather works to undermine the legitimacy and relevance of historical-materialist analysis for feminist work, seeking instead to "sensitize" the discourse of radical critique to the issues raised by poststructuralism" (*FE*, 184).[34] According to Lather, critical pedagogy's concern with a conscious unitary subject, economic materialism, "totalizing categories," and positions of closure all derive from a patriarchal view of the world, creating an inherent tension between critical and feminist pedagogies. Though this tension was previously aired in a series of exchanges between education feminists and "the

33. "For the purposes of economy and concentration," Lather limits her critique of critical pedagogy to the analysis of *one essay* by Peter McLaren. As a school of thought, critical pedagogy spans at least seventy years and McLaren's work alone spans more than twenty years. To limit a review of critical pedagogy to one essay by one author seems highly reductionistic, ironically violating one of the principles of the kind of feminist analysis Lather endorses.

34. For a more extensive discussion of Marxist and Marxist-feminist responses to Lather's critique of historical-materialist analysis and Marxism, see Dave Hill, Peter McLaren, Mike Cole, and Glenn Rikowski, eds., *Marxism Against Postmodernism in Educational Theory* (Lanham, Maryland: Lexington Books, 2002).

boys" of critical pedagogy nearly ten years ago, Lather regards the problems as still relevant, producing "the truth of critical pedagogy as a 'boy thing' and the use of poststructuralism to deconstruct pedagogy as a 'girl thing'" (*FE*, 184). She explains, "this is due not so much to the dominance of male authors in the field as it is to the masculinist voice of abstraction, universalization, and the rhetorical position of 'one who knows'" (*FE*, 184).

In contrast to the "certainties" presumed by critical pedagogy, Lather proposes a feminist praxis of "not being so sure," or one in which "questions are constantly moving and one cannot define, finish, close" (*FE*, 184). She further asserts that "rather than return to historical materialism...my interest is in a praxis in excess of binary and dialectical logic, a praxis that disrupts the horizon of already prescribed intelligibility" (*FE*, 189). Ultimately, she calls for a feminist praxis that attends to the "poststructural suspicions of rationality, philosophies of presence, and universalizing projects," that embraces undecidability and the unforeseeable (*FE*, 189–190).

At base, it seems that Lather calls for feminism to move away from standing for something (as in being *against* exploitation and *for* emancipation) to nothing, the unknown, the undecidable, the unforeseen. Ironically, she levies this call for uncertainty and incompleteness with a great deal of certitude, adopting the voice of "one who knows" to argue that poststructuralism is "the one right story."[35] In so doing, Lather writes in the dominant voice of whitestream feminism — a post-Marxist, postmodern, poststructural voice that rejects the so called patriarchal and "masculinist" theories of Karl Marx and other emancipatory theorists, taking issue with the goal of emancipation itself as "messianic."

CONCLUDING THOUGHTS

The aim of this analysis has been to determine where contemporary forms of feminism have maintained their adherence to whitestream logic and where they have moved beyond this logic to engage in historical-materialist analyses that account for both the intersections of gender and power (as specifically expressed through race and racism) and the forces of global capitalism and colonization. The texts under review here ultimately reveal a discourse that, by and large, is unconcerned with or merely genuflects to race; that remains fundamentally "academic" and stubbornly resistant to more complicated analyses of gender and power; and that ignores the issues of production, labor, and economic power — the machinery of capitalism and colonization. In other words, these texts simply theorize race as color and culture; gender as white, female, and middle class; and class as just another form of difference.

Such analyses are not only deeply insufficient, erasing the "real historical, material, specificity of bodies" and their struggles over "the relations of production," but they also work to obfuscate feminism's implication in the larger social contradictions of colonization and global capitalism.[36] Indeed, the whitestream feminist

36. Ebert, "For a Red Pedagogy," 808.

dismissal of emancipatory theories that take the issues of economics, labor, production, and exploitation seriously — treating them as little more than ventures in masculinist discourse and "messianism" — is voiced so adamantly that it begs the question: Who gains from abandoning the problems of labor? One response is that it allows white middle-class women to ignore the fact that the gains they have made in terms of power and resources have come at the expense of poor women and women of color both nationally and internationally. In this sense, Ebert draws a distinction between *emancipatory pedagogies*, which explain how exploitative relations operate in the everyday lives of people so that they can be changed, and *liberatory pedagogies*, which privilege the desiring subject at the center of their politics, protecting the material interests of the powerful and propertied classes. In this light, Lather's resistance to "totalizing" and "universal" categories (and her subsequent assertions of indeterminacy) is revealed as a "legitimization of the class politics of an upper-middle-class Euroamerican feminism obsessed with the freedom of the entrepreneurial subject."[37] In other words, the "master discourses of liberation" (such as whitestream feminism) ultimately work to privilege the desires of the white, bourgeois, female subject over the collective emancipation of all peoples.

Based on the texts considered for this review, it appears that whitestream feminism's failure to engage more substantive analyses of power can mainly be attributed to the emergence of "ludic" postmodern and poststructural feminist theories. The capriciousness of such theories enables whitestream feminists to disregard the political imperatives of radical critique and to replace them with "poststructuralist assumptions about linguistic play, difference, and the priority of discourse."[38] As a result, academic feminists have virtually transformed the feminist project into a textual practice that isolates language and ideas from their historical and materialist frames of reference.

The writings of whitestream feminists reviewed here provide various rationales for privileging the personal world of text over the so-called patriarchal world of social transformation. They claim that writing in an intimate voice, about local knowledges, and with partial understanding is an act of resistance against the "masculinist voice" of universalization and truth, which depicts oppression in "essentialist" terms. Despite such claims, the rejection of "totalizing" narratives, particularly those that depict "oppressor" and "oppressed" in a binary relation, ultimately enables difference to be relativized and the power and ubiquity of totalizing projects such as colonization to be diminished. Indeed, it becomes impossible, if not profane, in whitestream feminism to speak of the relations of colonizer/colonized and oppressor/oppressed, as such language is viewed as the "residue of modernity" and patriarchal oppression.[39] Although they claim that they use postmodern tactics to put "emancipatory agendas under suspicion for their coercion, rationalism, and

universalism," these tactics ultimately serve the whitestream quest for absolution and desire more than they serve the projects of emancipation or decolonization.

In the final analysis, feminist pedagogies that merely assert the equality of female power and desire are accomplices to the projects of colonialism and global capitalism. As an indigenous woman, I understand such discourse as a "theory of property holders," of privileged subjects unwilling to examine their own complicity in the ongoing project of colonization. Until feminism's participation in the forces of domination is widely acknowledged, indigenous and other colonized women will continue to resist its premises.

Dangerous Difference: A Critical–Historical Analysis of Language Education Policies in the United States

Teresa L. McCarty
University of Arizona

> [U]nless the stream of [German] importation could be turned ... to other Colonies, ... they will so out number us, that all the advantages we have will not ... be able to preserve our language, and even our government will become precarious.
>
> —U.S. statesman and inventor Benjamin Franklin, in a letter to a British member of Parliament, May 9, 1753 (cited in Crawford, 1992, p. 19).

> No unity or community of feeling can be established among different peoples unless they are brought to speak the same language, and thus to become imbued with like ideas of duty. Deeming it for the very best interest of the Indian, both as an individual and as an embryo citizen, ... no school will be permitted on the reservation in which the English language is not exclusively taught.
>
> —Commissioner of Indian Affairs J. D. C. Atkins, in his annual report of 1887 (cited in Crawford, 1992, pp. 50–51).

> *Gobernar es poblar* translates "to govern is to populate".... Will the present majority peaceably hand over its political power to a group that is simply more fertile? ... As Whites see their power and control over their lives declining, will they simply go quietly into the night? Or will there be an explosion?

> —John Tanton, cofounder of U.S. English and founder of the Federation for American Immigration Reform, in a memorandum to supporters, October 10, 1986 (cited in Crawford, 1995, p. 68).

As ideological constructs, language policies both reflect and (re)produce the distribution of power within the larger society. Language policies may be officially sanctioned, as in the 1887 dictate of Commissioner Atkins, just mentioned, or as exemplified a century later in the 1986 passage of California's Proposition 63, making English the state's official language. Language policies are often assumed to involve "government action or lack of it" regarding language statuses and uses (Ricento & Burnaby, 1998, p. 33). This definition, however, tends to reify official acts and formal state policies, and to obscure the complex human dynamics these policies represent. Here, I view language policy as a *sociocultural process*: that is, as modes of human interaction, negotiation, and production mediated by relations of power (see, e.g., Bourdieu, 1977; Levinson, Foley, & Holland, 1996; Wiley, 2000). From this perspective, language policy includes public and official acts and documents, but equally important, it constitutes and is constituted by the practices each of us engages in every day. "When we fight in support of a community-based language program," Pennycook (2001) writes, "when we allow or disallow the use of one language or another in our classrooms, when we choose which language to use in Congress, conversations, conferences, or curricula, we are making language policy" (p. 215). Holm (in press), and Parsons-Yazzie (1996/1997) provide a more specific and intimate example: When a bilingual Navajo child hears a request in Navajo from her parent and chooses to respond in English, that child is also responding to a wider discourse on language policies. At the same time, child and parent are negotiating the language policy of the home.

Schools are among the most dominating discursive sites in which both official and unofficial language policies are produced and legitimated. In this chapter, I offer a critical–historical analysis of these enactments in the education sphere. Grounded in critical pedagogy and a historical–structural approach to language planning (see, e.g., Bourdieu, 1977; Forester, 1985; Freire, 1970, 1993, 1998; Pennycook, 1999; Tollefson, 1991, 2002), this analysis assumes that medium-of-instruction policies are neither historically nor socially neutral. As Pennycook (2001) points out, they are not simply about "the educational efficiency of one code over another" (p. 195). Rather, choices about media of instruction, whether officially sanctioned or not, concern struggles for political and economic participation, democracy, and human rights. Expanding on an earlier analysis of Indigenous educational and linguistic rights (Lomawaima & McCarty, 2002; McCarty, 2002a), I argue that these struggles can be conceptualized as contests over what constitutes "safe" versus "dangerous" difference in human social life.[1] In these contestations, language becomes a proxy for social class and race.

For example, how do we explain the paradox of the value placed on foreign language instruction in U.S. schools, and the simultaneous devaluing of those same "foreign" languages among Indigenous and immigrant minorities? In Arizona, the state with the most restrictive antibilingual education policy to date, public school districts have been placed in the position of expunging non-English languages from English language learners (ELLs), while being simultaneously required to provide foreign language instruction as part of the core K–12 curriculum. Who are the intended recipients of these two different medium-of-instruction policies? Whose interests are being served by sorting language education in these ways? And, if we assume a federal commitment to eradicate Indigenous languages, as articulated by Commissioner Atkins in 1887, how do we explain the subsequent federally sponsored development and dissemination of Native language teaching materials? How do the 1968 Bilingual Education Act, the 1975 Indian Self-Determination and Educational Assistance Act, and the 1990/1992 Native American Languages Act square with widespread standardizing regimes focused on English (only) and scripted reading programs?

In the context of historically constituted power relations, these apparent policy contradictions can be seen as responses to larger political, socioeconomic, and demographic forces. When linguistic and cultural diversity have been viewed by dominant interests as instrumental, "safe," or nonthreatening—as was the case in the colonial United States, Benjamin Franklin's protestations notwithstanding—linguistic and cultural pluralism has been tolerated and even supported in official and unofficial ways (Heath, 1992). "Dangerous" difference—manifest, for instance, in the presence of enslaved Africans who were systematically denied access to English literacy, and more recently in the Ebonics controversy—is frequently associated with what Hill (2001) calls "language panics." The Ebonics controversy, in which the Oakland, California school board's recognition of the vernacular language of its African American students unleashed months of media furor, is one illustration of a "national language panic" (Hill, 2001, p. 250). One response to the controversy was the introduction of bills in the California legislature and the U.S. Congress disapproving the use of state or federal funds for Ebonics instruction, and requiring that any existing funds for such instruction be immediately shifted to the teaching of English (Chen, 2001; Hill, 2001). Language panics, Hill (2001) asserts, "are not really about language … they are about race" (p. 245). And, I argue, they are about social class, power, and control.

The United States provides an especially revelatory context for the analysis of these struggles over medium-of-instruction policies. As the most powerful country in the world in which English dominates as the national if not the official language, debates over the status and role of English have shaped educational practices for centuries. The United States also repre-

sents a colonial power with ongoing territorial interests. In Puerto Rico, language education policies continue to be hotly debated, and the schools, especially, have become "a battleground over Americanization" (Crawford, 1992, p. 11; see also Delgado Cintrón, 1994; García, Morín, & Rivera, 2001; Language Policy Task Force, 1992).

Finally, the United States is one of the most linguistically and culturally diverse countries in the world. At the end of the 20th century, "people of color made up 28% of the nation's population.... The [U.S. Bureau of the Census] predicts that their numbers will grow to 38% of the nation's population in 2024 and 47% in 2050" (Banks, 2001, p. ix). A significant proportion of this population are English language learners who speak over 150 different languages and who represent the "new immigration"—those who have come to the United States since 1965, when Congress abolished the national origins quota system (Qin-Hilliard, Feinauer, & Quiroz, 2001). Unlike earlier waves of immigration, which originated in Europe and were largely White, the "new immigrants" come primarily from Latin America, Southeast Asia, and the Caribbean (Qin-Hilliard et al., 2001; Suárez-Orozco, 2001). These demographic shifts are having a profound impact on U.S. schools. According to Suárez-Orozco (2001), immigrant children are "the fastest growing sector of the U.S. child population .... Nationwide, there are now over 3.5 million ELL youth enrolled in U.S. schools" (pp. 351–352).

Efficacious medium-of-instruction policies that build on this growing diversity, treating it as an individual and a collective resource (Ruiz, 1984), could not be more timely. Instead, we are witnessing another seeming paradox: Even as pressures mount for cultural and linguistic homogenization—reflected most visibly in English-only mandates and the growing standardization movement—a clear pattern of heightened social, economic, and educational stratification exists. Virtually every social indicator demonstrates a widening gap between those with and without access to economic and social capital. Indigenous and other minoritized students[2] experience the lowest rates of educational attainment, the lowest family incomes, and, particularly among Indigenous youth, the highest rates of depression and teen suicide (Garcia, 2002; Lomawaima & McCarty, 2002; Valdés, 2001). Suárez-Orozco (2001) notes further that, "Among immigrants today, the length of residence in the United States seems associated with *declining* health, school achievement, and aspirations" (p. 354). Acculturation, ostensibly a force for homogenization, appears to lead not to a more equitable distribution of resources and opportunity, but rather "to detrimental health, more ambivalent attitudes toward school, and lower grades" (Suárez-Orozco, 2001, p. 354).

A critical–historical analysis of medium-of-instruction policies sheds a revelatory light on these processes. In this chapter, I examine key episodes in the enactment of language education policies in the United States. This

informs an examination of more recent developments, particularly anti-bilingual/anti-immigrant legislation and the "New Literacy Movement" (Gutiérrez, 2001), characterized by phonics-driven reading programs and a renewed emphasis on school "accountability" and testing. Although these developments illuminate the levers of power that have been clamped on difference deemed to be proscribed, or dangerous, they also reveal the windows of opportunity that have been levered open by minoritized groups in struggles for linguistic and educational self-determination.

This is not a comprehensive historical overview. For that, readers are referred to the classic analyses of Fishman (1966), Kloss (1977), and Ferguson and Heath (1981), and to the more recent work of Crawford (1992), González & Melis (2001a, 2001b), Piatt (1990), Ricento and Burnaby (1998), and Wiley (2000, 2002). However, I do cover a wide historical horizon, beginning with the first encounters between Native peoples and Europeans.

EXPEDIENT TOLERANCE

In the swirl of interests that engulfed the North American continent following the European invasion, multilingualism was both common and necessary, a tool of trade and intertribal communication among Native peoples, and of the diffusion of Christianity and European ideas. Goddard (1996) documents 62 language families and more than 300 distinct languages indigenous to North America—a remarkably rich diversity of peoples and mother tongues. Although less diverse, colonial languages also flourished, with Spanish, French, English, Dutch, German, and Russian being the most numerically significant. It is not surprising, then, that there also was widespread use of regional lingua francas, both among Indigenous speakers and between them and Europeans, as a means of practical communication for specific purposes (Silverstein, 1996, p. 117).

Beginning with Christopher Columbus' late 15th century voyage, and continuing in the 16th century with Ponce de Leon's colonization of Puerto Rico and Florida, and the subsequent expeditions of Cabeza de Vaca, Cortés, de Soto, Alarcón, and Oñate, "Spaniards held a virtual [colonial] monopoly over the southern half of this country for one entire century before the arrival of other Europeans" (Castellanos, 1992, p. 14). In his comprehensive treatment of the overlapping "cycles of conquest" in what is now the southwestern United States and northwestern Mexico, Spicer (1962) asserts that the ruling principle of the Spanish Catholic Church—"an obligation to civilize the barbarians"—"was never questioned as the *raison d'etre* of the Spanish conquest" (p. 281). Native life was to be reorganized around the missions, led by the Jesuits in the south (until their expulsion from New Spain by the King of Spain in 1767), and the Franciscans in the north. The fundamental change introduced by the missionaries "was

summed up in the conception of 'reduction'"—that is, settlement in compact villages where Native people presumably would be more susceptible to social manipulation and ideological management (Spicer, 1962, p. 288). The indoctrination of children was a major focus of the missionaries' efforts, and in schools in or near the missions, they taught literacy and numeracy in Spanish (Spicer, 1962).

Instruction in Native languages also was fundamental to the Spanish program. Particularly among the Jesuits (less so for the Franciscans, at least in northwest New Spain), there was an emphasis on the missionaries' acquisition of Native languages. Indeed, according to Spicer, some Jesuit missionaries hesitated to teach Spanish because of its perceived destabilizing effects on Native people who gravitated to Spanish mining settlements in search of employment. "To distribute land to [Natives] …to encourage Indians to mingle with the riffraff of the frontier settlements would … break up the little kingdoms of God" (Spicer, 1962, p. 307).

Nearly all Indigenous languages of Sonora and Chihuahua were committed to writing by Spanish Jesuits. The oldest surviving Native North American grammar of Timucua, spoken in what is now Florida and Georgia, was completed by the Franciscan missionary Francisco Pareja (Goddard, 1996). Goddard (1996) writes that, "Many Timucuas, both men and women, learned to read and write using Pareja's books" (p. 18). And, as early as 1688, there is evidence of Native literacy in Apalachee, a Muskogean language spoken in what is now the Florida Gulf Coast (Goddard, 1996).

The policy of using Indigenous languages as media of instruction, and of developing Indigenous writing systems to create religious texts, continued with the English and French Jesuits in New England and New France. In 1663, working with Native speakers, Congregationalist minister John Eliot completed a translation of the Bible into Massachusett. Like other Puritan missionaries, Eliot deemed Native peoples to "have no principles … nor wisdome of their own" (Eliot, 1651, cited in Szasz, 1988, p. 106). One of his chief projects was the Indian praying town, small, self-governing villages where Native children could be removed from the influences of family and tribal community, and instructed in Christianity and the "civilized" arts. Native languages were essential to the civilizing process, and in the 18th century, "Native literacy became widespread in the praying towns" (Goddard, 1996, p. 23).

German Moravian, Russian Orthodox, Dutch Reformed, Presbyterian, and Roman Catholic missionaries adopted similar practices. A primer in Delaware, an Eastern Algonquian language, was developed by Moravian missionary David Zeisberger and became "the first school book used in the state of Ohio" (Goddard, 1996, p. 23). Working with Cherokee speaker David Brown, Congregationalist missionary Daniel Buttrick produced a Cherokee spelling book in 1819 (Buttrick & Brown, 1819, cited in Goddard, 1996,

p. 31; see also Noley, 1979). This was displaced by Sequoyah's syllabary in 1821. In accordance with 19th century church policy, Russian Orthodox missionaries also developed alphabets, grammars, dictionaries, and primers in Aleut and Central Yup'ik (Goddard, 1996).

Missionaries were not alone in the instrumental value they attached to Indigenous languages and literacies. Thomas Jefferson recorded vocabularies of Unquachog and Unami, spoken in what is now Long Island and New Jersey. William Anderson, a member of Captain James Cook's 18th century maritime expeditions, compiled a Nootka vocabulary. Meriwether Lewis and William Clark collected linguistic data on their cross-country expedition, and numerous other European traders and invaders found it expedient to become knowledgeable of Indigenous languages (see, e.g., Goddard, 1996).

Thus, from the initial invasion through the early 1800s, there was a striking consistency in the formal and informal policies of Europeans toward Native languages and their speakers. These policies can be characterized as ones of expedient tolerance. Although the transmission of colonial languages was clearly a priority, this aim, and the larger ones of religious conversion and territorial usurpation, could only be achieved *through* knowledge and use of Native tongues.

Early colonial policies toward Native languages, however, cannot be decoupled from the larger colonizing agenda and its more diffuse and deadly impacts. Although estimates vary, prior to European encroachment, the Native North American population numbered in the tens of millions (Dobyns, 1983; see also Lomawaima, 1995, p. 332). Two centuries of contact and conflict with Europeans decimated that population, leaving fewer than 250,000 in 1890 (Adams, 1988, p. 3; Lomawaima, 1995, pp. 332–333). Native people often felt the impact of Europeans well before they saw a European. Western European crops, material culture, livestock, and disease spread more quickly than did the Europeans, transforming Indigenous sociopolitical systems and cultural practices. Corruption and brutality among both state and church officials was rampant (see, e.g., Spicer, 1962). Language policies were but one aspect of a much broader cultural transformation project carried out by several competing colonial powers—all intent on asserting dominion over Native lands and lives.

CALCULATED TOLERANCE

As missionaries and colonial civil authorities prosecuted their interests, "settlers from almost every northern and western European nation continued to arrive in the Americas" (Castellanos, 1992, p. 15). In 1664, 18 European languages, in addition to Indigenous Algic languages, were spoken by people of 20 nationalities in what is now Manhattan Island (Castellanos, 1992).

In much the same way that missionaries and traders found it advantageous to learn Indigenous languages, statesmen and other colonists in the emerging republic placed an instrumental value on the use and coexistence of multiple colonial languages. Among the founding leaders of the new republic there was an ideological commitment to democracy, and an explicit rejection, at least with regard to White Europeans, of any appearance of aristocratic coercion (Heath, 1992). Silverstein (1996) also notes that at this time, many European languages were only emerging as "standardized, written vehicles and communicative emblems of crowns, of nation-states, and of aggressive colonial enterprises" (p. 117). In other words, there were "no colonial language policies or programs to build upon" (Heath, 1992, p. 20). There also seems to have been a pragmatic recognition of the value of multiple languages for diffusing the ideals of the new government: "[I]f leaders recognized the potential of plural languages to spread the ideas of the new government, the citizens would become capable of helping legitimate the new government" (Heath, 1992, p. 24). And, it was recognized that the spread of English might be more readily achieved without coercion, as English became associated with liberty (Heath, 1992, p. 24). Heath (1992) characterizes this as a dual ideology of universalism—the notion that the ideals of political liberty are universal—and pragmatism (see also Crawford, 1992, p. 9). Between 1780 and 1820:

> The national elite recognized the plural nature of American society .... During this period ... [d]iversification in language choice, change, and use not only prevailed, but was purposefully left unrestrained by leaders' repeated failure to provide a national language academy. (Heath, 1992, pp. 30–31)

The case of German in the emerging republic is of particular interest. Wiley (1998) notes that German was then "in an analogous position to that of Spanish in the United States today" (p. 215). But German enjoyed a much more elevated status than Spanish ever has in the U.S. For example, the Continental Congress published extracts of many of its documents in German (Piatt, 1990). During this time there were significant regional concentrations of Germans and, in the early 19th century, German immigration increased. By the 1830s, there were 100,000 Germans in New York alone (Wiley, 1998).

Not surprisingly, in areas with large concentrations of Germans, German was used as a medium of instruction. In 1840, the first German public school was established. According to Crawford (1995), during this period "no uniform language policy prevailed" (p. 23)—at least with regard to native speakers of European languages.[3] Bilingual education, Crawford (1995) maintains, "was likely to be accepted in areas where language-minority groups had influence and to be rejected where they had none" (p. 23).

It was not until the latter part of the 19th century that state legislatures began to pass measures intended to suppress non-English colonial lan-

guages. In the case of German, this was largely in reaction to German Catholic schools "as tools for the Holy Roman subversion" (Wiley, 1998, p. 218; see also Crawford, 1995, pp. 24–25). Still, at the turn of the 20th century, more than a half-million German students were being schooled in their mother tongue (Crawford, 1995).

The U.S. entry into World War I brought on a full-fledged language panic. German Americans were suspected of sabotaging food supplies, and newly created state councils of defense took the use of German in schools, churches, and newspapers as a sign of disloyalty. Wiley (2002) reports that Germans were beaten, tarred and feathered, and otherwise threatened. German book-burnings were common, both by xenophobic mobs and German Americans desperately trying to demonstrate their patriotism. Thousands of Germans were fined for "language violations" (Wiley, 1998, p. 223).

During this period, several states passed legislation banning instruction in languages other than English, focusing especially on the primary grades "to make foreign languages inaccessible during those ages when children would have the best opportunity for acquiring them" (Wiley, 2002, p. 232). It was in this context that, in May of 1920, a teacher in Hamilton, Nebraska was charged and convicted under Nebraska law for using a German Bible to teach reading. The teacher, a Mr. Meyer, appealed to the state supreme court, arguing that his 14th amendment rights to due process had been violated. When the state court upheld the conviction, Meyer appealed to the U.S. Supreme Court. What is important for present purposes is that in overturning the Nebraska court's ruling, the U.S. Supreme Court recognized the constitutional right to speak one's mother tongue. (For greater detail on the 1923 Meyer v. Nebraska case, see, e.g., Piatt, 1990.)

Meyer v. Nebraska is significant in another sense, for it was the first U.S. Supreme Court decision in which language rights were contested. That the Supreme Court found in favor of Meyer is a positive sign for the protection of language rights, as is the fact that *Meyer v. Nebraska* has never been overturned. That the case was brought at all, however, suggests a deeper subtext. It is not coincidental that during the same period, 20 states enacted legislation establishing Americanization programs "to insure that all immigrants would learn English" (Piatt, 1990, p. 17). Large manufacturing companies, including Ford Motor Company and International Harvester, offered English classes for employees. In 1921, Congress introduced national immigration quotas, and in 1924, the National Origin Act was passed, limiting immigration to 150,000 Europeans per year, placing quotas on immigrants from other nations, and prohibiting immigration from Japan (Piatt, 1990, p. 18).

In the industrializing United States, linguistic and cultural tolerance was giving way to nativism, and difference was becoming dangerous and proscribed.

THE CIVILIZING PROJECT

Following the American revolution, the new federal government turned its attention to pacifying and "civilizing" Native peoples, "so that they would live on small farms and, therefore, make available their hunting grounds to White settlers" (Spring, 1996, p. 12). Toward this end, Congress passed the 1819 Civilization Fund Act to support the work of missionaries on the frontier. Education and civilization were synonymous, as illustrated by this coterminous statement to Congress by the House Committee on Indian Affairs:

> Put into the hands of [Indian] children the primer and the hoe, and they will naturally ... take hold of the plow; and as their minds become enlightened and expand, the Bible will be their book, and they will grow up in habits of morality and industry, ... and become useful members of society. (cited in Adams, 1988, p. 2)

Throughout the 19th century, the campaign for Indian removal and containment continued through a policy of military aggression, removal to reservations, and formal schooling. Toward the end of the century, as treaty-making ended, the federal government looked increasingly to schooling as the solution to the "Indian problem." "There is something whimsical in planting schoolhouses where no man [sic] can read," a missionary to the Lakota reflected at the time. "It is a remedy for barbarism we think ... and so we give the dose" (cited in Adams, 1988, p. 3). Unlike earlier missionary efforts, the goal was now complete annihilation of Indigenous languages and lifeways. In the words of the same missionary: "Uncle Sam is like a man setting a charge of powder. The school is the slow match. He lights it and ... in time it will blow up the old life, and of its shattered pieces will make good citizens" (cited in Adams, 1988, p. 3).

In 1887, Congress initiated a two-fisted policy designed to "blow up the old life." The General Allotment or Dawes Act provided for dividing reservation lands into 160-acre family plots, with the "surplus" to be sold to Whites. The effect of the Allotment Act was to dispossess tribes of millions more acres of their land. At the same time, the federal government declared a policy of compulsory school attendance for Indian children, with threats of imprisonment for parents who failed to comply. Adams (1988) characterizes the federal goal as "education for citizenship focused on [English] language instruction and political socialization" (p. 8). English-only policies were "largely instrumental," Adams maintains, with the real objective being "the Indian's political socialization" (Adams, 1988, p. 9).

The chief instruments of this plan were the boarding schools. "Schools ... could not only civilize," Adams (1988) points out, "they could civilize quickly" (p. 12). Over the next century, on- and off-reservation boarding schools proliferated as sites where Indian children could be isolated for

years at a time, until their deculturation and re-ethnification were complete. The boarding school experience has been well documented (see, e.g., Ellis, 1996; Horne & McBeth, 1998; Lomawaima, 1993, 1994, 1996; McCarty, 2002b; Trennert, 1988), and I will not repeat that here. What is of interest for present purposes are the shifts in educational policy that have attended federal efforts to discern what constitute "safe" or allowable practices, versus those that are so dangerously different that they must be neutralized (Lomawaima & McCarty, 2002).

For part of the 20th century, the boarding schools remained the bedrock of the government's assimilation campaign (Ellis, 1996, p. 20). Prohibitions against speaking Indigenous languages were strictly enforced. "There is not an Indian pupil … who is permitted to study any other language than our own," Commissioner of Indian Affairs Atkins affirmed in 1887, articulating a policy that would remain in effect well into the 20th century (Crawford, 1992, p. 49). Stories abound of students having their mouths "washed" with yellow bar or lye soap, or of standing for hours holding stacks of books over their heads as punishment for speaking the Native language (McCarty, 2002b, p. 45).

Coupled with an English-only curriculum was a program of military drill, harsh discipline, and training in the manual trades—all aimed at preparing Indian people as a working class, "amenable to federal control" (Lomawaima, 1995, p. 332). Textbooks included such titles as *Baking Dictionary* (Rhodes, 1953a), *Shoe Repairing Dictionary* (Rhodes, 1953b), *Please Fill the Tank* (Benton & Kinsland, 1953), *Be a Good Waitress* (Payne, Wallace, & Shorten, 1953), and *I Am a Good Citizen* (Williamson, 1954).

The abuses of the boarding schools eventually came under public scrutiny, prompting Secretary of the Interior Hubert Work to commission an independent survey of school conditions. In 1928, the study's director, Lewis Meriam, issued his team's report, a scathing indictment of federally controlled Indian education (Meriam et al., 1928). Over the next few decades, the Bureau of Indian Affairs (BIA) loosened its stranglehold over the use of Indigenous languages in schools, and in the context of the progressive education movement, authorized the development of some Native-language teaching materials. Under Commissioner of Indian Affairs John Collier, who served President Franklin D. Roosevelt from 1933 to 1945, the Indian New Deal included tribal economic development, self-government, and "civil and cultural freedom" for tribes (Szasz, 1974, p. 41). Although the Collier-era reforms represented a decided break with the past, they did not radically alter the status quo. Newly authorized tribal governments were patterned after the U.S. constitution, with BIA oversight. And newly created day schools—intended in theory to be schools from which children would return to their families at the end of the day— were in practice little more than local boarding schools. Although the edifices had changed, the

ideologies held by BIA school personnel were not so easily modified (see, e.g., Szasz, 1974, pp. 71–72). "'We weren't allowed to talk Navajo,' one day school graduate recalls, '[a]nd our visitation from our parents was very limited—maybe 5 or 10 minutes, that was it" (McCarty, 2002b, p. 49).

Through the 19th and part of the 20th centuries, federal Indian education policy was one of almost zero tolerance for linguistic and cultural difference. The underlying agenda was the complete subjugation of Indian people and the confiscation of their lands. This agenda was justified by a civilization-savagery Protestant ideology (Adams, 1988; Spring, 1996). Although John Collier and his successors instigated important reforms, including the introduction of bilingual instruction at selected locales, the assimilationist goals and ideology of racial superiority were never threatened. As late as 1953, BIA Education Director Willard Beatty—an architect, with Collier, of New Deal reforms—wrote that Indian education required "a recognition that the richest future for Indians … lies in a mastery of the material culture of the dominant race" (1953, pp. 10–11).

SELF-DETERMINATION OR MASKED COLONIZATION?

The government's assimilationist agenda was not simply received by its intended targets. "Formal education did change my behaviors and attitudes," boarding school graduate Galena Sells Dick writes. "At the same time, I maintained a strong belief in my language and culture. Looking back, … this foundation led me to become a bilingual teacher in my own community" (Dick, 1998, p. 24).

One unintended outcome of the boarding school system was the nurturing of an alliance of Native people from diverse tribes who grew up together in the schools, and who shared the sentiments espoused by Galena Dick, just mentioned (see, e.g, Horne & McBeth, 1998; Lomawaima, 1994). In the context of the Civil Rights Movement and liberal-Democratic reforms, these experiences and sentiments found expression in a growing movement for Indigenous self-determination. Perhaps more than any other episode in the history of American education, the struggle for self-determination lays bare the fault lines between "safe" and "dangerous" difference.

In 1970, President Richard M. Nixon delivered a historic message to Congress, proclaiming "every Indian community wishing to do so should be able to control its own Indian schools" (American Indian Policy Review Commission [AIPRC], 1976, p. 111). Nixon's address inaugurated a policy of Indigenous self-determination. This policy, however, did not emanate from sudden federal enlightenment. Just months before, the Senate Subcommittee on Indian Education, chaired by Robert Kennedy and, after his assassination, by his brother Edward Kennedy, had released a report on a 2-year Congressional investigation that condemned federal Indian educa-

tion policy as "one of coercive assimilation" (U.S. Office of Education, 1969, p. 21). Moreover, in 1966, the Navajo community of Rough Rock, Arizona, had established the first Indian school to have its own governing board, and to teach in the Native language (McCarty, 2002b; Roessel, 1977). Other Indian communities were poised to follow suit.

These developments had been foreshadowed in the strong support for education of Presidents John F. Kennedy and Lyndon B. Johnson. In 1954, *Brown v. Topeka, Kansas Board of Education* reversed a century-and-a-half of legal doctrine upholding "separate but equal" racial segregation sanctified in *Plessy v. Ferguson* in 1886, and in 1964, Congress passed both the Civil Rights Act and the Economic Opportunity Act, which, respectively, provided legal protection from discrimination and authorized community development programs for the poor. A spirit of innovation and emancipation characterized the field of education (Crawford, 1995, p. 12). In 1968, Congress passed the Bilingual Education Act (authorized as Title VII of the 1965 Elementary and Secondary Education Act [ESEA]), calling for new and imaginative programs that used children's native language while they learned English. In a reversal of past policies, the Bureau of Indian Affairs embraced bilingual education as one of the most promising approaches for educating Indigenous students (Bauer, 1970, p. 223).

For a time, state interests and those of Indigenous and other minoritized communities seemed fortuitously aligned. In 1972, Congress passed the Indian Education Act (initially Title IV of the ESEA)—the first federal legislation to support Indigenous bilingual/bicultural materials development and teacher preparation—and in 1975, the Indian Self-Determination and Educational Assistance Act (P.L. 93–638) was passed, codifying the procedures for Indian tribes and communities to run their own schools. Together with the Bilingual Education Act, this legislation laid the legislative and financial framework for placing American Indian education under local control (McCarty, 1997, p. 46).

By 1978, there were 34 American Indian community-controlled schools. Supported by Title IV, Title VII, and P.L. 93–638, Indigenous communities across the nation were producing a corps of bilingual teachers, a corpus of Native-language teaching materials, and evidence of substantial student benefits (AIPRC, 1976, p. 265). The policy paradigm had shifted.

But the liberatory goals of Native educators have not gone uncontested by the federal bureaucracy, and many have been curtailed or turned back. When its funding was reauthorized in 1974, the Bilingual Education Act took on an explicitly remedial emphasis. In subsequent years, the trend has been toward transitional bilingual education as well as alternative approaches (such as English immersion programs) that do not include bilingual instruction at all. (See the discussion of "English for the Children" statutes below. See also Grinberg and Saavedra [2000]

for an insightful critique of the processes through which the Bilingual Education Act has been subverted from its original emancipatory goals, to a new form of minority docilization.)

Furthermore, the exercise of Indigenous self-determination has been undermined by the very legislation ostensibly designed to promote it. From the beginning, Indian community-controlled schools have operated under a constant cloud of financial insecurity. Delays in contract negotiations between Indigenous school boards and the BIA were notorious (see, e.g., AIPRC, 1976). "The system we operate under would defeat the President of General Motors," Rough Rock School Director Ethelou Yazzie stated in federal testimony. "It is a political game in which the community or school that refuses to lie down and die wins just enough to stand up for the next punch" (AIPRC, 1976, p. 311). "We are made to feel like the proverbial stepchild," the Coalition of Indian Controlled School Boards pointed out in federal testimony; "too much time and effort goes into securing funds rather than focusing on the educational needs of our children" (AIPRC, 1976, p. xii). Other critics have charged that achieving self-determination under P.L. 93–638 was "like trying to climb a greased pole" (Senese, 1986, p. 153).

The 1988 passage of P.L. 100–297, which provided a forward-funding system for Indian community-controlled schools, has been touted by federal officials as a cure for these problems and a boost to Indian self-determination (see DeConcini, in White House Conference on Indian Education, 1992, p. 6). Participating in these forward-funding arrangements, however, requires schools to meet standards determined not by local school boards, but by national accrediting organizations. Thus, Native American schools have been plunged into the treacherous waters of English-only standards, accountability, and high-stakes testing. In this scenario, there is little room for instruction that incorporates local languages and knowledge.

In 1974, Richard Nixon's Commissioner of Indian Affairs pledged that, "From any angle you … look at the Bureau's education program today—and increasingly so in the future—you will see emblazoned on the school walls: Indian control" (AIPRC, 1976, p. 119). That federal rhetoric was and is tethered to a bureaucracy that cannot shake loose its colonial moorings. The fact that Native people have managed to survive in this system and to carve out places of difference, such as community-controlled schools, is testimony to their ingenuity, perseverance, and genuine belief in self-education as an inherent human right. Two hundred years after the first federal forays into American Indian education, that fundamental right is still under assault.

DANGEROUS DIVERSITY

As these battles have continued in American Indian and Alaska Native education, a wider struggle for linguistic human rights and educational self-determination has gained momentum across the United States. In-

deed, as Fishman (1991, 1994, 2001) and Skutnabb-Kangas and Phillipson (1994) demonstrate, the struggle is international in scope (see also Phillipson, 2000; Skutnabb-Kangas, 2000; Tollefson, 2002). In the United States, this struggle has centered on moves to make English the nation's official language, and to outlaw bilingual education in public schools.

The English-Only movement had its official beginnings in 1981, when Senator S. I. Hayakawa introduced an amendment to the U.S. constitution that would make English the nation's official language. Two years later, Hayakawa and John Tanton, a physician who had earlier founded the Federation for American Immigration Reform (FAIR), started U.S. English, a group determined to stop what it called "the mindless drift toward a bilingual society" (Crawford, 1995, p. 65).

Between 1981 and 1995, 14 Official English bills were introduced in Congress (Chen, 2001, pp. 61–62). To date, none has been approved. Although still working at the national level, English-Only supporters have taken their message—and their dollars—to the state level. In 1986, with financial support from U.S. English, California—the state with the fastest growing "minority majority," primarily Latinos—declared English the state's official language. Within 2 years, nine additional states adopted official English statutes (Piatt, 1990, p. 22; for more on the English-Only movement, see Adams & Brink 1990; Crawford, 1992; Fishman, 1988; González & Melis, 2001a, 2001b). How is it that citizens feel compelled to safeguard a language that, without official safeguards, has become the most power-linked language in the world?

If we look closely at the recent history of immigration to the United States, we see certain striking parallels. In 1965, following proposals by President Kennedy, Congress abolished national origin quotas on immigration. As indicated earlier in this chapter, the vast majority of recent immigrants have come from Latin America, the Caribbean, and Southeast Asia. As the racial and ethnic background of newly arrived immigrants has shifted, Congress and some states (e.g., California) have imposed tighter immigration laws. In 1986—the same year as California's official language referendum—Congress passed the Immigration Reform and Control Act, the first legislation to impose sanctions on employers who hire undocumented workers, and to require English proficiency as a condition of permanent residence and citizenship (Piatt, 1990, p. 20).

Difference in the United States has taken on not only new languages, but new colors. In an increasingly conservative and nativist sociopolitical environment, the new colors of diversity are perceived by many in the dominant White mainstream as dangerous indeed.

REPRODUCING THE GREAT DIVIDE

With the passage of twin English-for-the-Children statutes in California (1998) and Arizona (2000), the movement to officialize English has been

taken to the classroom. Initiated and financed by California software millionaire Ron Unz, both statutes require public schools to replace multi-year bilingual education programs with 1-year English immersion for English language learners. In California, Proposition 227 was followed by the adoption of an English-Only school accountability program (Gutiérrez et al., 2002). In Arizona, exceptions to the statute may be granted if parents request a waiver, subject to approval by the school superintendent and "under guidelines established by … the local governing body and … state board of education" (A.R.S. Title 15, Chapter 7, Article 3.1, Section 15–753). The waiver requires that parents provide "written documentation of no less than 250 words," demonstrating their child's "special needs." This document must then be placed in the child's permanent file.

Arizona's Proposition 203 makes clear that its authors understand perfectly the distinction between safe and dangerous. In Section 15–753, B.1, parental waivers are unproblematic for children who already know English and score at or above grade level on standardized tests—that is, enrichment bilingual and foreign language instruction is not to be denied to middle- and upper-class (White) students. On the other hand, non-English-speaking children—those who already possess native fluency in the languages their middle- and upper-class peers will acquire less well through enrichment and foreign language programs—are constructed in the statute as deficient, abnormal, and underachieving. Worse, they are permanently ensnared in this construction, as the documentation of it—*penned in their parents' hands*—will follow them for the remainder of their school careers. The hegemonic entrapment could not be more complete.

There is nothing neutral or impartial about these media-of-instruction policies. Furthermore, they are not disconnected from more widespread standardizing regimes and scripted reading programs. The latter constitute what Gutiérrez (2001) calls the New Literacy Movement: "reductive literacy practices [that] are bolstered by English-only legislation" (p. 565). In school districts across the country, phonics-based reading programs have become the panacea for "dismal test scores, high student mobility, and the growing demographic of English language learners" (Gutiérrez, 2001, p. 565). Affluent and middle-class White students elude these pedagogies by virtue of their social position and access to private and gifted education (see, e.g., Gee, in press). Those most disadvantaged by these pedagogies, Lankshear (1998) points out, "are those *already* most marginal within educational, economic, and social life" (p. 368).

Elsewhere I argue that these dynamics represent a 21st century "Great Divide" (McCarty, in press). Great Divide arguments can be traced to the distinction first made by Goody and Watt (1963) between oral and written language and, by extension, between those with and without literacy (Collins, 1995). It is not far from this distinction to related claims for single, standard, or "pure"

forms of language and literacy. When these claims intersect with ideologies of meritocracy and privilege—as they inevitably do—the result is the naturalization of existing power hierarchies, "whereby deviations from the norms are defined as deficiencies and disabilities" (Collins, 1995, p. 83).

Great Divide ideologies are implicit and explicit in current U.S. media of instruction policies, and they are constructing two kinds of people: those with and without access to opportunity and resources. Despite the calls of conservative politicians to "leave no child behind"—codified in Federal education policy under President George W. Bush—an unconscionable number of English language learners, students of color, and working-class children are, in fact, being left behind (see, e.g., Cummins, in press). When we examine the policies underwriting English for the Children and the New Literacy Movement, we must ask whether that is not exactly what those policies are intended to do.

CONCLUDING THOUGHTS

This analysis would be incomplete without highlighting real possibilities for positive change. For example, in the summer of 1988, Native American educators from throughout the United States came together to draft the resolution that would become the 1990/1992 Native American Languages Act. NALA is the only federal legislation that explicitly vows to protect and promote Indigenous/minoritized languages. It might be argued that, given more than two centuries of federally sponsored linguicidal policies and the attendant decline of Native languages,[4] NALA is a relatively innocuous and symbolic act. Nevertheless, this legislation has spurred some of the boldest efforts in heritage language recovery to date (see, e.g., Hinton & Hale, 2001; McCarty, Watahomigie, & Yamamoto, 1999). These initiatives, and similar ones among other minoritized communities, are fundamental to cultural survival and self-determination.

There is no question, however, that the United States is in the midst of a national language panic, where language has become a proxy for social class and race (Hill, 2001). Spanish speakers, in particular, have been singled out as the targets of national language hysteria. The horrific events of September 11, 2001 have exacerbated these xenophobic trends, placing Arabic speakers—indeed, all those who "look Middle Eastern" (see, e.g., Noonan, 2001)—in great jeopardy as well. In the current sociopolitical environment, racial and linguistic profiling, antibilingual measures, and the New Literacy Movement can be seen as all of the same cloth. Enacted in official decrees, in government rhetoric and media disinformation, and informally in everyday practice, these policies serve to discipline minoritized groups, reminding them "that they can be defined as illegitimate members of the larger population" (González, 2001, p. xxviii).

Can these truly dangerous forces be resisted and transformed? During his first year as head of the bureau of education in Sao Paulo, Paulo Freire (1993) observed that education "is not a lever for the transformation of society, but … it *could* be" (p. 48; emphasis added). Medium-of-instruction policies are at the heart of the challenge—and the possibilities—of what education *could* be. Although these policies can be instruments of linguistic and cultural imperialism, they also can be tools for strengthening the rich diversity that is the nation's heritage and its future. This vision of education has the power to lead the United States out of the either–or politics and pedagogies of English-for-the-Children and the New Literacy Movement, toward a more democratic, just, and equitable educational system for all.

ENDNOTES

1. I am indebted to my colleague, K. Tsianina Lomawaima, for first pointing out to me the policy implications of "safe" versus "dangerous" difference in American Indian education (Lomawaima & McCarty, 2002).

2. I prefer the term *minoritized* to *minority*, as the latter term can be stigmatizing and is often numerically inaccurate. Minoritized more accurately conveys the power relations by which certain groups are socially, economically, and politically marginalized. It also implies human agency and the power to effect positive change.

3. The notable exceptions were federal policies toward American Indians, state policies toward enslaved Africans, and policies toward deaf students. With the passage of the Civilization Fund Act in 1819, federal policy became increasingly oriented toward the eradication of Indigenous languages. At the same historical moment, "Every Southern state except Tennessee had laws expressly forbidding instruction for African Americans" (Smith, 1998, p. 191). And, throughout much of the 19th and 20th centuries, audism and oral methods emphasizing speech competency over the use and development of American Sign Language have been the rule in schools serving deaf students (Nover, 1995).

4. According to Krauss (1998), there are now 175 Indigenous languages still spoken in the United States, only 20 of which are being naturally acquired by children.

II

Language in Post-Colonial States

3

RESEARCH AS RELATIONAL

Introduction

Across Chapters 1 and 2, I situated educational research in its settler colonial contexts, providing an analytic frame for understanding how and why educational research has so consistently failed to deliver on its avowed premise of ameliorating educational disparity. Given the pervasive and long-standing structure of settler colonialism, then, begs the question whether educational research is doomed to enliven these logics. In this chapter and the next, my optimistic offering is no, this is not a teleological given or *fait accompli*. Research is a fundamentally relational project—relational to ways of knowing, who can know, and to place. It has, for centuries, been situated within and animated settler colonial logics. The logics of property and ownership are undergirded by colonial needs for stratification and categorical divides but are not inherent to educational research or research writ large. While I do not suggest here that shifting referents and patterns is a simple undertaking given hundreds of years of colonial structuring, I also do not concede that the pursuit of knowledge is doomed to colonial referents. In fact, regarding research as fundamentally a relational endeavor of seeking and communicating knowledge opens up materially transformative inquiries into the coordinates used. The search and communication of knowledge is imbued with relations to social and material contexts, epistemologies, and living beings. In this chapter, I frame research as a permeable and relational force, consistently shaping and being shaped throughout the various "parts" of a research design and process. This stance productively destabilizes overly linear conceptualizations of cause, effect, objectivity, and implications while also not shirking responsibility.

Research is Relational to Contexts

That all research is situated contextually may seem somewhat obvious, given the extant literature that has described the project of research itself, from situating the origins and sociopolitical uses of the bell curve (Gould, 1996), to historical analyses of higher education (Wilder, 2013), to analyses of the ways specific nondominant populations experience higher education, the primary institutionally sanctioned location of research (Muhs, Niemann, González, Harris et al., 2012). Research is a project and product of culture, sociopolitics, and material conditions. It does not exist outside of trajectories of thought and action but firmly within. This perspective, though, stands in direct opposition to science, as commonly and historically understood in Westernized contexts, as a practice of tried and true methods that can only be undertaken by specially trained (social) scientists, and because of that special training, able to operate from and measure its worth in terms of objectivity and neutrality. These referents of objectivity and neutrality, though, are themselves far from their ideal but rather are nestled in settler logics. As Marie Battiste notes in her book on decolonizing education,

> Eurocentric science seeks principles that are universal and, as such, can be applied anywhere and any time. Born of empirical observation, made sense of by hypotheses which can, in turn, be empirically tested, Eurocentric science contradicts the faith in its knowledge. In effect, it suggests that all information is open to be disproved, thus severing it from temporal and geographic specificity. In so doing, it loses its meaning to context, and as David Suzuki has offered, such "a story ... has lost its meaning, its purpose and its abilities to touch and inform."
>
> (Battiste, 2013, citing Suzuki, 1997, pp. 19, 20)

To understand research as contextually influenced and influential, though, is not to resign ourselves from being able to enter it. We do not exist in isolation from social and material contexts, separated from each other. This is true in the sense of humans being connected as well as human and nonhuman entities being connected and coming into existence with each other. This is a long-standing tenet of much of Indigenous knowledge systems. In 1995, Yupik scholar Oscar Kawagley wrote about ethnoecology, the study of humans and material environments in dynamic inter-relation, in his book, *A Yupiaq Worldview: A Pathway to Ecology and Spirit*. Kawagley's (2006 [1995]) book was, in relation to Western knowledge systems, preternatural in its discussion of ecology beyond an object/subject relation of human study and consideration, but of humans and nonhumans in dynamic relation with each other. But in relation to Indigenous knowledge systems, Kawagley's work speaks out loud a centuries-old (if not older) epistemology such that Western(ized) audiences might be able to read it, as well as exploring what this knowledge system means in an era marked not by

interconnection but by the Anthropocene. In this way, Kawagley's work and how it is situated is itself an example of relationality, of ideas never being absent of thinkers in specific contexts. "Science is not an agentless juggernaut sweeping us along; there are agents in every corner of every context playing roles" (N. Drane, personal communication, March 14, 2015).

These entanglements of ideas, people, and material conditions are also one of the central areas of inquiry and analysis that Karen Barad (2007) explores in her book, *Meeting the Universe Halfway*. Barad, a quantum physicist who is also an expert in feminist social theory, explores the ways in which the meanings that we make of material conditions are intricately imbued into, through, and with those conditions and vice versa. This is particularly impactful in understanding the relationship between research and knowledge. Rather than separated as a static and isolable set of factors, phenomena are intricately bound up in attempts to measure them. In an apt example, Barad draws attention to what we know, or more so what we cannot know, scientifically about light. Measured through one set of coordinates, light is a particle; through another, a wave. According to each set's logics, the results are undeniably true, but how can two truths be accurate if they are incommensurable? Barad proposes, drawing on insights from quantum physics and critical social theory, that they are true because of the more fundamental reality that all matter and ways of knowing about matter are impermanently, continuously, and contiguously interconnected. Barad uses the term, intra-action rather than interaction, to highlight the simultaneously co-constitutive and intertwined nature of research and knowledge.

Consider this more detailed example from Barad's exploration of matter and measurement tools, themselves matter as well, specifically piezoelectric transducers, apparatuses that use electric pulses to measures shifts in surface and subsurface materials. These devices are used in a variety of industries, but Barad is focused on their medical use with pregnant women and fetuses. Piezoelectric transducers do not exist in and of themselves as might be thought, still-standing and as pure objects, lying inert in complete physical form and only slightly less inert when being used. Rather, they have been and are continually put in

> intra-action with a multitude of practices, including those that involved medical needs, design constraints (including legal, economic, biomedical, physics, and engineering ones); market factors; political issues; other R & D projects using similar materials; the educational background of the engineers and scientists designing the crystals and the workplace environment of the engineering firm or lab; particular hospital or clinic environments where the technology is used; receptivity of the medical community and the patient community to the technology; legal, economic, cultural, religious, political, and spatial constraints on their uses; positioning of patients during examination; and the nature of training of technicians and physicians who use the technology. (2007, p. 203)

Similarly, educational research has taken shape, continues to take shape, and will continue to take shape in dynamic relation, in intra-relation, as Barad would put it, with its sociopolitical, economic, and cultural contexts. Or more fundamentally, more radically expressed by Kawagley before Barad and articulated with his frequent co-author, Barhhardt,

> Alaska Native people have their own ways of looking at and relating to the world, the universe, and to each other. Their traditional education processes were carefully constructed around observing natural processes, adapting modes of survival, obtaining sustenance from the plant and animal world, and using natural materials to make their tools and implements. All of this was made understandable through thoughtful stories and demonstration. Indigenous views of the world and approaches to education have been brought into jeopardy with the spread of western social structures and institutionalized forms of cultural transmission.
>
> (Kawagley and Barnhardt, 1999, para. 5)

Kawagley and Barnhardt respectively articulate the differences between Indigenous and Western worldviews, and in part, they do so in order to demonstrate the ways Alaska Native peoples have, as is their history, present, and future, adapted projects of well-being and balance in the face of contradictory Western frameworks. This is not to say Native peoples have adopted these contradictory frameworks or assimilated within them. Indigenous epistemologies, as well as many Eastern and African thought traditions speak of all actions, reaction, practices, and thought being interactive. Such views demand an attention to balance and health throughout. Knowledge and practice emanating from knowledge is always in context.

Seeing all knowledge as contextual and shaping context is neither to capitulate the shape of educational research to contextual realities, such as the prominence of certain definitions of science, nor to hold it overly powerful and agentic in its own right. It is tied to and ties, binds up with humans, human history, physical objects, the planet, and the intentional and unintentional practices of all of these entities. Such an understanding is also posited in the well-known work of the philosopher Jacques Derrida, who asserted that no text or word is authoritative; they are all imbricated with traces, shadows, and referents. To date, particularly in Westernized post-industrial contexts that exhibit neocolonial logics of settler relationships, these intra-actions have shaped research to be something that has been commodified to serve the logics of property, ownership, and societal stratification.

Let's consider more, in detail, the parallels in educational research as it intra-acts with just a few of the practices that Barad lists: design constraints, market forces, and the educational background of professionals in a given area. I start with Barad's work because it speaks first, and foremost, to Western technologies. It is likely to connect most readily with Western-based readers. After the

discussion, I'll return to how Barad's ideas can be read and bracketed with Kawagley's work. I include both to connect to the entry points of many readers of this text, but it is important to note that citation practices and more fundamentally, epistemic genealogies hold material force in not just our histories but our possible futures. This is a point that has been made by several critical, Indigenous and third world scholars, such as Linda Tuhiwai Smith, Eve Tuck, and Ngugi Wa Thi'ongo.

Design Constraints

Educational research has accepted design elements that render some studies more authoritative than others. There are two strong strains to this. First is the strain of objective, empirical research, with experimental, inferential quantitative designs prevailing. In many ways, the definitions of science that were solidified through this cultural space, those of reliability and validity, shaped qualitative research for many years. Qualitative research itself grew out of anthropology's methods of ethnography, an inauspicious commencement whose very design hinged on axes of researcher and the other (Somerville, 2013). Ethnography, literally meaning to write the people, from its Greek root words of *ethno* and *grapho*, fundamentally is about the study of peoples and the way they are written about. Within that entanglement, then, is the fact that someone is doing that writing and another being written about. Qualitative research for many decades embraced its particular disciplinary space of studying specific cultures (and not others) while also attempting to answer to questions of reliability (are the findings reproducible in other contexts?) and validity (do the measures capture the desired phenomena?) that had been established through concepts of research driven by neutrality and objectivity.

These concepts, though, stand in direct contradiction to an Indigenous worldview that sees all living beings and the planet in constant flux. The concepts of objectivity and immutable, isolable factors also stand in contrast to physical realities in which the actions of all beings and entities impact each other. Perhaps at no other time has this fundamental truth been so readily comprehensible. In the current Anthropocene (Somerville, 2013) era, as it's been termed, humans and their industrial technological developments have fundamentally and deleteriously impacted the planet's well-being and balance. From this understanding of the momentum of damage done in the name of universality, then, the claim of replicability, of stand-alone actions that can be measured by themselves and unhinged from the measurer, the measurement, or the specifics of place seems naive. However, this genealogy of social science has created design constraints that invoke these ideas as standards, with aberrations requiring specific justifications, often through the language of the existing standards (Wilson, 2009). Critical qualitative and critical ethnographic studies (e.g., Daza, 2009) have thoroughly critiqued such attempts to filter qualitative research through objectivist-driven concepts, which has yielded more space for research designs to draw from and

produce decidedly multi-perspectival stances. The growth of postmodern and poststructural studies has also influenced educational research, particularly in qualitative, decolonial, and critical research designs. The open access academic journal, *Decolonization: Indigeneity, Education, and Society*, for example, explicitly seeks, among other formats, empirical research from qualitative designs, delineating this preference out of a decolonial dismissal of imperial notions of objectivity and generalizability (http://decolonization.org/index.php/des). Design of research, though, is just one aperture into the particular cultural, sociopolitical, and material realities that have contributed to its sanctioned versions.

Market Factors

While we may not like to consider research as being subject to economics and markets, the pursuit of knowledge in racist capitalist settler societies, particularly when coupled with career and livelihood, is intricately tied to market forces. Because education and educational research are part of a larger societal fabric, ideas and perspectives come in and out of favor and experience trends, and therefore some research projects and publications are more strongly supported, literally, through funding, and somewhat more figuratively, although still linked to economic capital, through status and reputation. Studying and writing about immigration, as I've been doing for the past several years, during this large wave of push–pull of beings across fictive nation-state borders may have more market appeal than it did in the 1970s, but at the same time, writing about the racialization processes that immigrants from the global South experience may not connect with market preferences. This dichotomy is connected to the pervasive grip of the meritocratic ideals of the American Dream that may hold much stronger sway in what consumers (the granting agency, those with status already in the system) and larger politic discourses of meritocracy demand. For example, most studies about nondominant populations are framed in such a way as to address what is often termed to be a concerning exclusion of the said populations from upward social mobility and/or the American Dream (e.g., the immigrant paradox of not being able to fully access upward social mobility after the first generation). This referent has political mettle that gives it purview and market stamina despite the historical reality that upward social mobility has only been precariously granted to specific populations, most often contingent on their abilities to shed what are seen as ethnic traditions to be accepted as U.S.-born white (Ignatiev, 2008). Perhaps because the ideologies of meritocracy and social opportunity still pervade so strongly in the U.S. as well as other settler colonies, the market for research that addresses structural racism as a given and protected feature of this settler colony has less of a broad-based market value, although there are niches where such scholarship can be found.

In conjunction with the content and focus having more or less traction socioeconomically, the perception of specific researchers also comes into play.

Barad also mentions the educational background of the engineers and scientists designing the crystals used in the piezoelectric transducers. In terms of educational research, this can be understood in terms of the larger demographics of higher education and its historical and contemporary practices that have shaped and continue to shape these demographics. While the nation's student population is becoming increasingly diverse, the overwhelming majority of full-time faculty positions continue to be filled by white men and women (Muhs et al., 2013). From 1997 to 2007, the percentage of students of color enrolled in U.S. colleges and universities climbed from 25 to 30 percent, yet in 2007, women of color held only 7.5 percent of full-time faculty positions (Ryu, 2009). White men persist in composing the majority of tenure-track faculty positions, holding close to 90 percent of the nation's appointments to full professor (Fast Facts, 2013). While the whiteness of the American K–12 teaching force is a widely known entity (Sleeter, 2001), the whiteness of the professoriate and more specifically, the teacher education faculty nationwide is less addressed in relation to durable patterns of inequity (Gordon and Radway, 2008). However, if there is one learning that has been widely accepted from understanding race to be a strategically devised social, political, and cultural construct, it is that white supremacy affords access to intertwined sets of privileges and protection from complementary sets of social ills and dangers (Harris, 1993). This is of course not to say that white people do not experience prejudice or suffering, but that this prejudice is not institutionalized and is not subject to the craven exponentializing forces that systematically marginalize populations of color, poor populations, and nongender conforming and nonnormatively abled bodies. Whites across class, gender, and sexual identity lines experience far less physical, socio-emotional, cognitive, and spiritual violence than do their counterparts of color.

Educational researchers, of course, do not sit outside these dynamics but are as thoroughly entangled in these realities as anyone else. While extant white educational researchers may well have sharp and sophisticated intellectual analyses about racialization as a system of oppression, they still experience ongoing contexts of colonization within the protective wrap of white privilege. This may be part of the explanation of why the mythology of the American Dream and associated research frames that justify their premise from a withholding of the Dream for just some populations may continue to flourish. If one's personal experience of society has largely been a series of doors opening with new opportunities, a well-intentioned teacher, teacher educator, or researcher might seek a professional vantage to make this dream more available, perhaps more viable for other populations. It is perhaps much easier to believe in the American Dream or perhaps more palatable to use it as a frame for necessary research on those who have not succeeded within the United States. I do not mean to say that all white educational researchers hold an acritical belief in meritocracy, nor that researchers of color necessarily are more critical. In fact, no one's beliefs and epistemologies are intractable or easily essentialized with phenotype. Rather,

when a concentration of an upper middle social class that has racialized protection predominates in the demographics of paid researchers, there will be population-level echoes in the ideological, methodological, and material impacts on the field of educational research (Henrich, Heine, and Norenzayan, 2010).

That this privileged population persists in control of the uppermost spaces of the academy perhaps explains why, even 30 years after the death of ethnography was proclaimed (Somerville, 2013), problematic patterns persist in white researchers pursuing and speaking of research about racially minoritized populations, to presumably white audiences. It raises questions of the larger patterns that are echoed when a young white upper middle class female ethnographer can be celebrated for her undergraduate and graduate studies of African Americans living in inner city Philadelphia.

Alice Goffman began volunteering as a tutor in a predominantly Black neighborhood in West Philly, situated next to but not integrated with the campus of the elite institution, the University of Pennsylvania, when she was an undergraduate. While she wrote about mothering in this Black community, she did not think she could add very much to the existing research literature on the topic. She did, however, see an opportunity in studying young Black men living in a police state of surveillance, control, and persecution. She became a participant observer in this culture, and her book (Goffman, 2014) provides details on the reach and contours of this police state as well as the ways that the young Black men who allowed her into their worlds, or parts of it, crafted life and vibrancy in these difficult spaces. In her work, Goffman employs the concept of fugitivity, which Keguro Macharia defines as "seeing around corners, stockpiling in crevices, knowing the un-rules, being unruly, because the rules are never enough, and not even close" (as quoted in Sharpe, 2014). In contrast to this theoretical base of fugitivity, Goffman provides her rendering of the details of these fugitive practices for the gaze and view of whites with better social status, such as herself. In many ways, how could she not do this? It is the lens through which she looks, the path upon which she walks, and the cultural context in which she, the daughter and granddaughter of well-known academic ethnographers, was socialized. To put it more simply, she comes by this honestly. But as with the example of Jared Diamond's (1999) work in Chapter 1, the point here is not Goffman as a lone researcher or unusual example but rather what the celebration of a clearly problematic text reveals about the assumptions of competence and the ability to annotate others' lives. The high-profile and positive reception of her book within academia conveys the durable comfort levels that exist for peering into cultures of color through white, even with self-avowed naive, lenses. The question is not whether Goffman does or does not offer some valuable sociological analyses of this cultural and structural space. The question is how such a perspective, one that recreates an Other and dominant culture ethnographer, receives not just unfettered passageway as institutionally sanctioned research but is celebrated, verily ushered, into academic and market prominence (Sharpe, 2014).

Goffman's work and the impact of her social location, and extant parallel examples, can be further theorized through Barad's conceptualizations of action, intra-action, and assemblage. Different than postmodern takes on knowledge being subjective, a consideration of Barad's work pushes the reader of Goffman's ethnographies to consider how her material experiences of the world, including her upbringing, and her project of ethnography, make experiences come into existence, hearable, seeable, and then scriptable within the market-based academy. However, while Barad's work speaks to the intricacies of matter and meaning, with human beings as one element, it lacks a grounding in ethics, in spirituality that is just as fundamental in shaping how matter comes into existence. Kawagley's work addresses meaning and matter as co-constitutive, as foundational to not just the nature of matter but also as investment and deference to the life of matter and life itself. In other words, understanding that the knowledge is inseparable from materiality does not necessarily move to a less colonial stance. Understanding matter, beings, and meaning as part of a broader ecology begs the question of what are more generative stances.

Parallel to the question of what research lenses are assumed preferential and competent is what work could be foregrounded instead. Public scholar activists like Ruthie Wilson Gilmore and Mariame Kaba engage, design, and facilitate direct actions and public scholarship from within and for specific communities and challenges. There are many other examples, but here I focus on the work they engage for a few specific reasons. The first is that their work is not their work alone. I provide their names in order to follow and find their resultant collective places and projects. Kaba helped to create Project NIA, the Chicago-based advocacy and popular education organization that works to end youth incarceration. Gilmore's award-winning book, *Golden Gulag* (2006), a scholarly contribution that dismantles many taken-for-granteds in understanding the growth of the prison industrial complex as a state strategy, was borne of her work with the mothers of incarcerated young people whose questions were about why incarceration had become the norm. Kaba's and Gilmore's projects share in common a resolute grasp of societal conditions, praxis that is considerate of those conditions, and ongoing practices that reach beyond critical analyses. As Gilmore puts it in the opening pages to *Golden Gulag*, "On the contrary, in scholarly research, answers are only as good as the further questions they provoke, while for activists, answers are as good as the tactics they make possible" (2006, p. 27).

All of these are entanglements of knowledge, and there is not a static identity or social location that is empirically better for researchers to have. How we engage in and with research, though, would benefit from a constant consideration of its ethnoecologies with privilege, oppression, coloniality, and for quite some time now, historical patterns of seduction and betrayal (Newkirk, 1996). How can educational research contend with being entangled with histories, currents, and do so in ways that engage futurities outside of settler colonial logics? To paraphrase from Kawagley and Barnhardt, how can knowledge be found and

illuminated with a deep respect for our subsistence, not status, as dependent on future knowledge? One of many reasons why it's important to see Kawagley and other Indigenous scholars' work as foundational is that their projects of survivance (Vizenor, 2008) are simply longer and better, out of necessity and ethics.

One move toward acting on behalf of ethnoecologies is to constantly ask essential questions of any research endeavor. The first questions that I propose are in no way new ones. They are found within many nonWestern spiritual and thought traditions, as they defer to interconnections and responsibility. In Chapter 4, I take up more specifically the referents that educational research as a field should steward. Here, I provide these questions as a way to attend to relationality.

Why This? Why Me? Why Now?

Research is a relational and ontological practice. It is always entangled with specific researchers in specific spaces and with specific outcroppings. Very little of this dynamic is linearly predictable, and yet, precisely because of the variances among and within dynamics, a closer attention and rigor should be paid to questions of coordinates and ongoing responsibilities and relations among peoples, places, and practices. This stance has a long history in many worldviews and even some research traditions, such as Participatory Action Research (PAR) approaches, but by and large, is not commonplace in institutionally sanctioned research within the Western academy. As detailed in Chapter 1, most doctoral programs encourage apprentice researchers to look to the existing research literature, find a gap within that literature, and justify a research focus based on that gap. Sometimes, personal knowledge sets are germane, but generally, they are not. When introduced and mentioned, personal perspectives are often invoked in order to be "bracketed" (Tufford and Newman, 2010), that is, either set off to the side or made explicit so that the reader can ascertain the lenses through which the research is presented.

Because of the long-standing and ongoing harmful relationships between researchers working from dominant cultural backgrounds and those who are likely to be dispossessed through research that frames them as at-risk, then, researchers working in the social sciences should be attending to questions other than gaps in the literature. While we have a responsibility to understand, contribute to, and be fluent in existing research, we also are responsible for our ontological entry-points and impacts as researchers. Because all research is conducted by living beings, with specific histories, we are beholden to consider and answer, perhaps always incompletely, the three core questions of "Why me?", "Why this?", "Who now?"

Why Me?

This question should not be misconstrued as a prompt for exceptionality or destiny. In contrast to the oft-imbued message at elite institutions of higher

education that further anoint already societally privileged populations (Deresiewisz, 2014), this question should prompt a humble pause and reflection on the specifics of individuals' experiences that make them appropriately able to craft, contribute, and even question knowledges. This is a necessary and ongoing set of reflexive practices that push beyond the reflexivity responses to critiques of ethnography in the 1980s. Those practices took hold in qualitative research, but have not been seen as something that all researchers should interrogate. On the contrary, views that pursue objectivity and neutrality would eschew discussions of specific entanglements of personhood, space, and materiality. And yet, all research is entangled. To deal more straightforwardly with how individuals are entangled in the research they conduct affords spaces to discuss the ways in which specific manifestations yield specific locations for the knowledge being offered. For example, educational researchers who investigate the experiences of migrant youth in schooling will present a specific set of perspectives if they themselves come from lived migrant experiences, speak more than one language, have been racialized across different nation/state/cultural settings, and on. This is not to say that being a migrant will automatically create more useful research that addresses the experiences of migrant communities. There are simply far too many other factors and entities that are in complex inter- and intra-relation with each other to be able to parse these out in isolation from each other for the purposes of predication. But it also should raise more frequent questions about the utility of so much social science research conducted by members of the dominant culture within cultures that have been historically marginalized.

In her 2009 "A Letter to Communities," Eve Tuck advised both Indigenous communities and outsider researchers to consider the cumulative effects that come from predominant framings of marginalized communities as damaged. This holds effects both for those community members and arguably more subtly for how it positions the external researcher as a change agent, perhaps because he or she is not a member within the community. Tuck's piece has been widely cited, in part, because damage-based frames are ubiquitous through social science, and because she disrupts monolithic and unitary concepts of identity that still work from modernist frames. Central to my discussion of "Why me?" is a responsibility to consider ones' place within and among longitudinal and vast patterns of who has been researched, by whom, and from what theoretical frameworks.

For those who are insiders to communities, the contours are no less complicated but substantively different. Julie Kaomea, a Native Hawaiian scholar, wrote about the ways that she needed to approach research with both knowledge and humility, particularly when bringing to light potentially concerning practices (2001). Kaomea frames her article through a use of several theoretical stances that, at times, might seem to be contradictory, but that are also familiar for culturally marginalized groups that know incommensurate existences intimately. Kaomea then provides a glimpse into a paradox of findings and commitment to community:

> I knew full well that if I chose to continue with my critique of this Hawaiian-initiated program, there would probably be many Hawaiians who had been involved in the original design and implementation of the curriculum and numerous others who are strong supporters of the program whom I might unintentionally offend.
>
> (p. 71)

Kaomea cites Maori scholar Linda Smith's now-classic work in *Decolonizing Methodologies* (2012), and the often difficult position that Indigenous scholars are put in when faced with findings that challenge taken-for-granted or long-held community beliefs. Kaomea, in a telling move, returns to Native Hawaiian referents to determine how to share information that, while potentially painful, also holds important potential gains. She asks for forgiveness for the likely pain and contextualizes her work in the contextual necessary good that may result form the pain. In and of itself, this is a fundamentally relational act of research pursuit and sharing.

As the reader might expect, in keeping with a view that knowledge and ways of knowing are intricately tied and co-influential, there is not a static set of experiences, preferred personhoods, or social locations befitting educational research. Rather, we must be able to ask and articulate an answer to "Why me?" that is attentive to connections beyond academic qualifications and institutional affiliations. Our responsibilities should lie in how we frame, approach, and attend to the constantly fluctuating dynamics being researched and how the research is exacting impacts. These specifics, though, should be addressed, and in ways that are rigorously taken up throughout a research project and its products, not bracketed into a few introductory or concluding paragraphs.

Why This?

How we frame a research problem and its context is pivotal to understanding how it has already been understood, perhaps misunderstood, and what stances are fruitful for further understanding it.

As Barad notes, "the positioning of patients during examination," is an element that will have material intra-play with all the other elements she lists. Such is the case with anyone who is invited to be part of a social science project. They are being positioned, by the researcher, and such a positioning will have immediate and ongoing, yet not fixed ramifications for everything else in the research project and products. How Black-on-Black violence is understood, for example, through the theoretical lenses of intersectional and settler colonial theories would be subtly yet substantively different than mainstream narratives afford. Users of settler colonialism would foreground a consideration of violence among people of color in reckoning with anti-blackness (King, 2010), chattel labor for settler dominance that discriminates between respectable chattel (e.g., model minority) and criminal chattel (e.g., Black menaces, migrant as illegal) as part of conjoined projects of

colonialism and imperialism (Arvin, 2013), or internal and external colonialism, as Tuck and Wayne Yang put it. Theorizing violence amid people of color through the lens of intersectionality would afford and demand an analysis of the conjoined legal and institutional categorical locations that vulnerabilize populations of color and provide articulation about how those dispossessed locations, through categorical constructs, often manifest in violence as a culturally fluid and available resource. While intersectionality does explicitly critically examine legal categories for the ways they simultaneously protect white male hetero privilege, it does not necessarily link such an analysis to land and relationships to land. Settler colonialism is insistent on this point. How a social "problem," is framed, then, even in seemingly compatible anti-oppression frameworks actually holds important differences. This insight is not a new one, particularly to beginning social scientists who have the very legitimate and frequent question of how one chooses theoretical lenses if so many address similar phenomena. Many theories can be used to explain experiences and data, but they do not do so equally.

The issue at hand, though, is that while social scientists, experienced and novice alike, may grapple with the fit and affordance of various theoretical concepts, less often are theoretical frameworks interrogated for their own social locations. In the introductory pages to his book, *Habeas Viscus*, Alex Weheliye (2014) interrogates the critical theoretical work of biopolitics from esteemed theorists Giorgio Agamben and Michel Foucault for its frequent omission of racialization processes and recurrent reinstantiation of race as empirically biological. Contrasting their work, ubiquitously popular in the social sciences, with the work of feminist theorists of blackness and anti-blackness, Sylvia Wynter and Hortense Spillers, Weheliye situates the popular yet race-muted theories of white male Europeans within a settler–Indigenous–chattel perspective.

The question "Why this?" should include the kind of analysis and consideration that Weheliye offers. He explores the content-centered consideration of what a theory affords, but also what the theory backgrounds, to what effects, and how the theory's uptake in the social sciences and citations in publications contribute materially to, in this case, settler colonial structures. Relevant questions to consider with the use of theories is what the theory affords analytically, what the theory backgrounds, to what effect, how this has played out in historical trajectories of citation and reputation, what and whose voices have been silenced, and how land and relationship to land is theorized and/or invisibilized? All of these questions are legitimate to pose to any social science research project. In the area of educational research, which I will take up more explicitly in Chapter 4, these questions are specifically located in relation to learning and knowledge (for and to the planet, humans, and nonhumans).

Why Now and Why Here?

By posing the questions "Why now?" and "Why here?", I foreground the responsibility to think about context. In their book, *Place in Research*, Tuck and

McKenzie (2015) situate all research as connected to place, meaning geographically, chronologically (but not linearly), and spatially. Attending to context, to place, to temporality, is perhaps one of the strongest ways that educational researchers can interrupt coloniality. Coloniality, with its thirst for universal truths, values placelessness, in part, because this implicitly justifies the seizure of land and the forced movement of people and resources for the interest of landowners. The fundamental colonial view of knowledge is as objective, as residing above place and space, but the terms of that objectivity cede to those who hold it, as then follows with land. Learning and knowledge are never placeless. How humans and nonhumans learn and grow is always situated in specific places, in specific dynamics.

In a mainstream magazine article, entitled, "Speaking in (Green) Tongues: Scientist Discovers New Plant Language" (Mejia, 2014) the journalist describes how Jim Westwood, a professor of pathology, physiology, and weed science, "discovered" ways that some plants communicate with each other, particularly about risks that may be coming. But these practices are not vaguely present in the same way, from any plant to any other plant. The practice is specific, and is shaped by material conditions of soil, air, water, and levels and forms of host and parasite interactions. And, the practice is not empirically new, of course, but is only new to the researcher. The article's problematic framing of discovering this language is a cue to both the colonial stance that presumes that a practice has not existed before it has been documented and analyzed by a sanctioned researcher as well as how little Western science traditions operate from assumptions of interconnectedness.

Understanding all research as being placed does not mean that we cannot know or connect across spatialities, but simply that we must be cognizant that there is not an automatic transferability to knowledge, skills, or dispositions. For example, in the popular rush to examine what has made education in Finland successful, the contrast with the United States holds important lessons, but also equally important, cautions about the distinctly different sociohistorical, cultural, and political differences across these nation-states (N. Drane, personal communication, April 17, 2015). This also means that what might be vitally important in a particular moment and place may not be so vitally important elsewhere. For example, I am an unabashed supporter of the need for more critically conscious researchers who come from nondominant backgrounds, particularly those who are Indigenous and/or racially minoritized; however, I see this as a situated need because of the long-standing deference to whiteness as intellect, capacity, and even more fundamentally, humanness. I am unequivocal about this priority, and therefore see the project of dismantling white supremacy threatened when race-neutral justifications for diversity are used, as they are most often invoked in order to deny systemic racism and support liberal humanist justifications for individuals' property holdings (Bell, 1979; Bonilla-Silva, 2009). With many of the central shifts that this book calls for, including situating research as a relational endeavor and learning as transformation (Chapter 4), there may have to be exaggerated, protective, and vigilantly self-critical engagements as we

unfurl literally centuries of settler colonial logics. "Why now?/Why here?" reminds us to stay steadfast with this mantle.

What Does Research Being Relational Mean for Methods? Or Can I Still Interview People for My Dissertation?

Each fall, faculty are contacted by prospective doctoral students who are interested in furthering their education, acquiring more credentials, becoming researchers, and sometimes looking for another way of being an educator. When students call or email expressing interest, we faculty respond back, often invite them for a visit to campus, and at least where I work, there is usually one full day of mutual vetting. During the meetings I've had with prospective doctoral students, at some point in this process the student asks about my research and, then almost always, asks about potential involvement in the work. It goes something like this, "Your work sounds important/intriguing/*insert adjective that conveys interest*. If I were to come here would I be involved in that research?"

Usually I blink while thinking, "Hmmm. We just met."

It's not that I have any illusion about the strategic question of these prospective doctoral students – they should be asking about the kinds of research projects sponsored at an institution if they intend to become researchers. Nor do I operate under the illusion that research institutions are not very much about preparing paid researchers, and that does not happen very much or very effectively outside of conducting actual research. And of course I am as functionally aware as I can be of how much of a non-treat it is to work with me specifically. No, the "hmm" in my reaction is that there is no way of knowing if this person's involvement in the collaborative research I've been part of would be beneficial to the people involved outside of the university. Research is a fundamentally relational, cultural, and political practice. As an intentionally community-involved, collaborative researcher, such a question without contextual knowledge leaves me at a complete loss. I shouldn't be able to answer that question, as it is simply not up to me completely, and relationships for a newcomer have to be built all around, not just with the person who holds the institutional designation of principal investigator.

When we engage in many academic research activities, though, there tends to be a generic, tacit reference to accepted graduate students (and more so faculty for that matter) as inherently, perhaps unilaterally, capable of conducting research. For example, in applying for and procuring grants, an essential activity for any faculty member at a research institution, it is wise to include line items to fund graduate students, to both people the work of the research as well as to support their stipends, tuition needs, and their development as researchers. But here's the problem: acceptance into a graduate program does not necessarily tell us very much about the ability to be of service to a specific population in specific contexts working on often multi-faceted, hydra-headed issues (Picower and Mayorga, 2015) of equity and oppression. Considering the demographics of those who

make it into doctoral programs at research-intensive universities, the viability of what population knowing the needs, logics, and intelligences in communities far flung from the academy should minimally be up for discussion. Of course, neither do the initials P, h, and D necessarily tell a person, particularly one not intimately familiar with the academy, anything about those capacities. In fact, those initials have far too often meant seduction, betrayal, and opportunism. It is for these good reasons that so many communities have enacted their own processes (Indigenous Rights Radio, 2014) of ascertaining how and when to grant external researchers entry. In fact, while it has become the bane of some researchers' existences, the practice of several Indian nations, school districts (e.g., Navajo Human Research Board, 2007), and other collectives to have minimally named their own research clearance procedures and sometimes barred external researchers should be seen as a powerful act of empowerment and refusal (Tuck and Wayne Yang, 2014) in the face of so much appropriation.

Working across the very different and sometimes oppositional needs of marginalized communities and university-based researchers should not be, as it has often been, a question of how the researcher can "gain access." In participatory approaches to research, for example, access itself is an insufficient if not problematic concept. Most participatory approaches to research are long-term and multi-perspectival and as such, access is neither a single point of entry nor singly conferred. It takes a long time to establish trust, to build relationships, to engage in ongoing, messy dialogues and practices that interact with systemic issues, which are, by definition and reality, never a single-fulcrum issue. To put this in terms used by Barad and Somerville, they are entanglements. None of that, though, is well reflected in traditional linear research designs of problem, literature review (from the academic library), methods, findings, and results.

This, however, does not mean that tactics like observation, watching, interviewing, and mapping, to name the methods most frequently found in qualitative designs, are no longer viable. The tension arises when such methods are used in a fashion that mimics a desire for the mythological objectivity most frequently claimed through inferential statistical designs. It is more than possible and exists in extant examples, to devise and roll out qualitative research projects involving interviewing, observing, and coding. The questions and approaches that control for variables are important, but for different questions than those that tend to be asked and pursued by marginalized communities finding ways to survive despite what a heteropatriarchal racist settler state might have in mind for them. Life just isn't that controllable outside of labs. It's much messier, and it should be. The mess also yields insights, if we can shake off the logarithms of the academic processes long enough to see them.

For example, in a collaboration with a group of youth, educators, and social justice activists living in the same city, I was working with two graduate students to investigate the contours of settings outside of school that support critical consciousness of youth. In this mix, sometimes some of the youth have sophisticated

analyses about a just society, and sometimes not, as would be the case with any group. At one meeting, there were some strongly misogynistic phrases thrown around at the end of one of our sessions. Now, adherence to the previously designated inquiry into social justice development might mean asking some of the youth to participate at a later date because their comments and practices do not resonate with any descriptor of social justice praxis and therefore would yield little in the way of data. In such a scenario, the graduate students might interview those who remained in the program and conduct some activities with them, but they wouldn't necessarily be directly making central decisions about who should remain in the program, as those decisions would be for the principal investigator, not the apprentice graduate students. But in this approach, insight from the graduate students was crucial to making meaning of the interactions. They had been onsite, working as long-term substitutes with these youth and therefore, could pose plausible theories to make meaning of the comments within a larger knowledge base of these youth, and provide suggestions on how to proceed. These "students" have that place as researchers because of their time in the school, certainly, but that would not have come to be without their ability into those roles in the school, be effective teachers of the youth, and to be critically reflective practitioners. It also helps that they understand aspects of navigating the world from nondominant social locations through their own lived experiences. In such embedded and complex projects of knowledge pursuit, it is my hope that these graduate students are learning something much more important than a textbook-worthy semi-structured interview protocol. I'm hoping they're learning that if the research is worth its mettle, it won't simply seek the cherries in the data that all but shout "quotable," but that the research makes the theories work as well as works the theories in relation to the data. That is research that is considerate of its fundamental nature of movement and impact without trying to control every aspect.

Which brings me back to the blinking I do when asked if someone I just met three minutes ago would be able to work, to be of service, to be a "researcher" in such a setting. I've yet to arrive at a better, more honest answer than "Let's see how it goes" because that contains my desire to delay making promises that serve academic processes but at the backgrounding of other participants.

Does Answerability Mean that Everyone Should Be Doing Participatory Action Research or Qualitative Research?

No. While we have a long and vast history of imperialist-infused prominence of protecting stakes in objectivity and neutrality, social science and educational research more specifically should not lurch to uniformly adopting a different particular epistemic stance, methodology, or approach, particularly while so few are fluent with the echoes and ongoing structure of settler colonialism. Decolonization requires, at minimum, a consideration of how ideologies impact material practices, how practices are always epistemically shaped, and vice versa.

To swap, then, a set of material practices for another flirts with cosmetic changes that may do precious little to interrupt material coloniality. In the greater Mikmaq and Wamponoag lands, more commonly known as Boston, there are now over 60 institutions of higher education. Of those, about a dozen have doctoral programs in educational research. Imagine if just half of those doctoral programs began requiring their students to use participatory approaches with "the community." Of immediate concern is the need to better consider who and what counts as "the community," and how that nominal does work to also name and locate higher education and research as beyond the community. But more central to my point here is that schools, community-based organizations, families, and spaces would be quickly inundated. Already poorly compensated nonprofit workers, who are strapped for fiscal, human, and material resources, would be in the unenviable position of hosting graduate students and paid researchers who may be helpful but also would require training to learn some of the institutional history, of the nonprofit organizations. Worse yet, they might ride roughshod over the cultural specifics of the nonprofit organization's population's needs. What happens in the spaces where the needs of the nonprofit organization are incommensurable with the needs of the institutionally affiliated personnel, such as university institutional review board clearances, timelines for graduation, and captured data? What happens when, as more and more higher education moves from public funding sources to short-term private sources, the grant runs out?

For example, in some of my work with undocumented youth (Patel, 2013), the university-based procedures for informed consent ran counter to the participatory and activist goals that we had as a collective. Typically in science, and particularly within qualitative studies, masking the identities of participants is seen to be one of the pre-eminent ways to protect participants. One of the projects I've been involved with sought to interrupt narratives of meritocracy as they are applied to undocumented migrants. In this project, undocumented youth activists used their names and their stories in loud and explicit ways as forms of public pedagogy, activism, and social agitation. None of them wanted their names masked in the research. To them, this seemed to be completely out of keeping with what they were trying to counter: an anonymizing of identity to deny personhood. To conduct research with them into these practices begged at minimum a reconsideration of what is seen to be default "good practice" in university-sanctioned research. For a more thorough discussion of the social, political, economic, and cultural locations of consent in university research, see Tuck and Guishard (2013).

Does Prioritizing Holism and Intra-Relationships Mean That It's Incorrect to Look Closely at Specifics?

One of the great draws and strengths of advanced higher education is the ability to focus in closely on a topic and/or particular methodologies. To become expert

in a field requires depth in the field and an automaticity with its particular schematics. However, one of the drawbacks of this rigor of study is a segmented and isolated set of expertises. While there is not anything inherently wrong with depth and expertise, it becomes problematic when expertise sets are incapable of speaking to each other and lose a sense of how multiple forces interact in everyday lives. For example, in the late 1980s and early 1990s, several studies indicated that there is an extremely strong correlation between lead levels and occurrence of violent crime in cities. However, these compelling results were not taken up or even pursued by criminologists. As Drum explores in his 2013 article about the general shrug that this compelling finding received, part of the answer to why this has not been taken up has to do with how specializations tend to privilege certain types of explanations, and background others. He quotes public policy professor Mark Kleiman, who has studied promising methods of controlling crime. Kleinman stated that because criminologists are sociologists, they are more drawn to sociological explanations, not medical ones. Without a doubt, all disciplines are susceptible to this kind of patterned meaning making. The problem, therefore, is not in deep knowledge, but in siloed knowledge that rarely has the opportunity to be filtered and connected through a different lens. This is a particularly robust place for educational research to show deeply needed research. Educational research is not a discipline unto itself. It is a geographic space in society. To understand it, economists, sociologist, linguists, anthropologists, historians, and psychologists could all contribute perspectives. As a field, though, educational research should draw from and work across those disciplines, having each be essential and simultaneously insufficient on its own.

Conclusion – Educational Research as Relation

Education and educational research have always been entangled with intra-acting with material conditions of children, teachers, families, communities, and the planet. However, this stance of seeing research relationally, inextricably bound in its material contexts, has not been commonly taken up. Perhaps this is because of an echoing default to and desire for an objective or removed position of research and therefore researchers. However, to be so, educational research would have to be an overwhelmingly unique and spontaneous generator of decontextualized phenomena. Clearly, this is not the case. What would it mean, then, for educational research to be more explicit about how it is situated within, affecting, and affected by other material conditions and ideologies?

Headlines bring the frequent newest case of legal and extralegel violence against people from non-dominant communities, but rarely is it asked how research is part of this history and contemporary structure. In the summer of 2013, George Zimmerman, a white self-appointed neighborhood watchperson, was acquitted of legal charges stemming from his arrest after shooting and killing unarmed Trayvon Martin, a young black male who was out for a walk. For

populations of color, the murder and subsequent acquittal were testimony to the engrained structural racism endemic to the United States. Around the same time as the acquittal, educational researchers in the United States, as well as other locations, were nearing the deadline to submit proposals to the largest convening of educational researchers in the continent, the American Educational Research Association. I wrote the following short essay out of sheer frustration at seeing a disconnect between so many conference proposals, manuscripts, and the societal context in which they take place. It seems an appropriate summation of what it means to see educational research as relational and then seek realistic coordinates from a place of integrity.

WHAT DOES THE TRAYVON MARTIN CASE HAVE TO DO WITH EDUCATIONAL RESEARCH?

I write this still reeling from the Zimmerman verdict that verified, again, that the infrastructure of this nation is one built to support and maintain white supremacy. My social media feeds are flooded by the posts of pain, anger, and resentment that people of color are feeling as they are reminded of the core truths about this nation. Many of my educational researcher colleagues are also likely preparing their proposals this week to present at the American Educational Research Association that takes place every spring.

What does one have to do with the other? Everything. Schooling is one of the key locations of social reproduction in society. That means, put less academically, that schools are one of the core spaces where some are privileged and others are marginalized. It is where standards of competency and images of intellect are conveyed, all culturally based and typically, biased. Schools, as a part of a nation built on white supremacy, reflect this culture. From pedagogy and curriculum to policy and private interests, schools do the bidding of a nation constructed to eradicate Indigenous populations, ensure that populations of color are trained to populate low-income home, work, and incarceration spaces, and maintain property rights for European Americans.

Educational research undoubtedly figures into this equation and therefore we must ask what our research does to advance, topple, or create alternatives outside of this deliberate design of domination. As we prepare our proposals and proofread the required sections of theoretical framework, research methodology, and significance, let us do so with some modicum of answerability to the ways in which schooling has acted, for centuries, to name Indigenous peoples as savage to treat them savagely, African American people as thugs to treat them thuggishly, and immigrant populations as peripheral to place them on the side. Higher education and the research industrial complex are a fundamental part of this landscape and calculus of schooling.

> The proposals that we prepare should minimally explicitly address how the research we present addresses a system that requires individualistic ideas of meritocracy to maintain a white heteropatriarchal supremacy. Meritocracy tells us that if we work hard, play by the rules, and are good people, this system will reward us. Put in terms of higher education, this is the logic used to position publications in high status journals as the sure route to promotion and tenure. Put in terms of K-12 schooling, it comes down to the grades and, increasingly, test scores.
>
> So, for AERA, if the research is about increasing those beloved test scores, at least be explicit about what Eve Tuck implores social science to do and address your theory of change: how exactly will the better scores alter the "open season on black boys" as Gary Younge put it so eloquently? A bit more broadly construed, how might this research help different populations locate their social advantage and act responsibly from those places? I don't imagine educational research to be able to speak to the triage needs that many of us are feeling right now, but neither should it require six steps of extrapolation to address explicitly systems of codified colonialism, racism, and patriarchy.
>
> Educators and educational researchers often work from the theory that with a good education, social mobility and achievement and safety is likely in the United States. Trayvon Martin was an honor student with a 3.7 GPA and had a full-ride scholarship to a college. He played by those oh-so-precious rules of meritocracy, but Zimmerman played by the much more fundamental rules of white supremacy and violence.

This essay has within it initial, incomplete but necessary stances to engaging research as answerable to not just "larger" societal problems but as having played a role in coloniality for hundreds of years. However, this is not a commonly shared or rigorously understood history. Because of that, there have been, and we should expect that there will continue to be, ways that educational research is connected to contexts in less than helpful ways. Attending to our role within shifting contexts, our own shifting roles, in a constant state of flux with each other is, at the onset, a seemingly daunting task, particularly when we understand the premise that there cannot be a pure knowability of any phenomenon, educational or otherwise. However, this stance also affords the opportunity to unfurl the grip on control and instead situate ourselves as answerable. While this is a preferable stance for anyone, particularly given the historical stance of ownership and territory that is fundamental to settler colonial logics, as educational researchers we are also able/obligated to be specific about what we are answerable to. In the next chapter, I discuss three key tenets that educational research should be answerable to: learning as transformation, knowledge as impermanent, and genealogies of coloniality.

Indigenous Environmental Education for Cultural Survival

Leanne Simpson, Trent University, Canada

Abstract

Aboriginal Peoples are facing a number of serious and complex environmental issues within their territories. Post-secondary environmental education programs in Canada have been slow to adopt curriculum and develop programs to meet the needs of Aboriginal students and their communities. This manuscript outlines necessary components of successful Indigenous environmental education programs at the post-secondary level based on the author's participation in three such programs as a program developer/director, curriculum developer and instructor, the current literature, and, in addition, her experiences as an Anishinaabe student studying Western science.

Résumé

Les peuples autochtones font face, sur leurs territoires, à de sérieuses et complexes questions de nature environnementale. Les programmes d'éducation environnementale offerts au niveau postsecondaire au Canada tardent à concevoir des programmes et à adopter un programme d'enseignement qui soient en mesure de répondre aux besoins des étudiants autochtones et à ceux de leur communauté. Le présent manuscrit donne un aperçu des composantes nécessaires au succès d'un programme postsecondaire d'éducation environnementale pour les Autochtones. L'auteure se prononce en vertu de sa participation à trois programmes d'éducation environnementale (en tant que directrice et conceptrice de programme, conceptrice de programme d'enseignement et enseignante) et en vertu de la littérature actuelle publiée à ce sujet. Le manuscrit fait suite à l'expérience personnelle de l'auteure, une Anishinaabe ayant étudié la science occidentale.

Many Aboriginal Peoples face devastating environmental degradation impacting their ways of life, knowledge systems, traditional governance systems, foods, and cultures. While larger Aboriginal Nations and tribal council organizations are often able to hire personal to address and manage some of these issues, it is difficult for smaller communities to find the monetary resources and personnel to develop and fill such positions. Consequently, few communities are equipped with the necessary resources to effectively deal with the over-whelming number of environmental issues facing their people and their lands.

The root cause of many of the environmental issues facing Aboriginal communities lies in the process of colonization and subsequent colonial policies

that continue to grip our Nations in contemporary times. Aboriginal Nations still do not have control over their Traditional Territories. We are still not able to make decisions about how our land will be used, or not used, how we will govern, and to a large extent, how our children will be educated.

The Canadian government and Aboriginal leaders have often promoted education as the answer to injustices we face in our communities (Castellano, Davis, & Lahache, 2000). Currently, there are very few post-secondary educational programs in Canada that root their curriculum in Aboriginal languages, content, processes, perspectives, philosophies, knowledge, and Indigenous methods of teaching and learning (Royal Commission on Aboriginal Peoples (RCAP) Volume 3, 1996). Further, few programs are designed to enable students to address the issues of colonization and colonialism in their communities, effect healing and decolonization at the individual, community and national levels, facilitate resistance strategies in response to current injustice, and promote the building of healthy, sustainable Aboriginal communities and Nations based on traditional cultural values and processes. These skills are essential to enable Aboriginal students to return to Aboriginal communities and urban organizations and effect change. More often post-secondary educational programs are designed to prepare students to fully participate in the economic and academic life of the dominant society (RCAP Volume 3, 1996). This leaves Aboriginal students in a difficult position. Having been told that education is the key to their future, they are often keen and committed to programs that will better the social, environmental, and political conditions in their communities and for their children. Yet the vast majority of these programs are geared towards the learning needs of non-Aboriginal students, leaving Aboriginal students with little knowledge they can apply to the situations they face in their communities and few skills to ensure the cultural survival of their people. This situation is particularly real for Aboriginal students with the desire to become environmental problem solvers within Aboriginal communities, and Aboriginal political or urban organizations.

Environmental Issues in Aboriginal Communities

Aboriginal Nations currently face some of the most devastating effects of environmental destruction in Canada. The Gwitch'in and First Nations in the Yukon are battling toxic contamination brought to their territories through long-range transport, industry, and government ignorance. Inuit Elders in Nunavut warn of the dire consequences of global warming as they witness accelerated climate change. The Mohawks of Akwesasne in southeastern Ontario continue to fight against industrial contamination of their waters, air, land, fish, and animals in addition to the human health impacts of that contamination. The Pimicikamak Cree Nation in northern Manitoba demand to be treated fairly and equitable by governments responsible for flooding 1.2 million hectares

of their land for hydroelectric development. The Innu Nation in Labrador confront low level military flight testing on their territory in addition to mining and forestry interests. Burnt Church First Nation in New Brunswick continue to exercise their Treaty Right to fish lobster despite non-Native violence and injustice on the part of the Department of Fisheries in Oceans. Traditional Métis farmers in Manitoba and Saskatchewan are concerned with the impact of biotechnology on their traditional seed stocks. In the west, the Haida and Gitsan Nations are working to protect their forests from unsustainable industrial clear cutting, while the Nuu-chah-nulth and Shuswap Nations try to protect their lands from the impacts of tourist development and deforestation and their waters from exploitation.

These struggles are not easy. Indigenous Peoples often find themselves challenging government-supported multinational corporations who exploit their territories for profit with no acknowledgment that their operations are on Indigenous lands, or that the industrial waste products they produce negatively impact local Aboriginal communities. Yet protecting our Traditional Territories is paramount for our cultures and Nations to flourish. Our spiritualities, identities, languages, and systems of governance come from the land. The sustenance of our wisdom, worldviews, philosophies, and values comes from the land. The source of our knowledge and our teachers themselves come from the land and the spirit-world it encompasses.

Arming Aboriginal students with the skills and knowledge to address these issues is a difficult task, particularly when they will often have to find funding and infrastructure within their communities to support their efforts upon graduation. Our continuance as peoples will be dependent upon the ability of our youth to protect traditional lands; reclaim, revitalize, and nurture our traditional systems of knowledge and language; and build sustainable local economies.

I come to this work as an Anishinaabekwe (Ojibwe woman) with training in both Anishinaabeg Knowledge and Western science. Throughout the completion of my PhD, I was repeatedly asked by different Aboriginal organizations to develop curriculum and courses around the environment that included both Western science and Indigenous Knowledge. This is a difficult task, and the following paper is a result of five years of curriculum and program development in addition to teaching in different post-secondary programs designed to deliver Indigenous environmental education to varying degrees.

I am involved in three different environmental education programs at the post secondary level. The first, Soaring Eagle (Gaa Bi Ombaashid Migizi), is a four-week community-based cultural immersion program for Aboriginal youth (18 to 30) concerning different environmental issues from both Western and Aboriginal perspectives. Much of the program takes place on the land and the curriculum is rooted both pedagogically and epistemologically in Anishinaabeg Knowledge. Western science is presented as a useful tool for Aboriginal communities to address particular issues within this context. I am involved with the program and curriculum development in addition to the delivery of the program.

I have also been an instructor and curriculum developer in the First Nations Environment and Education Training Program at the Centre for Indigenous Environmental Resources in Winnipeg for the past five years. This program promotes both Indigenous and Western scientific pedagogy and content to Aboriginal students from across Canada. Teams of instructors including an Elder, a Western scientist and an Aboriginal academic or community person teach each course. Over the 18 month program, there is an emphasis on hands-on learning, support for field trips onto the land and into communities, and scientists are encourage to adopt an issues based approach to their course material (Simpson, 1998; Sellers, McDonald, & Wilson, 2001).

Currently, I am the Director of the Indigenous Environmental Studies Program at Trent University. This program encompasses a two-year diploma program designed primarily for Aboriginal students in Indigenous Environmental Studies in addition to a special emphasis degree program for both Aboriginal and non-Aboriginal students. The program is taught within a university system presenting numerous barriers to realizing and employing elements of Indigenous education models. I attempt to expose these students to issues surrounding Indigenous Knowledge in academic and environmental management type situations and employ Indigenous ways of teaching and learning as much as the university environment permits.

The following paper outlines components of successful post-secondary Indigenous environmental education models as realized through my own experiences as a program/curriculum developer and instruction, interactions with Elders, and a review of the pertinent academic literature (that with the exception of one or two authors contains very little pertaining to Indigenous environmental education in Canada). The first section entitled, "Indigenous Knowledge in Indigenous Environmental Education Programs" outlines necessary components of programs designed to promote Indigenous Knowledge, traditional Aboriginal environmental philosophies, and Indigenous teaching and learning processes. The second section, "Western Science in Indigenous Environmental Education," outlines necessary program elements when including Western science in Indigenous environmental education programs. My perspectives are strongly informed by my experiences as an Aboriginal student studying science at Canadian universities for six years in addition to the traditional teachings of Anishinaabeg Elders.

Indigenous Knowledge as the Foundation of Indigenous Environmental Education

Founding Indigenous Environmental Education programs within Indigenous Knowledge systems is one of the most important ways of strengthening our cultures, promoting environmental protection, the realization of sustainable local economies, and supporting students through healing and decolonizing

processes. It requires the participation and leadership of the Elders in all aspects of the program, access to the land, the application of Indigenous education models and philosophies of education, the employment of Indigenous teaching and learning mechanisms, and a constant decolonization process for both instructors and students. It is a transformative process in its very nature. Ultimately, this approach requires not only consistent financial support but also a strong commitment to educating students in not just *culturally appropriate* ways, but *culturally inherent* ways. It requires flexibility and open-ness on the part of the post-secondary institutions that house these programs and a willingness to completely recognize Indigenous Knowledge and Indigenous education philosophies on their own terms, as valid ways of teaching and learning, equal to their Western counterparts. The following elements are necessary for programs attempting to promote Indigenous Knowledge as the foundation of Indigenous environmental education.

Including Elders as Experts

"Elders are keepers of tradition, guardians of culture, the wise people, the teachers. In Aboriginal societies, elders are known to safeguard knowledge that constitutes the unique inheritance of the nation" (RCAP Volume 3, 1996). As such, Elders must be included, supported and looked upon to provide guidance and direction for both instructors and students in post-secondary Indigenous environmental education programs. In order to do this, programs must consider Elders as valuable Gifts, not as "extras" or "guest speakers." Programs must adapt to provide teaching and learning environments that compliment Elders' cultural teaching styles and comfort levels in addition to the special needs of Elders. Programs must ensure that Elders are properly compensated for their participation, leadership and instruction. Our Elders provide us with the inspiration, knowledge, and guidance to face contemporary environmental issues and to assume our roles within our cultures, communities, and Nations. Promoting Indigenous Knowledge as the foundation of Indigenous environmental education programs necessitates our experts, the Knowledge-Holders, to be at the fore of program and curriculum development as well as course instruction.

Grounding Programs in Indigenous Philosophies of Education

Numerous Aboriginal researchers have written about the importance of grounding Aboriginal education in Aboriginal educational philosophies in order to promote healthy identities (Antone, 2000; Corbiere, 2000; Fitznor, Haig-Brown, & Moses, 2000; Castellano, Davis, & Lahache, 2000; Cajete, 1999; Graveline, 1998; RCAP Volume 3, 1996). While this is not disputed, it can be difficult to fully ground programs in Indigenous education philosophies

within post-secondary institutions in Canada because this requires programs and courses to be run in a fundamentally different way than what occurs in the majority of post-secondary education institutions. Indigenous education has been well documented in the literature and is generally described as wholistic education (RCAP Volume 3, 1996), education that is tailored to the person, and encompasses learning from emotional, intellectual, physical, and spiritual realms. Indigenous education philosophies also embrace hands-on-learning techniques where students are able to apply their learning to real-world situations. They promote life long learning, personal reflection and change, and flexible teaching and learning processes based on the needs of individual students. Developing programs and curriculum grounded in Indigenous philosophies of teaching and learning entails employing the processes of Indigenous teaching and learning encompassed in Indigenous pedagogies.

Utilizing Indigenous Ways of Teaching and Learning

Employing Indigenous ways of teaching and learning, including ceremonies, dreams, visions and visioning, fasting, storytelling, learning-by-doing, observation, reflecting, and creating, not only allows students to share and learn in a culturally inherent manner, but also reinforces the concept that Indigenous Knowledge is not only content but also process (Simpson, 1999, 2000a; Graveline, 1998; Cajete, 1994; Peat, 1994). Incorporating a diversity of teaching methods amongst time for personal reflection and emotional, intellectual, physical, and spiritual support can re-focus post secondary education programs from content driven curriculum to process-oriented learning. Teaching Circles can be used to ensure students have the chance to participate in class discussions, while Sharing Circles can assist students in working through emotional aspects of the curriculum (Hart, 1996). All of these components promote Indigenous Knowledge as a process and support the essence of Indigenous education philosophies.

Language

Many Elders and Aboriginal academics have written about the importance of promoting Aboriginal languages as a means to ensure cultural survival (Corbiere, 2000; Antone, 2000). Aboriginal languages are the basic repositories of Aboriginal worldviews and thus contain within their grammatical structures the values and teachings of the people that construct them (Little Bear, 1998; Armstrong, 1995). Language instruction within post-secondary Indigenous environmental studies programs is virtually non-existent except in a very few university/college programs where students can take a language course as part of their larger program of study, yet language remains a vital link between the land, Aboriginal Peoples, and our knowledge. Promotion of

Aboriginal languages within Indigenous environmental educations programs is an essential skill for communication within Aboriginal communities and with Elders, it reinforces a deeper understanding of Aboriginal knowledge and it lays the foundation for cultural survival.

Connecting to the Land

Connecting to the land is critical if Indigenous ways of teaching and learning are to be employed and programs are to be grounded in Indigenous educational philosophies. "Being out on the land" is the place where Elders are often most comfortable teaching and interacting with students. Since Indigenous knowledge comes from the land, it is imperative that students are given the opportunity to connect to the land in an emotional, spiritual, physical, and intellectual way. This means instructors and programs must have the necessary resources and established relationship to enable instruction to occur outside of the classroom and often out of urban areas for extended periods. It can also mean that programs have to be willing to support students who are parents in either arranging child-care or bringing their children with them. The latter option usually works well with traditional education models (in which children were always included in daily life), as children are not only consider to be important teachers, but can remind students and instructors of their original motivation for engaging in a formal learning process.

Making a Space for Resistance

In addition to grounding the processes of teaching and learning in Indigenous Knowledge, and basing the curriculum in Indigenous content, students and instructors must also be encouraged to think about how our Ancestors have resisted the processes of colonization, colonialism, and assimilation in the past. This injects the learning process with power and hope with the recognition that our peoples have worked hard to protect our Traditional Territories, cultures, and knowledge in the past, and it counters the stereotype that Aboriginal Peoples were simply helpless victims in these horrific processes. It assists students and instructors in recognizing their responsibilities to the coming generations and allows students to develop the skills they need to engage in effective resistance strategies once they graduate. Engaging students in a community project or practicum component provides them with the opportunity to gain supported real-world experience in fund raising, proposal writing, budget making, project management, and decision-making. This can also link students together in a powerful support network that can continue well after programs end.

Supporting Decolonization

Decolonization is a personal process that involves a great deal of time and effort for each individual (Anderson, 2000; Graveline, 1998). At the same time we are encouraging students to critically analyze the processes and worldviews contributing to contemporary environmental issues in Aboriginal Territories, we must also work actively to revitalize cultural knowledge and positive alternatives for the future based on traditional Indigenous values. Theatre, singing, drumming, dancing, and storytelling, in addition to humour are all excellent culturally inherent ways of facilitating these processes. Elders can also provide appropriate ceremonies and counseling support. The theme of decolonization and cultural reclamation should be consistent and run throughout the program, rather than attempting to compartmentalize the process into a unit or learning module. These processes are intensely personal and emotional, so programs must ensure that appropriate support mechanisms are in place. Students should be encouraged to work through these issues at their own pace and must be given time and space their personal decolonization path. Instructors should be prepared to engage in a learning processes in a way that is much more intense and time consuming than mainstream university or college teaching.

Grounding programs in Indigenous Knowledge provides students with some of the wisdom and many of the skills needed to facilitate change in their communities and in the field of the environment. It is also important for students to gain Western scientific literacy and competency. This allows Aboriginal environmental problem solvers to use knowledge and skills from both knowledge systems in addition to enabling students to deconstruct and critique scientific evidence used to justify environmental destruction in their territories. Western scientific literacy can assist students in hiring scientists, co-ordinating community-based scientific research, and in becoming a liaison between the community and Western scientific experts once they graduate.

Western Science in Indigenous Environmental Education

Western science has been closely linked to imperialism and colonialism throughout history (Tuhiwai-Smith, 1999). In Aboriginal communities, Western science is often perceived as the primary tool governments and industry use to nullify environmental impacts created by unsustainable industrial and resource development, particularly in impact assessment proceedings. Western scientific literacy however, is also often seen an important and necessary tool for Aboriginal Peoples working in the field of the environment at the community and tribal organization level, yet mainstream science education has failed miserably at attracting and retaining Aboriginal students (Cajete, 1999). Despite advances made in the past decade in graduating

Aboriginal students in post-secondary education programs, the lowest participation rates for Aboriginal students at universities in Canada occur in agriculture, biological sciences, mathematics, and the physical sciences. The reasons for these low participation rates are complex. Much university science education focuses on theory and is taught in the lecture/lab format, teaching styles and philosophies that run contrary to Indigenous traditions in education. Aboriginal students are concerned with the relevance of this approach, particularly when their educational decisions are based on the real-world needs of their communities and nations (Simpson, 2000b). Other Native students become frustrated with the lack of Aboriginal content in science programs, particularly when much of mainstream Western scientific education is in direct contrast to traditional Aboriginal worldviews, knowledge, philosophies, and values. Little room is made to accommodate Aboriginal students who need to work through these contradictions and controversies.

Gregory Cajete, a Tewa educator writes:

> Teaching the basic concepts forming the foundations of modern science, students are led to believe that:
>
> - Time is uniform and flows in a single linear direction from a past to a present and on to a future;
> - Matter is made of particles that obey universal laws which never change;
> - Our mind is our brain;
> - Only the fittest survive through the process of natural selection;
> - Modern science will eventually solve all major mysteries of the universe; and
> - Scientists are totally objective and scientific knowledge is universally applicable [Hayward, 1984, p. 66]. (1999, p. 37)

Aboriginal worldviews directly contradict each of the above statements. So unless time, space, and guidance is give to Aboriginal students as they come to terms with these inherent differences, science can serve either to assimilate Aboriginal students into its framework or further alienate them by undermining their own knowledge systems. The situation is only made worse given that Western science is so dominant in Euro-Canadian society, and that it is often used to support and maintain oppressive power relationships between Indigenous Peoples and the state. These realities must be acknowledged. Challenging the popular scientific assumption that science is the *only* way of knowing is also important and Western science can begin to become more palatable to Aboriginal students if it is presented as another tool they can use to advance the agendas of their people and the environment. Presenting case studies of communities and Nations that have employed science as part of a resistance or environmental justice strategy can also spark student's interests in the value of science. However, instructors must be very cognizant of the exclusionary nature of the discourse around science and actively promote Western science as just another way of knowing, not one

that is more valid, or more reliable than Indigenous systems. Again, Aboriginal students need time to discuss these issues, express themselves emotionally, and they need space to reflect. Elders can be most helpful in these situations, because they can assist students coming to an understanding of these apparent dichotomies and contradictions within their own cultural philosophies, theories and knowledge systems.

Oftentimes, Aboriginal students have negative first encounters with Western science either within their own communities or within the public school system. The historic (and often contemporary) relationship between Western science and Indigenous Peoples has been laden with racism, power imbalance, and oppression (Tuhiwai-Smith, 2000). Aboriginal students need to be afforded the opportunity to express these experiences, seek validation, and heal from pain this has caused them.

Based on my experiences as an Aboriginal science student at the undergraduate and graduate level, and six years of teaching and developing curriculum for Aboriginal environmental education programs, of which at least a part are grounded in Western science, I have found the following to be necessary elements of successful programs:

- The use of Aboriginal instructors and scientists as much as possible is important to provide students with role models, and people who can answer their questions about perceived/actual conflicts between Western science and Aboriginal knowledge and culture;
- The employment of scientists who have experience working with Aboriginal Peoples and in Aboriginal communities, and who are sensitive to the needs and realities of Aboriginal communities ensures that Aboriginal students understand that there are concerned sensitive individuals working within scientific fields;
- Students must be able to personally identify with course content and the real-world applications of that content. This means designing courses and programs with substantial Aboriginal content, issues, and case studies at the fore in addition to using Aboriginal teaching and learning methods to present Western ideas;
- Curriculum must be used that acknowledges science as one knowledge system, not the only system. It must also acknowledge explicitly and implicitly that Aboriginal Peoples have been employing complex technologies, engineering knowledge, mathematics, and methods of experimentation for thousands of years, that both knowledge systems have their benefits and weaknesses;
- Curriculum must also include a critical evaluation of Western science from Aboriginal perspectives including the negative impacts of science on Aboriginal communities in the past and in contemporary times. This analysis must make space for students' personal reactions to the content in addition to providing positive examples of how contemporary communities are using science as a tool to advance their agendas;

- Content should be useful and applicable to the situations students will find themselves in the future—i.e. working on environmental issues for communities and Aboriginal organizations, not just preparing students for post-graduate programs;
- Space must be made for students' concerns, anger, confusion, and conflict between science and Aboriginal knowledge. This is often a necessary part of coming to terms with Aboriginal knowledge and Western science. This will require culturally based methods of healing, conflict resolution and the leadership of Elders;
- Programs and curricula that employ applied and issues based approaches must not be viewed as being less academically rigorous simply because they present science in a different way than traditional science courses; and
- Effort needs to be channeled into modifying curriculum so that it is process-oriented rather than content and theory driven. This means letting go of many of the standard evaluation techniques used in post-secondary science programs (quizzes, tests, multiple choice exams) and embracing appropriate alternatives (community reports, critiques, field reports, journals, etc.)

Looking to the Ancestors to Prepare for the Future

Over the past five years, a few post-secondary Indigenous environmental education programs in Canada have begun to address the needs of Aboriginal students and Aboriginal communities with regard to environmental education. By grounding programs in Indigenous education philosophies and Indigenous knowledge students are better prepared to take on their responsibilities in their communities and Aboriginal organizations upon graduation. By modifying mainstream Western scientific instruction, students can also successfully gain the necessary scientific literacy to assist in becoming environmental problem-solvers.

Our Elders teach us that the Earth is sick, and that when the earth is sick we will all suffer the consequences. The philosophical foundations of Aboriginal education have been well documented in the literature. Post-secondary institutions are eager to attract Aboriginal students to their institutions. Approaching the development of Indigenous Education programs with the needs of Aboriginal students and communities at the fore, and with cultural prosperity as the goal, can produce programs that promote Indigenous Knowledge, Indigenous processes of teaching and learning, and the appropriate use of Western science to counteract the environmental destruction in Indigenous Territories. Protecting the land and building healthy, sustainable local economies will provide future generations of Aboriginal Peoples with the wisdom and tools to strengthen their relationships to the land and to continue to decolonize their communities and Nations.

Notes on Contributor

Leanne Simpson is of Anishinaabeg ancestry. She is currently the Director of Indigenous Environmental Studies at Trent University in Peterborough, ON.

Introduction

From the vantage point of the colonized, a position from which I write, and choose to privilege, the term 'research' is inextricably linked to European imperialism and colonialism. The word itself, 'research', is probably one of the dirtiest words in the indigenous world's vocabulary. When mentioned in many indigenous contexts, it stirs up silence, it conjures up bad memories, it raises a smile that is knowing and distrustful. It is so powerful that indigenous people even write poetry about research. The ways in which scientific research is implicated in the worst excesses of colonialism remains a powerful remembered history for many of the world's colonized peoples. It is a history that still offends the deepest sense of our humanity. Just knowing that someone measured our 'faculties' by filling the skulls of our ancestors with millet seeds and compared the amount of millet seed to the capacity for mental thought offends our sense of who and what we are.[1] It galls us that Western researchers and intellectuals can assume to know all that it is possible to know of us, on the basis of their brief encounters with some of us. It appals us that the West can desire, extract and claim ownership of our ways of knowing, our imagery, the things we create and produce, and then simultaneously reject the people who created and developed those ideas and seek to deny them further opportunities to be creators of their own culture and own nations. It angers us when practices linked to the last century, and the centuries before that, are still employed to deny the validity of indigenous peoples' claim to existence, to land and territories, to the right of self-determination, to the survival of our languages and forms of cultural knowledge, to our natural resources and systems for living within our environments.

This collective memory of imperialism has been perpetuated through the ways in which knowledge about indigenous peoples was collected, classified and then represented in various ways back to the West, and then, through the eyes of the West, back to those who have been

colonized. Edward Said refers to this process as a Western discourse about the Other which is supported by 'institutions, vocabulary, scholarship, imagery, doctrines, even colonial bureaucracies and colonial styles'.[2] According to Said, this process has worked partly because of the constant interchange between the scholarly and the imaginative construction of ideas about the Orient. The scholarly construction, he argues, is supported by a corporate institution which 'makes statements about it [the Orient], authorising views of it, describing it, by teaching about it, settling it, ruling over it'.[3] In these acts both the formal scholarly pursuits of knowledge and the informal, imaginative, anecdotal constructions of the Other are intertwined with each other and with the activity of research. This book identifies research as a significant site of struggle between the interests and ways of knowing of the West and the interests and ways of resisting of the Other. In this example, the Other has been constituted with a name, a face, a particular identity, namely *indigenous peoples*. While it is more typical (with the exception of feminist research) to write about research within the framing of a specific scientific or disciplinary approach, it is surely difficult to discuss *research methodology* and *indigenous peoples* together, in the same breath, without having an analysis of imperialism, without understanding the complex ways in which the pursuit of knowledge is deeply embedded in the multiple layers of imperial and colonial practices.

Many researchers, academics and project workers may see the benefits of their particular research projects as serving a greater good 'for mankind', or serving a specific emancipatory goal for an oppressed community. But belief in the ideal that benefiting mankind is indeed a primary outcome of scientific research is as much a reflection of ideology as it is of academic training. It becomes so taken for granted that many researchers simply assume that they as individuals embody this ideal and are natural representatives of it when they work with other communities. Indigenous peoples across the world have other stories to tell which not only question the assumed nature of those ideals and the practices that they generate, but also serve to tell an alternative story: the history of Western research through the eyes of the colonized. These counter-stories are powerful forms of resistance which are repeated and shared across diverse indigenous communities. And, of course, most indigenous peoples and their communities do not differentiate scientific or 'proper' research from the forms of amateur collecting, journalistic approaches, film making or other ways of 'taking' indigenous knowledge that have occurred so casually over the centuries. The effect of travellers' tales, as pointed out by French philosopher Foucault, has contributed as much to the West's knowledge of itself as has the systematic gathering of scientific data. From some indigenous perspectives the gathering of

information by scientists was as random, *ad hoc* and damaging as that undertaken by amateurs. There was no difference, from these perspectives, between 'real' or scientific research and any other visits by inquisitive and acquisitive strangers.

This book acknowledges the significance of indigenous perspectives on research and attempts to account for how, and why, such perspectives may have developed. It is written by someone who grew up within indigenous communities where stories about research and particularly about researchers (the human carriers of research) were intertwined with stories about all other forms of colonization and injustice. These were cautionary tales where the surface story was not as important as the underlying examples of cultural protocols broken, values negated, small tests failed and key people ignored. The greater danger, however, was in the creeping policies that intruded into every aspect of our lives, legitimated by research, informed more often by ideology. The power of research was not in the visits made by researchers to our communities, nor in their fieldwork and the rude questions they often asked. In fact, many individual non-indigenous researchers remain highly respected and well liked by the communities with whom they have lived. At a common sense level research was talked about both in terms of its absolute worthlessness to us, the indigenous world, and its absolute usefulness to those who wielded it as an instrument. It told us things already known, suggested things that would not work, and made careers for people who already had jobs. 'We are the most researched people in the world' is a comment I have heard frequently from several different indigenous communities. The truth of such a comment is unimportant, what does need to be taken seriously is the sense of weight and unspoken cynicism about research that the message conveys.

This cynicism ought to have been strong enough to deter any self-respecting indigenous person from being associated with research. Obviously, in this case, it has not, which leads to my other motivation for writing about indigenous peoples and research. This is a book which attempts to do something more than deconstructing Western scholarship simply by our own retelling, or by sharing indigenous horror stories about research. In a decolonizing framework, deconstruction is part of a much larger intent. Taking apart the story, revealing underlying texts, and giving voice to things that are often known intuitively does not help people to improve their current conditions. It provides words, perhaps, an insight that explains certain experiences – but it does not prevent someone from dying. It is with that sense of reality that the second part of the book has been written. Whilst indigenous communities have quite valid fears about the further loss of intellectual and cultural knowledges,

and have worked to gain international attention and protection through covenants on such matters, many indigenous communities continue to live within political and social conditions that perpetuate extreme levels of poverty, chronic ill health and poor educational opportunities.[4] Their children may be removed forcibly from their care, 'adopted' or institutionalized. The adults may be as addicted to alcohol as their children are to glue, they may live in destructive relationships which are formed and shaped by their impoverished material conditions and structured by politically oppressive regimes. While they live like this they are constantly fed messages about their worthlessness, laziness, dependence and lack of 'higher' order human qualities. This applies as much to indigenous communities in First World nations as it does to indigenous communities in developing countries. Within these sorts of social realities, questions of imperialism and the effects of colonization may seem to be merely academic; sheer physical survival is far more pressing. The problem is that constant efforts by governments, states, societies and institutions to deny the historical formations of such conditions have simultaneously denied our claims to humanity, to having a history, and to all sense of hope. To acquiesce is to lose ourselves entirely and implicitly agree with all that has been said about us. To resist is to retrench in the margins, retrieve what we were and remake ourselves. The past, our stories local and global, the present, our communities, cultures, languages and social practices – all may be spaces of marginalization, but they have also become spaces of resistance and hope.

It is from within these spaces that increasing numbers of indigenous academics and researchers have begun to address social issues within the wider framework of self-determination, decolonization and social justice. This burgeoning international community of indigenous scholars and researchers is talking more widely about indigenous research, indigenous research protocols and indigenous methodologies. Its members position themselves quite clearly as indigenous researchers who are informed academically by critical and often feminist approaches to research, and who are grounded politically in specific indigenous contexts and histories, struggles and ideals. Many indigenous communities and organizations have developed policies about research, are discussing issues related to control over research activities and the knowledge that research produces, and have developed ethical guidelines and discussion documents. The second part of this book addresses some of the issues currently being discussed amongst indigenous communities that relate to our own priorities and problems. These priorities often demand an understanding of the ways in which we can ask and seek answers to our own concerns within a context in which resistance to new formations

of colonization still has to be mounted and articulated. In other words, research is not an innocent or distant academic exercise but an activity that has something at stake and that occurs in a set of political and social conditions.

If in a sense this book is simply another contribution to the ways in which social science researchers in general think about methodologies and approaches to research – in this case among people and communities who hold research in high disdain – it has not been written with that intention. Rather, it is addressed more specifically to those researchers who work with, alongside and for communities who have chosen to identify themselves as indigenous. A growing number of these researchers define themselves as indigenous, although their training has been primarily within the Western academy and specific disciplinary methodologies. Many indigenous researchers have struggled individually to engage with the disconnections that are apparent between the demands of research, on one side, and the realities they encounter amongst their own and other indigenous communities, with whom they share lifelong relationships, on the other side. There are a number of ethical, cultural, political and personal issues that can present special difficulties for indigenous researchers who, in their own communities, work partially as insiders, and are often employed for this purpose, and partially as outsiders, because of their Western education or because they may work across clan, tribe, linguistic, age and gender boundaries. Simultaneously, they work within their research projects or institutions as insiders within a particular paradigm or research model, and as outsiders because they are often marginalized and perceived to be representative of either a minority or a rival interest group. Patricia Hill Collins refers to 'the outsider within' positioning of research.[5] Sometimes when in the community ('in the field') or when sitting in on research meetings it can feel like inside-out/outside-in research. More often, however, I think that indigenous research is not quite as simple as it looks, nor quite as complex as it feels! If I have one consistent message for the students I teach and the researchers I train it is that indigenous research is a humble and humbling activity.

Indigenous researchers are expected, by their communities and by the institutions which employ them, to have some form of historical and critical analysis of the role of research in the indigenous world. In general, this analysis has been acquired organically and outside of the academy. Despite the extensive literature about the life and customs of indigenous peoples, there are few critical texts on research methodologies which mention the word indigenous or its localized synonyms. Critiques by feminist scholars, by critical theorists, by black and African American scholars have provided ways of talking about knowledge and

its social constructions, and about methodologies and the politics of research. But the words that apply to indigenous researchers have been inserted into the text, then read with our own world in/sight. I hope that what is written here provides space for further dialogue within a framework that privileges the indigenous presence, that uses 'the words' (such as colonialism, decolonization, self-determination), and that acknowledges our continuing existence. It has not been written, therefore, as a technical book about research for people who talk the language of research, but as a book which situates research in a much larger historical, political and cultural context and then examines its critical nature within those dynamics.

The term 'indigenous' is problematic in that it appears to collectivize many distinct populations whose experiences under imperialism have been vastly different. Other collective terms also in use refer to 'First Peoples' or 'Native Peoples', 'First Nations' or 'People of the Land', 'Aboriginals' or 'Fourth World Peoples'.[6] Some groups prefer the labels that connect us to Mother Earth, and to deeply significant spiritual relationships. While not denying the powerful world views embedded in such terms, within my own cultural framework as within others, they are not the terms that will be used here. A recent phenomenon which partly explains such a position is the Western fascination with New Age spiritual meanings which makes our own belief systems available, yet again, for further mining and exploitation. In some contexts, such as Australia and North America, the word indigenous is a way of including the many diverse communities, language groups and nations, each with their own identification within a single grouping. In other contexts, such as New Zealand, the terms 'Maori' or *tangata whenua* are used much more frequently than 'indigenous' as the universal term, while different origin and tribal terms are also used to differentiate between groups. Although the word 'Maori' is an indigenous term it has been identified as a label which defines a colonial relationship between 'Maori' and 'Pakeha', the non-indigenous settler population. For many of the world's indigenous communities there are prior terms by which they have named themselves. There are also terms by which indigenous communities have come to be known, initially perhaps as a term of insult applied by colonizers, but then politicized as a powerful signifier of oppositional identity, for example the use of the term 'Black Australia' by Aborigine activists. Inside these categories for describing or labelling are other terms that describe different layers of relationships and meanings within and between different groups. Some of these terms are about the classification systems used within the local colonial context, and others are about a prior relationship with groups whose territories now span different states.

'Indigenous peoples' is a relatively recent term which emerged in the 1970s out of the struggles primarily of the American Indian Movement (AIM), and the Canadian Indian Brotherhood. It is a term that internationalizes the experiences, the issues and the struggles of some of the world's colonized peoples.[7] The final 's' in 'indigenous peoples' has been argued for quite vigorously by indigenous activists because of the right of peoples to self-determination. It is also used as a way of recognizing that there are real differences between different indigenous peoples.[8] The term has enabled the collective voices of colonized people to be expressed strategically in the international arena. It has also been an umbrella enabling communities and peoples to come together, transcending their own colonized contexts and experiences, in order to learn, share, plan, organize and struggle collectively for self-determination on the global and local stages. Thus the world's indigenous populations belong to a network of peoples. They share experiences as peoples who have been subjected to the colonization of their lands and cultures, and the denial of their sovereignty, by a colonizing society that has come to dominate and determine the shape and quality of their lives, even after it has formally pulled out. As Wilmer has put it, 'indigenous peoples represent the unfinished business of decolonization'.[9]

The word 'indigenous' is also used in ways which are quite contrary to the definitions of the term just described, but which are legitimate meanings of the word itself. For example it is used to describe or account for the distinctiveness of colonial literary and/or feminist traditions. It has been coopted politically by the descendants of settlers who lay claim to an 'indigenous' identity through their occupation and settlement of land over several generations or simply through being born in that place – though they tend not to show up at indigenous peoples' meetings nor form alliances that support the self-determination of the people whose forebears once occupied the land that they have 'tamed' and upon which they have settled. Nor do they actively struggle as a society for the survival of indigenous languages, knowledges and cultures. Their linguistic and cultural homeland is somewhere else, their cultural loyalty is to some other place. Their power, their privilege, their history are all vested in their legacy as colonizers.

Part of the project of this book is 'researching back', in the same tradition of 'writing back' or 'talking back', that characterizes much of the post-colonial or anti-colonial literature.[10] It has involved a 'knowingness of the colonizer' and a recovery of ourselves, an analysis of colonialism, and a struggle for self-determination. Research is one of the ways in which the underlying code of imperialism and colonialism is both regulated and realized. It is regulated through the formal rules of individual scholarly disciplines and scientific paradigms, and the

institutions that support them (including the state). It is realized in the myriad of representations and ideological constructions of the Other in scholarly and 'popular' works, and in the principles which help to select and recontextualize those constructions in such things as the media, official histories and school curricula. Ashis Nandy argues that the structures of colonialism contain rules by which colonial encounters occur and are 'managed'.[11] The different ways in which these encounters happen and are managed are different realizations of the underlying rules and codes which frame in the broadest sense what is possible and what is impossible. In a very real sense research has been an encounter between the West and the Other. Much more is known about one side of those encounters than is known about the other side. This book reports to some extent on views that are held and articulated by 'the other sides'. The first part of the book explores topics around the theme of imperialism, research and knowledge. They can be read at one level as a narrative about a history of research and indigenous peoples but make much more sense if read as a series of intersecting and overlapping essays around a theme.

One of the issues examined relates to the way research became institutionalized in the colonies, not just through academic disciplines, but through learned and scientific societies and scholarly networks. The transplanting of research institutions, including universities, from the imperial centres of Europe enabled local scientific interests to be organized and embedded in the colonial system. Many of the earliest local researchers were not formally 'trained' and were hobbyist researchers and adventurers. The significance of travellers' tales and adventurers' adventures is that they represented the Other to a general audience back in Europe which became fixed in the milieu of cultural ideas. Images of the 'cannibal' chief, the 'red' Indian, the 'witch' doctor, or the 'tattooed and shrunken' head, and stories which told of savagery and primitivism, generated further interest, and therefore further opportunities, to represent the Other again.

Travellers' stories were generally the experiences and observations of white men whose interactions with indigenous 'societies' or 'peoples' were constructed around their own cultural views of gender and sexuality. Observations made of indigenous women, for example, resonated with views about the role of women in European societies based on Western notions of culture, religion, race and class. Treaties and trade could be negotiated with indigenous men. Indigenous women were excluded from such serious encounters. As Memmi noted in his 'Mythical Portrait of the Colonized', the use of zoological terms to describe primitive people was one form of dehumanization.[12] These images have become almost permanent, so deeply embedded are they

in the way indigenous women are discussed. 'How often do we read in the newspaper about the death or murder of a Native man, and in the same paper about the victimisation of a female Native, as though we were a species of sub-human animal life?' asks a First Nation Canadian woman, Lee Maracle. 'A female horse, a female Native, but everyone else gets to be called a man or a woman.'[13] Across the Pacific, Maori women writers Patricia Johnston and Leonie Pihama make reference to Joseph Banks's description of young Maori women who were as 'skittish as unbroke fillies'.[14] Similarly, in Australia, Aborigine women talk about a history of being hunted, raped and then killed like animals.

Travellers' tales had wide coverage. Their dissemination occurred through the popular press, from the pulpit, in travel brochures which advertised for immigrants, and through oral discourse. They appealed to the voyeur, the soldier, the romantic, the missionary, the crusader, the adventurer, the entrepreneur, the imperial public servant and the Enlightenment scholar. They also appealed to the downtrodden, the poor and those whose lives held no possibilities in their own imperial societies, and who chose to migrate as settlers. Others, also powerless, were shipped off to the colony as the ultimate prison. In the end they were all inheritors of imperialism who had learned well the discourses of race and gender, the rules of power, the politics of colonialism. They became the colonizers.

The second part of the book examines the different approaches and methodologies that are being developed to ensure that research with indigenous peoples can be more respectful, ethical, sympathetic and useful. The chapters in the second part ought not to be read as a 'how to' manual but as a series of accounts and guidelines which map a wide range of research-related issues. Feminism and the application of more critical approaches to research have greatly influenced the social sciences. Significant spaces have been opened up within the academy and within some disciplines to talk more creatively about research with particular groups and communities – women, the economically oppressed, ethnic minorities and indigenous peoples. These discussions have been informed as much byth e politics of groups outside the academy as by engagement with the problems which research with real, living, breathing, thinking people actually involves. Communities and indigenous activists have openly challenged the research community about such things as racist practices and attitudes, ethnocentric assumptions and exploitative research, sounding warning bells that research can no longer be conducted with indigenous communities as if their views did not count or their lives did not matter.

In contemporary indigenous contexts there are some major research issues which continue to be debated quite vigorously. These can be

summarized best by the critical questions that communities and indigenous activists often ask, in a variety of ways: Whose research is it? Who owns it? Whose interests does it serve? Who will benefit from it? Who has designed its questions and framed its scope? Who will carry it out? Who will write it up? How will its results be disseminated?[15] While there are many researchers who can handle such questions with integrity there are many more who cannot, or who approach these questions with some cynicism, as if they are a test merely of political correctness. What may surprise many people is that what may appear as the 'right', most desirable answer can still be judged incorrect. These questions are simply part of a larger set of judgements on criteria that a researcher cannot prepare for, such as: Is her spirit clear? Does he have a good heart? What other baggage are they carrying? Are they useful to us? Can they fix up our generator? Can they actually do anything?

The issues for indigenous researchers seeking to work within indigenous contexts are framed somewhat differently. If they are 'insiders' they are frequently judged on insider criteria; their family background, status, politics, age, gender, religion, as well as on their perceived technical ability. What is frustrating for some indigenous researchers is that, even when their own communities have access to an indigenous researcher, they will still select or prefer a non-indigenous researcher over an indigenous researcher. There are a number of reasons this happens, sometimes based on a deeply held view that indigenous people will never be good enough, or that indigenous researchers may divulge confidences within their own community, or that the researcher may have some hidden agenda. For quite legitimate reasons the indigenous researcher may not be the best person for the research, or may be rejected because they do not have sufficient credibility. The point being made is that indigenous researchers work within a set of 'insider' dynamics and it takes considerable sensitivity, skill, maturity, experience and knowledge to work these issues through. Non-indigenous teachers and supervisors are often ill prepared to assist indigenous researchers in these areas and there are so few indigenous teachers that many students simply 'learn by doing'. They often get hurt and fail in the process. I have heard this articulated by indigenous researchers as 'being burned' or 'being done over'. The second part of the book provides some ways for thinking about such issues.

In writing a book that focuses on research I have drawn together a range of experiences and reflections on both indigenous and research issues. I have a childhood familiarity with museums, having helped my father – a Maori anthropologist – pursue his own research in the back rooms of the Auckland War Memorial Museum and other museums in the United States. I cannot really recollect how, specifically, I helped him

because many of my strongest memories are of playing hide and seek in the cupboards and corridors. I do remember quite vividly, however, the ritual of cleansing ourselves by sprinkling water over us which my mother insisted on when we returned home. My grandmother was not too thrilled with the idea of my being in a museum at all. Many other Maori people, I was aware, were scared of what lay in the cupboards, of whose bones and whose ancestors were imprisoned in those cases. Later, my first ever paid job was as an assistant working at the Peabody Museum in Salem, Massachusetts. I helped my father, when required, to photograph intricately carved Marquesan adzes which ships of the East India Company had taken back from the Pacific to Salem. My paid job was to work in the basement of the museum typing labels to put on the logbooks of ships which had sailed from New England during the American Revolution. What was especially ironic was that there I was, a 16-year-old Maori, in the basement of a museum in Salem, Massachussetts, working on material related to the American Revolution – and none of it was new to me! I had already had a strong diet of British, European and American history.

In a sense, then, I grew up in a world in which science and our own indigenous beliefs and practices coexisted. I did not become an anthropologist, and although many indigenous writers would nominate anthropology as representative of all that is truly bad about research, it is not my intention to single out one discipline over another as representative of what research has done to indigenous peoples. I argue that, in their foundations, Western disciplines are as much implicated in each other as they are in imperialism. Some, such as anthropology, made the study of us into 'their' science, others were employed in the practices of imperialism in less direct but far more devastating ways. My own academic background is in education, and in my field there is a very rich history of research which attempts to legitimate views about indigenous peoples which have been antagonistic and dehumanizing. Discussions around the concept of intelligence, on discipline, or on factors that contribute to achievement depend heavily on notions about the Other. The organization of school knowledge, the hidden curriculum and the representation of difference in texts and school practices all contain discourses which have serious implications for indigenous students as well as for other minority ethnic groups.

My own career in research began in the health field, working alongside a team of respiratory physicians, paediatricians, epidemiologists and psychologists who were trying to make sense of the ways families manage asthma in young children. As coordinator of this project I had to learn very quickly how to participate in discussions on a wide range of matters, how to gain access to some very serious bureaucratic systems

such as hospital wards and emergency clinics, and how to talk about research to a range of audiences, from medical doctors to families with limited English language. I enjoyed the challenges of thinking about what things mean, about why things happen and about the different ways in which the world can be understood. I also enjoyed interviewing people and, even more, analyzing the responses they gave. While I enjoyed the hands-on level at which I was working I found that the more rewarding work involved me in trying to 'think through' a problem, 'working with' the data and bringing it together with my own readings. Mostly, however, I found that the particular issues I faced as an indigenous researcher working with indigenous research participants were never addressed by the literature, my own training or the researchers with whom I worked. Later I became involved in other research projects in education, evaluation, tribal research and community-based projects. I began to teach others about research and have since become involved in managing much larger research projects that train indigenous and non-indigenous researchers. I have spoken about research to First Nations peoples in Canada, to Hawai'ian and other Pacific Islands researchers, and to Aborigine audiences as well as to many Maori groups who have become active as research communities. I supervise indigenous students carrying out their research projects, participate in research groups and lead some of my own projects.

In positioning myself as an indigenous woman, I am claiming a genealogical, cultural and political set of experiences. My *whakapapa* or descent lines come through both my parents. Through them I belong to two different major 'tribal' groups and have close links to others.[16] In my case, these links were nurtured through my early years by my extended family relationships and particularly by my maternal grandmother. It is through my grandmother that my sense of place became so firmly grounded. That was especially important because my parents worked away from either of their tribal territories. My grandmother insisted, and my parents supported this although she gave them no choice, that I return to her as often as possible. When I had to return to my parents she would pack food parcels for me just in case they did not feed me well enough! Although she developed in me the spiritual relationships to the land, to our tribal mountain and river, she also developed a sense of quite physical groundedness, a sense of reality, and a sense of humour about ourselves. It may be those qualities that make me sceptical or cautious about the mystical, misty-eyed discourse that is sometimes employed by indigenous people to describe our relationships with the land and the universe. I believe that our survival as peoples has come from our knowledge of our contexts, our environment, not from

some active beneficence of our Earth Mother. We had to know to survive. We had to work out ways of knowing, we had to predict, to learn and reflect, we had to preserve and protect, we had to defend and attack, we had to be mobile, we had to have social systems which enabled us to do these things. We still have to do these things.

Politically, my dissent lines come down through my tribal lines but also through my experiences as a result of schooling and an urban background. One of my tribes, Ngati Awa, is part of what is referred to as the *raupatu*. The *raupatu* refers to those tribes whose territories were invaded and whose lands were confiscated by the New Zealand Government last century. The grievances which have come about through the *raupatu* form the basis of our claim to the Waitangi Tribunal. That particular dissent line is part of a legacy shared by many other indigenous peoples. My other dissent lines, however, were shaped by the urban Maori activism which occurred in New Zealand in the late 1960s and early 1970s. I belonged to one group, Nga Tamatoa or 'Young Warriors', and was at one point its secretary. We had several aims, although the main two were the recognition of the Treaty of Waitangi and the compulsory teaching of our language in schools. We formed a number of different alliances with other radical groups and some of our members belonged simultaneously to two or three groups. One of my roles was to educate younger Maori students about our aims. This took me into school assemblies and to situations where young people gathered. From those beginnings I became a primary or elementary teacher, then a secondary school counsellor, a health researcher and then a lecturer at university. While my professional career was developing I also helped in the early development of Te Kohanga Reo, the Maori language nests, and was one of the group which initiated an alternative Maori elementary school movement known as Kura Kaupapa Maori. I write, therefore, from the position of an indigenous Maori woman from New Zealand. Like indigenous peoples in Australia, Canada, the United States and Western Europe I write from the context of the First World, a world described in Julian Burger's *Report from the Frontier* simply as rich.[17] Despite the very powerful issues which locate many First World indigenous peoples in Third World social conditions we still, comparatively speaking, occupy a place of privilege within the world of indigenous peoples. That does not mean that indigenous peoples from the First World have better ideas or know anything more. It may mean that such things as access to food and water can be taken for granted or that the politics of food and water can be played out in vastly different ways within the First World than is possible within developing states.

One of the many criticisms that gets levelled at indigenous

intellectuals or activists is that our Western education precludes us from writing or speaking from a 'real' and authentic indigenous position. Of course, those who do speak from a more 'traditional' indigenous point of view are criticized because they do not make sense ('speak English, what!'). Or, our talk is reduced to some 'nativist' discourse, dismissed by colleagues in the academy as naïve, contradictory and illogical. Alternatively it may be dismissed as some modernist invention of the primitive. Criticism is levelled by non-indigenous and indigenous communities. It positions indigenous intellectuals in some difficult spaces both in terms of our relations with indigenous communities and within the Western academy. It is not a new phenomenon either, the matter having been addressed previously by Frantz Fanon, for example. More recent writers have situated discussions about the intellectual within debates about post-colonialism.[18] Many indigenous intellectuals actively resist participating in any discussion within the discourses of post-coloniality. This is because post-colonialism is viewed as the convenient invention of Western intellectuals which reinscribes their power to define the world. For each indigenous intellectual who actually succeeds in the academy, however – and we are talking relatively small numbers – there is a whole array of issues about the ways we relate inside and outside of our own communities, inside and outside the academy, and between all those different worlds.

Language and the citing of texts are often the clearest markers of the theoretical traditions of a writer. In this book I draw on selected ideas, scholarship and literature. These may or may not be attributed to either Western or indigenous traditions. I say that because like many other writers I would argue that 'we', indigenous peoples, people 'of colour', the Other, however we are named, have a presence in the Western imagination, in its fibre and texture, in its sense of itself, in its language, in its silences and shadows, its margins and intersections. The selection of ideas has been informed by a preference for, and a grounding in, particular forms of analysis which are probably already evident. Like many other Maori undergraduate students who attended university in the 1970s I read some texts for my formal course of study and another set of alternative readings to keep sane, to keep connected to the rest of my life and, more importantly, to make sense of things that were happening around me. Much of that alternative reading course is now collected in anthologies labelled as cultural studies.

In addition to this literature, however, are the stories, values, practices and ways of knowing which continue to inform indigenous pedagogies. In international meetings and networks of indigenous peoples, oracy, debate, formal speech making, structured silences and other conventions which shape oral traditions remain a most important way of developing

trust, sharing information, strategies, advice, contacts and ideas. In Maori language there is the expression *Kanohi kitea* or the 'seen face', which conveys the sense that being seen by the people – showing your face, turning up at important cultural events – cements your membership within a community in an ongoing way and is part of how one's credibility is continually developed and maintained.[19] In First Nations and Native American communities there are protocols of being respectful, of showing or accepting respect and reciprocating respectful behaviours, which also develop membership, credibility and reputation. In Hawai'i *kanaka Maoli,* or native Hawai'ian researchers, have talked of the many aunties, uncles and elders whose views must be sought prior to conducting any interviews in a community. In Australia Aborigine researchers speak also of the many levels of entry which must be negotiated when researchers seek information. Other indigenous researchers speak of the long-term relationships which are established and extend beyond a research relationship to one involving families, communities, organizations and networks.

Some methodologies regard the values and beliefs, practices and customs of communities as 'barriers' to research or as exotic customs with which researchers need to be familiar in order to carry out their work without causing offence. Indigenous methodologies tend to approach cultural protocols, values and behaviours as an integral part of methodology. They are 'factors' to be built in to research explicitly, to be thought about reflexively, to be declared openly as part of the research design, to be discussed as part of the final results of a study and to be disseminated back to the people in culturally appropriate ways and in a language that can be understood. This does not preclude writing for academic publications but is simply part of an ethical and respectful approach. There are diverse ways of disseminating knowledge and of ensuring that research reaches the people who have helped make it. Two important ways not always addressed by scientific research are to do with 'reporting back' to the people and 'sharing knowledge'. Both ways assume a principle of reciprocity and feedback.

Reporting back to the people is never ever a one-off exercise or a task that can be signed off on completion of the written report. Some of my students have presented their work in formal ceremonies to family and tribal councils; one has had his work positioned amongst the wreaths which have surrounded the casket of a deceased relation. I have travelled with another student back to an area where she carried out her interviews so that she could present copies of her work to the people she interviewed. The family was waiting for her; they cooked food and made us welcome. We left knowing that her work will be passed around the family to be read and eventually will have a place in the living room

along with other valued family books and family photographs. Other indigenous students have presented a symposium on their research into native schools to an international conference, or given a paper to an academic audience. Some have been able to develop strategies and community-based initiatives directly from their own research projects. Some have taken a theoretical approach to a problem and through their analyses have shown new ways of thinking about issues of concern to indigenous peoples.

Sharing knowledge is also a long-term commitment. It is much easier for researchers to hand out a report and for organizations to distribute pamphlets than to engage in continuing knowledge-sharing processes. For indigenous researchers, however, this is what is expected of us as we live and move within our various communities. The old colonial adage that knowledge is power is taken seriously in indigenous communities and many processes have been discussed and enacted in order to facilitate effective ways of sharing knowledge. Indigenous communities probably know more than the dominant white community about issues raised by the Human Genome Diversity Project, for example, or the General Agreement on Tariffs and Trade (GATT) agreement. I recall, when attending the Indigenous Peoples World Conference on Education in Woollongong, New South Wales, an Aborigine woman telling me that 'we are always waiting for them [white Australia] to catch up. They still don't know.' I use the term 'sharing knowledge' deliberately, rather than the term 'sharing information' because to me the responsibility of researchers and academics is not simply to share surface information (pamphlet knowledge) but to share the theories and analyses which inform the way knowledge and information are constructed and represented. By taking this approach seriously it is possible to introduce communities and people who may have had little formal schooling to a wider world, a world which includes people who think just like them, who share in their struggles and dreams and who voice their concerns in similar sorts of ways. To assume in advance that people will not be interested in, or will not understand, the deeper issues is arrogant. The challenge always is to demystify, to decolonize.

In reading this book you may well think that it is an anti-research book on research. There is certainly a history of research of indigenous peoples which continues to make indigenous students who encounter this history very angry. Sometimes they react by deciding never to do any research; but then they go out into the community and, because of their educational background and skills they are called upon to carry out projects or feasibility studies or evaluations or to write submissions that are based on information, data, archival records and interviews with

elders. They are referred to as project workers, community activists or consultants, anything but 'researchers'. They search and record, they select and interpret, they organize and re-present, they make claims on the basis of what they assemble. This is research. The processes they use can also be called methodologies. The specific tools they use to gain information can also be called methods. Everything they are trying to do is informed by a theory, regardless of whether they can talk about that theory explicitly.

Finally, a brief comment on non-indigenous researchers still researching with indigenous peoples or about indigenous issues. Clearly, there have been some shifts in the way non-indigenous researchers and academics have positioned themselves and their work in relation to the people for whom the research still counts. It is also clear, however, that there are powerful groups of researchers who resent indigenous people asking questions about their research and whose research paradigms constantly permit them to exploit indigenous peoples and their knowledges. On the positive side, in the New Zealand context, work is being carried out in terms of bicultural research, partnership research and multi-disciplinary research. Other researchers have had to clarify their research aims and think more seriously about effective and ethical ways of carrying out research with indigenous peoples. Still others have developed ways of working with indigenous peoples on a variety of projects in an ongoing and mutually beneficial way. The discussion about what that means for non-indigenous researchers and for indigenous peoples is not addressed here directly. It is not that I do not have views on the matter but rather that the present work has grown out of a concern to develop indigenous peoples as researchers. There is so little material that addresses the issues indigenous researchers face. The book is written primarily to help ourselves.

Notes

1 Thompson, A. S. (1859), *The Story of New Zealand. Past and Present – Savage and Civilized*, John Murray, London. Thompson writes that, 'The comparative smallness of the brain is produced by neglecting to exercise the higher faculties of the mind, for as muscles shrink from want of use, it is only natural that generations of mental indolence should lessen the size of brains', Vol. 1, p. 81.

CHAPTER 8

Twenty-Five Indigenous Projects

The implications for indigenous research which have been derived from the imperatives inside the struggles of the 1970s seem to be clear and straightforward: the survival of peoples, cultures and languages; the struggle to become self-determining, the need to take back control of our destinies. These imperatives have demanded more than rhetoric and acts of defiance. The acts of reclaiming, reformulating and reconstituting indigenous cultures and languages have required the mounting of an ambitious research programme, one that is very strategic in its purpose and activities and relentless in its pursuit of social justice. Within the programme are a number of very distinct projects. Themes such as cultural survival, self-determination, healing, restoration and social justice are engaging indigenous researchers and indigenous communities in a diverse array of projects. The projects intersect with each other in various ways. They have multiple goals and involve different indigenous communities of interest. Some projects, for example, have been driven by indigenous lawyers and constitutional experts, others by indigenous women and health workers, or by social workers and policy analysts. This chapter sets out 25 different projects currently being pursued by indigenous communities. The projects constitute a very complex research programme. Each one intersects with the agenda for indigenous research discussed in Chapter 6 in two or three different ways, that is by site/s and by processes. Each project is outlined to give a bare indication of the parameters offered within it and how these may link in with some of the others.

The projects are not claimed to be entirely indigenous or to have been created by indigenous researchers. Some approaches have arisen out of social science methodologies, which in turn have arisen out of methodological issues raised by research with various oppressed groups. Some projects invite multidisciplinary research approaches. Others have arisen more directly out of indigenous practices. There are two technical

points to make here. First, while most projects fall well within what will be recognized as empirical research, not all do. Some important work is related to theorizing indigenous issues at the level of ideas, policy analysis and critical debate, and to setting out in writing indigenous spiritual beliefs and world views. Second, the focus is primarily on social science research projects rather than what may be happening in the natural or physical sciences or technology. There is one technical distinction to clarify. In the chapter I draw on Sandra Harding's very simple distinction between methodology and method, that is, 'A research methodology is a theory and analysis of how research does or should proceed ...' and, 'A research method is a technique for (or way of proceeding in) gathering evidence.'[1] Methodology is important because it frames the questions being asked, determines the set of instruments and methods to be employed and shapes the analyses. Within an indigenous framework, methodological debates are ones concerned with the broader politics and strategic goals of indigenous research. It is at this level that researchers have to clarify and justify their intentions. Methods become the means and procedures through which the central problems of the research are addressed. Indigenous methodologies are often a mix of existing methodological approaches and indigenous practices. The mix reflects the training of indigenous researchers which continues to be within the academy, and the parameters and common sense understandings of research which govern how indigenous communities and researchers define their activities.

The Projects

The following projects are not ranked or listed in any particular order.

1 Claiming

In a sense colonialism has reduced indigenous peoples to making claims and assertions about our rights and dues. It is an approach that has a certain noisiness to it. Indigenous peoples, however, have transformed claiming into an interesting and dynamic process. Considerable work and energy has gone into developing the methodologies which relate to 'claiming' and 'reclaiming'. For some indigenous groups the formal claims process demanded by tribunals, courts and governments has required the conducting of intensive research projects resulting in the writing of nation, tribe and family histories. These 'histories' have a focus and purpose, that is, to establish the legitimacy of the claims being asserted for the rest of time. Because they have been written to support claims to territories and resources or about past injustices, they have been constructed around selected stories. These claiming histories have

also been written for different audiences. One audience is the formal court or tribunal audience, who are generally non-indigenous, another the general non-indigenous population, and a third the people themselves. For this last audience the histories are also important teaching histories. They teach both the non-indigenous audience and the new generations of indigenous peoples an official account of their collective story. But, importantly, it is a history which has no ending because it assumes that once justice has been done the people will continue their journey. It may be that in time the histories have to be rewritten around other priorities.

2 Testimonies

> 'My Name is Rigoberta Menchu, I am twenty-three years old, and this is my testimony.'[2]

Testimonies intersect with claiming because they are a means through which oral evidence is presented to a particular type of audience. There is a formality to testimonies and a notion that truth is being revealed 'under oath'. Indigenous testimonies are a way of talking about an extremely painful event or series of events.[3] The formality of testimony provides a structure within which events can be related and feelings expressed.[4] A testimony is also a form through which the voice of a 'witness' is accorded space and protection. It can be constructed as a monologue and as a public performance. The structure of testimony – its formality, context and sense of immediacy – appeals to many indigenous participants, particularly elders. It is an approach that translates well to a formal written document. While the listener may ask questions, testimonies structure the responses, silencing certain types of questions and formalizing others.

3 Story telling

Story telling, oral histories, the perspectives of elders and of women have become an integral part of all indigenous research. Each individual story is powerful. But the point about the stories is not that they simply tell a story, or tell a story simply. These new stories contribute to a collective story in which every indigenous person has a place. In a book called *The Wailing: A National Black Oral History*, Stuart Rintoul has called the oral histories he gathered 'stories handed down in the homes of Black Australians, told to new generations, taught in explanation of racism and mistreatment, recited with rage and dignity and sorrow'.[5] Rintoul writes further that the stories are also 'memories of injustice ... an avalanche of voices crying out in hundreds of countries across innumerable Dreamings'.[6] For many indigenous writers stories are ways of passing down the beliefs and values of a culture in the hope that the new

generations will treasure them and pass the story down further. The story and the story teller both serve to connect the past with the future, one generation with the other, the land with the people and the people with the story. As a research tool, Russell Bishop suggests, story telling is a useful and culturally appropriate way of representing the 'diversities of truth' within which the story teller rather than the researcher retains control.[7] Bishop also suggests that 'the indigenous community becomes a story that is a collection of individual stories, ever unfolding through the lives of the people who share the life of that community'.[8]

Intrinsic in story telling is a focus on dialogue and conversations amongst ourselves as indigenous peoples, to ourselves and for ourselves. Such approaches fit well with the oral traditions which are still a reality in day-to-day indigenous lives. Importantly, story telling is also about humour and gossip and creativity. Stories tell of love and sexual encounters, of war and revenge. Their themes tell us about our cultures. Stories employ familiar characters and motifs which can reassure as well as challenge. Familiar characters can be invested with the qualities of an individual or can be used to invoke a set of shared understandings and histories.

4 Celebrating survival

Celebrating survival is a particular sort of approach. While non-indigenous research has been intent on documenting the demise and cultural assimilation of indigenous peoples, celebrating survival accentuates not so much our demise but the degree to which indigenous peoples and communities have successfully retained cultural and spiritual values and authenticity. The approach is reflected sometimes in story form, sometimes in popular music and sometimes as an event in which artists and story tellers come together to celebrate collectively a sense of life and diversity and connectedness. Events and accounts which focus on the positive are important not just because they speak to our survival, but because they celebrate our resistances at an ordinary human level and they affirm—our identities as indigenous women and men. Celebrating survival as an approach is also a theme running through the collections of elders' stories. In one such collection told to Sandy Johnson she writes of the way in which '[the elders] speak openly of their personal struggles to stay on the path against impossible odds. Their stories of what they have lost and what they have fought to save are both tragic and heroic.'[9] Gregory Cajete writes that 'celebrating is a natural outcome of spiritual sharing and it too can take a diversity of forms. It is an individual and communal process that celebrates the mystery of life and the journey that each of us takes. Celebration is a way of spreading the lights around.'[10]

5 Remembering

The remembering of a people relates not so much to an idealized remembering of a golden past but more specifically to the remembering of a painful past and, importantly, people's responses to that pain. While collectively indigenous communities can talk through the history of painful events, there are frequent silences and intervals in the stories about what happened after the event. Often there is no collective remembering as communities were systematically ripped apart, children were removed for adoption, extended families separated across different reserves and national boundaries. The aftermath of such pain was borne by individuals or smaller family units, sometimes unconsciously or consciously obliterated through alcohol, violence and self-destruction. Communities often turned inward and let their suffering give way to a desire to be dead. Violence and family abuse became entrenched in communities which had no hope. White society did not see and did not care. This form of remembering is painful because it involves remembering not just what colonization was about but what being dehumanized meant for our own cultural practices. Both healing and transformation become crucial strategies in any approach which asks a community to remember what they may have decided unconsciously or consciously to forget.

6 Indigenizing

This project has two dimensions. The first one is similar to that which has occurred in literature with a centring of the landscapes, images, languages, themes, metaphors and stories in the indigenous world and the disconnecting of many of the cultural ties between the settler society and its metropolitan homeland. This project involves non-indigenous activists and intellectuals. The second aspect is more of an indigenous project. The term is used more frequently in South and Central America. The concept of indigenist, says Ward Churchill, means 'that I am one who not only takes the rights of indigenous peoples as the highest priority of my political life, but who draws upon the traditions – the bodies of knowledge and corresponding codes of values – evolved over many thousands of years by native peoples the world over'.[11] The term centres a politics of indigenous identity and indigenous cultural action. M. Annette Jaimes refers to indigenism as being grounded in the alternative conceptions of world view and value systems, 'These differences provide a basis for a conceptualisation of Indigenism that counters the negative connotations of its meanings in third world countries, where it has become synonymous with the "primitive", or with backwardness among superstitious peoples.'[12] Lester Rigney, an Aborigine researcher in New South Wales, names the approach he takes

as indigenist research, an approach which borrows freely from feminist research and critical approaches to research, but privileges indigenous voices.

7 Intervening

Intervening takes action research to mean literally the process of being proactive and of becoming involved as an interested worker for change. Intervention-based projects are usually designed around making structural and cultural changes. Graham Smith describes this approach as a necessary approach when faced with crisis conditions. Smith argues

> firstly, that Maori educational crises continue – this points to a failure of educational policy reforms, research and researchers. Secondly, educational researchers have continued to fail to intervene because of the lack of responsibility and accountability placed on researchers and policy makers. Thirdly much of research has been counter productive to Maori interests, and has merely served the dominant Pakeha group interests, by maintaining the status quo of unequal power distribution.[13]

It is not ethical to walk away, or simply to carry out projects which describe what is already known. State policies for indigenous peoples were also interventionist in profoundly destructive ways. The indigenous intervening project carries with it some working principles. For example, the community itself invites the project in and sets out its parameters. The various departments and agencies involved in such a project are also expected to be willing to change themselves in some way, redirect policy, design new programmes or train staff differently. Intervening is directed then at changing institutions which deal with indigenous peoples and not at changing indigenous peoples to fit the structures.

8 Revitalizing

Indigenous languages, their arts and their cultural practices are in various states of crisis. Many indigenous languages are officially 'dead' with fewer than a hundred speakers. Others are in the last stages before what is described by linguists as 'language death'. Revitalization initiatives in languages encompass education, broadcasting, publishing and community-based programmes. While the Welsh people are not formally part of the indigenous peoples' movements as described in Chapter 6, their programmes are often studied as examples of indigenous achievement. The Welsh language programme is promoted as a model for language revitalization. Welsh schools, from kindergarten to secondary schools, offer teaching through the medium of Welsh. This is supported officially through government funding. Television and newspapers in the medium of Welsh – which include children's programming, drama,

documentaries, news, and sports – provide a comprehensive approach to language revitalization. The European Bureau of Lesser Languages has a role of supporting the diverse minority languages of Europe. Maori language development has followed a similar pattern to the Welsh language example, with an official Language Act and associated educational programmes. In the case of Maori and Welsh language, there is a clear singular language. Many places have to battle for the survival of several languages spoken by small populations. In Canada, for example, most of the indigenous languages could be categorized as being on the verge of extinction. British Columbia has a diverse range of indigenous languages, all of which require support. The Squamish language, for example, has few native speakers. The Squamish Nation helped co-host a conference on indigenous languages in 1989 in order to stimulate discussions and seek solutions to the language crisis. Their Nation's Band Office has an education centre whose staff develop resources for schools and encourage the use of the language by their remaining native speakers. For much of the indigenous world there is little proactive coordination or support. Literacy campaigns tend to frame language survival programmes. Such campaigns are designed around either official languages or one or two dominant languages. The indigenous language is often regarded as being subversive to national interests and national literacy campaigns.

9 Connecting

The importance of making connections and affirming connectedness has been noted also by other minority group researchers. Connectedness positions individuals in sets of relationships with other people and with the environment. Many indigenous creation stories link people through genealogy to the land, to stars and other places in the universe, to birds and fish, animals, insects and plants. To be connected is to be whole. The project of connecting is pursued in New South Wales in one form as literally connecting members of families with each other. A link programme has been designed to restore the descendants of 'stolen children', ones forcibly taken from their families and adopted, to their family connections. Forced adoption and dehumanizing child welfare practices were carried out in many indigenous contexts. Being reconnected to their families and their culture has been a painful journey for many of these children, now adults. Connecting also involves connecting people to their traditional lands through the restoration of specific rituals and practices. In New Zealand one example of this is the practice of burying the afterbirth in the land. The word for afterbirth is the same as the word for land, *whenua*. The practice was prohibited as Maori mothers were forced to have their babies in hospitals rather than

at home. The policies and hospital practices have now changed and Maori parents have reinstituted the practice of taking the afterbirth and burying it in traditional territory. Connecting children to their land and their genealogies through this process is also part of a larger health project designed to encourage young Maori mothers to take better care of themselves and their babies through stronger cultural supports. Connecting is related to issues of identity and place, to spiritual relationships and community wellbeing.

There are other challenges in relation to the project of connecting. Researchers, policy makers, educators, and social service providers who work with or whose work impacts on indigenous communities need to have a critical conscience about ensuring that their activities connect in humanizing ways with indigenous communities. It is a very common experience to hear indigenous communities outline the multiple ways in which agencies and individuals treat them with disrespect and disregard. Connecting is about establishing good relations.

10 Reading

Critical rereading of Western history and the indigenous presence in the making of that history has taken on a different impetus from what was once a school curriculum designed to assimilate indigenous children. The new reading programme is motivated partly by a research drive to establish and support claims, but also by a need to understand what has informed both internal colonialism and new forms of colonization. The genealogy of colonialism is being mapped and used as a way to locate a different sort of origin story, the origins of imperial policies and practices, the origins of the imperial visions, the origins of ideas and values. These origin stories are deconstructed accounts of the West, its history through the eyes of indigenous and colonized peoples. The rereading of imperial history by post-colonial and cultural studies scholars provides a different, much more critical approach to history than was previously acceptable. It is no longer the single narrative story of important white imperial figures, adventurers and heroes who fought their way through undiscovered lands to establish imperial rule and bring civilization and salvation to 'barbaric savages' who lived in 'utter degradation'.

11 Writing

Indigenous people are writing. In Chapter 1 the writing project was named as 'the empire writes back' project. In a localized context, however, writing is employed in a variety of imaginative, critical, and also quite functional ways. Maori author Witi Ihimaera has assembled a

five-volume anthology of Maori literature which he argues represents the 'crossroads ... of a literature of a past and a literature of a present and future'.[14] The title of an anthology of Native Women's writings of North America, *Reinventing the Enemy's Language*, gives a sense of the issues being explored through writing.[15] Similar anthologies and works of indigenous literature are being published around the world by indigenous writers for indigenous reading audiences.[16] The boundaries of poetry, plays, song writing, fiction and non-fiction are blurred as indigenous writers seek to use language in ways which capture the messages, nuances and flavour of indigenous lives. The activity of writing has produced the related activity of publishing. Maori newspapers, which were quite common in the nineteenth century, have been revived as different organizations and tribes seek to provide better information than is available in the mainstream media. Language revitalization initiatives have created a demand for multi-media language resources for children. In the Western Isles of Scotland, a Stornaway publishing house called Acair has produced children's comic books in Scottish Gaelic and cookbooks and other material which supports the Gaelic language. Similar small publishing groups are operating across the indigenous world. Writing workshops and writing courses offered by indigenous writers for indigenous people who want to write are held in many places. The work of authors such as Patricia Grace, Paula Gunn Allen, Louise Erdrich, Witi Ihimaera and Sally Morgan is read by both indigenous and non-indigenous audiences. Biographies and autobiographies including those which are accounts 'told to a non-indigenous person', are sought after by a new reading audience of indigenous people.

12 Representing

Indigenous communities have struggled since colonization to be able to exercise what is viewed as a fundamental right, that is to represent ourselves. The representing project spans both the notion of representation as a political concept and representation as a form of voice and expression. In the political sense colonialism specifically excluded indigenous peoples from any form of decision making. States and governments have long made decisions hostile to the interests of indigenous communities but justified by a paternalistic view that indigenous peoples were like children who needed others to protect them and decide what was in their best interests. Paternalism is still present in many forms in the way governments, local bodies and non-government agencies decide on issues which have an impact on indigenous communities. Being able as a minimum right to voice the views and opinions of indigenous communities in various decision-making bodies is still being struggled over. Even at the minimal level of representation indigenous communities

are often 'thrown in' with all other minorities as one voice amongst many. The politics of sovereignty and self-determination have been about resisting being thrown in with every other minority group by making claims on the basis of prior rights.

Representation is also a project of indigenous artists, writers, poets, film makers and others who attempt to express an indigenous spirit, experience or world view. Representation of indigenous peoples by indigenous people is about countering the dominant society's image of indigenous peoples, their lifestyles and belief systems. It is also about proposing solutions to the real-life dilemmas that indigenous communities confront and trying to capture the complexities of being indigenous. Many of the dilemmas are internalized stress factors in community life which are never named or voiced because they are either taken for granted or hidden by a community. There is an element of the raw, tough and unsympathetic representation of indigenous life by a writer such as Allen Duff who wrote the novel *Once Were Warriors*. And there is the humour of Alexie Sherman who wrote *Reservation Blues*. Film makers such as Merata Mita have a very clear purpose in their work which locates it firmly within a decolonization framework. She says that,

> Not surprisingly, when my obsessive struggle with filmmaking began, it was with the issues that most concerned us as Maori women that I became pre-occupied – the issues of injustice, land, te reo Maori [Maori language], the Treaty, and racism. Add to that women and gender issues, and for those who don't know, these are the things that consume us, consume our energy, beset us every moment of our daily lives, they are brutalising, violent, and some of us die because of them.[17]

13 Gendering

Gendering indigenous debates, whether they are related to the politics of self-determination or the politics of the family, is concerned with issues related to the relations between indigenous men and women. Colonization is recognized as having had a destructive effect on indigenous gender relations which reached out across all spheres of indigenous society. Family organization, child rearing, political and spiritual life, work and social activities were all disordered by a colonial system which positioned its own women as the property of men with roles which were primarily domestic. Indigenous women across many different indigenous societies claim an entirely different relationship, one embedded in beliefs about the land and the universe, about the spiritual significance of women and about the collective endeavours that were required in the organization of society. Indigenous women would argue that their traditional roles included full participation in many aspects of

political decision making and marked gender separations which were complementary in order to maintain harmony and stability. Gendering contemporary indigenous debates occurs inside indigenous communities and while it is debated in other contexts, such as in Western feminist debates, indigenous women hold an analysis of colonialism as a central tenet of an indigenous feminism. A key issue for indigenous women in any challenge of contemporary indigenous politics is the restoration to women of what are seen as their traditional roles, rights and responsibilities. Aroha Mead gives an account of a statement delivered by two Maori women to the Twelfth Session (1994), of the United Nations Working Group on Indigenous Peoples which addressed the way colonialism has influenced indigenous men and had a detrimental affect on indigenous gender relations. She says that

> never before have I witnessed what occurred while the full statement was being read out. Indigenous women sitting within their delegations were visibly moved – some looked around to see who was talking about their pain – some gave victory signals and physical signs of agreement, and many, perhaps even the majority, sat stoically, with tears swelling in their eyes. The words broke through the barriers of language and regionalism. A raw wound was clearly touched.[18]

14 Envisioning

One of the strategies which indigenous peoples have employed effectively to bind people together politically is a strategy which asks that people imagine a future, that they rise above present day situations which are generally depressing, dream a new dream and set a new vision. The confidence of knowing that we have survived and can only go forward provides some impetus to a process of envisioning. In New Zealand, for example, tribes which began their grievance claims against the Crown last century have not only had their claims heard but are negotiating a settlement. For the people who began the process these settlements were simply dreams. If they had listened to politicians, taken the mainstream media seriously, taken heed of scholars and commentators, they would not have begun. Similarly, communities who have worked to revitalise their language or build a new economic base or renegotiate arrangements with governments have worked on the basis of a shared vision. The power of indigenous peoples to change their own lives and set new directions despite their impoverished and oppressed conditions speaks to the politics of resistance.

Sometimes the visions which bind people were set a long time ago and have been passed down the generations as poems, songs, stories, proverbs or sayings. Every indigenous community probably has special

sayings, predictions, riddles and proverbs which are debated frequently and raised both informally and formally. Children are socialized into these sayings and pass them down to their own children. The profound statements of indigenous leaders from the last century and the centuries before are often written in diaries and notebooks, carved into stone, distributed by T-shirt and poster. Often the original source of the comment has been forgotten but the power of the words remain. They make our spirits soar and give us hope. Indigenous people have borrowed freely from each other and it is not uncommon to find the saying of an Indian chief stuck to the kitchen wall in a Maori home, or the saying of a Maori chief embroidered into a wall hanging in an Aborigine home. These sayings have acted like resistance codes which can be passed down by word of mouth to the next person, to the next generation.

15 Reframing

Reframing is about taking much greater control over the ways in which indigenous issues and social problems are discussed and handled. One of the reasons why so many of the social problems which beset indigenous communities are never solved is that the issues have been framed in a particular way. For example, governments and social agencies have failed to see many indigenous social problems as being related to any sort of history. They have framed indigenous issues in 'the indigenous problem' basket, to be handled in the usual cynical and paternalistic manner. The framing of an issue is about making decisions about its parameters, about what is in the foreground, what is in the background, and what shadings or complexities exist within the frame. The project of reframing is related to defining the problem or issue and determining how best to solve that problem. Many indigenous activists have argued that such things as mental illness, alcoholism and suicide, for example, are not about psychological and individualized failure but about colonization or lack of collective self-determination. Many community health initiatives address the whole community, its history and its wider context as part of the problem and part of the solution.

Reframing occurs in other contexts where indigenous people resist being boxed and labelled according to categories which do not fit. This is particularly pertinent in relation to various development programmes, government and non-government. In the case of Maori, for example, a Maori language initiative for young children from birth to school age – known as Te Kohanga Reo, or Maori language nests – constantly has to explain why it is not a child-care centre but a language and culture initiative for young children. The problem of definition is important in this case because it affects funding, but the constant need to justify

difference is experienced by many other communities whose initiatives are about changing things on a holistic basis rather than endorsing the individualized programme emphasis of government models. The need to reframe is about retaining the strengths of a vision and the participation of a whole community.

Reframing occurs also within the way indigenous people write or engage with theories and accounts of what it means to be indigenous. In the politics of indigenous women, for example, there is continuing resistance to the way Western feminists have attempted to define the issues for indigenous women and categorize the positions in which indigenous women should be located. Moves to discuss patriarchy without addressing imperialism and racism are always reframed by indigenous women, and of course other minority women, as inadequate analyses. Similarly moves to attack indigenous culture or indigenous men 'as a group' are also resisted because for indigenous women the issues are far more complex and the objective of analysis is always focused on solving problems. In the end indigenous men and women have to live together in a world in which both genders are under attack.

16 Restoring

Indigenous peoples across the world have disproportionately high rates of imprisonment, suicide and alcoholism. Some indigenous activists regard these rates as the continuation of a war. Says Bobbi Sykes, 'The main question, which has not been addressed by government, is the legitimacy or otherwise of the assumption that white domination of Aboriginal people is in itself a concept of justice.'[19] For Aborigines the high rates of black deaths in custody eventually provoked the establishment of a Royal Commission of Inquiry in 1987 into a problem which had been hidden for many years. The Aborigine rates of death in custody was said to be higher than the rate in South Africa. Inside the incarceration rates for indigenous peoples are similar rates for youth offending and for indigenous women. In the health arena indigenous people have high rates of morbidity and mortality. Maori women have one of the highest rates of lung cancer in the world. Maori suicide rates, both male and female, have risen sharply over the last decade, with New Zealand rates amongst the highest in OECD countries. Aborigine rates of illness have frequently been cited as examples of the Fourth World, rates, which are worse than the rates in developing Third World states, and are made more horrific by the fact that these communities live in nations that have the highest standards of living. At a recent gathering of Pacific leaders, for example, the Australian Prime Minister John Howard was reported to have been reluctant to agree on helping to counter the effects of global warming, citing his duty to put the standard

of living of Australians first. He was not talking about indigenous Australians.

The restoring of wellbeing spiritually, emotionally, physically and materially has involved social workers and health workers in a range of initiatives, some of which have been incorporated into mainstream programmes. Restorative justice in Canada, for example, applies concepts of the 'healing circle' and victim restoration which are based on indigenous processes. These systems have been discussed widely and used to motivate other societies to develop better ways of dealing with offenders and victims. In New Zealand adoption policies and programmes for dealing with children have similarly coopted indigenous practices. Restoring is a project which is conceived as a holistic approach to problem solving. It is holistic in terms of the emotional, spiritual and physical nexus, and also in terms of the individual and the collective, the political and the cultural. Restorative programmes are based on a model of healing rather than of punishing. They sometimes employ concepts such as public shaming as a way of provoking individual accountability and collective problem solving. Health programmes addressing basic health issues have begun to seek ways to connect with indigenous communities through appropriate public health policy and practice models. The failure of public health programmes to improve the health of indigenous communities significantly has motivated a self-help approach by communities. It is especially infuriating when projects such as the Human Genome Project are justified on the grounds that knowledge about genetic resistances to various diseases will 'benefit mankind' when Western health has failed to benefit indigenous human beings.

17 Returning

This project intersects with that of claiming. It involves the returning of lands, rivers and mountains to their indigenous owners. It involves the repatriation of artefacts, remains and other cultural materials stolen or removed and taken overseas. Sykes lists the following examples: 'pickled heads, human gloves, scrotum tobacco pouches, dried scalps, pickled foetus, cicatured skins, complete stuffed, mummified children's bodies and women with child'.[20] In New Zealand the current Minister of Maori Affairs, who is a Maori, has set out a plan to return all tattooed Maori heads which are housed in museums and other collections across the world. They apparently number in the hundreds. In a previous chapter I discussed the house Mataatua which has now been returned to Ngati Awa.

Returning also involves the living. One major tribe in New Zealand has negotiated the return of traditional food gathering sites which will

be marked out for their exclusive use by tribal members. Other programmes have been initiated to repatriate people either through ensuring their membership in official tribal registers or by physically reclaiming them. Adopted children, for example, are encouraged to seek their birth families and return to their original communities.

18 Democratizing

Although indigenous communities claim a model of democracy in their traditional ways of decision making, many contemporary indigenous organizations were formed through the direct involvement of states and governments. Legislation was used to establish and regulate indigenous councils and committees, indigenous forms of representation and indigenous titles to lands. They are colonial constructions that have been taken for granted as authentic indigenous formations. Furthermore many such councils, because they were established through colonialism, have privileged particular families and elite groups over other indigenous families from the same communities. Needless to say, many councils were created as exclusively male domains while the health and welfare programmes were assigned to the women. Maori lawyer Annette Sykes argues, for example, in relation to a claim being made by Maori women to the Waitangi Tribunal, that

> The essence of the claim is to bring to the forefront of the current Treaty jurisprudence, the need to look at notions of governance in Aotearoa and the exclusionary practices that exist, which inhibit and prevent participation by Maori women in the tribal models for self-determination, that have been erected under New Zealand legislation, and the erosion that this in itself has had on Te Mana Wahine in Te Ao Maori [the *mana* of women in the Maori World].[21]

Democratizing in indigenous terms is a process of extending participation outwards through reinstating indigenous principles of collectivity and public debate.

19 Networking

Networking has become an efficient medium for stimulating information flows, educating people quickly about issues and creating extensive international talking circles. Building networks is about building knowledge and data bases which are based on the principles of relationships and connections. Relationships are initiated on a face to face basis and then maintained over many years often without any direct contact. People's names are passed on and introductions are used to bring new members into the network. The face to face encounter is about checking out an individual's credentials, not just their political credentials but their

personalities and spirit. Networking by indigenous peoples is a form of resistance. People are expected to position themselves clearly and state their purposes. Establishing trust is an important feature. In many states police surveillance of indigenous activists and their families is common practice. In some states, such as Guatemala, the disappearance of indigenous peoples has also been common practice. In these contexts networking is dangerous.

Networking is a way of making contacts between marginalized communities. By definition their marginalization excludes them from participation in the activities of the dominant non-indigenous society, which controls most forms of communication. Issues such as the Conventions on Biodiversity or GATT, for example, which have a direct impact on indigenous communities, are not addressed by mainstream media for an indigenous audience. Indigenous peoples would not know of such agreements and their impact on indigenous cultural knowledge if it were not for the power of networking. The project of networking is about process. Networking is a process which indigenous peoples have used effectively to build relationships and disseminate knowledge and information.

20 Naming

This project takes its name from Brazilian educator Paulo Freire whose saying, 'name the word, name the world' (which was about literacy programmes), has been applied in the indigenous context to literally rename the landscape. This means renaming the world using the original indigenous names. Naming as a project of Maori people can be seen in the struggles over the geographical names of some of New Zealand's mountains and significant sites which were renamed randomly after British people and places. Many of the Maori names have now been restored. Naming can also be seen in the naming of children. Indigenous names carried histories of people, places and events. As a result of Christian baptism practices, which introduced Christian names and family names, and schooling practices, where teachers shortened names or introduced either generic names or nicknames, many indigenous communities hid their indigenous names either by using them only in indigenous ceremonies or by positioning them as second names. A more recent assertion in Maori naming practices has been to name children again with long ancestral names and to take on new names through life, both of which were once traditional practices. Children quite literally wear their history in their names.

Naming applies to other things as well. It is about retaining as much control over meanings as possible. By 'naming the world' people name their realities. For communities there are realities which can only be

found in the indigenous language; the concepts which are self-evident in the indigenous language can never be captured by another language.

21 Protecting

This project is multifaceted. It is concerned with protecting peoples, communities, languages, customs and beliefs, art and ideas, natural resources and the things indigenous peoples produce. The scale of protecting can be as enormous as the Pacific Ocean and the Amazon rainforest or as small as an infant. It can be as real as land and as abstract as a belief about the spiritual essence of the land. Every indigenous community is attempting to protect several different things simultaneously. In some areas alliances with non-indigenous organizations have been beneficial in terms of rallying international support. In other areas a community is trying to protect itself by staying alive or staying off alcohol.

Some countries have identified sacred sites and have designated protected areas. Many of these, unfortunately, become tourist spots. Issues about the protection of indigenous knowledge have been discussed at various indigenous conferences which have produced charters and conventions aimed at signalling to the world at large that indigenous knowledges ought to be protected. History seems to suggest that many of these calls for international adherence to such charters will be at best highly selective. The need to protect a way of life, a language and the right to make our own history is a deep need linked to the survival of indigenous peoples.

22 Creating

The project of creating is about transcending the basic survival mode through using a resource or capability which every indigenous community has retained throughout colonization – the ability to create and be creative. The project of creating is not just about the artistic endeavours of individuals but about the spirit of creating which indigenous communities have exercised over thousands of years. Imagination enables people to rise above their own circumstances, to dream new visions and to hold on to old ones. It fosters inventions and discoveries, facilitates simple improvements to people's lives and uplifts our spirits. Creating is not the exclusive domain of the rich nor of the technologically superior, but of the imaginative. Creating is about channelling collective creativity in order to produce solutions to indigenous problems. Every indigenous community has considered and come up with various innovative solutions to problems. That was before colonialism. Throughout the period of colonization indigenous peoples survived because of their imaginative spirit, their ability to adapt and to think around a problem.

Indigenous communities also have something to offer the non-indigenous world. There are many programmes incorporating indigenous elements, which on that account are viewed on the international scene as 'innovative' and unique. Indigenous peoples' ideas and beliefs about the origins of the world, their explanations of the environment, often embedded in complicated metaphors and mythic tales, are now being sought as the basis for thinking more laterally about current theories about the environment, the earth and the universe.

Communities are the ones who know the answers to their own problems, although their ideas tend to be dismissed when suggested to various agencies and governments. Visits to communities which have developed their own programmes demonstrate both the creativity alive and well at the community level and the strength of commitment shown when the programme is owned by the community.

23 Negotiating

Negotiating is about thinking and acting strategically. It is about recognizing and working towards long-term goals. Patience is a quality which indigenous communities have possessed in abundance. Patience and negotiation are linked to a very long view of our survival. When one reads of the decisions made by various indigenous leaders to accept the terms and conditions of colonization, what emerges from those stories is the concern shown by leaders for the long-term survival chances of the collective, of their own people. That was the basis of their courage and, despite the outrage younger generations of indigenous people might feel about the deal which some leaders accepted, the broader picture across several indigenous contexts is one of dignity and acceptance of a specific reality. Their negotiations were undertaken quite literally with guns held at their heads, with their people starving and with death around them.

In today's environment negotiation is still about deal making and it is still about concepts of leadership. Negotiations are also about respect, self-respect and respect for the opposition. Indigenous rules of negotiation usually contain both rituals of respect and protocols for discussion. The protocols and procedures are integral to the actual negotiation and neglect or failure to acknowledge or take seriously such protocols can be read as a lack of commitment to both the process and the outcome. Many indigenous societies are socialized into some forms of negotiation because they are part of trading practices or basic communication styles. The contemporary negotiation project is related to self-determination, in that indigenous nations are negotiating terms for settlements which often mean semi-autonomous government or statutory representation or control over key resources, such as natural

resources within their own territories. Negotiation also occurs where small gains are at stake, however, such as when local communities have worked out an agreement with a local government or agency or another local community. The formality of negotiation is important in protecting the sanctity of the agreement which emerges from a negotiation. Indigenous peoples know and understand what it means for agreements to be dishonoured. The continued faith in the process of negotiating is about retaining a faith in the humanity of indigenous beliefs. values and customary practices.

24 Discovering

This project is about discovering Western science and technology and making science work for indigenous development. There are very few indigenous scientists who remain closely connected to their own indigenous communities. Indigenous students across many contexts have struggled with Western science as it has been taught to them in schools. Science has been traditionally hostile to indigenous ways of knowing. Science teaching in schools has also been fraught with hostile attitudes towards indigenous cultures, and the way indigenous students learn. There are huge debates within the scientific community about the nature of science and how it ought to be taught. This debate is over the notion of constructivism, and concerns the extent to which knowledge is socially constructed or exists 'out there' as a body of knowledge which students simply learn. The development of ethno-science and the application of science to matters which interest indigenous peoples such as environmental and resource management or biodiversity offer some new possibilities for indigenous people to engage with the sciences which they decide are most relevant.

25 Sharing

The final project discussed here is about sharing knowledge between indigenous peoples, around networks and across the world of indigenous peoples. Sharing contains views about knowledge being a collective benefit and knowledge being a form of resistance. Like networking, sharing is a process which is responsive to the marginalized contexts in which indigenous communities exist. Even in the context of New Zealand – a small country, relatively well-off in terms of televisions and communications – Maori people learn more about the issues which affect them at one of the many community gatherings which are held on *marae* then they do from the mainstream media. These gatherings may be for weddings or funerals but they are also used as opportunities to keep the community informed about a wide range of things. The face-to-face nature of sharing is supplemented with local newspapers which

focus on indigenous issues and local radio stations which specialize in indigenous news and music. Sharing is also related to the failure of education systems to educate indigenous people adequately or appropriately. It is important for keeping people informed about issues and events which will impact on them. It is a form of oral literacy, which connects with the story telling and formal occasions that feature in indigenous life.

Sharing is a responsibility of research. The technical term for this is the dissemination of results, usually very boring to non-researchers, very technical and very cold. For indigenous researchers sharing is about demystifying knowledge and information and speaking in plain terms to the community. Community gatherings provide a very daunting forum in which to speak about research. Oral presentations conform to cultural protocols and expectations. Often the audience may need to be involved emotionally with laughter, deep reflection, sadness, anger, challenges and debate. It is a very skilled speaker who can share openly at this level within the rules of the community.

Summary

The projects touched on in this chapter are not offered as the definitive list of activities in which indigenous communities are engaged. There are numerous collaborative projects being undertaken with non-indigenous researchers and organizations. Many of these research partnerships help to develop a trained workforce through the mentoring and guidance provided by the non-indigenous researchers. There are also the more standard types of research projects and methodologies in the social sciences that have not been mentioned here. Some of these approaches, for example those in critical ethnography, have been written about and theorized by scholars working in those disciplines. The naming of the projects listed in this chapter was deliberate. I hope the message it gives to communities is that they have issues that matter and processes and methodologies which can work for them.

CHALLENGING KNOWLEDGE CAPITALISM. INDIGENOUS RESEARCH IN THE 21ST CENTURY

MAKERE STEWART-HARAWIRA
University of Alberta

Keywords
Indigenous research, knowledge capitalism, Maori, western science

Biographical note
Makere Stewart-Harawira, Waitaha, is part of the New Zealand Maori diaspora in Canada. She is the author of *The New Imperial Order: Indigenous Responses to Globalization.* Her research and scholarship are driven by her conviction of the necessity for active critical engagement in the local and global crises of governance and sustainability that confront us in the 21st century; the necessity for a re-visioning of how we live together on this planet; and the vital contribution of traditional Indigenous knowledge systems and languages. She may be reached at makere@ualberta.ca.

There is, of course, nothing new about the idea that Indigenous people conduct research. Indigenous peoples have been conducting research since time immemorial, in the sense of investigating and uncovering knowledge and developing new ways of understanding the world. Arguably what might be new, at least as far as the last thirty or so years are concerned, is the formalizing and positioning of Indigenous research as both an act of re-claiming Indigenous sovereignty and authority and as an anti-colonial process of engagement by Indigenous scholars and researchers with mainstream, western science, an engagement that is transforming western research. At the same time, Indigenous researchers claim their ways of knowing and doing research as valid, legitimate and essential ways of understanding and interpreting the world.

The last decades have also seen re-newed attempts within some sections of the academe to discredit both Indigenous ontologies and research methods. In such cases, Indigenous research is deemed inadequate unless it meets western standards of validity. In the context of the neoliberal turn, with its emphasis on market relationships and the related pressures to monetarize research, the efforts to discredit Indigenous researchers take on a dangerous new dynamic. In the past, political correctness concerns dismissed Indigenous research as the misguided political appeasement of disgruntled 'minorities'.

Now such political correctness issues are recast as an insistence on the importance of promoting markets and private-public, or Indigenous-industry partnerships. Indigenous research is deemed important only insofar as it is compatible with overriding concerns for knowledge that creates profits. As I have argued elsewhere, the elevation of the market as the main driver of the academy has profound implications for how we think about knowledge. For Indigenous peoples in particular, this approach constitutes a form of cognitive imperialism which impacts on Indigenous knowledge and Indigenous scholarship in deeply contradictory but ultimately very damaging ways.

In this article, I reflect on these issues within the context of an environment that is in many ways familiar in its relative inhospitality to Indigenous research and in other ways changing at bewildering speed. But first there are some important disclaimers. I make no attempt in this article to define Indigenous people, an important and extensive debate that is however outside the scope of this paper. Nor do I attempt an authoritative definition of either Indigenous knowledge or Indigenous research. Just as there is no single definition of Indigenous people or even of 'western' knowledge or research, nor can there be single, authoritative definition of the nature of Indigenous knowledges and research. Rather, I briefly explore concerns raised by Indigenous scholars and raised by my own and other Indigenous experiences before considering the potential for radically rewriting the postcolonial project against new forms of imperialism, including within the academy. As Foucault points out, the genealogy of subjugated knowledges is important. Thus I take as my starting point the trajectory of Indigenous research within the academy.

Historicizing Indigenous research

Since the earliest days of colonialism over five hundred years ago, the colonial endeavor has sought to codify, quantify and tabulate flora, fauna and peoples. Early anthropologists in 19th century Britain, for instance, literally 'collected' specimens of Indigenous peoples and displayed them in zoos. Within the last hundred years, the identification and study of Indigenous peoples, including their knowledge, ways of being and cultural practices has been dominated by anthropologists and to a lesser but still important degree by historians. The trajectory of Maori Studies in Aotearoa New Zealand underlines the role of anthropology in particular (see Steve Webster (1989), Ranginui Walker (1990), Hirini Mead (1983) and Catriona Timms (2007).

Maori Studies was established as a separate subject of academic study as early as 1952, when the University of Auckland established a branch of Maori Studies within the department of Anthropology. As Hirini Mead observes, the predominant view at the time was that Maori Studies was not worthy of a place within the academy in its own right and should not be "seen as separable from anthropology" (Mead, 1983, p. 335, cited Timms, 2007). These were the heady days of an 'Enlightenment' tradition that for centuries has

treated 'others' as their own private zoo to be identified, categorized, codified and tabulated (c.f. Stewart-Harawira 2005: 61-64), sometimes literally as we have seen. In particular, cultural anthropologist Steve Webster (1989:49) describes the detrimental influence of the positivist tradition of noted anthropologists Malinowski and Firth for Maori peoples and culture. These social scientists redefined and reconstructed Maori culture in ways that made sense to them within a worldview both foreign and in many ways opposed to Maori culture, accruing considerable prestige and advancing their careers at the same time as they developed deformed and distorted accounts of Maori social and cultural life.

At that time, measuring 'acculturation' was an important anthropological project, associated with a covert assimilation agenda and implying the inevitable absorption of the Maori into colonial development. The merger of social anthropology and psychology during the 1950s and 1960s saw the strengthening of the assumption of western social scientists of the right to explain and defines Maori social functioning, personality development and the directions for future Maori social and economic development. Indices for measuring 'Maoriness' (Ritchie 1963: 39) based on the survival of belief and behavior from pre-European Maori culture discounted more recent elements of Maori world views and cultures and simultaneously assumed non-Indigenous 'experts' had the authority to decide who was and was not Maori. As settler anthropologist James Ritchie asserted in his study "Rakau Maoris who continue to base their identity on their Maoriness do so at their own peril" (Richie, 1963: 191). In other words, as Webster argues, anthropologists' cultural definitions and normative assumptions about the 'dangers' of continued Maori identity, as defined by anthropologists, were an expression of colonial power, both over what constitutes Maori identity and regarding the (lack of) desirability of that identity in a context where settler development was assumed to be the destiny of Maori peoples (Webster 1989: 48) 55). The assimilationist agenda of social psychology and anthropology became the commonsense belief of many Maori who absorbed the notion that they must subsume their 'Maoriness' for the greater good, although there has always been important Maori resistance.

It is against this history that Maori research in particular, and Indigenous research more generally, can be understood. In claiming the rights of self-definition, the right to tell their own histories, recover their own traditional knowledge and culturally grounded pedagogies, epistemologies and ontologies, Indigenous scholars are engaged in an arena of struggle which is systemic and sustained. In Aotearoa New Zealand, as elsewhere, at the centre of this struggle are relationships of power and the right of Maori to sovereignty. Nor is this story unfamiliar outside of the Maori context. The complaint that Aboriginal people had been "researched to death" reported by Marlene Castello (2000: 31) regarding the 1992 Royal Commission on Aboriginal Peoples in Canada echoed complaints from many Indigenous communities over many decades. To a large degree this sense of being "researched to death" drove Indigenous initiatives to assert their own sovereign authority

over the right to name and claim their own identities, definitions, traditional knowledge and cultural practice. Most notably, this encompasses the right to their Indigenous intellectual and cultural property and to the repatriation of cultural treasures referred to in the social science community as 'artifacts'. Integral to this movement was the politicization of Indigenous communities and activists during the 1960s and 1970s. The background and details of this global Indigenous movement and its connection to ongoing misappropriation of traditional lands and the loss of language and cultural knowledge has been well recounted by those who were in the forefront of this movement (c.f. Harold Cardinal [1969] 1999; Linda Tuhiwai Smith [1999] 2012; Graham Hinangaroa Smith 1997, Kathy Irwin 1994; Marie Batiste 2000). In Aotearoa New Zealand, Canada and the USA, Indigenous education initiatives by and for Indigenous people emerged alongside legal challenges to states for redress of illegal land appropriations (Smith, 2005; Walker, 1990). In Aotearoa New Zealand, early childhood immersion language programs in Maori expanded to include elementary schools and colleges and leading ultimately to the establishment of autonomous Maori Studies programs in certain universities (for a more detailed account, see Smith, 2005). Similar processes occurred in Australia Canada, the US and elsewhere

In the early 21st century, Indigenous studies programs are significantly different from colonially oriented studies of Indigenous peoples. Once, such studies limited their attention to the cultural artifacts of ethnic groups who expected to pass peacefully or otherwise into oblivion. Today, Indigenous Studies Faculties, Schools and Departments exist within multiple universities across Aotearoa New Zealand, Australia, Canada, the United States and the Pacific, testimony to the ongoing survival and strength of Indigenous communities once programmed for cultural and in some cases, physical, genocide. These academic programs include post-graduate instruction in Indigenous law, international politics, arts and literature, pedagogy, epistemology and research, all recognized as integral to the success of Indigenous post-secondary students and programs and to the broader project of decolonization, not least within the university. Yet these successes have not been achieved without constant and determined negotiation and re-negotiation on the part of Indigenous scholars who have continued to struggle within and without a system whose environment today, while familiar in many ways, is undergoing rapid changes. First signaled in the late 1980s by the World Bank followed by the Organization for Economic Cooperation and Development in the 1990s, the reconceptualization and reconstruction of the academy as the driver of the new 'knowledge economy' heralded a new kind of struggle over the nature and meaning of knowledge (Peters 2003). Accompanying this redefinition of knowledge within the academy, without the academy has been an inexorable resurgence of the re-appropriation of Indigenous lands and identities, often through legislative measures which redefine Indigenous self-determination as economic development, remove environmental

protections over lands and waterways, and reduce requirements to consult the traditional Indigenous landholders prior to initiating resource development activities on those lands.

The politics of reclaiming

Before turning to the new challenges posed by this reconceptualization of the university, it is necessary to consider the politics of reclaiming historical research by and for Indigenous peoples. As discussed above, Indigenous historiographies have frequently been subjected to invisibilization, misrepresentation and misinterpretation by historians trained in the positivist tradition, as well as some more critical traditions. Thus the reclaiming of those historiographies and the insurrection of subjugated Indigenous cosmologies and ontologies continue to be central in Indigenous peoples' resistance to the homogenising impulse of modernity, including in its current manifestations. At the heart of the decolonizing project has been the restoration and legitimation of Indigenous knowledge systems and methods of conducting research. For some Indigenous scholars, an important step on the journey has been to see the convergences between Indigenous and qualitative research methods (see for instance Kahakalau, 2004; Smith, 2008) For others the most important part of the process is to distinguish the nature of Indigenous knowledge and research from dominant western forms of knowledge, for example comparing individually based approaches to knowledge and research to the collective approaches of most Indigenous communities (c.f. Bishop, 1998; Urion, 1999). Often these comparisons take the form of 'writing back' against mainstream interpretations which describe Indigenous peoples' information-gathering methodologies as evidence of the 'prescientific', precausal nature of Indigenous knowledge systems, proof of an inability to conceptualize in an objective symbolic manner (c.f. Widdowson and Howard, 2008). Thus it is not unusual to see Indigenous thought systems described by Indigenous scholars (and some non-Indigenous scholar) as circular or spiral in nature and inclusive of both experiential and intuitive data. This contrasts with western knowledge systems, frequently described as linear and concerned primarily with empirical data and materiality. Lakota scholar Vine Deloria Jr. describes Indigenous conceptions of knowledge as intrinsically connected to the lives and experiences of human beings, both individuals and communities and emphasizes that all data and all experience is seen as relevant to all things. All human experiences and all forms of knowledge contribute to the overall understandings and interpretations, with no experience or piece of data seen as invalid. The critical task, Deloria (1999) explains, was (and is) to find the proper pattern of interpretation. Knowledge itself is commonly described as sacred, having come from the Creator. Rather than being limited to a 'codified canon', a canon separated from everyday life and taking place only in the special conditions of the laboratory, the experiment, as 'field work' and in other highly codified ways, traditional or Indigenous

knowledge is an expression of life itself, of how to live, and of the connection between all living things. From an Indigenous perspective, everything is living. This includes inanimate objects that are understood to hold their own energy, or in Maori terms, *mauri*, through which they are connected to the energetic web of the entire planet. Thus, as Vine Deloria wrote, nothing is considered in isolation, rather, all data within the whole system is carefully included.[1]

In short, interconnectedness, or relationality, is frequently described as the foundational principle in Indigenous ontologies and cosmologies and the epistemological and ontological base of Indigenous research. In this respect, it has much in common with some kinds of 'western' scientific discoveries in the field of quantum physics and related canons, although there may be important differences too. For instance, Métis professor Carl Urion insists that Indigenous knowledge is at once spiritual, emotional, physical and mental. In contrast, even 'holistic' western approaches like quantum physics fail to take seriously spiritual and emotional experiences as well as physical, material and mental ones. From this Indigenous concept of relationality derives sets of ethical principles that define the boundaries for engaging in Indigenous research.

Considering method

Indigenous research operates within a complex set of interrelationships and rules whose specifics are always determined by the Indigenous community itself. Indigenous research has been defined as emerging from an epistemological base that foregrounds the legitimacy and validity of locally determined Indigenous ontologies, epistemologies and methodologies (cf Pihama, Cram, and Walker 2002), is conducted only with the full consent and participation of the Indigenous communities concerned, and within the boundaries, protocols, principles and practices determined by the community. Within this space, protocols, relationships, reciprocity, methods, process and ownership of data and findings define the parameters of the research project and are carefully and thoroughly negotiated with the community. At the heart of Indigenous research lie issues of who benefits, how, and to what purpose. Not infrequently, these questions may be negotiated over and over again in the process of a major research project. At any given point, the community may decide to discontinue the research. And at that point, the research stops. In a very important sense, then, this is the heart of Indigenous research.

Intuition, dreams, and insights and ceremony frequently play an important role in the protocols of Indigenous research. Ceremony, the details of which vary widely from continent to continent and group to group, can prepare and open the mind to the possibility of intuition and insights. As well as opening the mind, ceremony and prayer are important mechanisms for ensuring that the researcher is of good mind, good heart,

[1] This section has to a large extent been drawn from Stewart-Harawira 2005, pp. 35-39.

and good motive – all three critical in conducting Indigenous research – and that the proposed research is in alignment with the highest good. Often a project will not begin without this preparation. Notwithstanding that intuition, insight, and reams have not infrequently been the catalyst for new discoveries and understandings within 'western' sciences, principles and practices such as these that are often the target of mainstream scholars' critiques which understood them as 'unscientific'.

Another common target for critique is the recovery of data that is orally held and sourced. Indigenous research recognizes that important historical and cultural knowledge is often held in Indigenous communities in the form of story and songlines. Jo-ann Archibald (2008) describes deep storying, or storywork, as an Indigenous research methodology which builds on seven critical principles of respect, responsibility, reciprocity, reverence, holism, interrelatedness, and synergy that form a framework for understanding the characteristics of stories, appreciating the process of storytelling, establishing a receptive learning context, and engaging in holistic meaning-making (Archibald, 2008). Meaning-making can involve the process of comparing and cross-matching oral accounts and it also involves careful interpretation of the language in which the information is held, be it song, chant, story. Linguistic changes over time mean that often such knowledge is described in language not readily accessible today, thus the need for careful discernment of the pattern of interpretation, as Deloria points out. On this basis, the notion that orally held knowledge lacks validity and verifiability is readily challengeable by those who have access to understanding these processes. Stories' in fact provide a rich source of verifiable data that can be cross-matched and compared from multiple perspectives when viewed through the right lens. The trick is in the knowing. Just as mainstream knowledge systems have their own processes for 'gate-keeping', Indigenous communities also have strategies for protecting the integrity of knowledge. These are but some of the critical issues that are shaped and negotiated within particular frameworks and relationships when entering the space of research negotiation with and for Indigenous communities.

Inevitably, gate-keeping strategies have both positive and negative consequences. Among the latter are gross misinterpretations and misrepresentations of, for example, the rationales for particular cultural practices, the genealogy of certain aspects of knowledge – often delivered in only partially accurate forms, in order to protect both the receiver and the knowledge itself. For instance Maori have commonly held the view that in certain cases the right to particular aspects of knowledge has to be earned, whereas in other cases that right may be ascribed. Similarly, aspects of historical events, practices, and rationales, may be creatively reinterpreted for the listener. In each situation the objective is protection of that knowledge base. The difficulty, of course, is that these partial truths are often replicated through dissemination activities by western scholars and administrators such as presentations, publications, and texts. Ironically, these partial truths are frequently mobilized by western scholars to justify attacks on the credibility of

Indigenous cultural knowledge and research methods; in fact, this is simply partial knowledge that has been decontextualized and therefore robbed of its meaning, which appears only within the proper relational context.

Careful observation and testing, often over hundreds and thousands of years, is equally part and parcel of Indigenous research methods. When Indigenous scholars write about Indigenous scientific knowledge they are referring to minutely detailed knowledge of the natural world and comprehensive understandings of the nuances that signal phases of change within the natural world. Some of this is reflected in the traditional practices of naming, as is also well documented and hardly needs recounting here (see for example Basso, 1996) From the multitude of possible examples from Aotearoa New Zealand, Huhana Smith's (2008) doctoral thesis carefully tabulates five years of painstaking, rigorous community research seeking out, analyzing and applying the necessary information to restore a badly polluted and diverted river system. This provides an outstanding example of an Indigenous methodological approach to research. The methods utilized by Huhana Smith and the community included identifying, cross-matching and analyzing oral stories and histories, songs, proverbs and other forms of orally recorded information. The vast reservoir of traditional knowledge that emerges from such painstaking tabulation and recording certainly can and does contribute immeasurably to eco-system restoration. Its importance in enlarging scientific understandings of the impacts of, for instance, climate change or industrial development has been well documented (c.f. Gadgil, Berkes, Foke, 1993; Berkes, 2008; Green, D. & Raygorodstky, 2010; Tyrell, 2011). The astronomical and cosmological knowledge recorded in some communities may also contribute to our understandings of the potential effects of proposals to mitigate the effects of its climate change. The possibilities are limited only by the narrowness of our gaze.

As the academy undergoes deep and radical reconstructions, the unequal status and ongoing attacks upon Indigenous knowledge and research demonstrates the "epistemological tyranny" of 'Western' science, its rules for determining truth and so its rules for disqualifying and marginalizing Indigenous ways of knowing (Kinchloe & Steinberg 2008, pp.144-145). On the extreme end of such critiques are scholars such as Widdowson and Howard who insist that the term 'traditional knowledge' is tendentious, and that each item of purported traditional knowledge should be evaluated on the basis of the evidence for and against it. Unless and until subjected to scientific (western) methods of validation, traditional knowledge – which they distinguish from Indigenous knowledge defined as a postmodern construct – can make no claims to validity. On the other hand, they argue, if traditional knowledge is subject to the same kinds of scientific method as western knowledge e.g. replicating and testing, what is the point of distinguishing it from scientific knowledge? (Widdowson & Howard 2008, p. 231-240). Small wonder that Indigenous scholars tend not to rely for validity on western science research methods by which 'heads, you lose; tails, you lose'. Yet arguments such as those presented by

Wddowson have been met with enthusiasm by many western scholars and critics of the Indigenous turn in the early twenty-first century.

New Zealand scholar Elizabeth Rata, whose critiques of cultural relativism target Maori education policy and practice, is more refined in her argument. Rata attacks the equalizing of status of Indigenous knowledge in New Zealand universities, the unfortunate creation of what she terms a 'global industry' (2011, 1-22), arguing that the deployment of culturally appropriate pedagogies in education and by extension, traditional cultural knowledge which is described as an expression of "immanentism – the practice of asserting a necessary movement of history that confers subordinate groups with objective interests in radical change" – works against social justice goals for those whom it is intended to benefit. Her argument rests on what she holds to be the blurring of the social knowledge and disciplinary knowledge within the curriculum following the turn towards constructivism. The problem, she argues, lies with the relativist claim that all knowledge is socially constructed, a claim that extends to worldviews, ways of knowing, and 'knowledges' and consequentially to the equalizing of status between social and disciplinary or 'scientific' knowledge. Attacks of this nature are symptomatic of an ongoing and systemic cognitive imperialism, an imperialism that fails to recognize the ways that western science is historically and socially constructed. Far more troubling than such attacks, however, is the radical shift to monetized knowledge and research and the implications of this for Indigenous knowledge and research within the academy.

Futures for Indigenous research

As universities are reconstructed as the drivers of knowledge capitalism, the challenges to Indigenous scholarship and research are significant. The conundrum faced by Indigenous scholars and researchers in this environment is played out in our entry into the global market model of knowledge capitalism in scholarship, in the discourses of excellence and best practice, and in academic performance reviews which measure the value of research in terms of its marketability. This substitution of industry and the operation of the market for the pursuit of truth and meaning as the main driver of the academe constitute a new form of cognitive imperialism which impacts on indigenous knowledge and indigenous scholarship in deeply contradictory but ultimately damaging ways.

On one hand, the new 'knowledge economy' operates to marginalize Indigenous philosophical knowledge and traditional ways of being in the world as valid and legitimate forms of study, insofar as Indigenous ways of knowing do not immediately produce profitable research. On the other hand, it repositions (some) Indigenous knowledge and scholarship within the discursive framework of innovation, excellence and contribution to economic wealth. As university-industry partnerships substitute public funding and demands and scholars and researchers are faced with monetizing

their teaching and research in order to maintain programs and spaces of engagement, there are difficult decisions to be made, especially by those of us who see our work as holding the space for Indigenous community-University relationships and engagement. At the root of these decisions lie ethical and philosophical principles that are complex, contested and contradictory. For Daniel Heath Justice (2004), the academy is a place of engagement where "the world of ideas can meet action and become lived reality." It is here, he argues, in this borderland space of profound contradiction that cultural recovery work can begin. Here also, I believe, is the place where the intersection of western and Indigenous science can address the triple crises of ecological and economic catastrophe and human wellbeing that confronts us – and which our children, and their children's children, will inherit (c.f. Addison, et al, 2010). On this account, a radically different paradigm is required. Perhaps that, after all, is the true challenge of decolonization. Most certainly, outside the academy, that sits at the heart of the rising crescendo of struggle over the right to maintain, protect and preserve lands, waters, and ecosystems.

There is no question that inequity regarding Indigenous research and knowledge is prevalent within the academy. There is equally no question that Indigenous knowledge and research together with those of social and natural sciences provide a complex and dynamic set of skills and understandings. These may yet enable humanity to find its way out of the worst set of crises in the known history of humankind and towards a radical reconceptualization of the complexity of interrelationship and the nature of being.

Abstract
This paper introduces the special issue of *Decolonization* on land-based education. We begin with the premise that, if colonization is fundamentally about dispossessing Indigenous peoples from land, decolonization must involve forms of education that reconnect Indigenous peoples to land and the social relations, knowledges and languages that arise from the land. An important aspect of each article is then highlighted, as we explore the complexities and nuances of Indigenous land-based education in different contexts, places and methods. We close with some reflections on issues that we believe deserve further attention and research in regards to land-based education, including gender, spirituality, intersectional decolonization approaches, and sources of funding for land-based education initiatives.

Keywords: *land based education; Indigenous Knowledge; Indigenous Resurgence; decolonization*

Introduction

What does it mean to think of land as a source of knowledge and understanding? How do our relationships with land inform and order the way humans conduct relationships with each other and other-than-human beings? How do we offer education to people on the land in ways that are grounded in Indigenous knowledge? What does it mean to understand "land" – as a system of reciprocal social relations and ethical practices – as a framework for decolonial critique? These are a few of the central questions that have been answered by contributors to this special edition on land-based education, in *Decolonization: Education, Indigeneity and Society*.

Settler-colonialism has functioned, in part, by deploying institutions of western education to undermine Indigenous intellectual development through cultural assimilation and the violent separation of Indigenous peoples from our sources of knowledge and strength – the land. If settler colonialism is fundamentally premised on dispossessing Indigenous peoples from their land, one, if not the primary, impact on Indigenous education has been to impede the transmission of knowledge about the forms of governance, ethics and philosophies that arise from relationships on the land. As Leanne Simpson argues in the feature article of this issue, if we are serious about decolonizing education and educating people within frameworks of Indigenous intelligence, we must find ways of reinserting people into relationships with and on the land as a mode of education.

Key to the set of inquiries contained in this special issue is moving from *talk* about the land within conventional classroom settings, to studying instances where we *engage* in conversations with the land and on the land in a physical, social and spiritual sense. In addition to the comprehensive theoretical engagement with land based practices, the ten articles in this issue provide us with a specific examples of how land based activities are occurring on and with the land. What is gained from moving the classroom to the land? As Leanne Simpson, in a recent interview conducted by Eric Ritskes with her and Glen Coulthard, summarizes, land-based education sustains and grows Indigenous governance, ethics and philosophy – and life:

> We're practicing conflict management, agency and transparency and the things that Indigenous political cultures value. We're asking students to engage in a fairly rigorous process from a Dene perspective, in an intellectual, emotional and a spiritual and a physical way… we have to remember the ways that we replicated our nations through education and what were those critical components that produced people who could embody our political cultures and survive in our lands and think within Nishinaabeg or Dene thought and live a life where they were promoting more life in the coming generations. (Simpson & Coulthard, 2014)

In that same interview, Glen Coulthard also reflects on how land based education has been fundamental to his own understanding of Dene knowledge:

> I had learned as much as I could in the archive, talking to people, and reading about that history, but it was only when I started to commit myself to re-learning those practices and re-embedding myself in those social relationships with place, that I understood in a more concrete and embodied way, what was wrong with the forms of economic development that have come to be dominant in the North and elsewhere. (Simpson & Coulthard, 2014)

Land-based education, in resurging and sustaining Indigenous life and knowledge, acts in direct contestation to settler colonialism and its drive to eliminate Indigenous life and Indigenous claims to land.

In their own unique ways, each contribution to this volume aims to sever the historical and contemporary relationship between education and the reproduction of settler-colonial power and associated forms of knowledge. On the one hand, the pairing of colonial domination with western education has had a devastating effect on Indigenous students, contributing to a contemporary educational deficit that expresses itself in lower academic success rates and experiences of racism and alienation in the classroom. On the other, institutions of mainstream education have fostered high levels of ignorance regarding Indigenous issues within the non-Native student and educator community. In different ways, each paper in this collection takes stock of what settler colonialism makes lost, damaged, and destroyed, as well as what is being and can be changed, gained and restored through various forms of land-based resurgence. In doing so, the examples of Indigenous land-based pedagogy discussed in this volume all offer a way of fostering individual and collective empowerment for students by re-embedding them in the land-connected social relationships that settler-colonialism, through education and otherwise, sought to destroy. The initiatives discussed in this issue, each focused on resurging Indigenous knowledges, leaves us with room for optimism despite the stranglehold that colonial education currently has in Canada and other settler nations. But, contrary to mainstream discourse, ours is not an optimism grounded in the ideal or hope of reconciliation through inclusion. Our optimism is grounded in a call for Indigenous resurgence and settler reckoning.

This issue highlights the diversity of land-based education and is a major contribution to the *Indigenous Resurgence* paradigm of intellectual thought. For scholars working on Indigenous political issues within Canadian universities and elsewhere, Indigenous resurgence has become one of the most robust scholarly paradigms to study Indigenous politics from. The term owes its intellectual origin to Taiaiake Alfred's (2009) work in *Wasase: Indigenous Pathways of Action and Freedom* and is now widely used by many scholars in the field including many of the editors and contributors to this journal issue. For Alfred, the resurgence paradigm was a way of theorizing how a shift in the consciousness of Indigenous peoples, away from reconciliation and towards decolonization, would provide the foundation of an Indigenous social movement capable of transforming Canadian society.

To create this social movement, what was needed was initially a *regeneration* of Indigenous cultural, spiritual and political practices. This revitalization would provide the

personal and collective strength necessary for a confrontation with Canadian society. Having undergone cultural regeneration, an Indigenous resurgence would engage in an outward, disciplined confrontation with settler society. Due to the protracted struggle and engagement with this Indigenous movement, settler society would be forced into reckoning with its colonial past and present and undertake in its own decolonizing journey.

This issue can then be read as a useful contribution to the resurgence paradigm in its emphasis on both the importance of cultural regeneration, as well as outward resurgence and contestation with settler colonial incursions and violence in the realms of education, and more broadly against Indigenous peoples, knowledges, languages, and the relationships with the land that sustain these. This issue is a reminder that Alfred's original formulation equally emphasized regeneration of Indigenous knowledges and ways of being in the world, as well as their necessary contestation with settler colonial power.

The issue begins with a feature article by Leanne Simpson and then traverses ten articles, two creative writing pieces, a video and a poem. We encounter Mohawk lives disrupted by industrial pollution and Métis landscapes transformed through the rise of industrial capitalism; Tlingit and Mono places whose names, stories and ecological realities have been overwritten by colonial relations; contributions from three Anishnaabe authors who discuss land as both culturally grounding and contested; the social relations of Chisasibi Cree; stories from the land provided by a Swampy Cree author and a Tłı̨chǫ author; and we see the perspective of a Maori knowledge keeper in film. Many of these contributions include collaborations between settler scholars working in the academy and Indigenous community members, and we also have two great contributions from settler scholars working in collaboration with Indigenous peoples of Denedeh/NWT. Including the cover from a Coast Salish artist and the work of Plains Cree and Yellowknives Dene editors, we have here an edition with contributions from Indigenous people from 12 different nations.

Taken together, we believe the issue offers a nuanced and diverse appreciation for the significance of land based pedagogy and practices as a catalyst for regenerating Indigenous social, spiritual and physical land-connection. In lieu of descriptions of each piece, our introduction will highlight important insights provided by the ten articles and two creative writing pieces. These insights provide only a small sample of the theoretical complexity and empirical richness developed by the authors. We conclude by examining areas for further exploration and inquiry in land-based education.

Issue overview

Leading off the issue, Leanne Simpson's article prompts deeper thinking about ways in which mainstream education is at odds with resurgent life ways. Simpson provides a compelling argument for the necessity of raising Indigenous youth who are strongly connected to the land and the Indigenous cultures and languages that the land sustains. Employing the story of Kwezens, she anchors her argument within a Nishnaabeg intellectual framework. Using this

frame provides a "critical intervention into current thinking around Indigenous education, because Indigenous education is not Indigenous or education from within our intellectual traditions unless it comes through the land, unless it occurs in an Indigenous context using Indigenous processes" (p. 9). For people working in Indigenous education at any level or locale, this article represents one of the most definitive statements on the importance of land-based education for Indigenous cultures and the resurgence of them.

As Simpson states in her opening footnote, her paper was generated "inside a community of intellectuals, artists, Elders and cultural producers to whom I am both influenced by and accountable to" (p. 1). While her article did not go through a standard academic peer review process, it is important to note that drafts were peer-reviewed by four prominent Nishnaabeg thinkers. Given that the majority of our articles in this issue were written or co-written by Indigenous scholars, and written in conversation and collaboration with Indigenous communities and educational projects, Simpson's approach is a powerful challenge to how peer review is conducted in the context of land-based education and Indigenous resurgence. Namely, we should not assume that 'peers' in these circumstances are university professors, nor demand that the review process require submitting papers for anonymous feedback. It is a challenge to think about how we create review processes that involve people from the communities that support and foster these land-based initiatives. As Coulthard points out about his role as an academic in collaboration with community, "we're not renegades that are dropped into territories and determine what the most radical and transformative educational experiences *we* think would be relevant for *them*; it's done in a spirit of reciprocity, with community engagement and input" (Simpson and Coulthard, 2014). This requires academics to think further about how we can practice and foster reciprocity with communities in order to create land-based sites of education.

Aldern and Goode, in part, focus on how Indigenous intellectual thought can be mobilized in land management decision-making. Their article provides an account of ways that land-based methods influence ecological policy in the traditional territory of the North Fork Mono peoples, in what is today known as the Sierra National Forest area in central California. They expertly outline a method that combines traditional Mono narratives with site visits that happen with the leadership and presence of Mono elders and other knowledge holders. They discuss how this method is applied to government policy decisions with respect to the endangered Pacific Fisher (weasel). Critically, Aldern and Goode demonstrate that including Mono knowledge within ecological decision-making is not done solely for the sake of fulfilling requirements of consultation. Rather, Mono knowledge arises from deeply rooted land relationships that can improve ecological outcomes, while at the same time transforming settler-privilege, which is further discussed by Irlbacher-Fox in her contribution. After a site visit to the forest with author Ron Goode, a federal biologist "remarked that he saw the forest in a new way …something that was not easy to imagine without getting out onto the land" (p. 43). Being present on the land provides powerful ways of seeing one's relationships to the land and other-than-humans, as well as new ways in contesting settler colonialism and its sense making mechanisms.

While Goode and Aldern's article offers an example of ways to challenge settler colonialism's formula of Indigenous dispossession, Jennifer Adese provides a careful account of ways in which industrial modes of production structure Métis relations to land. Adese relies on Métis Elders' life stories to illustrate changing relationships with land. She shows that industrial life ways have fundamentally and negatively impacted Métis relations with land. Importantly, this argument avoids any reliance on tropes that believe contact with modernity renders Indigenous peoples 'inauthentic' (see Raibmon, 2005) by bringing forward descriptions from Métis autobiographies about their changing relationship with land and the various ways in which Métis peoples navigate these changes. Quoting from the biography of Elmer Ghostkeeper, Adese describes the transition as moving from "living with the land to living off the land," requiring Ghostkeeper to deny and suppress "his inclination to understand the world around him through the prism of relatedness, leading to his detachment from the land" (p. 62). Building on the work of Chris Andersen and Adam Gaudry, this contribution is also a counter to Métis histories authored by non-Indigenous writers that essentialize the Métis and their histories through racialized understandings of 'mixedness', without reference to how Métis actually understood their own lifeways through relationship to place and land.

Erin Freeland Ballantyne, in her article, positions Dechinta Bush University as a site of decolonizing praxis in her analysis of settler colonial capital and the history of the public education system in Denendeh. Arguing that Indigenous-led land-based education has the potential to undermine petrocapitalism in the north, she draws from Dechinta's five years of land-based programming to demonstrate that land-based learning supports individuals and communities ability to live and envision life outside of the enclosures of capital. While self-identifying as a settler and calling for settler people to take responsibility for settler colonialism, the site of decolonizing praxis she describes is inclusive of people and families who are both Indigenous and non-Indigenous. She articulates a site of multi-cultural decolonizing praxis where all students learn from the land in a shared space in which Indigenous epistemologies are central. She writes, "Building strong relationships of reciprocity with the land results in the crumbling of settler capitalism because it fundamentally shifts the relationships people experience and what they believe about who they are, how they are in relation to and with land, and what they believe to be true" (pp. 76-77).

Equally intriguing, Ballantyne argues that settler capital can and should be realigned and reconfigured to serve the resurgent goals of Indigenous communities. This is an important and probably contentious point in the world of anti-colonial activism, as many organizers and activists are vocally apprehensive about 'buying into' what's termed the non-profit industrial complex or funding mentality. This article addresses this question in an important way by grounding this dilemma within a space of learning that is reliant on funding from social innovation funders, but that has also consistently received evaluations from students who speak of Dechinta as providing a transformative experience.

One of the most comprehensive overviews of land-based programming is provided by Radu, House, and Pashagumskum. The three-year old "Chisasibi land-based healing program"

provides a space for those seeking to overcome addictions and mental health issues. Participants learn from two elders who combine counselling methods with "teaching Indoh-hoh[1] (Cree bush skills) and values embedded in the Cree language" (p. 88). This article shows how combining land-based activities can work in conjunction with other institutional requirements. The authors make two valuable theoretical contributions. First is an exploration of how ecological connectedness promotes good health. For Eddie Pash, one's connection to nature encourages reflection upon what healthy relationships look like. He states: "All through these traditional ways of living we respect nature. If you respect nature, you have to respect each other too, and you have to respect yourself… Respect is a gift in our traditions, because it is the way to be happy" (p. 94). Second, the article positions healing as a central component of decolonization. For the authors, healing is a "relational process that fosters spaces in which social and familial bonds are strengthened and make possible community conversations about what is needed to mend local relationships that is in line with Indigenous life-worlds" (p. 97). While this is important for the decolonizing journey of the community, it also creates a situation where: "healing fosters decolonization by empowering individuals and communities to engage in transforming the Indigenous-State relationship" (p. 97).

The article by Schreyer, Corbett, Gordon and Larson describes the development of a place names website using participatory mapping and crowd sourcing techniques. The website was created through a collaboration between the Taku River Tlingit and a team from University of British Columbia – Okanagan. The authors provide a description of their website, where users can manually upload place names onto the traditional territory of the Taku River Tlingit. This approach is guided by a commitment to stewardship as a guiding principle of decision making and promoting an appreciation of the close connection between the Tlingit language and the landscape. The authors describe the application of these values as being able to "talk to the land." The website has only recently been completed and the authors also provide a useful discussion of the potential pitfalls in such a project, such as the possible decontextualization of Indigenous knowledge from place. In response, they also point out how the website can be used in conjunction with people engaging in land based activities. In doing so, their honest and reflexive description of their project animates the kinds of difficulties encountered in the course of land-based initiatives which is instructive for others considering similar approaches to foster language learning and land-based connections.

Taiaiake Alfred details a cultural apprenticeship program in the Mohawk community of Akwesasne. For those familiar with the work of Alfred, this piece provides an important corrective to those who claim Alfred's theorizing is impractical in the face of societal and institutional constraints. Alfred details his work as principle consultant for the Mohawks of Akwesasne as they moved through the Natural Resources Damages Assessment process, remediation projects that are more commonly known as "Superfund" sites. While the Mohawks of Akwesanse clearly face legal and legislative barriers in undertaking the process, they were also able to "put forward and defend their understanding of cultural loss within the context of

[1] See the glossary at the end of their article for a detailed definition of the term.

their nationhood" (p. 135). The "superfund" process asks groups to negotiate settlements that remediate the natural environment and establishes a monetary settlement to compensate for lost economic opportunities. The Mohawks of Akwesasne were able to alter the terms of compensation to focus on how 'cultural injury' caused by pollution would be addressed by instituting measures and mechanisms aimed at restoring "relationships that are crucial to the expression of Mohawk identity" (p. 139). Alfred summarizes how the restoration plan for the Mohawks of Akwesasne created a land-based cultural apprenticeship program targeting youth, instead of the typical approach that asks groups to simply negotiate a monetary figure that will compensate for past harm.

Irlbacher-Fox focuses on what decolonization requires in settler colonial contexts. Drawing on a combination of personal experience and scholarly thought, Irlbacher-Fox traces the role settler privilege plays in blocking the establishment of structures that enable Indigenous peoples from having effective political power and control. Here we see how self-reckoning with settler privilege is fundamental to creating spaces of respect, in order to work towards creating a context of co-existence in which Indigenous knowledge and practice can safely circulate. Many of the contributions in this special issue describe Indigenous-funded or controlled and/or Indigenous generated initiatives; here, Irlbacher-Fox provides an important addition by focusing on a conceptual framework for how settler people can work towards enacting decolonization. For Irlbacher-Fox, in order to achieve respectful co-existence in the future, settlers must engage in forms of co-resistance that challenge settler privilege in the present. Irlbacher-Fox provides us with an important conceptual framework for settlers attempting to tear down institutional barriers, such as those described by Leanne Simpson's observations on mainstream education or Goode and Aldern's on curriculum and policy development.

The final two articles deal with sites of Anishnaabe resurgence. Unlike the other land-based programs described in the edition, both of these sites do not receive funding or material support from government, non-profit or corporate sources. Yerxa provides us with an examination of a recent resurgence project she is involved in. For the past two years, Anishnaabe from multiple communities have come together to Gii-kaapizigemin (we roast) manoomin (wild rice) neyaashing (at The Point). In this article, Yerxa characterizes this collective organizing as a 'Manoomin Movement' and, building on the work of Avery Kinew, Yerxa outlines how "making manoomin is a ceremonial act, as much as it is a practical act, as much as it is a political act" (p. 108). Roasting manoomin at the point is a political act because it foregrounds a history of dispossessing Anishnaabe jurisdiction in the area. In 2009, a ninety-nine year lease expired on The Point and Anishnaabe moved to reassert ownership and control. Four Anishnaabe Nations are pursuing the matter through the specific land claims process to regain control of The Point, an approach Yerxa problematizes. She states: "Through this process we automatically negate what we are trying to assert - Anishinaabeg nationhood - because we grant authority to the Canadian state to decide matters over our lives and our lands" (p. 109). As an alternative, people from four communities have come together to roast wild rice and 're-presence' themselves on their traditional territory. Yerxa calls for a 'Manoomin movement', where roasting wild rice at

The Point every fall provides the basis of a resurgence that has the ability to overwrite the land with Anishnaabeg law.

Continuing the themes explored by Yerxa, Gardner and Giibwanisi discuss the creation and maintenance of the Oshkimaadziig Unity Camp. The authors describe the camp as a land reclamation conducted in the same spirit as other camps such as Grassy Narrows, Kitchenuhmaykoosib Inninuwug, or Elsipogtog. One notable difference is that this camp arose in response to the settlement of a Specific Land Claim by four surrounding First Nations, instead of in response to incursions by resource extraction projects, and the authors contextualize the camp within Canada's attempt to retroactively legitimize its claimed sovereignty through the specific land claims process. Although the Oshkimaadziig Unity Camp is meant to challenge the legitimacy of Canadian law over the claim area, an action that aligns with Audra Simpson's (2014) theorizing on 'refusal', the camp is equally focused on internal acts of regenerating Anishnaabe connections to land. From this standpoint, the authors concisely discuss four modes of internally directed regeneration. First, establishing connection with land as a necessary aspect of Anishnaabe ceremony and governance. Second, the camp as a method of passing on teachings to the next generation. Third, the camp as a method of establishing just relations between Indigenous and settler peoples. And, finally, the camp as a source of alternative social relations and practices that model a more just world.

To conclude, the special issue takes a more creative turn. Tłı̨chǫ writer and storyteller Richard Van Camp and our editor, Maskîkow graduate student and Dechinta Program Manager Mandee McDonald, provide us with two pieces of creative writing, fiction and non-fiction respectively. Van Camp's story introduces us to two young cousins, recent high school graduates facing the next stage of life. We follow the young men on a hunting trip with their Father/Uncle. Van Camp's piece is an important illustration of how spending time on the land allows generations to connect and form bonds, but it also depicts the land as a source of joy and happiness for the characters. This same theme illuminates the creative non-fiction piece written by Mandee McDonald. Her story telling approach is enlivened by the emotions of her experiences on the land, which in turn determines the flow of her narrative: Moose Hides, Bears, Fish, and Hunting. McDonald's account of her experiences on the land brings some of the broad theoretical insights from the issue into focus as they circulate in her lived experience. Her story situates the land as an animating force of teaching and learning. McDonald also reminds us that to build self-determining futures, Indigenous peoples must find ways to practice governance that centres love for the land and each other as the basis of the courage necessary to see it through.

Future directions

Although the contributions made in this issue are substantial and important, many readers will no doubt have questions or concerns about the lack of discussion on some issues. We would like to reflect on three issues that deserve further attention in future research on land-based education. These are gender, spiritual values, and intersectional approaches to settler colonialism.

Gender is touched upon by a number of the authors, but it is not the primary focus of any author. Discussing the story of Kwezens, a young girl discovering maple syrup, Simpson points out how the discovery could only be made in a context where observation and creativity are fostered in young children, and trust is reciprocated between the young girl, her family and other community members. In this story, trusting the teaching of the young girl is central to Nishnaabeg intelligence. Many other contributions bring forward and value the voices of women, and those wanting to think about those issues will find important contributions to think about, especially in the contributions of Adese, McDonald and Irlbacher-Fox. Yet, as a whole, the issue reveals rather than addresses the need for more thoughtful consideration towards gender. These considerations include focusing on gender relations in contemporary land-based contexts, how we might queer land-based pedagogy, and discussing the role gender plays in understanding the land as a source of knowledge.

Such analyses might illustrate how the internalization of colonial patriarchy and heteropatriarchy in Indigenous communities informs contemporary gender relations, values and roles when it comes to land-based practices - specifically regarding ceremony and harvesting protocols. The prevalence of violence against women in land-based contexts is also an unfortunate reality requiring critical attention, support and awareness, as land-based educational settings are often remote and novice learners or practitioners can be in vulnerable positions of dependence and isolation.

Spirituality or spiritual beliefs are clearly infused throughout the issue, or at least seem to inform many of these articles. In particular, Radu, House and Pashagumskum speak to the spiritual healing that occurs at Chisasibi's land-based healing program, stating that "the reciprocal and dialogic relationship with nature provides not only the material needs but also the ethic, moral and spiritual underpinnings of living a good life" (p. 93). Spiritual healing and grounding is an important benefit that comes with cultivating a strong relationship to land. This is more than a fortunate by-product of engaging in land-based practices. Teachings and practices based in spiritual values are critical components of learning and teaching on the land. Protocols that demonstrate respect and reciprocity, such as putting down tobacco, making offerings, ceremonies, or particular ways of harvesting or treating unused animal parts, are a part of Indigenous land-based education. The question that arises from this discussion is, how does the internalization and adoption of Euro-western religious values impact our abilities to pass on traditional land-based knowledge that is rooted in Indigenous spiritual values, and how are the knowledge and practices themselves potentially altered?

Many of the articles in this issue deal with settler-Indigenous relations, and the impact of settler colonialism in our contemporary context. The discussions of settler colonialism within the issue implicitly revolve around white settler – Indigenous relations. We do not have contributions that broach the much discussed topic of how non-Indigenous people of colour do or do not fit into the concept of settler and how this impacts discussions of land-based education and solidarity against colonialism. Nor does the issue deal with how Indigenous critiques of settler colonialism intersect with other anti-colonial critiques and radical traditions connected to

place. Various other intersections with other axes of oppression could be pointed out here, such as racism, heteronormativity, ablelism or ageism and the list could go on. It might be easy to write these concerns off as beyond the scope of discussing Indigenous land-based pedagogy but recent scholarship on settler colonialism and within critical Indigenous studies has continued to make it clear that we must bring intersectional and nuanced approaches to the fore of our analysis.

Land-based education and funding

Finally, we cannot ignore the issue of funding and institutional capacity for land-based initiatives. One of the reasons we believe Leanne Simpson's article is a vital read for people working in Indigenous education is because she calls on us to increase the energy we devote to fostering sites of land-based education. Yerxa and Gardner & Giibwanisi show us how it is possible for people to undertake these activities without funding from mainstream institutions. These and other grassroots initiatives provide us with an important baseline for those who may argue that we lack the funds to undertake land-based practices.

Yet, simply saying funding is not an issue ignores how economic disparities within Indigenous communities gives those with resources greater access to the land. This is a tension brought to light by Eden Robinson (2008), "For instance, you have to be fairly well-off to eat traditional Haisla cuisine. Sure, the fish and game are free, but after factoring in fuel, time, equipment, and maintenance of various vehicles, it's cheaper to buy frozen fish from the grocery store than it is to physically go out and get it" (pp. 214-215). Freeland also discusses this phenomenon, in her discussion of students who have grown up in northern communities, where histories of dispossession have hindered young people from acquiring bush skills and denied them access to the land.

This brings us to the dilemma outlined by Coulthard (2013) in regards to land-based practices:

> Although all of these place-based practices are crucial to our well-being and offer profound insights into life-ways that provide frameworks for thinking about alternatives to an economy predicated on the perpetual exploitation of the human and non-human world, [these practices require participation in capitalist economies] in order to generate the cash required to spend this regenerative time on the land.
>
> A similar problem informs self-determination efforts that seek to ameliorate our poverty and economic dependency through resource revenue sharing, more comprehensive impact benefit agreements, and affirmative action employment strategies negotiated through the state and with industries tearing-up Indigenous territories. [Although these resources could be spent on cultural revitalization, they are] entirely at odds with the deep reciprocity that forms the cultural core of many Indigenous peoples' relationships with land.

Freeland-Ballentyne makes a valuable first foray into addressing this dilemma but more work needs to be done to explore the forms of education that are capable of fostering Coulthard's call for the creation of "Indigenous political economic alternatives." At the very least, this will mean creating forms of education that allow us to teach people within Indigenous philosophies and pedagogies, that in turn will guide how we select economic activities to engage in, how we organize work and labour within our economic activities, and how we distribute the products and resources generated through our economic activities.

To create these sites of education we must also think about how we can push forward institutional capacity. Although Indigenous peoples as a whole remain in an impoverished condition and resources are scarce, furthering land-based education is a necessary undertaking. Increasing capacity to offer land-based education is going to require a discussion of how various First Nation governments and organizations might cooperate with each other in order to foster these sites of learning. This is going to require moving beyond a practice where individual First Nations governments undertake programs and services in isolation from each other, as well as in isolation from other parts of the Indigenous political landscape such as urban communities, and Métis and non-status people. As Giibwanisi states in regard to the Oshkimaadziig Unity camp, "We want to be a connector between the city and the land. The broader work of being a connector is bringing together community-building strategies in urban areas and community building work at Oshkimaadziig. Settler colonialism, here and now, affects and implicates us all" (p. 173).

Of course, this does not mean centralizing or standardizing the delivery of land-based education. While we will learn from each other, the delivery of land-based education must always be rooted in place and the histories of Indigenous peoples from those places. Rather, the call to consider how we foster cooperation in service of furthering land-based education is a call to consider how we practice forms of governance between communities. While grassroots initiatives will always remain important within land-based learning, the institutional funding that Indigenous peoples do have control of must also contribute to land based initiatives. Typically, Band Councils in Canada have political authority over a membership and territory (both reserve and traditional) that is held in exclusion to other Band Councils and other aspects of the Indigenous political landscape. If we maintain these rigid boundaries, First Nations governments will not only limit their ability to support land-based education, but we will hinder traditional forms of governance that fostered connections between communities. As James Anaya (2004) argues: "Any conception of self-determination that does not take into account the multiple patterns of human association and interdependency is at best incomplete and more likely distorted" (p. 103). In short, we need to find ways for multiple communities to weave their authority together in service of fostering sites of land-based education.

Conclusion

Although we feel this issue is a valuable and important contribution to the literature on land-based education, it only represents a beginning. Rather than filling a gap in the literature on Indigenous land-based education – a gap far too large for any one volume to fill – we hope this issue provides a platform for further study. The research of the editors, as well as the editorial process of this issue, has made it clear that further studies and publications focusing on land-based education are required. Longitudinal evaluations of existing land-based healing and education programs that indicate the impacts these experiences have on participants would be incredibly useful research. Such findings would prove useful for organizations in their efforts to secure funding for programs already known and understood to be vitally important. While a diverse range of land-based initiatives is contained in this special issue, this edition only represents a small sample of efforts that we are aware of. This means there is a great need to continue and further the conversation moving into the future.

Acknowledgements

This issue is based in part on research conducted under a Partnership Development Grant from Canada's Social Science and Humanities Research Council. The grant was entitled "Building Economic and Social Prosperity: Connecting a Northern University Vision Through Dechinta Bush University." Dechinta offers university-accredited, land-based programming on Chief Drygeese Territory of the Akaitcho Region of Denendeh, the traditional territory of the Yellowknives Dene First Nation. The co-principal investigators for the grant are Dr. Stephanie Irlbacher-Fox and Dr. Glen Coulthard. Matthew Wildcat and Mandee McDonald were the PhD and MA research assistants for the grant in its final year of study. Research assistance was also provided during the first two years of the grant by PhD student Darcy Leigh and MA student Elaine Alexie. The grant was expertly administered throughout its tenure by Ms. Nina Larsson, in Yellowknife, and Ms. Elaine Maloney and Ms. Cindy Mason at the Canadian Circumpolar Institute at the University of Alberta, and more recently by Mr. Reg Cardinal at the University of Alberta's Faculty of Native Studies.

The editorial team would like to thank Eric Ritskes for his excellent work and support in bringing this journal edition to completion. His dedication to *Decolonization* is tireless and

without this venue to publish in, our path towards publishing research on land-based education would surely have been much more difficult. The issue also received help from Janey Lew, who provided much needed expertise and advice in publishing our poetry submission. David Gaertner provided excellent suggested readings to help advance one of our articles. Kelsey Wrightson also helped Matthew Wildcat work through the introduction.

We would also like to thank the board and staff of Dechinta, all of the students, Kids U alumni, Elder Professors and academic instructors who have, since 2011, participated in the research associated with this grant. All of the editors have participated in Dechinta and have supported the program in different ways. Glen Coulthard and Mandee McDonald have now been involved with Dechinta for six and four years respectively. Many people have contributed to sharing Dene knowledge over that time, but Coulthard and McDonald's relationships with elders Terese Sangris and Modeste Sangris, and with Melaw Nakehk'o have been the most consist and extensive during this time and they deserve special mention.

The grant itself focuses on building key institutional structures of Dechinta through developing organizational tools and evaluating programming, and assisting in expanding partnerships with and within academia in support of land based education. This grant was possible given the strength of the original partners, involving academics from the universities of Alberta, UBC, Carleton, McGill, and Aberdeen, with many more organizations who lent support and expertise along the way. Specifically we would like to thank Dr. Frances Abele, Dr. Linda Starkey, Dr. Allice Legat, Dr, Ellen Bielawsi, and Dr. Marianne Douglas.

We would also like to thank the Dene, Metis and Inuvialuit, and Coast Salish peoples from whose territories most of the work by the editorial team was conducted on. We would also like to thank all people who defend the land and promote alternative relationships with landscapes and non-human beings who exist in the places we live.

Visualizing Resistance and Water Protectors

Photos Show Why The North Dakota Pipeline Is Problematic

A proposed oil pipeline is set to begin construction on tribal lands in North Dakota. Members of various Native American reservations gathered Monday to try to stop it.

Riders from the Standing Rock, Rosebud, and Lower Brule Lakota reservations came together on horseback to push back a police line that had formed between a group of protesters and the entrance to the Dakota Access Pipeline construction site. Daniella Zalcman

Last week, the federal government gave final approval to the construction of the Dakota Access Pipeline, which will run for 1,172 miles to transport crude oil from North Dakota's Bakken oilfields to Patoka, Illinois.

Hundreds of protesters, primarily Lakota and Dakota from Native American reservations within a several-hundred-mile radius, convened over the weekend at the edge of the Standing Rock reservation in North Dakota to voice their anger.

The pipeline would travel through lands sacred to the Lakota people, and cross under the Missouri, Mississippi, and Big Sioux rivers.

A possible spill, which can occur with pipelines, would mean contaminating farmland and drinking water for millions.

After a series of tense interactions with North Dakota state police on Monday, the protesters succeeded in temporarily halting the beginning stages of construction.

Protesters stand at the front barricades of the protest zone, holding signs that read “Water is sacred” and “Mni Wiconi” (“Water is life” in Lakota). Daniella Zalcman

Horses and riders from the Rosebud reservation arrive to support the Standing Rock community. The horses are in traditional Lakota regalia. Daniella Zalcman

Protesters congregate next to a construction site for the Dakota Access Pipeline on Monday morning, as a crew arrives with machinery and materials to begin cutting a work road into the hillside. The flag in the foreground belongs to the American Indian Movement. Daniella Zalcman

North Dakota state police form a line between the protesters and the entrance to the construction site as a tank truck turns into the property. Daniella Zalcman

From 280 Tribes, a Protest on the Plains

By JACK HEALY SEPT. 11, 2016 New York Times

Susan Leopold, a member of the Patawomeck tribe of Virginia, watching the sun rise over an encampment where thousands have come to protest an oil pipeline near Cannon Ball, N.D. Credit Alyssa Schukar for The New York Times

NEAR CANNON BALL, N.D. — When visitors turn off a narrow North Dakota highway and drive into the Sacred Stone Camp, where thousands have come to protest an oil pipeline, they thread through an arcade of flags whipping in the wind. Each represents one of the 280 Native American tribes that have flocked here in what activists are calling the largest, most diverse tribal action in at least a century, perhaps since Little Bighorn.

They have come from across the Plains and the Mountain West, from places like California, Florida, Peru and New Zealand. They are Oglala Lakota, Navajo, Seneca, Onondaga and Anishinaabe. Their names include Keeyana Yellowman, Peter Owl Boy, Santana Running Bear and Darrell Holy Eagle.

Some came alone, driving 24 hours straight across the Plains when they saw news on social media about the swelling protest. Some came in caravans with dozens of friends and relatives. One man walked from Bismarck.

Others finished the journey in canoes. They brought ceremonial pipes, dried sage, eagle-feather headdresses and horses that they ride bareback through the sea of prairie grass. They sleep in

tepees, camper trailers and tents, and they sing and drum by firelight at a camp that sits on Army Corps of Engineers land.

On Friday, the federal government announced that it was temporarily blocking construction of the pipeline at an important river crossing just up the road from the camp.

“We say ‘mni wiconi’: Water is life,” said David Archambault II, the chairman of the Standing Rock Sioux, whose reservation sits just south of the pipeline’s route. “We can’t put it at risk, not for just us, but everybody downstream.”

He added: “We’re looking out for our future, the children who are not even born yet. What is it they will need? It’s water. When we start talking about water, we’re talking about the future generations.”

Here are stories about a few of the people who have come to this remote rolling corner of North Dakota.

-

Howard Eagle Shield
Sioux of North Dakota

“This is my home, and my granddaughters are going to be here long after I’m gone,” Mr. Eagle Shield said.

He grew up in North Dakota, on the Standing Rock Reservation. “There was trees all the way through here, all the way down to the Nebraska border,” he said of his youth. “There were trees

big enough that it would take five or six guys to hold their hands around to circle those trees. And they're all flooded out; they're gone after they put this dam up."

- 

Credit Alyssa Schukar for The New York Times
Joseph and Kinehsche' Marshall
Hoopa Valley tribe of Northern California

"I've been telling her since she was a little person that she's the storyteller," Mr. Marshall said of Kinehsche', his 9-year-old daughter. "When we're all gone, she's going to be the one telling the story. So it was really important that as soon as I found out I was going, I was like, 'Kinehsche', you're going with me.' "

-

Apesanahkwat
Menominee tribe of Wisconsin

Apesanahkwat spent 30 years as the tribal chairman of the Menominee. “It wasn’t something I chose when I came home from Vietnam,” he said. But it led him into a career in Washington, D.C., which is near where he now lives.

When he heard of the events in North Dakota, he felt compelled to drive to the Sacred Stone Camp. “All of these things that are happening are incredibly beautiful,” he said.

Aaron Makwa Chivis, Joe Amik Syrette and Cece Stevens
Anishinaabek of Michigan

“The water that comes from Mother Earth is like her blood, which gives life,” said Mr. Syrette, center.

“A lot of our teaching is to respect all women,” he said, explaining that the ability to bear children in water was one source of the respect. “So they have that connection. For myself to be here, it’s a representation of all of the women in my life. Starting with my ancestors, to my grandmother, my mother, my wife, my sister, my daughters.”

Credit Alyssa Schukar for The New York Times
Arrow Heart
Lakota and Dakota of South Dakota

Arrow Heart, a senior at Little Wound School in Kyle, S.D., travels with his family to the Standing Rock Reservation every year for the annual pow wow, a spiritual gathering for indigenous communities.

“I’ve been doing that for 15 years now. Haven’t missed it once,” he said, adding that it was “awesome that people are getting together to protect the water.”

Ceanna Horned Eagle
Nakota and Kickapoo of Kansas

“Many of our ways — our culture, our way of life, our spirituality, our language — we have slowly lost it,” said Ms. Horned Eagle, who has a prayer fan tattooed on her neck.

“But I have seen a change. We’re trying to relearn it or to gain it back. And this coming together gives me hope that my kids won’t have to fight as hard as my parents did, as I have,” she said.

Credit Alyssa Schukar for The New York Times
Whitney Custer
Cheyenne of Kansas

Ms. Custer, who drove to Cannon Ball from Atchison, Kan., says she grew up with the knowledge that she is a fifth-generation descendent of Gen. George Custer and a Cheyenne woman.

“This water is sacred, and this water is important,” she said. “I’m here because that water — not only does it feed this state, it goes through many states, and it goes directly through the city I live in. I have four children of my own, and my children deserve to have clean water.”

Credit Alyssa Schukar for The New York Times
Charles Baker
Lakota and Swinomish of Washington

“Our water matters, and they can’t just put a pipeline through it,” Charles, 13, said.

His father is Lakota from Standing Rock and his mother is Swinomish from La Conner, Wash. The family returns to Standing Rock often to visit relatives.

Catcher Cuts the Rope
Aanii and Nakota

An Army veteran who was wounded in Falluja, Iraq, Catcher Cuts the Rope spoke of his hope for a nonviolent resolution to the dispute over the Dakota Access pipeline. “We will stop the pipeline, and we will do it peacefully,” he said.

- 

Credit Alyssa Schukar for The New York Times
John Thomas Arnel
Northern Arapaho of Wyoming

“The veterans that are here, we fought for this country,” Mr. Arnel said. “We fought for this land to preserve it for our future generations to enjoy it.”

“We helped defend with nontribal members,” he continued, “and other people that have different points of view from all around the world. We were all united as military, but once you get out and come back to the civilian sector, you’re automatically put into a demographic scale.”

“But,” he added, “we’re all Americans.”

- 

Credit Alyssa Schukar for The New York Times
Melanie Thompson
Standing Rock Lakota of South Dakota

“You can feel the strength of the prayers here,” said Ms. Thompson, who had been at the camp for four weeks. “Poisoning the water is not good for anybody, and especially Mother Earth.”

She added, “We don’t need the poison to cut right through the middle of the United States.”

Credit Alyssa Schukar for The New York Times
Julius Page
Grandson of a Cherokee from South Carolina

“I know a big part of the discrimination here is due to ignorance, because our history books don’t tell the whole story for us, for Native Americans,” said Mr. Page, who lives in Fargo, N.D. “And people are stuck in those beliefs.”

- 

Credit Alyssa Schukar for The New York Times
Jakob Cordero
Chumash, Sioux, and Hunkpapa of California

Jakob, 11, is spending two weeks at the camp with his family. “Some parts are super cold, and the rest is warm,” he said of the Cannonball River, which he swims in almost every day.

Credit Alyssa Schukar for The New York Times
Thayliah Henry-Suppah
Paiute of Oregon

Ms. Henry-Suppah wears a traditional wing dress with ribbons, beaded necklaces, shells, otter furs and basket earrings for a ceremony.

She said she kept the following Native American proverb in mind while in North Dakota: “Treat the earth well. It was not given to you by your parents. It was loaned to you by your children.”

“We’ve lived without money,” she added. “We can live without oil, but no human being can live without water.”

Credit Alyssa Schukar for The New York Times
Stanley Perry
Diné of Arizona

Mr. Perry walked 45 miles to the Sacred Stone Camp from Bismarck, N.D., after flying there from Arizona.

“We are all like water,” he said. “And if you hurt water, then you hurt us — us meaning the United States.”

Credit Alyssa Schukar for The New York Times
Shirley Romero Otero
Chicana of Colorado

“When we heard about this particular struggle, our hearts pulled us this way,” Ms. Otero said, “because the next battle after losing our land is truly the fight for water.”

Ms. Otero’s community in San Luis, Colo., is dealing with its own fight for water.

10 Photos That Show the Magnificent Light Shining on Standing Rock

Despite all the news of pipeline regulation, court appeals, and activist arrests, Native photographer Josue Rivas reminds us that it is actually a peaceful place.

Yes! Magazine

Josue Rivas posted Sep 19, 2016

A month and a half ago, I was deeply moved by an urgent plea for support from friends and relatives who are in solidarity with the people of the Standing Rock Sioux reservation in North Dakota. As a Native photojournalist, I believe it's important to let our people tell their own stories. That's why I drove 1,545 miles to connect with the protectors of this land and report on what is happening here. This tribe has been fighting to protect their clean water, critical habitats, and sacred sites from an oil pipeline that would cross under the Missouri River.

For the most part I've been documenting the action on the front lines, but there came a moment when I realized I had to take a step back and see something else. I don't consider myself a landscape photographer, so learning how to capture the beauty of the land was a challenge.

One day I sat near the Cannonball River and listened to the water. It was then that the spirits of this land told me to just follow my light. This is what I saw.

Sunrise at the Oceti Sakowin camp near Cannon Ball, North Dakota.

Horses roam free near the Cannonball River.

Sunset at the Cannonball River in North Dakota.

Mississippi River near Fort Yates, North Dakota.

Tree and clouds on Hwy 1806 near Mandan, North Dakota.

Images from Standing Rock

Lakota photographer Jaida Grey Eagle shares her experience with art and activism from the protector camps near Standing Rock. The Institute of American Indian Arts in Santa Fe, where Grey Eagle is a student, will host a benefit show Oct. 16 featuring her images and other artwork.

STORY & PHOTOS BY JAIDA GREY EAGLE, Native Peoples Magazine

Chad Browneagle (Shoshone/Spokane), IAIA Class President. Photo by Jaida Grey Eagle (Oglala Lakota).

Last month, I joined several of my artist friends on a journey to Standing Rock, where hundreds of tribal nations and thousands of protectors have gathered since spring to oppose construction of the **Dakota Access Pipeline (DAPL)**.

In July, the US Army Corps of Engineers authorized the $3.7 billion pipeline, which, if constructed, will carry some 470,000 or more barrels of crude oil a day from North Dakota's Bakken oil fields to a hub in Illinois, where it would go on to reach other refining markets.

The Standing Rock Sioux Tribe has been fighting DAPL since its early planning stages in 2014, when most people were concentrating solely on the now-defunct Keystone XL pipeline. The tribe's drinking water, as well as sacred cultural sites and economy, are threatened by the pipeline's route and its construction.

We made the decision to travel from Santa Fe, New Mexico, up to North Dakota, because we wanted to use our creative energy to help raise awareness of this moment of Indigenous unity. **Click here** to see a slideshow of more of my images.

We brought canvas, paint and brushes for anyone who wanted to create with us. It was absolutely wonderful to see the kids painting what was around them, everything from tipis to water to flowers and horses. Each one of their paintings reaffirmed their strength -- and mine -- and why we are fighting DAPL and protecting life for our future.

George Alexander (Muscogee Creek), paints with a youth at the Sacred Stone Camp.

We brought some of the canvases back with us to Santa Fe and will be holding an art show Oct. 16 from 2-4 p.m. at the Institute of American Indian Arts, where I am a student, with all funds raised benefiting the Sacred Stone School and Standing Rock. **Check out this link for more information about the art show**.

We spent a few days meeting new people and reconnecting with others. Like many who visit the Sacred Stone Camp and surrounding communities, we immediately found ourselves caught in the power of this amazing Indigenous and ally unity.

Sacred Stone Camp.

What's happening in Standing Rock is a tremendous and beautiful moment in our history, and I am honored to share these images I captured while at the camp. With these photographs, I wanted to share the light and joy happening amidst the chaos of what is trying to be accomplished against corporate greed and systemic, state-sponsored oppression.

The experience at protector camps was one of the most incredible of my life and something I will tell my grandchildren about someday. Everyone was so welcoming, giving, open and peaceful.

My name is **Jaida Grey Eagle**. I am Oglala Lakota. After being told my entire life that I am an artist, I am finally starting to believe it. My photography gear includes a Canon 5D Mark II and a Canon EF 50mm f/1.4 USM. You can see more of my photographs from this visit to Standing Rock **here**. I can be reached at *jaida.greyeagle@gmail.com*.

For more information about how you can help the efforts in Standing Rock, check out **this article** written by *Native Peoples* editor Taté Walker.

Photos: a Visit to the Standing Rock Pipeline Protest Camp in North Dakota

By Council Brandon • Oct 14, 2016 NPR

- 

  View Slideshow 1 *of* 13

A large group of teenagers visited the camp, representatives from different tribes, to join forces with Standing Rock's Youth Council.

Protesters are challenging the Dakota Access Pipeline with concerns that it will eventually contaminate area drinking water.

Since April, protesters against an oil pipeline have been camping in tents, tipis, and trailers at a site just across the Missouri River from the Standing Rock reservation in North Dakota. For a few days, I stayed at the camp, and met people who gathered there to support the effort.

The camp is known as Oceti Sakowin, meaning Seven Council Fires, a reference to the origin of the Sioux tribe.

The unarmed protesters call themselves Water Protectors. They are challenging the Dakota Access Pipeline, or DAPL, a 1,172-mile-long crude oil pipeline meant to transport oil from North Dakota to Illinois.

The Standing Rock tribe has voiced worries that the pipeline, which is proposed to pass under the Missouri River, would inevitably burst, and contaminate their drinking water.

Energy Transfer Partners, the private company behind the project, has met protesters at the front line with dogs, tear gas, army vehicles, and guns. As the weather gets colder and construction moves slowly forward, the camp and Standing Rock Tribe continue their opposition of the DAPL, sustaining discussion about the future of energy and conservation.

Facebook Hill

The day I arrived, more than 20 campers had been arrested while returning from a prayer ceremony at a DAPL construction site. The next morning was quiet.

Early risers climbed “Facebook Hill” to watch the sun rise while charging their cell phones. Smoke began to rise from fire pits while a few cars left to go to the front line. Chatting with other campers revealed that there wasn’t going to be much direct action for a few days; time was needed to regroup.

Monitoring the Monitors

Every day, at sunrise and noon, a helicopter sent by Energy Transfer Partners comes from the north and flies around the entire camp. I asked a young woman if she knew why they did this.

“They want to look scary,” she told me. People pulled out their phones and filmed the helicopter making its daily rounds.

Smartphones are almost always being used at Oceti Sakowin. Although service is difficult to find below the hills, people record everything, streaming live on Facebook when they can, and posting their experiences on social media. As with police shootings, phone cameras have become mechanisms for protection at the Standing Rock camps and actions.

“People are getting more used to the idea that we need our phones and cameras out,” my friend Thomas told me. He was also camped with the Hoopa kitchen and was doing a lot of organizing within the camp. “We use our devices to prove that something is happening here.”

I heard rumors of moles hired by ETP or the FBI taking drone footage of the camp and recording conversations. Many people that I talked to were skeptical of these accounts, but everyone agreed that the camp was being monitored closely.

Sustenance

The main kitchen and sacred fire are situated on a low hill, right next to Oceti Sakowin’s entrance. The spot serves as the primary gathering place.

Most people come to this kitchen for breakfast and a late dinner. Everyone in the camp is invited to make use of a PA system. Elders and community organizers come first, but artistic performances, musical acts, jokes, and storytellers are always welcomed alongside history lectures, prayers, and appeals to the camp.

Play

People have moved their entire lives to the camp, bringing their horses and basketball hoops with them to Standing Rock. Basketball provides a social and competitive activity during long, harsh winters, and young men bring old tribal rivalries with them to games, playing for the honor of their families and communities. At Oceti Sakowin, sports and horse-riding keep boredom at bay.

When the young children of the camp were not in classes at the makeshift school, they would roam the grounds with their bikes and skateboards, rolling down hills and makeshift jumps. Older youths would grab horses from friends' campsites and ride them bareback through the camp.

I saw people sitting around their campfires chatting all day. Others put themselves to work doing physical labor, including cooking, chopping wood, and building kitchens or showers. The community feeling was one of a shared life.

Readying for the Cold

Winterization is a major point of concern at the camp. The campers cannot stay on the current grounds for much longer, and the site needs to become more organized and sustainable.

There are plans for solar homes and a couple hundred tipis, available for anybody who needs one. There is a constant need for donations and physical laborers. The camp ran out of water and firewood one day I was there -- both are needed daily for cooking and heat.

The camp did not have enough tipi poles for canvases, and was waiting on a group from Colorado to bring a truckful of poles. Still, campers said they needed more if they were going to provide enough shelter for people camping through the winter.

Thomas told me the organizers and Standing Rock Tribal Council want the camp to be a model for the world of sustainable living, depending entirely on renewable energy.

Standing for Peace

While getting lunch at the main kitchen, I ran into Arnie, whom I'd I met earlier that day. He introduced me to three young Mohican men he had traveled with to Standing Rock. I asked if I could take their photo.

Arnie asked me what I'd been doing since our breakfast encounter, where he introduced himself to me as an Amish man with two PhDs (he wouldn't tell me what they were in) and asked me if he looked like a man with two PhDs. I studied his ensemble — socks with sandals, sweatpants, a long black coat, a baseball cap and a gray beard — and I told him no. Arnie laughed.

As we sat watching the morning's announcements and prayers, he told me that the violence and hatred circling the Standing Rock movement reminded him of his own village, when a man murdered several Amish children. One of them had been Arnie's.

"We need to not only stand for peace, but also make peace," he told me. "In my town, after those children were killed, we got together some money and gave it to the murderer's parents as a gift, because we knew they needed to heal. We made peace. We produced it. That needs to happen here, too, and everywhere really — we have to create peace and loving kindness. It can't be effortless."

"We Are the Mexica"

The Oceti Sakowin camp has drawn people from across the globe. One afternoon, a large group of youth and traditionally dressed dancers marched through the camp to the sound of drums. "We are the Mexica," announced one of the dancers. He pronounced it as Me-she-cah.

"You know us as the Aztecs, but this is not our original name." They brought a large group of teenagers with them, representatives from different tribes, to join forces with Standing Rock's Youth Council.

The march ended at the main camp, where one of the Standing Rock elders told the crowd about the ancient Amazon prophecy of the Condor and the Eagle — two different ways of life, the

heart and the mind — and of the potential for these two paths to join to create a new consciousness for humanity.

“Our Mexica friends have brought the Condor to the Eagle,” he said. “We must fulfill our potential.”

Protest and Prayer

Much of the conversation at Oceti Sakowin revolved around how to remain positive despite the difficulties the camp has to overcome.

Late one afternoon, I met a man who was deeply upset about the lack of constant action by the Council and by the elders. He felt that the whole camp should be rising every day to be at the front line, trying to stop construction no matter what.

"Protest is not in our native tradition. Our young people want to get up and yell and hold signs, but we are here to fight this battle with prayer."

When I brought up this encounter with Tribal Councilman Robert Taken Alive, he told me, “Protest is not in our native tradition. Our young people want to get up and yell and hold signs, but we are here to fight this battle with prayer.” I talked about it with some fellow campers over a late-night fire. Several people echoed Robert’s statement.

One young man advised us all that we needed to focus on turning negative talk and patterns of thought into positive ones. If we respond to others’ fears and worries with more fears and worries, we allow space for disunity. Without unity, he said, it all falls apart.
