As time went on and escapes like the one above became less viable, *joyas* trapped in the missions or brought in as adults by raiding parties suffered from a kind of social dislocation that must have been deeply troubling for individuals accustomed to a rich but specialized community network. Precontact native Californian societies operated under a gender separation that generally kept men and women working at separate tasks, away from the opposite sex, most of the day. Women had their work areas and were accustomed to withdrawing to them to weave, harvest, process and prepare food, care for children, and so on. *Joyas* were always a part of this women's world and did not cross over into the men's territory. The mission priests, however, demanded that *joyas* spend all their time in "masculine" company, doing "masculine" work, rather than in the company of women and benefiting from the camaraderie, friendships, and sense of worth found there. Aside from the emotional shock of being cut off from friends and community, *joyas* were also faced with what, to them, was an inappropriate mixing of genders. In a culture where work and play were gendered activities (although not necessarily gendered as the Spanish would think of them), being forcibly placed in the "wrong" group would have been both extremely uncomfortable and unfamiliar for *joyas*. Remember that Father Palóu remarked of the *joya* found in his mission, "Taking off his aprons they found that he was more ashamed than if he really had been a woman." In a kind of involuntary gender-reassignment, *joyas* were made to dress as men, act as men, and consort with men in contexts for which they had little if any experience. For the "normative" men, having a *joya* among them all day and night—let alone someone stripped of appropriate clothing, status,

and respect—must have also been disturbing and a further disruption of cultural signification. Women, too, would have noticed and missed the presence of *joyas* within that smaller, interdependent feminine community.

As a consequence of this regendering, renaming, and murder, one of the *joya*'s most important responsibilities, on which the well-being of the tribe depended, was completely disrupted; prohibited by the priests, the complex and deeply spiritual position of undertaker became a masterful example of colonization by appropriation.

Replacement

Most research on the indigenous third gender agrees that a person living this role had particular responsibilities to the community, especially ceremonial and religious events and tasks.[37] In California, death, burial, and mourning rituals were the exclusive province of the *joyas*; they were the undertakers of their communities. As the only members of California Indian communities who possessed the necessary training to touch the dead or handle burials without endangering themselves or the community, the absence of *joyas* in California Indian communities must have constituted a tremendously disturbing crisis.[38] As Sandra E. Hollimon states, "Perhaps most profoundly, the institution of Catholic burial programs and designated mission cemeteries would have usurped the traditional responsibilities of the *'aqi* [Ventureno Chumash word for *joya*]. The imposition of Catholic practices in combination with a tremendously high death rate among mission populations would undoubtedly have contributed to the disintegration for the guild."[39] It is hard to overstate the chaos and panic the loss of their undertakers must have produced for indigenous Californians. The journey to the afterlife was known to be a prescribed series of experiences with both male and female supernatural entities, and the *'aqi*, with their male-female liminality, were the only people who could mediate these experiences. Since the female (earth, abundance, fertility) energies were so powerful, and since the male (Sun, death-associated) energies were equally strong, the person who dealt with that moment of spiritual and bodily crossing over between life and death must have specially endowed spiritual qualities and powers, not to mention long-term training and their own quarantined tools. Baskets used to scoop up the earth of a grave, for example, were given to the *'aqi* by the deceased person's relatives as partial payment for burial services, but also because they could never again be used for the life-giving acts of cooking or gathering.[40]

The threshold of death was the realm of the *'aqi*, and no California Indian community was safe or complete without that mediator. Asserting that undertakers were exclusively *'aqi* or postmenopausal women (also called *'aqi*), Hollimon specu-

lates that perhaps "the mediation between death and the afterlife, and between human and supernatural realms, was entrusted by the Chumash to individuals who could not be harmed by symbolic pollution of the corpse, and who were no longer (or never had been) capable of giving birth."[41] Hollimon's archaeological work allows us to understand that the "third gender" status of *joyas* may have been extended, in some fashion, to postmenopausal women as well, should they desire to pursue a career as undertaker. Another strong possibility is that elderly women stepped into the role of undertaker when persecution reduced the availability of *joyas*.

With the loss of the *'aqi*, then, came an instant and urgent need for some kind of spiritual protection and ritualization of death. This would have suited the Roman Catholic Church, which had more than enough ritual available—and priests were anxious to institute new rituals to replace what they regarded as pagan practices. While founding the San Francisco Mission, Fray Palóu wrote, "Those who die as pagans, they cremate; nor have we been able to stop this," indicating that burial—as tribes farther south practiced—was the only mortuary practice considered civilized.[42] At these same cremations, in reference to funeral rituals, Palóu noted that "there are some old women who repeatedly strike their breast with a stone. . . . they grieve much and yell quite a bit."[43] It would have been difficult to tell an elderly *joya* dressed as a woman from an elderly woman, if one did not know of the connection between *joyas* and the death ceremony; in fact, years later, when Harrington interviewed Maria Solares, a Chumash survivor of Mission Santa Ynez (and one of his major consultants), she told him that all undertakers ("aqi") were women, strong enough to carry bodies and dig deep graves, and that the role was passed from mother to daughter.[44] Harrington pointed out that the Ineseño word for *joto* was also *'aqi*, that it was strange that "women should be so strong to lift bodies," and Solares agreed, though still puzzled.[45] It seems that by the mid-1930s, the memory of *'aqi* as beloved members of the community no longer matched Solares's cultural understanding of *joto*—the long-term damage of homophobia was substantial even in linguistic terms, let alone human terms. It is not hard for me to imagine my ancestors, fearing for their spiritual well-being, their loved ones, and what remained of their communities, turning to Catholicism out of desperation. As the diseases and violence of colonization took their toll, communities were under intense pressure about the many burials or cremations to be carried out. The turn to, and dependence on, Catholic burial rituals was a form of coerced conversion that had nothing to do with Christianity, and everything to do with fear.

Through these methods, then—murder, renaming, regendering, and replacement—the *joya* gendercide was carried out. The destruction seems to

cover every aspect of *joya* identity and survival. Yet, I argue, *joya* identity did not disappear entirely.

Surviving Gendercide

How could *joyas* survive such devastation? Where are they? What is their role in contemporary California Indian life?

First, it is important to note that mission records show baptisms of adult *joyas* as late as 1832, almost sixty years after Fages expressed his outrage in 1775. "Late arrivals" to the mission — adult Indians who, having lived most of their lives as "wild" Indians, were rounded up and brought in for forced baptism — actually slowed the missionization process considerably. In combination with the low life expectancy of mission-born children (two to seven years), a strong influx of adult indigenous cultural practices probably also kept the role of *joya* from fading away as quickly as might otherwise be expected (allowing younger Indians to witness or know *joyas*, as well as pass on that information orally to future generations).[46]

Second, just as the extermination of California Indians, while extensive, has been exaggerated as complete, so too is the idea that *joyas* could be gendercided out of existence. A *joya*'s conception does not depend on having a *joya* parent, unlike normative male and female sexes, who depend on both male and female for conception; as long as enough of the normative population remains alive and able to bear children, the potential for *joya* gender to emerge in some of those children also remains. To exterminate *joyas* entirely, *all* California Indian people would have had to be killed, down to the very last; thus it makes sense that during missionization and postsecularization, as in the past, *joyas* rose out of the general population spontaneously and regularly. However, those *joya* had virtually no choice but to hide their gender. Like Pueblo tribes who took their outlawed religious ceremonies underground until it was safe to practice more openly (although outsiders are understandably rarely allowed to partake or witness the ceremonies), *joyas* in California may have taken a similar tactic, removing themselves from ceremonial roles with religious connotations and hiding out in the general population. Sadly, the traditional blend of spiritual and sexual energy that was a source of *joya* empowerment suffered an abrupt division; as time passed and the few surviving elder *joyas* passed on, younger *joyas* would have been forced to function without role models, teachers, spiritual advisers, or even — eventually — oral stories of their predecessors. Walter Williams reports that he "could not find any traces of a *joya* gender in oral traditions among contemporary California Indians from mis-

sionized tribes," but adds, "that does not mean that a recognized and respected status for berdache no longer existed, or that same-sex behavior vanished. To find evidence of such continuity is extremely difficult."[47]

Williams outlines three major obstacles to finding such evidence: inability of surviving *joyas* to use written language (or refusal, once it was introduced), resulting in a lack of documentation; the need for extremely specialized and culturally sensitive oral ethnographies by contemporary researchers with some way to take part in community conversations; and the backlash against earlier kinds of research that left indigenous peoples distrustful and unwilling to share sensitive material.

Williams's research in South America suggests that a division of the third gender occurred there, perhaps as a conscious effort to "remove the berdaches from a public institutionalized role, to protect them from the Spanish wrath," resulting in two new, distinct groups, each with distinct roles.[48] One group are those who identify as "homosexual"—males whose preferred sexual partners are men, but who often marry women later in life to attain acceptance and status within their birth families. This group does not participate in any ceremonial or religious activity. The other group consists of a switch from traditional shamanism, with its association with male-male sex, to powerful, oftentimes physically androgynous, shamans or spiritual leaders whose birth sex is female and who identify as women (often married with children, but just as often unmarried or postmenopausal). "So strong was the association of femininity with spiritual power that if the androgynous males could not fill the role," Williams writes, "then the Indians would use the next most spiritually powerful persons. In striving for effective spirituality, they responded in a creative way to Spanish genocidal pressures."[49] By dividing sexual and spiritual power, indigenous people were able to deflect some of the violence visited on those original individuals yet maintain living connections with essential powers of life and death. Neither a traditional nor an ideal solution, such a split was nonetheless necessary for tribal survival.

I suggest that a similar survival strategy evolved among missionized California Indians: that those people who may have identified as or been identified as *joyas* experienced the spiritual-sexual split in one of two ways: they became either closeted same-sex *jotos* who engaged in secret sexual relationships with other men, or they became adult male or female members of the community with important roles as caretakers and "grave-tenders" of Native culture who chose to remain single—that is, unmarried to normative genders—throughout life. Traces of a split *joya* gender, I argue, can be found from the time of the gendercide to the

present day, if not in our oral traditions then in the libraries and documentation of our colonizers, as well as in our own Two-Spirit bodies. Two examples illustrative of this split are outlined below.

Kitsepawit Fernando Librado, a Chumash man born early in 1839, became a primary consultant for Harrington.[50] Librado lived his long life as a person who adapted from someone who might have been *'aqi* (or *joya*) in an earlier time to what seems to be a kind of cultural caretaker, collecting and preserving stories, technologies, and histories. Born at the end of mission life into the chaos of secularization, Librado would not have been allowed to become a *joya*, even if he could have found enough of a community to support him in his efforts. However, Librado fulfilled many of the spiritual roles of a *joya*: in oral material gathered by Harringon, Librado comments frequently on his intense desire to learn as much about his "dying" culture's knowledge as possible, tracking down Chumash doctors and quizzing Chumash women about plants, wild harvesting, and how to prepare traditional foods, ceremonies, and songs.[51] Librado traveled widely to attend Chumash dances, sings, storytellings, or ceremonies to observe and learn; significantly, his hunger for knowledge encouraged him to cross male and female gender boundaries, not limiting his research by labels such as "men's work" or "women's work." Librado never married, never had children, and never spoke of having ever been partnered.

Even when discouraged or chastised by other Indian people, Librado persisted in his own form of research. Repeatedly throughout his narrative in *Breath of the Sun*, he speaks of scenes like this: "Francisca . . . asked me why I wanted to learn the Swordfish Dance songs, and then she said to me: 'You should abandon the idea.' I replied: 'What is the matter with it?' and Francisca told me: 'It is not good. You better abandon the idea.'"[52] But Librado was persistent and well versed in Indian etiquette; gathering up valuable gifts of food and drink, he visited another home: "Donociana and Nolberto knew the Indian dances too. . . . I once went over to Donociana's house, taking with me some marrow, guts, tripe, and other inner things of a beef, along with some bread and wine. I wanted to learn the Swordfish Dance. After the meal I asked her to teach me the old dances, saying, 'for you are the only ones left who know the old dances.' Donociana began to cry, and I left saying nothing more."[53] Such refusal and grief among his own people must have been difficult to bear, yet Librado continued collecting knowledge and storing it away. While Librado was not able to act as an actual undertaker, tending to dead bodies, departing spirits, and their final needs, he did, in many ways, act as an undertaker for his culture, gathering indigenous cultural knowledge and caring for those scattered pieces. As traditional *joyas* protected the people and

community through their tending of the dead, so Librado protected his people and community through his tending of what culture the dead had left behind. He had no idea that someone like Harrington would come along; Librado was simply compelled to care for his culture.

Remember that in Librado's time, it was easy to believe that this world had come to an end. Anglos and Indians alike were under the influence of the notion of Manifest Destiny, which preached the inevitable and imminent death of all things Indian. Ultimately, Librado told much of what he knew to Harrington, knowing that it would be recorded—both in writing and on early sound recordings—and preserved, perhaps, until descendants came to claim it. In other words, Librado gave the remnants of his culture—all that he could gather in his long and determined lifetime—a good burial, a good place to rest, rather than let the pieces lie scattered all over the ground, without prayers, ritual, proper care. While I can't do more than speculate about Librado's decision to remain unmarried and without children, when considered together with his caretaking, his chosen role seems to be that of an *'aqi* who adapted to the times in order to best serve his community's spiritual needs. In fact, when Maria Solares from Santa Ynez discussed the word *'aqi* with Harrington, she told him that Librado was *'aqi*, meaning homosexual: "He stayed with men and would go crawling to other men in the night."[54]

Here we see clearly the spiritual-sexual split of the *joya* role; Solares knew about queerness, and she knew about undertakers, but until Harrington pointed out that the two roles shared the same word, she did not realize the connection between the two. At the same time, Solares, by her use of what she thought of as the word for faggot, indicates that she knew something of Librado's more private life that, together with his efforts as a cultural caretaker, seem to point to his living adaptation of the traditional *'aqi* role.

We glimpse the sexual side of the *joya* split in those field notes from Harrington mentioned early in this essay, in two brief comments by his consultant Isabel Meadows, from Mission Carmel. Following are my transliteration and translation of those notes.

> Transliteration:
> Isabel
> Mar. 1934
> Estefana Real tenia muchos maridos. Her children had many fathers—eran joteras las Viejas antes.
> Isabel Mar.[19]37 understands joteras above to mean that the Viejas eran muy macheras. But no, the real reason Isabel used jotera in 34 was

> because la Estefana had a son, Victor Acedo, who was joto. Nuca decir nada la vieja Estefana, o no savia quezez [quizas?], que su hijo, Victor, era joto. This was why in [19]34 Isabel spoke of Estefana as muy jotera, she had a son who was joto.[55]
>
> Translation:
> Isabel
> Mar. 1934
> Estefana Real had many husbands. Her children had many fathers—they were joteras, the old ladies before.
> Isabel March [19]37 understands "joteras" above to mean that the old women were very macho. But no, the real reason Isabel used "jotera" in '34 was because Estefana had a son, Victor Acedo, who was a faggot.[56] The old lady Estefana never said nothing, or she didn't know, maybe, that her son, Victor, was a faggot. This was why in '34 Isabel spoke of Estefana as very macho, she had a son who was a faggot.

These are not just names out of an ethnologist's old field notes, nor are these details simply interesting, if belated, gossip from a tribal consultant. I am related to Isabel Meadows by marriage.[57] In addition, Estefana Real was born in 1809 at the Carmel Mission; her sister, Josefa "Chepa" Real, born in 1812, was my great-great-great-great grandmother. Victor Acedo, my cousin, is the "joto" under discussion.

It's true what Isabel said about Estefana Real—she had at least nine, possibly eleven, children by at least several men whose names are sometimes recorded, sometimes not. She began having babies in 1825 and kept it up through 1848. Victor, born "Nestor Bitoreano Antonio," was given the surname Real at his baptism on March 4, 1846.[58] Fray Doroteo Ambris officiated. Estefana did not declare Victor's paternity at the baptism (the father's name is listed as "incognito"), but Padre Ambris noted "Parvulo [child] de Razon Real"—indicating that the father was "de Razon" or "of reason," meaning European, as well as "of Real," the priest.[59] The sketchy material is normal for this time period; during the post-secularization era of the California missions, life was a gamble and chaos was the everyday challenge. Steven W. Hackel, a scholar who has studied Mission San Carlos extensively, writes:

> By 1833, only about 220 Indians lived at San Carlos. The most skilled and independent had left or died. An untold number had never been born

> because of the sterility of many San Carlos residents. Of those at the missions, nearly half were under age twenty and a third were over forty, leaving just about two dozen men between the ages of twenty and thirty-nine. Too small to be an economically productive community, the mission had become a decaying congregation of families and dependents, an increasingly dilapidated place where people often competed with one another for food.[60]

Estefana, however, was a fighter from a long line of survivors. Her father, Fructuoso Jose Cholom, had served as a mission *alcalde* prior to secularization, which was a kind of overseer, or boss. With his wife, Hyginia, Fructuoso received a small parcel of land during secularization in 1835, one of very few Indians given this opportunity.[61] Fructuoso lived on this land until his death in 1845, when Victor was about a year old. By 1850, Hackel states, his widow may have been joined on the land by her daughter Estefana, and presumably her surviving underage children, including Victor, who would have been four years old. Some of the land was sold to Joaquin Gonzalez, an emigrant from Chile who had been a soldier at the Presidio in Monterey. The contract carried the agreement that Hyginia and Estefana (and presumably any of her surviving underage children) could continue to live on the land until Hyginia's death. By 1853, when Victor was seven, Hyginia had sold the remainder of her husband's rancho to Gonzalez, and around the same time, Estefana married the Chilean. Like several other Indian women, only marriage to a non-Indian secured what was left of Estefana's inheritance.

So it is possible for me to imagine a little of Victor Acedo's life. Born into a postholocaust Indian world, living in poverty, illegitimate in the Church's eyes, he grew up with his strong Indian grandmother Hyginia, her two powerful daughters Josefa (a.k.a. Chepa) and Teodosia as his aunts, on a small chunk of his indigenous land secured for him by his mother's marriage to a former soldier at the former mission. No wonder Isabel told Harrington those old women were "joteras"—meaning, I suspect, "tough broads"! Now that I know more about Estefana, I can see how Isabel used that word as a sign of her admiration, as a way to praise those "Viejas antes," those old women before us, troublemakers who never stopped fighting, never stopped loving, never stopped trying to survive, and never gave up their identity or their relationship with their homeland.

Of course, Estefana "never said nothing" about her son's sexual choices. First, her father's position as *alcalde* indicates that, premissionization, his family was probably already in a position of authority. Inherited family status often

replicated itself within the missions, with formerly high-status families gravitating toward whatever new positions of authority were available to Indians. These same high-status families also retained much of the traditional knowledge, language, and cultural information, in part because they were more able to protect themselves and preserve the individuals possessing this information. Fructuoso came from a time when knowledge of *joyas*, by any name, was common; when men of high status sought out *joyas* as wives because of their reputations as hard workers; when to be a *joya* was a position of high status in and of itself, no matter what status the *joya*'s family of origin. Fructuoso would have taught his daughters this, as well as much more about their indigenous culture, while striving to reinvent that culture in a world undergoing the worst devastation imaginable.[62]

Second, it is clear that everyone involved in the story, from Isabel the storyteller to the three Real sisters, Victor, and even Harrington, who, after all, went back to Isabel a year later for clarification, all understood that the word *joto* was not a compliment. The infliction of homophobia as a result of earlier gendercide on California Indians was deeply fixed well before Isabel's comments and was no doubt something Victor himself was forced to deal with all of his life.

Except for a brief mention in another Harrington field note from May 1936 in which Isabel recalls Victor Acedo working as a cook for a man named Snively, I don't know what happened to Victor.[63] Records from 1850 to 1900 are scarce for Indian people, especially with the Catholic missions in limbo between Spain, Mexico, and the United States, and especially for someone who would not show up on Church registers as a groom or father. This short note is all we know about him: his name, his mother's resistant behavior, his sexual orientation, the implication that for a woman to be strong implied a mixing of masculine and feminine energy. But Victor's *presence* gives me hope; hearing via Isabel that he grew to adulthood, and knowing who his mother was, allows me to imagine him as having, at the very least, a sense of self complicated not just by shame but by some knowledge of his historical and cultural inheritance. As the sexual side of the spiritual-sexual splitting of the *joya* role, *jotos* like Victor survived—quietly, and at great cost, but they survived.

Reemergence of *Joyas* as "Two-Spirited" Peoples

Looking forward now, it is clear to me that indigenous California third-gender people are reemerging from attempted gendercide, which we survived by performing a division between spiritual and sexual roles in our communities. We are reemerging as contemporary Two-Spirit people. This name, Two-Spirit, allows the

reunion of spiritual and sexual roles into a whole and undivided gender role, a role still needed in human society. Claiming our roles as the caretakers of culture and spirituality, like Fernando Librado, as well as our sexual selves, like Victor Acedo, we focus our attentions on the nurturance of our communities.

One contemporary example of a Two Spirit is L. Frank Manriquez, a Tongva/Ajachmen artist and tribal activist. She is a board member of the California Indian Basketweavers Association, the Advocates for Indigenous California Language Survival, and the Native California Network, organizations involved in the preservation and revival of Native Californian cultures through conferences, workshops, traditional arts practice, and language immersion camps, as well as chronicling collections of Native Californian art. Manriquez is also a respected artist in several genres (drawing, painting, soapstone carving, and basketweaving). Her book of drawings, *Acorn Soup*, earned her the title of "the Indian Gary Larsen," and she was coeditor of *First Families: A Photographic History of California Indians*, widely regarded as a powerful testimony to the continuation of California Indian culture.[64] I believe that what Manriquez has been doing is deeply traditional and part of the reemerging *joya* or Two-Spirit renaissance: as a person with the energy of two genders balancing within her, and conscious of the value of her work with the dead to nurture the living, Manriquez performs the ancient role of undertaker as so many specially trained indigenous people have done before her—but she is doing it without that careful training and so must find her own way. "Because our people are considered extinct, it's hard to get information," Manriquez writes. "So there's really nobody you can go to except for your dreams, and your prayers, and your wishes, and your longings."[65] In 2001 Manriquez wrote that she had felt compelled to travel to museums outside the United States where artifacts from California Indian tribes had been taken. Led by her dreams (and a timely award from the Fund for Folk Culture), Manriquez visited the Musée de L'Homme, where "I walked into this room where there were boxes and boxes and boxes and boxes of my people's lives, and they were like muffled crying coming from these shelves and these boxes, and it was just heart-breaking. . . . but these pieces and I became friends. *I tried to touch as much as I possibly could*."[66] For California Indians, as for many indigenous peoples, touching artifacts stolen from Native communities has connotations both deeply spiritual and terribly dangerous. "There was a piece that really worried me when I photographed it," Manriquez says. "It was on display in the Musée de L'Homme and it said specifically, 'grave item.'"[67] Knowing that contact with the dead, or objects buried with the dead, was a hazardous spiritual act that could affect her well-being and balance, Manriquez was torn between the desire to reclaim what little was left of her culture and a

duty to follow traditional prohibitions set in place long before that culture became endangered. Ultimately, she decided, "Well, I may burn in Indian hell, but this is really important for me to see this, for me and my people." Later, showing slides of this and other burial items to a group that included the Cahuilla elder Catherine Saubel, Manriquez was again unsure about her choice, this time for reasons of community disapproval; "I was incredibly worried because here's a grave item and I'm dealing with it. But [Catherine] looked at me and she understood what I was saying and what I was doing in bringing it back and showing people, and so I could carry on other traditions without fear of long term reprisal."[68]

Unmarried, without children, Manriquez has said that her work is her legacy: reclaiming indigenous knowledge and passing it on to the coming generations. She acknowledges that reclamation work is spiritually risky: "There aren't many of us who will endure museums because sometimes there are things in there that you should not touch, you should not see, you should not be near, and so we risk a lot going to recover."[69] I do not believe that it is a coincidence that Manriquez also identifies as a woman whose primary sexual and emotional relationships are with other women; to deal with the powerful energy of the dead, she must also be able to draw on the creative energy inherent in sexual existence. When asked if I could include her Two-Spirit identity in this discussion, Manriquez replied, "I have no problem being out there," indicating that it is as much a part of her work as any research or artwork.[70]

Many other Two-Spirit Indians currently serve the recovery of their indigenous communities via the spiritual and cultural arts of poetry, fiction, visual arts, basketweaving, tribal leadership, and environmental activism; these people also assert and live their sexual identities as what Euro-Americans call queer. In fact, Janice Gould (Concow) has described the work that indigenous women poets like Chrystos (Menominee), Joy Harjo (Mvskoke), and Beth Brant (Mohawk) do in grieving, honoring, and writing our historical losses in terms of "a resurrection of history through writing. . . . This writing, I would say, amounts almost to an act of exhumation"—a statement that reinforces the necessity of the Two-Spirit involvement in survival of Native culture and communities.[71]

Reconstructing a Spiritual, Community-Oriented Role for Two-Spirit People

In conclusion, I suggest that contemporary California Two-Spirits are the rightful descendents of *joyas*.[72] Two-Spirit people did not cease to exist, they did not

cease to be born, simply because the Spaniards killed our *joya* ancestors. This, in fact, is a crucial point: the words *gay* or *lesbian* do not fully define a Two-Spirited person, because those labels are based on an almost exclusively sexual paradigm inherited from a nonindigenous colonizing culture. The Chumash *'aqi*, or *joyas*, fulfilled important roles as spiritual community leaders, so although genocide and gendercide worked to erase their bodies, neither their spirits nor the indigenous community's spiritual needs could be murdered. This is what comes down to us as Two-Spirit people: the necessity of our roles as keepers of a dual or blended gender that holds male and female energy in various mixtures and keeps the world balanced. Although Two-Spirit people often had children in the past, and continue to do so in the present, and will into the future, we do not expect or train our children to follow in our footsteps. A Two-Spirit person is born regardless of biological genealogy. Thus we will always be with you. We *are* you. We are not outsiders, some other community that can be wiped out. We come from you, and we return to you.

Simply identifying as both Indian and gay does not make a person Two-Spirit, although it can be a courageous and important step; the danger of that assumption elides Two-Spirit responsibilities as well as the social and cultural needs of contemporary indigenous communities in relation to such issues as suicide rates, alcoholism, homelessness, and AIDS. What steps can we take to reconstruct our role in the larger indigenous community? I look back at this research on my family and find guidance, examples, strategies, and lessons that converge around six key actions:

1. reclaim a name for ourselves;
2. reclaim a place for ourselves within our tribal communities (which means serious education and presence to counteract centuries of homophobia—a literary presence, a practical presence, and a working presence);
3. resist violence against ourselves as individuals and as a community within Native America;
4. work to determine what our roles as liminal beings might be in contemporary Native and national contexts;
5. work to reclaim our histories from the colonizer's records even as we continue to know and adapt our lives to contemporary circumstances and needs; and
6. create loving, supportive, celebratory community that can work to heal the wounds inflicted by shame, internalized hatred, and fear, dealing with the legacy that, as the Chickasaw poet Linda Hogan says, "history is our illness."[73]

With the adoption of the name "Two Spirit," we have already begun the work of our lifetimes. As Sue-Ellen Jacobs, Wesley Thomas, and Sabine Lang write, "Using the word 'Two-Spirit' emphasizes the spiritual aspect of one's life and downplays the homosexual persona."[74] Significantly, this move announces and enhances the Two-Spirit need for traditionally centered lives with the community's well-being at the center. Still, we face a great problem: the lack of knowledge or spiritual training for GLBTQ Native people, particularly the mystery of blending spiritual and sexual energies to manage death/rebirth. In traditional times, there would have been older *joyas* to guide inexperienced ones; there would have been ceremony, role modeling, community support, and, most importantly, there would have been a clear role waiting to be filled.

The name Two-Spirit, then, is a way to alert others, and remind ourselves, that we have a cultural and historical responsibility to the larger community: our work is to attend to a balance of energies. We are still learning what this means; there has been no one to teach us but ourselves, our research, our stories, and our hearts. Maybe this will be the generation to figure it out. Maybe this will be the generation to reclaim our inheritance within our communities. And if it is not, I take heart from the history of the *joyas*, the impossibility of their true gendercide, and the deep, passionate, mutual need for relationship between Two Spirits and our communities.

Notes

2. Paula Gunn Allen, "Some Like Indians Endure," in *Living the Spirit* (New York: St. Martin's, 1988), 9–13.
3. Elaine Mills, ed., *The Papers of John Peabody Harrington in the Smithsonian Institution, 1907–1957*, microfilm (White Plains, NY: Kraus International, 1981).
4. *Salvage ethnology* is a term coined by Jacob Gruber to refer to the paradoxical obsession of Westerners to collect artifacts, linguistic traces, and cultural knowledge of cultures that they had previously spent much effort to colonize or exterminate. Rather than basic ethnological research, the study of a culture, "salvage ethnology" was concerned with an almost fanatic search (and often the hoarding of) any remains of a colonized culture. See Jacob Gruber, "Ethnographic Salvage and the Shaping of Anthropology," *American Anthropologist*, n.s., 72 (1970): 1289–99.
5. I use this name as it was coined during the Third International Two Spirit Gathering, to provide a positive alternative to the unacceptable term *berdache*: Two-Spirit

people are "Aboriginal people who possess the sacred gifts of the female-male spirit, which exists in harmony with those of the female and the male. They have traditional respected roles within most Aboriginal cultures and societies and are contributing members of the community. Today, some Aboriginal people who are Two-Spirit also identify as being gay, lesbian, bisexual or transgender" ("Background and Recent Developments in Two-Spirit Organizing," International Two Spirit Gathering, intltwo spiritgathering.org/content/view/27/42/ [accessed July 28, 2009]).

6. The archaeology of sexuality refers to a fairly recent movement within archaeology that brings together theoretical work from gender and women's studies, science studies, philosophy, and the social sciences on sex and gender to study material remains and to approach questions often considered accessible only through texts or direct observation of behavior, such as gender or multiple genders. An excellent collection of articles on this topic is Robert Schmidt and Barbara Voss, eds., *Archaeologies of Sexuality* (London: Routledge, 2000).
7. My use of the term *third gender* relies on and refers back to work done by Will Roscoe, Sabine Lang, Wesley Thomas, Bea Medicine, and others as a way to identify a gender that is neither fully male nor fully female, nor (more importantly) simply "half and half," but a unique blend of characteristics resulting in a third or other gender. See Sue Ellen Jacobs, Wesley Thomas, and Sabine Lang, eds., *Two-Spirit People: Native American Gender Identity, Sexuality, and Spirituality* (Urbana: University of Illinois Press, 1997). As Brian Gilley summarizes, "The institution of the third gender [in Native American precontact societies] was less about an individual's sexuality and more about the ways their special qualities were incorporated into the social and religious life of their community" (*Becoming Two-Spirit: Gay Identity and Social Acceptance in Indian Country* [Lincoln: University of Nebraska Press, 2006], 11).
8. Father Gerónimo Boscana, a Franciscan priest who kept extensive notes about Native culture and customs during his stay at Mission San Juan Capistrano from 1812 until 1826, wrote that the "Indians of California may be compared to a species of monkey" ("Chinigchinich," in Alfred Robinson, *Life in California: During a Residence of Several Years in That Territory, Comprising a Description of the Country and the Missionary Establishments*, ed. Doyce B. Nunis Jr. [New York: Wiley and Putnam, 1846], 335). Postsecularization, perceptions had not changed much; in 1849 Samuel Upham commented on California Indian genealogy and eating habits: "Like his brother, the gorilla, he is a vegetarian and subsists principally on wild berries and acorns, occasionally luxuriating on snails and grasshoppers" (*Notes of a Voyage to California Via Cape Horn, Together with Scenes in El Dorado, in the Years 1849–50* [New York: Arno, 1973], 240). This attitude persisted when John Audubon wrote in his journal of a Miwok child "eating [acorns] with the judgment of a monkey, and looking very much like one." Although the journal covers the years 1840–1850, it was published in 1906, perpetuating the distorted view of California Indians into the twentieth century

(John Audubon, *Audubon's Western Journal: 1840–1850*, ed. Frank Heywood Hodder [Cleveland: Clark, 1906], 213).

9. Although most scholars still use the population estimates by Martin Baumhoff (*Ecological Determinants of Aboriginal California Populations* [Berkeley: University of California Press, 1963]) and Sherburne Cook (*The Population of the California Indians, 1796–1970* [Berkeley: University of California Press, 1976]), many contemporary scholars view their numbers (150,000–350,000) as greatly outdated. In *American Indian Holocaust and Survival: A Population History since 1492* (Norman: University of Oklahoma Press, 1987), Russell Thornton, for example, writes that California Indian precontact population was "approaching 705,000" (200). In private correspondence with the author about more current population data, William Preston writes that "at this point I think Thornton's high number is totally reasonable. In fact, keeping in mind that populations no doubt fluctuated over time, I'm thinking that at times 1 million or more Native Californians were resident in that state." William Preston, e-mail message to author, July 8, 2009.

38. J. Alden Mason writes, "That the mention of the dead was as serious an offence among the Salinans as with other Californian Indians is well illustrated by the incident that when asked jocularly for a Salinan word of profanity, Pedro Encinales gave ca MteL and translated it 'go to the devil' (ve al diablo). [Father] Sitjar writes chavmtel 'cadaver.'" Sitjar, who compiled a useful list of Salinan words and phrases, knew enough of the Indian language to make his own translation, which apparently Pedro Encinales, the indigenous speaker, wasn't comfortable speaking (J. Alden Mason, *The Ethnology of the Salinan Indians* [Whitefish, MT: Kessinger, 2006], 167).

sultant" here rather than use the traditional ethnological term *informant* out of respect for all Native peoples who have retained and chosen to share their cultural knowledge and expertise; my purpose is to acknowledge that Indigenous knowledge puts Native consultants on an equal intellectual level with scientists and academics.

45. Hollimon suggests that "daughters" of male-bodied *'aqi* were probably fictive kinships (such as adoption) formed with other members of the same guild or role or premenopausal children of women who took up the *'aqi* role late in life, and when colonization had created a shortage in the usual mortuary profession (Holliman, "Archaeology of the *'Aqi*," 185).

56. Multiple translations of *joto* exist: for example, *faggot*, *queer*, *homosexual*, *pansy*. After consultation with colleagues, I believe I have chosen the word most likely to carry Isabel's meaning.
57. Isabel's older half-brother Jacinto Meadows (San Carlos, Baptism #04279), a son from her mother's first marriage to Quirino (San Carlos, Baptism #02993X), married my great-great-great-grandmother Sacramento Cantua (San Carlos, Baptism #04202). As Jacinto's baptismal information lists no surname, it seems that Jacinto adopted the Meadows name when his mother married Englishman James Meadows in 1842. Sacramento and Jacinto, both previously married, had no children together; hence, this is a familial, not blood, relationship.
58. *ECPPD*, San Carlos, Baptism #04700.

59. "Real" was a name conferred by common community use on Estefana and her sisters, probably because of their association with Padre Jose Real, a well-known womanizer; his women were known as the "Real women" and mothers of the "Real children." Even their father, Fructoso Real Cholom, acquired and used the Real name.
60. Steven Hackel, *Children of Coyote, Missionaries of Saint Francis: Indian-Spanish Relations in Colonial California, 1769–1850* (Chapel Hill: University of North Carolina Press, 2005), 388.
61. Hackel, *Children of Coyote*, 401.
62. Estefana's "muchos maridos"—her many husbands and/or men—look quite different from this perspective. Rather than being a *bad Indian woman* who slept around a lot, a sinner, or a lewd and loose woman, as the priests saw her, Estefana was actually practicing a very California Indian form of resistance and cultural preservation: maintaining her right to choose her sexual partners and bear children by the men she preferred regardless of Catholic marriage ceremony. Hurtado notes that Father Serra recognized early on that "common Indian sexual behavior amounted to serious sins that merited the friar's solemn condemnation" (Albert Hurtado, *Intimate Frontiers: Sex, Gender, and Culture in Old California* [Albuquerque: University of New Mexico Press, 1999], 6). Worst of all, of course, were the *joyas*, but normative men and women were a close second, practicing premarital sex, polygamy for higher-status men, serial monogamy for everyone else (in which marriage and divorce were both accomplished quickly and without "legal" or spiritual repercussions), the taking of lovers while married to someone else (which had its own risks and costs but was not forbidden), the restrictions preventing sexual relations for up to two years after childbirth or a day or two before hunting, acceptance of masturbation, birth control, and so on. It seems to me that Estefana was resisting the countless rules, punishments, pressures, and basic colonization methods of the Spaniards via her woman's body. Therefore it is possible she would have had fewer issues with her son's status as a *joto* than many and may have even seen his sexual orientation as Victor's own form of resistance and self-fulfillment.
63. This field note, in transcription, was generously shared with me by Philip Laverty. It reads in full: "76:37B [Iz. May 36; Victor Acedo, el cosinero de Esnáyvli [Snively], used to put up aulones in frascos (mason jars); mussels, clams]."

71. Janice Gould, "American Indian Women's Poetry: Strategies of Rage and Hope," *SIGNS: Journal of Women in Culture and Society* 20 (1995): 799. Gould's essay discusses poetry by eight Native women (Paula Gunn Allen, Luci Tapahonso, Janice Gould, Wendy Rose, Chrystos, Louise Erdrich, Linda Hogan, and Joy Harjo), four of whom have primary relationships with women as life partners, including Gould herself. I find this significant in light of the "exhumation" Gould speaks of; she also calls this "our imperative . . . to resurrect, sometimes hundreds of years after the fact, a history that has been buried, lost, or ignored" (799). As Gould's work points out, the liminal states of birth and death are strangely connected twins, whose mediators are often Two-Spirit people and women.
72. Other indigenous peoples around the world attributed special powers and rights to Two-Spirits within their tribes; although they were not always the mediators between life and death, similar patterns may be found. Because of the limitations of this essay, I leave that to future scholars and seekers.

POETRY AND SEXUALITY

Running Twin Rails

James Thomas Stevens (Akwesasne Mohawk)

I sit here at my window, looking out on the train tracks that run along the shore of Lake Erie. I've been considering the intersection, the overlap, and interstice of ethnicity and sexuality. Suddenly the house begins to shake; two trains approach from opposite directions, one heading to Buffalo and points east and one to Chicago and the wide Midwest. The sound is deafening for seemingly endless minutes, blocking out all else. For a time the trains share space side by side. This is the time my poetry occurs, when ethnicity and sexuality share these thunderous moments.

I look back some twenty years now and realize I have always been writing the same warning. I have been writing to warn myself against colonization, sometimes reminding myself not to become a victim of it, but more often reminding myself not to become the colonizer. I speak of colonization in terms of identity and relationships.

From my undergraduate days at the Institute of American Indian Arts (IAIA), I have been made to realize the identity that Anglo-America has constructed for Indian peoples. Santa Fe, New Mexico, is ripe with stereotypes; tourism thrives on it. Many times we, the students of IAIA, were asked to read during Indian Market season. We showed up in our T-shirts and jeans, inspired by the assigned writings of Galway Kinnell, Mei-mei Berssenbrugge, C. D. Wright, or Michael Palmer, and we read next to local Indian poets, who had learned to appear in buckskin for their readings. One poet, I remember, brought a drum to keep beat as he read. How quickly the audience dispersed when the drum ended, when they ceased to hear mention of Coyote or Raven, of how English was "like a razor slicing the indigenous tongue." We were simply Indians in T-shirts reading about who we are today.

Later that summer, while attending a very liberal poetics program in Colorado, I was asked to perform a blessing ceremony on July 4 at an "Interdepen-

GLQ 16:1–2
DOI 10.1215/10642684-2009-018

dence Day" celebration. When I declined, explaining that I was not an elder or an appropriate person to lead a blessing ceremony, I was handed a smudge-stick and told, "Just acknowledge the four directions and Mother Earth and Father Sky." Still, I declined, despite the kind instruction. I did not bother to explain the Ohén:ton Karihwatéhkwen, the Thanksgiving Address, or, literally, *The Words Before All Else*, or that once they found an appropriate speaker, it would be a good half hour of recital. While now I can look at this situation as comical, at the time I was angered by yet another affirmation of this identity that had been constructed for me. I spent the rest of the summer writing German-inspired poetry, missing my then partner, an Austrian national. How they had wanted a genuine Twin-Spirit to lead them in celebration and prayer.

Speaking of constructed identities — enter the Twin-Spirit. Since the mid-1970s, and the founding of GAI (Gay American Indians), those interested in sociosexual and anthropological/cultural research have taken up terms such as *berdache*, *Winkte*, *double-sex*, *Nadle*, *Hwame*, and *Twin-Spirit*. I will not go into the origins of these words, as they are well explored in countless other texts, such as Walter Williams's *The Spirit and the Flesh* and Will Roscoe's *Living the Spirit*, among others.[1]

Twin-Spirit is too often used as a pan-Indian term for queer-identified Native peoples, even where no such terms existed before. It glosses over the many autonomous views that individual nations held concerning their queer members. The above list of terms, one will find, comes from the nations of the west, where much later contact and missionizing occurred than in the east. There was study and record of the roles of queer peoples being done at that point in history. The nations of the east, having had such early contact with Christian Europeans and missionaries, suffered such great cultural losses that many are lucky to have maintained a record of their languages, let alone an understanding of the complex roles their queer members may have held, *if* such roles did exist among these tribes.

In my research of my own nation, I can find no documentation that this role of Twin-Spirit, for lack of a better term, ever existed as a sacred position. History has been unkind here, in the five hundred years of colonization. Queer Haudenosaunee poets have been identifying with their western counterparts since the 1970s and 1980s, when the poets Maurice Kenny and Beth Brant identified with the Winkte and a lesbian trickster Coyote. When elders are asked about the role of queer people, they speak only of tolerance and silence, not unlike that which I found in existence in small non-Native rural communities of Kansas when I lived in the Midwest.

It is impossible for me, personally, to identify with a role that has been recently constructed and to write as if I had lived that life, even if there did exist such a traditional role among Mohawks. Many Twin-Spirit writers find it necessary to adopt the first-person historical voice of the Winkte, Nadle, Hwame, regardless of tribal affiliation. I aim to honor the past but to write in the present. I have not suffered the oppression that my forefathers and foremothers, or my queer historical brothers and sisters, suffered. I can give voice to history and speak to what has happened, but I cannot speak as though it has happened to me. I must acknowledge that as a gay Indian academic today, I am in a place of privilege. Editors, publishers, and conference organizers seek out Native academics to read on panels, make presentations, and publish. I cannot write about how the White Man stripped my land out from under my feet while Mother Earth wept and screamed. That is not my reality. I will not colonize myself to become the angry, yet romantic, being-of-the-forest that the majority of non-Native readers still prefer, or the sacred queer entity.

I think of a quotation from an interview with Sherman Alexie, a Spokane/Coeur d'Alene author, with whom I disagree as often as I agree. In a 1999 interview in *Poets & Writers Magazine*, he stated, "I want us to write books about the way we live. When I see words like *the Creator*, *Father Sky*, *Mother Earth*, *Four Leggeds,* I almost feel like we are colonizing ourselves. These words, this is how we're supposed to talk—what it means to be Indian according to white America. But it's not who we really are; it's not what it means to be Navajo or Spokane or Coeur d'Alene."[2]

I would add to this that it is not who we really are as queer Native men and women. I cannot subscribe to the separatist notion that we as queer Natives are somehow more valid than other queer peoples because of a once sacred status, whether real or constructed. We are Ongwehonwe (Real People), and that is sacred enough.

The second colonization I mentioned in the opening of this essay is that of the *other* in a relationship. After spending two years at an all-Native arts college and reading and researching mainly Native issues, I went off to graduate school in Providence, Rhode Island. There, I would work for a brief time with the Narragansett tribal community on an after-school antidrug program. It was because of my work with Narragansett people that I began reading Roger Williams's *Key into the Language of America*. This lexicon of Narragansett language and customs became the basis for my first book, *Tokinish*, meaning "Wake them." I had been considering the effects of the English naming what was already named—"Asqútasquash,

their Vine aples, which the English *from them call* Squashes." I began to consider that every person, every partner, already has a name, a history, before contact. People are individual worlds, individual planets. When we speak of relationships in their early stages, we often hear, "That was back when we/they were just *discovering* each other." But did that discovery require a renaming of what already existed?

I have learned to say each word with caution,
your body or anybody,
I will not call mine.
Wuhock. The body.
Nohock: cohock. My body, your body.
The first to come
found baskets of corn
and brought them away without payment.
To know the feel and taste of a thing
as if knowing implies its ownership.

When if both employ the same word, *mine*,
familiarity with language blinds the user to contradiction,
action leads to reaction and consequence.

The next were met and assailed with arrows.[3]

The above section of *Tokinish* often comes back to haunt me in relationships. How quickly the other becomes *my* partner, *my* husband, *my* wife. Over and over, I see in my research that the point of exploration is the right to naming/claiming. When we take what is not ours (another's individuality), there are repercussions, "The next were met and assailed with arrows." It is human nature in relationships to colonize, regardless of gender. I most often write in the second person, hoping that this will function doubly to open the *you* up to any potential reader and to keep the reader from focusing too much on the specific *who* of whom I write. It is really only the descriptions of the male body in my work that designate it as queer. In that way, I do not see my sexuality as the ruling theme of my work.

In the series of poems titled *The Mutual Life*, a rewrite of an insurance book on accidents, emergencies, and illnesses, this theme of discovery/discoverer appears again. I was born in Niagara Falls, New York, and grew up hearing its

lore. I remember going on a field trip to the Niagara Power Project as a child and seeing the Thomas Hart Benton mural of Father Hennepin "discovering" Niagara Falls. There are Iroquois people in the painting (who had obviously led him there), but the teacher told us that Hennepin had discovered it. Small details like this come back years later in my writing. The following is from the section of *The Mutual Life* titled "Burns and Scalds."

> When clothing catches fire in the park or dew
> of nocturnal parking above the falls (I'd
> seen them a thousand times but
> when he saw them, they were discovered).
> Beneath the windshield, his fingers fanned out
> above the bush.
> The burn, superficial
> as far as depth is concerned,
> but his white hand hovering considered
> more serious than a burn, smaller, deeper
> but more complete.[4]

Here, those two trains are running side by side again, ethnicity and sexuality, and the walls of poetic memory begin to tremble.

My partner and I wrote a short manuscript last year. The poems have been published as a collaboration to show the dialogue that naturally happens between the work of two poets sharing a life and a home. The book is titled *Of Kingdoms & Kangaroo* and is published by First Intensity Press. While writing independently of each other, we were surprised at first by how many overlaps there were in our research. My half of the book, subtitled "Stir," is about the history of fruits and animals and objects from the New World that "caused a stir" when exhibited in the Old World, much like new love causes a stir. My partner was working on a series of poems on taxonomy, the effect of the namer on the namee. The conversation that occurs between the two series is obvious; it is one of Empire and the other. "Kingdoms" was chosen for its taxonomic relevance and "kangaroo" for its exotic otherness. I wrote the following canoe poem after reading about the dugout canoes unearthed in the British Isles. The British were surprised at their simple beauty, as Columbus had been in 1492, forgetting that they, themselves, had constructed these boats before being blinded by their own technology.

Burn Out

They came to the ship in small canoes, made out of the trunk of tree like
a long boat, and all of one piece and wonderfully worked. — Columbus

Amazed by the built thing
and the builders we've become.

In awe of our own mathematics,
we fashion the other
for smooth
sailing, safe passage.

Then awed again
by what we've forgotten, known once, felt once as simplicity.

There, in the mire of origin appearing.
You unearth the one piece, the self-worked
singular.

A log along the sluice — and natural
you move,
regardless of measure and math.

Me, surprised by
the simplicity
and solidarity of your craft.

All pithy burn-out, cleared by your own adze.

Chisel, gouge, wedge . . . how you work your way in.[5]

Once again, my self-warning is present. Do not "fashion the other" to suit your own need. Let the simplicity of his/her design awe you. It is not an easy thing to remember, but the history of exploration and colonization on this continent is a constant reminder. I am thankful for the knowledge of my Haudenosaunee ancestors, and I learn from it everyday. History is considered more of a lake than a river by Native peoples. Everything that has happened is there swirling around; it has not flowed past and been forgotten. I am a queer Native writer of today. I will con-

tinue to look to the past for guidance, but not for the anachronistic signifiers of a European constructed identity.

Twin-Spirited Woman

Sts'iyóye smestíyexw slhá:li

SAYLESH WESLEY

Abstract Coast Salish people, particularly the Stó:lõ of the lower Fraser Valley, have lost much of their language, histories, and teachings as a result of colonization. One such important identity that has been forgotten or erased is the two-spirited role. The author wishes to revitalize the cultural roles of transgendered/two-spirit people within the Coast Salish territory and ways in which they historically contributed to their societies prior to colonization. Traditionally, the Stó:lõ are matriarchal and matrilineal, and only grandmothers can create any new laws for their descendants. Thus given the vital role played by the author's grandmother in her process, this essay is a long-overdue proposal to all living grandmothers not only to stand by and accept their two-spirited grandchildren but to call for a celebration of their coming out. This visionary work serves to inspire future generations of Stó:lõ to fully embrace *all* members of their community, especially two-spirits. The first *Sts'iyóye Smestíyexw Slhá:li*, or *Twin-Spirited Woman,* as this essay is about, offers an example to this sacred work.
Keywords two-spirit; transgender; gender; restoration; reconciliation; indigenous; twin-spirited woman; storytelling; queer; LGBTQ

> To decolonize our sexualities and move towards a Sovereign Erotic, we must unmask the specters of conquistadors, priests, and politicians that have invaded our spirits and psyches, insist they vacate, and begin tending the open wounds colonization leaves in our flesh. . . . A Sovereign Erotic is a return to and/or continuance of the complex realities of gender and sexuality that are ever-present in both the human and more-than-human world, but erased and hidden by colonial cultures.
> —Qwo-li Driskill, "Stolen from Our Bodies: First Nations Two-Spirits/Queers and the Journey to a Sovereign Erotic"

The Stó:lõ people of British Columbia's lower Fraser Valley have ancient stories, or *Sx̱wõx̱wiyám,* to turn to when seeking traditional knowledge or teachings; however, the vast majority of these stories have been forgotten due to the colonial effects of assimilation. As an mtf transgendered Stó:lõ citizen and PhD student in

DOI 10.1215/23289252-2685624

gender, sexuality, and women's studies, I have made every effort to locate any precontact stories of the Stó:lõ two-spirits, but to no avail so far. In this essay, I endeavor to re-member the past differently, marshal new traditions and language together in ways that create a new vision of the future. For the Coast Salish territory, I wish to illustrate how we historically contributed to our society prior to colonization. My grandmother has overcome the colonized homophobia imposed upon her enough to coin a title for me from our Halq'eméylem language. Given it has been her acceptance I wanted most of all, I would like to propose to all living Stó:lõ grandmothers, the *Sisele*, that as the traditional makers of all laws on our matriarchal lands, they support this long-overdue initiative to reclaim lost identities erased through Western gen[der]ocidal action. The restoration of lost identities back to the Stó:lõ nation would further reestablish the identities deleted by Western gen[der]ocidal actions. This essay is a movement toward personal healing and internal reconciliation for the Stó:lõ as a whole. I feel that what my grandmother has done for me is a perfect example for this.

As Canada currently seeks to reconcile[1] with its indigenous people against whom it practiced genocide, in my case, as an mtf person who has lost access to traditional knowledge about people like me, I feel the need for this country to atone for its gendercide. While this reconciliation is important, it is more crucial that indigenous people reconcile among themselves first.

Therefore, this essay is intended not only to regenerate the lost teachings and stories of all Stó:lõ two-spirits but also to offer a new beginning toward a new realization and acceptance for all indigenous people. As a member of the Stó:lõ nation, I have inquired with elders and consulted all published works for a Halq'eméylem translation, and I have found that *two-spirit* is not yet a part of the Halq'eméylem language, nor can it be found in the English-to-Halq'eméylem dictionary (First Voices 2013a). Upon my request, my grandmother has been the first to conjure a Halq'eméylem term for my transgendered identity. In the recounting of my grandmother's work, I follow the "story-work" methodology of Stó:lõ scholar Jo-ann Archibald, articulated in her *Indigenous Storywork* (2008), whereby personal experience is considered in relation to stories of the elders, to craft an analysis that takes indigenous knowledge seriously. This is my story and analysis woven together.

First, I share some of my history in order to clarify how I carry both Stó:lõ and Tsimshian bloodlines. Approximately three years before I was born, my maternal grandmother moved from the Fraser Valley, her traditional Stó:lõ territory situated in Southwest British Columbia, Canada.[2] During this time, she was still married to my late biological maternal grandfather, who was also Coast Salish from the Musqueam nation located in Vancouver's Point Grey area. Their marriage had dwindled at this point, and they agreed to separate and divorce. She was federally contracted at the time to travel around the province to promote and

help preserve all traditional fine arts that many nations were quickly losing. On one of these excursions, she landed in Terrace, a small north coast town of British Columbia. This is when she met and eventually married my late step-grandfather who was a resident of Terrace and a member of the Tsimshian nation. The Tsimshian territory spreads vastly across the Pacific Northwest Coast and geographically includes Terrace and Prince Rupert, British Columbia, as well as southern parts of Alaska. Her plan was to send for her children from her previous marriage once she was settled, and my mother, a teen at the time, was one of them. Before my grandmother had anticipated, my mother showed up on the Greyhound bus from Chilliwack, because she missed her mother too much to wait any longer. It was not long before she met my father, who was not only Tsimshian but also my step-grandfather's maternal nephew. Thus this new grandfather of mine was also my great-uncle by blood.

My parents eventually married and I was born on October 28, 1972, at the Terrace Mills Memorial Hospital. The time of my birth was 10:30 p.m. My mother almost bled to death after an extremely difficult three-hour labor, and she remained as a patient for another week to recover from a life-saving postdelivery surgery. As I was jaundiced and three weeks premature, I had to be incubated in hospital for another two weeks. This birth resulted in two quite profoundly different stories, one from my maternal (Stó:lõ) grandmother and one from my father. He tells that the night I was born, the northern lights danced across the clear night sky more brightly than he had ever witnessed, and they apparently lasted throughout the night. To him, this was a spiritual sign. What is more significant is that he was not a spiritual man. He took the northern lights as an omen that his first-born son was going to be special—which I feel I have proved true. In those days, and in a town like Terrace, a son had great expectations placed on him to become a "man of men." Terrace was, and still is, a very redneck little city; "Indians" must overcompensate for anything and everything they do. The racist attitudes toward the indigenous populations in this rural community have changed little over the years that I have visited, so I understand the double work any "Indian" has to do to fit in. I cannot imagine what my father envisioned for me as his potential "hero" of a son, but he responded to the northern lights with hope that I would do him proud and with a belief that something divine acknowledged his vision for my future. Though these hopes for me weren't necessarily achieved as he imagined they would be, I must share that he is now absolutely proud of who I have become.

My grandmother's story is different. She first told it to me when I was about thirteen years old. She shared that my mother had almost bled to death as a result of my delivery. She also explained that such a difficult birth foretells a difficult life for such a child (according to her elders). As both the Stó:lõ and

Tsimshian are matrilineal, it goes without saying that I am to identify as Stó:lõ even though my blood is a blend of the two, and to this day, she maintains political jurisdiction over me. Perhaps this is why she felt she had the right to share what she did, as hurtful as it might seem. Throughout the remainder of my teenage years, it seemed that what she had foretold in regard to how tumultuous my life would become had come true. I was nearing the end of puberty. I knew that I was not the *man* that I was expected to be. Every night I prayed that a supernatural force would transform me into a "normal boy." Over the course of my lifetime and despite my family's dismay over my apparent lack of masculinity, my grandmother did love me and played a critical role in bringing me up. I spent many weekends throughout my childhood under her loving care, and there are no sad stories I can tell, except for the time she told her version of my birth. I never again felt her angst toward me until I came out as transgender. In fact, when I was a child, she would allow me to play with dolls and dress up like a bride, and she would have tea parties with me when no one else would. It hurt her to see how my family would shame me to the soul for indicating in any way that I was not supposed to be a boy. Ultimately, I loved my grandmother from the day of my memories and still do today.

I was also close to my maternal auntie, almost ten years my senior and my grandmother's youngest child. She was genderqueer like me, except the polar opposite. She, in her own crass words, "was supposed to have a pecker." By the time I was courageous enough to come out, my aunt had yet to do so. My entire family knew that she was, as everyone thought, a "lesbian," even though she later confessed to also being "trans" like me. Her story is even more painful than mine, and I will not delve into it here. When I was twenty-three, I came out to her and to the rest of my family. I started off identifying as gay, since it seemed less scary than to say I was actually a woman; however, I announced my true trans identity over the phone to my aunt. She was incarcerated at the time for dealing drugs and prostitution. She warned me: "Don't tell anyone! I don't want you to go through what I did!" She was the first in our extended family to break the ground for homophobia internally, as one might well imagine, and she faced far worse consequences for being gay than I would. Against her plea, I went ahead with revealing the truth about my identity. I was willing to be cast out from my family, but I hoped for at least some acceptance. Otherwise, I would have had to find a way to end my life for the mistake that I felt I was. Over the next little while, my aunt was released from prison, and we became even closer. My seemingly smoother journey of coming out compared to hers years earlier gave her the courage to do the same.

All this time, my grandmother had remained as diplomatically mute as possible, I think for the sake of my aunt and me. In 1997, about three years after I

told our family I was gay, I phoned her: to tell her that I was transgendered and ask if she would host a "coming out" feast for us. She said she could not fathom how I came to be this deviant, and how I thought I should be blessed with such a celebration. Perhaps in her mind, I should have grown out of my feminine phase. Needless to say, the conversation ended with her hanging up the phone and me in tears. In 1999, my aunt passed away from a heroin overdose. As keen as she was to continue negotiating her queer identity, she did not survive her own demons. For my grandmother, this was a loss from which she never fully recovered. I have since prayed these words to her countless times:

> I invite you Grandmother, to shape-shift your own thought process and open your mind a bit more and see that I am still, essentially, the grandchild with whom you shared a reciprocal loving relationship. I am not asking you to change who you are in principle, but rather, that you attempt to enhance your ability to be more at peace with diversity given your late daughter's fate. Perhaps I can take this opportunity to point out metaphorically that you too are akin to being two-spirited. In your stories of your cultural immersion combined with your experience as a converted Catholic, and how you now dwell (to some degree) in both faiths, you too share your own duality. Albeit, it isn't about your gender or sexuality, but in your own words "To Thine Own Self Be True" you justify your biculturalism and I beg that you accept my two-spirit identity all the same. I am, after all, a descendant of your rich bloodline, so there must be something worthy I can offer. The creative juices within you that produce your baskets flow through me too. I am taking what you taught me and now weave my own stories. My baskets are not literal, but they are certainly coming out to be "masterpieces" that would be finished perfectly with your loving pride.

My grandmother is a world-renowned basket weaver who not only continues to pass on her mastery of Stó:lõ styles of weaving but single-handedly revived the lost Tsimshian cedar bark and spruce root weaving and taught it back to them. I have since rooted in Chilliwack because my parents also divorced after fifteen years of marriage. My mother took my sister and me back to her hometown, and here I stay. In April 2012, my grandmother's second husband tragically passed away. This event prompted her to return to Chilliwack, since it is where the bulk of her children and their families live. This was a difficult transition for her, given that she is at this point in her 80s and that she has lived in Terrace for nearly forty years. In the last two years since she returned, my relationship with her has been entirely reshaped. As well, I am now her primary caregiver. Our closeness has given me the opportunity to become her weaving apprentice. I have learned to gather and prepare strips of cedar and roots for weaving; sitting with her, I have

learned basic techniques for making baskets and shawls. And as she shares with me her most cherished indigenous knowledge, I also share with her my insights about being two-spirited and how I have learned about this concept in university. Though this is uncharted territory for her, her receptiveness has clearly developed. She places absolute priority on higher education for her children and grandchildren. She feels as though if she had had the opportunity to get a postsecondary education that she would have become a scientist. Instead, she only received a grade six education in an Indian residential school. Though she still wrestles with the idea that I am now a woman, she respects my academic achievements and my natural flare for weaving. Given that I have revealed the emotionally awkward aspects of our relationship here, I want to emphasize that it is the progress we have made, not the pitfalls, that I wish to spotlight. My grandmother's instinctual *trans*phobia is not her doing. This is the "good work" of the Catholic Church and the rest of the colonial project; but as mentioned, our budding friendship also works to reprogram her worldview.

While my grandmother speaks English, learned at residential school, her first language is Halq'eméylem (First Voices 2013b). And recently I asked if she could meditate and conjure a title for me as a male-to-female in our traditional language. As previously mentioned, no such thing exists in recorded history. I had already shared with her what I have learned in university about two-spirited identities and so she took some time to think about it. Eventually, she came up with a Stó:lõ two-spirited identity for me in our mother tongue—an exchange that remains surreal and miraculous. She coined the term *Sts'iyóye smestíyexw slhá:li*. When she handed the piece of paper to me with this title on it, she included the English translation, "Twin-Spirited Woman," and explained that I could interpret it as "two-spirited woman," or "twin-soul woman," or "same spirit as a woman." Ultimately, she left it open for me to decide how I would like to interpret it, given that our language is much more fluid than English. As a fluent speaker of Halq'eméylem, she has taught me that our words were able to wield various contexts and concepts depending on the discussion. Therefore, she gave me permission to decipher for myself how *Sts'iyóye smestíyexw* translates. This was truly a "HALLELUJAH!" moment. I then asked her if it would have made sense to introduce my late aunt as *Sts'iyóye Smestíyexw Swí:qe*, or "Twin-Spirited Man," and her response was something to the effect of "I guess if she would have wanted to."

As I state in the opening paragraphs of this essay, the Stó:lõ have lost much of their Halq'eméylem language, histories, and teachings to colonization. As a result, any such focus on gender transition challenges many perspectives, particularly for gender-normative kin who must adjust their worldview once a family member discloses that she or he will change gender. I share this because I have observed how those who loved me were tremendously bewildered by my dramatic

transition and how, fifteen years later, this shift is not yet finished for everyone. For the most part, my family and community members have come a long way. Many did not know how to perceive me in a literal sense; some still do not. I remain troubling and/or invisible in their presence. Most have come to a frame of mind where *I am* who *I am*. Or, "That's just the way she is," with no agenda or bias, just matter-of-fact acceptance. In other words, they have achieved true contentment with my identity and in some cases have found even more love and respect for me as a result of my transformation, given how they have witnessed my life-and-death struggle with it.

This leads to the complexities of the term *two-spirit* and how perplexing it is for everyone's psyche to negotiate. For instance, any given cisgender Stó:lõ person who identifies as a contemporary two-spirit may not feel like a "twin-spirited woman" (i.e., my aforementioned late aunt might have adopted "twin-spirited man"). It only makes sense for them to choose how they wish to identify in Halq'eméylem as I have. In the introduction to the anthology *Queer Indigenous Studies* (Driskill et al. 2011), the authors suggest that the continued use of the prototype *two-spirit* is problematic: like *lesbian*, *gay*, *transgender*, and other terms, *two-spirit* "inevitably fails to represent the complexities of Indigenous constructions of sexual and gender diversity, both historically and as they are used in the present" (3). However, they also contend that two-spirit is a starting point toward the decolonization of queer indigenous identity in general. This admittedly implies that all cisgender queer people have both male and female spirits; it seems important to keep two-spirit open for such individuals to self-identify as to whether or not they understand themselves to have "two" spirits (3). Moreover, I tell my story in order to isolate my specific "queer" Stó:lõ identity that makes space for other transfolk of my nation and subsequently for all queer indigenous people who remain unidentified and/or displaced from their home territory(s). In other words, I happily share the newly conceived *Sts'iyóye smestíyexw* status with any who feel it fits, though it is only an invitation. As each nonindigenous person who fits under the evolving LGBTQ spectrum has the right to self-determine where they fit and/or how they identify, it makes sense that the same goes for the Stó:lõ "LGBTQ." Should any of those who do not identify as transgender wish to quest for a customized Halq'eméylem title as I have, then all the power to them.

Qwo-Li Driskill and colleagues also tell me to "talk back" to Western scholarship and compile and publish my own story: to claim first-voice authority as a contribution to the academic mainstream. Their message encourages me to bring what remains still in the proverbial closet—the lost and stolen history(s) that, until recently, remained the work of white scholars to excavate (10). However, I am grateful to some of these scholars who have engaged in this work, especially for any recent work that attempts to capture accurate and articulate

accounts with clear integrity (Morgensen 2011; Rifkin 2012). However, I am fortunate to be able to bring a firsthand, lived experience to enrich this budding field. In this sense, I make every attempt to "link arms together" with other two-spirited theorists and philosophers to continue imagining what our scholarship should look like (Rifkin 2012: 18).

As previously mentioned, the term *two-spirit* is not in the English-to-Halq'eméylem dictionary. Thus it is necessary to work to reestablish the best or most appropriate "fit" to name this term and determine how it may serve as an addition to the Stó:lõ gender binary.[3] Coast Salish nations traditionally hold ceremonial gatherings to "stand-up" ones who are receiving such names or honors,[4] and as our systems of passing knowledge and title down are matrilineal, only the eldest woman can legitimize this sort of work. I would thus require my grandmother to endorse this vision and support the endeavor to gift these roles back to the Stó:lõ. I have truly become not only her granddaughter, but also her friend and teacher who helps to reshape her worldview, which includes my queer identity. She now understands that the "grandson" I once was remains very much alive through my female eyes. For a woman of her age and stature, this is no small feat.[5] The Catholic Church and the Canadian Indian Residential School system (which only closed in 1996[6]) have thoroughly accomplished their assimilationist goals in her. Coincidentally, it was the grandmother who raised the children prior to colonization. So, in effect, my grandmother and I have fallen back to ancestral ways of child rearing. I realize I am not a child, according to Western ideology, but I place myself in this stage given that I am "first-born" as *Sts'iyóye smestíyexw slhá:li*, and my legacy for the Stó:lõ has begun.

As a philosopher and dreamer, I have come to know that fantasies of how the past could have been different are senseless, but I *do* know that there are miracles yet to unfold and that there is a possibility that my writing of this essay may very well become one. With Archibald's notion of "storywork," which gives academic freedom to scholars to cite indigenous elders and the stories they share as legitimate sources, I am secure in the fact that my grandmother has full authority to contribute to my work as she has in this essay. Storywork also has "the power to educate and heal the heart, mind, body and spirit," which is the absolute goal I have attempted to harness since the onset of my transition through the writing of this essay (Archibald 2008: back cover). Also, my work aims not only to "share back" what I have come to know but to support the change of the Coast Salish cultural landscape toward a setting that continues to honor and fulfill whatever remains necessary to please our Ancestors and to include *Sts'iyóye smestíyexw slhá:li*—while continuing to cultivate what "culture" is, how it will continue to evolve and adapt to our ever-changing world, and to "gift back" (143) fully our traditional matriarchal systems of governance and title. In order to

reestablish such two-spirit roles, it is crucial that matriarchal systems replace the current Indian Act elected-chief system of governance,[7] given the grandmothers' role of making any new "laws" and/or "declarations" that hypothetically include the reclamation of *Sts'iyóye smestíyexw slhá:li*. I am certain the Ancestors have been wondering where we, as two-spirits, have been on "This Side."[8]

Current indigenous scholars such as Archibald and Driskill have contributed the use of indigenous words, names, and concepts. Many of these warriors may not have many more than my forty years, and though not all of these warriors are Stó:lõ, I instinctively follow my teachings as a *xwélmexw te Semá:th* (Sumas Nation member) and regard them as elders, meaning that I am respectful of their knowledge and courage to speak what is in their hearts. In one of my conversations with my grandmother, she mentioned how she still notices my former "male" self peeking through my female identity. In a way, it is as though I have developed two personalities: the beloved [but vulnerable] male child who finds refuge in the arms of the protective and much more competent big sister. My grandmother explained to me in that conversation she misses her grandson but that she has come to really respect the woman I have become. It does, however, make her happy that "he" comes out and will say something funny and/or endearing in a way that only he could. As "he," I was much more emotional and extreme, with melodramatic outbursts and passion. I was not able to function well in the world, but my effect on a crowd was undoubtedly appreciated, given my alleged sweet nature. As "she," I am much more focused, serious, and even ambitious. I am well aware that it is "she" who has taken "us" this far with regard to education: I am now in a PhD program. While he remains very much a child, she has become a fully functioning adult.

I am fully committed to meeting the need to "stand-up" all roles (restorer, empowerer, healer) for future and ongoing battles toward the seemingly infinite uphill climbs toward liberation, self-determination, entitlement, title, restoration, privilege, empowerment, and decolonization. As I currently live and work on my own traditional Coast Salish territory, then perhaps the Halq'eméylem terms *x̱éyt* (transform it) or *méa:ylexw* (revive; come back to life) would serve more appropriately and inclusively to the aforementioned ideologies. As such, the articulation process for this essay feels intrinsically off, as if I am attempting to fight fire with fire—though this may prove to be ironically effective in other instances. Speaking in my own Halq'eméylem language would make for as close to perfect a way as possible to honor any who have been invisibilized (i.e., Stó:lõ women and *Sts'iyóye smestíyexw slhá:li*). It would then seem as though I would be more effectively fighting fire with water.

In the beginning of August 2012, a number of years after the phone call story with which I introduced this essay, I had the opportunity to work with my

grandmother on a cedar bark shawl project I had wanted to do for a long time. As I mentioned above, she is a world-renowned Stó:lõ weaver known for her skills and genius as the person who also revitalized the lost Tsimshian basketry techniques. I asked her to teach me to weave my garment. In my mind, I envisioned myself dancing around a gathering floor cloaked by my proud *Syewá:l* (Ancestors), particularly those who have been waiting for *Sts'iyóye smestíyexw meá:ylexw* (twin-spirits to come back to life). This was not an easy task for either of us, as this became a dual mission for me: to learn to weave such a garment as well as to request a specific identity for me that comes from our Stó:lõ language and her Stó:lõ consciousness. If I can borrow Driskill's words, from "Doubleweaving Two-Spirit Critiques, Building Alliances between Native and Queer Studies": "By pulling together splints from both disciplines [native studies and queer studies], we can doubleweave Two-spirit critiques that challenge and sharpen our scholarship and activism" (2010: 79). Driskill's words help me understand this weaving project and its dual purpose. As such, my grandmother and I embarked on serious work: this work not only taught me the skills to craft such a piece but also worked to *re*story the two-spirit beings who have long disappeared from her elders' memories and give them back to her. As my mind has transformed from child to inquisitive adult, I have come to know that to ask her (or any other elder) questions regarding culture and history must be done very carefully and that I must accept a nonresponse when they do not wish to answer at the time. To question and/or comment intermittently while an elder speaks often hinders what they are sharing and can abruptly stop the story or teaching. Usually, learning happens when they simply start talking about the *old days* and the *old ways* and lose themselves in these inner dialogues. I just listen, pay very close attention, and do the best I can to carefully take follow-up field notes. Serendipitously, I had just completed a research methods course the day before my weaving education began, and I had acquired new ethnographic tools; thus I went in with brand new "participant observation/observant participation" lenses. Also, I quickly realized that when I signed myself up for my grandmother's "course," attendance and punctuality were key—even though she provided no syllabus indicating these parameters. I had to tread carefully, every day and every moment of my learning. I waited for an opportunity to present itself to propose again what I had attempted to do since that painful phone call nearly fifteen years earlier. As much time, space, and worldviews as had passed for everyone, and for those who I was and had remained connected to since I came out as transgendered, I knew shifts in perspectives had to take place. My grandmother was not excused from this critical shift. I knew she would have moments where she would be softer with me given that I pleased her with my weaving progress, or at the very least, I hoped for that. So far, she has accommodated this crucial endeavor of mine, and I could not be

more relieved. At this point, I can only offer limited, albeit significant, findings from my quest to determine what *Sts'iyóye smestíyexw slhá:li* truly means. I do know that it is nothing short of a miracle. It is a miracle that she coined this title for me specifically, even though it went painfully against her colonized "homophobic" way of thinking after her eighty-plus years of living.

In the summer of 2011 I was approached by a prominent Tsleil-Waututh (Burrard First Nation) family and received a very esteemed invitation to "open the floor" for the memorial gathering of their late two-spirited son. This role involves attendance as an honored guest: to witness how a family honors their belated, and also to dance ceremonially to honor the one who has passed. In a Coast Salish Memorial gathering such as this, the teachings say that as four years have passed since the loss, the family will gather and rejoice one last time, and from there on in, they will cry for them no more. As I am a "Dancer,"[9] and a two-spirited one at that, I was asked especially because the young man who passed was also two-spirited. For this reason, I knew I wanted to make a special cedar bark cape to do justice to his beautiful memory. I knew him personally and remember well his sweet and feminine nature, and so I wanted to do justice to the beauty with which he carried himself. This occasion was a milestone not yet achieved before this moment, given there had never been a "two-spirited theme" for any event of this nature in recorded history, so I had never felt so compelled as when I was asked to undertake this important project. It was unprecedented that the family would bring his two-spiritedness to the forefront of this gathering and felt surreal for them to ask me to perform in such an important role. I needed to dance for more than just this memorial—for five hundred–plus years of two-spirited ancestors and their deleted identities. Ceremonial dances of this kind require some physical exertion. The rigorous style of dance must keep in time to a steady drumbeat. My cape is very heavy; I knew I would have to dance with added weight. Added to this was my age: I was already forty. I was concerned that I would not be able to complete my dance around the floor: as the date of the gathering drew near, I jogged daily to get my wind up. While I ran to shape up, I prayed that I would have the strength to make it around the floor and finish strong. When the time finally came, I unveiled my garment, fastened it around my neck, and could only hope that my spirit and body would not fail me. I do not recall anything beyond that point. I do not remember feeling the weight of my cape, but I do know I was flying. Before long it was over and I was back at my seat. Though the cape was heavy, it turned out that I had made myself wings. I made it around and, according to others present at the event, my feet did not touch the ground. It was a momentous occasion, and I still feel butterflies when I think about it today. I wove the cape you see me wearing in figure 1 in the summer of 2012 under my

grandmother's mentorship. It took approximately two months to prepare the bark and only a few days to weave.

Although the Canadian government made a very successful attempt to erase *Sts'iyóye smestíyexw*, some of us live on to tell new stories and to re-generate an entire gender and sexuality category that has been put away for so long. I invite other self-identified *Sts'iyóye smestíyexw* to pray together, laugh together, and weave our stories into a new *their*story. This invitation, of course, includes all that represent the spectrum of difference as the acronym *LGBTQ* intends, given that not all will identify as a "twin-spirit-to-a-woman" as I do. There are many *Sts'iyóye smestíyexw* who have passed and who never experienced the emancipation of a true coming-out as those of us who are left behind now have the privilege to do.

My grandmother and I have come a long way since 1997. I have had to heal and spiritually strengthen myself for independence because, at that point in time, she was not able to accept my transgendered identity within her political gaze. I can now say that this has changed. *X̱ex̱a:ls* (four children of *X̱a:ls*, the Creator/Transformer) have had pity on me.[10] They helped her to shape-shift her mind to one that demonstrates that transformative thinking and learning stop at no age. Now this new chapter begins, and the Coast Salish people as a whole can continue flourishing in their feasts with this new story.

Saylesh Wesley (Stó:lõ/Ts'msyan) is completing her PhD in Simon Fraser University's Gender, Sexuality and Women's Studies Department. Her research aims to re-story the deleted queer and two-spirit identities of the Stó:lõ people as well more broadly for all Coast Salish.

Acknowledgments

Angela Pietrobon must be acknowledged for her much-appreciated edits to this paper as well as my wonderful PhD committee supervisors Deanna Reder and Dolores van der Wey.

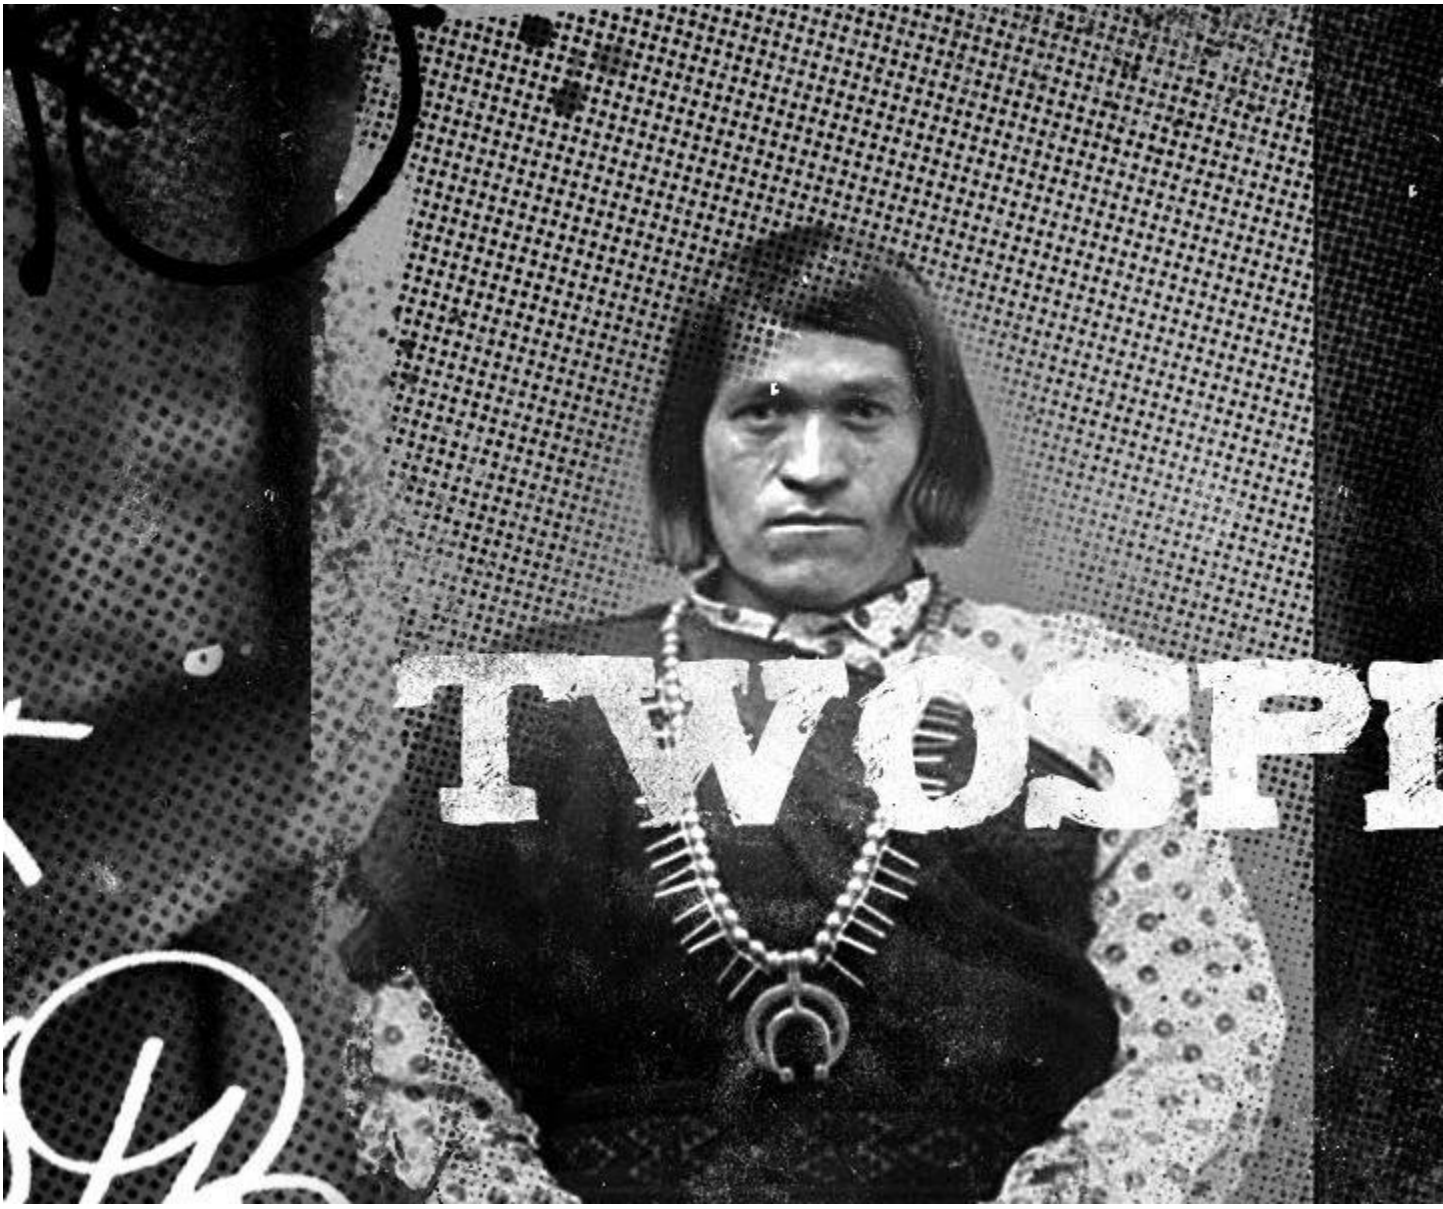
Two-spirit people, body sovereignty and gender self-determination

Red Rising Magazine
Alexandria Wilson September 21, 2015



As Cree people we understand that the nature of the cosmos is to be in balance and that when balance is disturbed, it must and will return.

Restoring balance

Two-spirit identity is one way in which balance is being restored to our communities. Throughout the colonial history of the Americas, aggressive assimilation policies have attempted to displace our own understandings, practices and teachings around sexuality, gender and positive relationships and replace them with those of Judeo Christianity. To recognize ourselves as two-spirit is to declare our connection to the traditions of our own people.
As a self-identifier, two-spirit acknowledges and affirms our identity as Indigenous peoples, our connection to the land, and values in our ancient cultures that recognize and accept gender and sexual diversity.

The recognition and acceptance of gender and sexual diversity is reflected in our languages, spirituality and cultures. Our Cree dialect does not include gender-distinct pronouns. Rather, our language is 'gendered' on the basis of whether or not something is animate (that is, whether or not it has a spiritual purpose and energy).

Cultural disruption and "Skirt Shaming"

Today some of our Elders and spiritual teachers have adopted and introduced understandings and practices and understandings that were not necessarily part of their own cultures prior to colonization and the imposition of Christianity. For example, a recent celebration in a community included a sweat lodge ceremony. When two-spirit and other participants arrived to take part in the ceremony, the person leading the ceremony demanded that some in the group change their clothing to conform with what he perceived their gender to be and added the warning that if he suspected that they had dressed inappropriate to their perceived gender, they would be required to prove their gender identity to him. In the face of this direct assault on their body sovereignty and gender self-determination, some people left the ceremony.. The role of Elders in our communities includes the sharing traditional teachings with youth that will help them understand their own experiences, including their expressions of gender identity and sexuality. However, in most of our Indigenous cultures where gender and sexual diversity were once accepted and valued, our traditional teachings, ways of being, spirituality, and languages were disrupted and displaced through the processes of colonization, Christianization and assimilation. The result (as the incident described above demonstrates) is that some of our own present-day cultural teachings and practices extend the continuum of violence that two-spirit people have been subject to since colonization began. "Skirt-shaming", excluding, policing or shaming trans, two-spirit people and women because they are not wearing long dresses in ceremonial settings, is increasingly common and is a continuation of the continuum of violence.

Two-spirit people are frequently subject to interconnected homophobia, transphobia and misogyny, and in the larger society they are additionally subject to structural and individual racism and classism. This has had devastating impacts on the two-spirit community. The suicide rate for LGBTQ Indigenous youth is ten times higher than that of any other group. Thirty-nine percent of two-spirit women and 21% of two-spirit men have attempted suicide . In a recent study of transgendered and gender non-conforming Indigenous people, nearly one-quarter lived in extreme poverty, elevated rates of HIV were found, and more than half of respondents (56%)

had attempted suicide . It is imperative that Elders and others consult with or rely on Two-Spirit leaders for teachings and direction regarding gender and sexual diversity.

Coming in

There is much work to be done, then, to undo the work that has been done upon us. When we call ourselves two-spirit people, we are proclaiming sovereignty over our bodies, gender expressions and sexualities. "Coming in" does not centre on the declaration of independence that characterizes 'coming out' in mainstream depictions of the lives of LGBTQI people. Rather, coming in is an act of returning, fully present in our selves, to resume our place as a valued part of our families, cultures, communities, and lands, in connection with all our relations.

Indigenous sovereignty over our lands is inseparable from sovereignty over our bodies, sexuality and gender self-expression.

Stolen Sisters

A Human Rights Response to Discrimination and Violence against Indigenous Women in Canada

Stolen Sisters:
A Human Rights Response to Discrimination and Violence against Indigenous Women in Canada

> "It is important to honour the missing and murdered women. It is unacceptable to marginalize these women. The Creator did not create garbage. He created beauty." - elder Dan Smoke, closing a healing ceremony for his sister-in-law, Deborah Anne Sloss who died in Toronto on August 24, 1997 under suspicious circumstances.

Introduction

Helen Betty Osborne was a 19-year-old Cree student from northern Manitoba who dreamed of becoming a teacher. On November 12, 1971, she was abducted by four white men in the town of The Pas and then sexually assaulted and brutally murdered. A provincial inquiry subsequently concluded that Canadian authorities had failed Helen Betty Osborne. The inquiry criticized the sloppy and racially biased police investigation that took more than 15 years to bring one of the four men to justice. Most disturbingly, the inquiry concluded that police had long been aware of white men sexually preying on Indigenous women and girls in The Pas but "did not feel that the practice necessitated any particular vigilance."[1]

The murder of Helen Betty Osborne is one of nine case studies presented in this report. These stories of missing and murdered Indigenous[2] women and girls take place in three of the Western provinces of Canada over a period of three decades. In some cases, the crimes remain unsolved. In others, the perpetrators have been identified as intimate acquaintances, strangers or men encountered in the course of desperate efforts to earn a living. In every instance, it is Amnesty International's view that Canadian authorities should have done more to ensure the safety of these women and girls.

This report examines the following factors which, too long neglected, have contributed to a heightened -- and unacceptable -- risk of violence against Indigenous women in Canadian cities:

- The social and economic marginalisation of Indigenous women, along with a history of government policies that have torn apart Indigenous families and communities, have pushed a disproportionate number of Indigenous women into dangerous situations that include extreme poverty, homelessness and prostitution.
- Despite assurances to the contrary, police in Canada have often failed to provide Indigenous women with an adequate standard of protection.
- The resulting vulnerability of Indigenous women has been exploited by Indigenous and non-Indigenous men to carry out acts of extreme brutality against them.
- These acts of violence may be motivated by racism, or may be carried out in the expectation that societal indifference to the welfare and safety of Indigenous women will allow the perpetrators to escape justice.

These are not new concerns. Indigenous women's organizations, government commissions such as the inquiry into the murder of Helen Betty Osborne and the Royal Commission on Aboriginal Peoples, and United Nations human rights bodies have all called on Canadian officials to address the marginalisation of Indigenous women in Canadian society and to ensure that the rights and safety of Indigenous people are respected and upheld by police and courts.[3] Sadly,

[1] Report of the Aboriginal Justice Inquiry of Manitoba: The Deaths of Helen Betty Osborne and John Joseph Harper, Commissioners A.C. Hamilton and C.M. Sinclair, 1991.

[2] The term "Indigenous" refers to all descendants of the original inhabitants of the territories that now make up Canada. This includes the First Nations, the Inuit and the Métis. In Canada, the word "Aboriginal" has the same meaning and is more widely used. This report uses the term "Indigenous" because of its use in international human rights laws and standards.

[3] See, for instance, Report of the Royal Commission on Aboriginal Peoples (RCAP), 1996, http://www.ainc.inac.gc.ca/ch/rcap/sg/sgmm_e.html; and the Concluding observations of the United

fundamental measures that could help reduce the risk of violence to Indigenous women remain unimplemented. This is only one example of the way Canadian authorities have failed in their responsibility to protect the rights of Indigenous women in Canada.

Scope, Methods and Limitations of This Study

This report examines the role of discrimination in acts of violence carried out against Indigenous women in Canadian towns and cities. This discrimination takes the form both of overt cultural prejudice and of implicit or systemic biases in the policies and actions of government officials and agencies, or of society as a whole. This discrimination has played out in policies and practices that have helped put Indigenous women in harm's way and in the failure to provide Indigenous women the protection from violence that is every woman's human right.

Amnesty International acknowledges that there are many similarities between Indigenous women and non-Indigenous women's experiences of violence in Canada. More needs to be done to address violence against all women. This report is part of a larger, international campaign to stop violence against women.

This report focuses specifically on violence against Indigenous women because of indications of the scale of such violence in Canada, because the link between racial discrimination and violence against Indigenous women has not yet been adequately acknowledged or addressed, and because the victims of this violence are all too often forgotten.

Amnesty International reviewed published reports and the findings of inquests and government inquiries, interviewed survivors of violence and the family members of Indigenous women who have been murdered or who have gone missing, and met with key organizations and individuals who have worked on their behalf. Where possible, the researchers also spoke with police investigators or spokespersons.

The individual stories that form the major part of this report are retold with the permission of the families and friends. Many of the families of missing and murdered Indigenous women in Canada were unable to take this step. Some find it too emotionally difficult talk about their loss. Others have had negative experiences with the way their stories have been told by reporters and academics. There are countless stories that remain untold.

This report focuses primarily on cities in the Western provinces of Canada where there is a large and growing Indigenous population and where there have been a number of highly publicized incidents of violence against Indigenous women. There were regions of Canada that Amnesty International did not have the opportunity to visit in the course of this research and as a result many specific experiences, such as those of Inuit and other northern Indigenous women, the experiences of rural Indigenous women, and Indigenous women living on reserves, unfortunately are not adequately reflected. As was stated by many interviewees, this report is still only 'scratching the surface.' However, Amnesty International hopes that it will contribute to a fuller understanding of the issue from a human rights perspective.

Violence against women, and certainly violence against Indigenous women, is rarely understood as a human rights issue. To the extent that governments, media and the general public do consider concerns about violence against women, it is more frequent for it to be described as a criminal concern or a social issue. It is both of those things of course. But it is also very much a human rights issue. Women have the right to be safe and free from violence. Indigenous women have the right to be safe and free from violence. When a woman is targeted for violence because of her gender or because of her Indigenous identity, her fundamental rights have been abused. And when she is not offered an adequate level of protection by state authorities because or her gender or because of her Indigenous identity, those rights have been violated.

Nations Committee on Economic, Social and Cultural Rights: Canada, 10/12/98, E/C.12/1/Add.31.

I. The international human rights framework

This report addresses violence against Indigenous women as a human rights issue. The concept of human rights is based on the recognition of the inherent dignity and worth of every human being. Through ratification of binding international human rights treaties, and the adoption of declarations by multilateral bodies such as the United Nations, governments have committed themselves to ensuring that all people can enjoy certain universal rights and freedoms.

Amnesty International's research demonstrates that violence experienced by Indigenous women gives rise to human rights concerns in two central ways.

First, is the violence itself and the official response to that violence. When indigenous women are targeted for racist, sexists attacks by private individuals and are not assured the necessary levels of protection in the face of that violence, a range of their fundamental human rights are at stake. This includes the right to life,[4] the right to be protected against torture and ill treatment,[5] the right to security of the person,[6] and the right to both sexual[7] and racial[8] equality. Canada has ratified all of the key human rights treaties that guarantee these fundamental rights.

Notably Canada has not yet ratified the only international human rights treaty dealing specifically with the issue of violence against women, the Inter-American Convention on the Prevention, Punishment and Eradication of Violence against Women (Convention of Belém do Pará). Canadian ratification of this treaty would strengthen the legal and institutional framework for protecting Indigenous women in Canada. The treaty not only requires states to condemn, prevent, and punish violence against women, but also obliges them to undertake progressively specific measures to deal with the root causes of gender-based violence, including, *inter alia*, the provision of specialized shelters and social services for the victims of violence; education and training programs for all those involved in the administration of justice; the gathering of statistics and other relevant information relating to the causes, consequences and frequency of violence against women; and specialized programs aimed at countering social and cultural patterns of conduct "which legitimize or exacerbate violence against women".[9]

The cases in this report and other cases of violence against Indigenous women that are already on the public record[10] do not involve allegations of violence by police or other public officials. But that does not mean that the human rights obligations of governments are not engaged.

International law is clear; governments are of course obliged to ensure that their own officials comply with human rights standards. Governments are also obliged, though, to adopt effective measures to guard against private individuals committing acts which result in human rights abuses.[11] International human

[11] CEDAW, article 2(e): "States Parties… undertake to take all appropriate measures to eliminate discrimination against women **by any person, organization or enterprise**." The United Nations' Declaration on the Elimination of Violence against Women requires states to "[e]xercise due diligence to prevent, investigate and…punish acts of violence against women, whether those acts are **perpetrated by the State or by private persons**." (ICCPR, article 2(1): "Each State Party…undertakes to respect **and to ensure** to all individuals…the rights recognized in the present Covenant…" ICCPR, article 2(2): "…each State Party…undertakes to take the necessary steps…to adopt such laws or other measures as may be necessary **to give effect to** the rights recognized in the present Covenant." CERD, article 2(1): "States parties condemn racial discrimination and undertake to pursue by all appropriate means and without delay a

rights bodies have made it clear that when governments fail to take such steps, often termed the duty of "due diligence", they will be held accountable under international human rights treaties. The Inter-American Court of Human Rights has described the duty of due diligence as follows:

> An illegal act which violates human rights and which is initially not directly imputable to a State (for example, because it is the act of a private person or because the person responsible has not been identified) can lead to international responsibility of the State, not because of the act itself, but because of the lack of due diligence to prevent the violation or to respond to it as required by the Convention.[12]

The Court stressed that this duty of "due diligence" means that a state must take reasonable steps to prevent human rights violations, use the means at its disposal to carry out serious investigations, identify those responsible, impose the appropriate punishment and ensure that the victim receives adequate reparation.[13] The UN Human Rights Committee, has stressed that the duty in article 2 of the Covenant on Civil and Political Right to "ensure" the rights included in the Covenant requires appropriate measures be taken to prevent and investigate abuses perpetrated by private persons or entities, punish those responsible and provide reparations to the victims.[14] This concept of due diligence does not in any way lessen the criminal responsibility of those who carry out acts of violence, including murder, against women. However, the concept does underline the inescapable responsibility of state officials to take action.

In her 2003 report to the UN Commission on Human Rights, Radhika Coomaraswamy, the first Special Rapporteur on violence against women clearly described the content of the duty of due diligence when it comes to preventing violence against women.[15]

States must promote and protect the human rights of women and exercise due diligence:

(a) To prevent, investigate and punish acts of all forms of violence against women, whether in the home, the workplace, the community or society, in custody or in situations of armed conflict;

(b) To take all measures to empower women and strengthen their economic independence and to protect and promote the full enjoyment of all rights and fundamental freedoms;

(c) To condemn violence against women and not invoke custom, tradition or practices in the name of religion or culture to avoid their obligations to eliminate such violence;

(d) To intensify efforts to develop and/or utilize legislative, educational, social and other measures aimed at the prevention of violence, including the dissemination of information, legal literacy campaigns and the training of legal, judicial and health personnel;

(e) To enact and, where necessary, reinforce or amend domestic legislation in accordance with

policy of **eliminating racial discrimination in all its forms** …" Emphasis added.

international standards, including measures to enhance the protection of victims, and develop and strengthen support services;

(f) To support initiatives undertaken by women's organizations and non-governmental organizations on violence against women and establish and/or strengthen, at the national level, collaborative relationships with relevant NGOs and with public and private sector institutions.

Second, the range of concerns, some historical and some continuing, which Amnesty International's research has shown to be factors that put Indigenous women at heightened risk of experiencing violence also directly engage a number of fundamental human rights provisions. For instance, past policies revoking the legal Indigenous status of Indigenous women who married non-Indigenous men[16] have already been found by the UN Human Rights Committee[17] to have violated minority cultural rights under article 27[18] of the International Covenant on Civil and Political Rights. Certainly the decades long residential schools program raises a range of human rights concerns related to the physical, sexual and psychological abuse and ill-treatment of the children sent to the schools, but also such economic, social and cultural rights as the right to education.[19]

The UN Committee on Economic, Social and Cultural Rights has highlighted that the economic marginalization of Indigenous peoples in Canada is of concern with respect to Canada's obligations under the Covenant on Economic, Social and Cultural Rights:

> The Committee is greatly concerned at the gross disparity between Aboriginal people and the majority of Canadians with respect to the enjoyment of Covenant rights. There has been little or no progress in the alleviation of social and economic deprivation among Aboriginal people. In particular, the Committee is deeply concerned at the shortage of adequate housing, the endemic mass unemployment and the high rate of suicide, especially among youth, in the Aboriginal communities. Another concern is the failure to provide safe and adequate drinking water to Aboriginal communities on reserves. The delegation of the State Party conceded that almost a quarter of Aboriginal household dwellings required major repairs and lacked basic amenities.[20]

These concerns engage a number of internationally protected human rights, including the rights to housing,[21] work,[22] health[23] and an adequate standard of living.[24]

[16] See text at footnotes 34-36, Infra.

[18] article 27: " In those States in which ethnic, religious or linguistic minorities exist, persons belonging to such minorities shall not be denied the right, in community with the other members of their group, to enjoy their own culture, to profess and practise their own religion, or to use their own language."

[19] The Convention on the Rights of the Child (CRC), article 29(c): "… the education of the child shall be directed to … the development of respect for the child's…own cultural identity, language and values…" The Convention did not enter into force until 1990, by which time the residential schools, which had sought to deny Indigenous children their culture and language, had been closed. However the long-term and inter-generational impacts of residential schools continue to the present.

[21] International Covenant on Economic, Social and Cultural Rights (ICESCR), article 11.

[22] ICESCR, article 6.

[23] ICESCR, article 12.

[24] ICESCR, article 11.

This report highlights some past and present concerns with respect to Indigenous children, such as residential schools and child protection policies as well as some cases involving violence against Indigenous girls. International human rights laws and standards recognize that children need and deserve special protection to ensure the full realization of their potential. The almost universally ratified United Nations Convention on the Rights on the Children establishes as an overarching principle that "in all actions concerning children… the best interests of the child shall be a primary consideration."[25] The Convention recognizes that there are instances where, in the best interests of the child, children must be removed from an abusive family situation. However, the Convention asserts that, in general, parents or legal guardians have the primary responsibility for ensuring the welfare of their children and should be supported by the state in meeting this responsibility.[26] Notably, the Convention also recognizes that every child has a right to preserve his or her cultural identity and family relations and that Indigenous children, in particular, "shall not be denied the right… to enjoy his or her own culture, to profess and practice his or her own religion, to use his or her own language."[27]

At the heart of the various human rights concerns documented in this report is discrimination. Amnesty International's research has found that Indigenous women in Canada face discrimination because of their gender and because of their Indigenous identity. The research highlights that this is compounded by further discriminatory treatment that women face due to poverty, ill-health or involvement in the sex trade.[28] Human rights experts have drawn attention to the interconnections between various forms of discrimination and patterns of violence against women.[29] Amnesty International's research has been conducted within a framework that recognizes the intersections between various forms of discrimination, and supports these findings.

In addition to these existing legal obligations, new and emerging international instruments, such as the UN's draft Declaration on the Rights of Indigenous Peoples, seek to clarify the specific measures needed to ensure the protection and fulfillment of the rights of Indigenous peoples.

II. Understanding violence against Indigenous women

Stolen generations: Colonization and violence against Indigenous women

The UN Declaration on Violence Against Women calls violence against women "a manifestation of historically unequal power relations between women and men" and a means by which this inequality is maintained."[30] Around the world, inequality between men and women in terms of wealth, social status, and access to power has created barriers to women seeking protection of their rights. These barriers include economic dependence on abusive spouses, fear of having their children taken away if they report the abuse, or knowing that they will not be taken seriously by the police and courts.

Moreover, both the perpetrators of violence against women and those who administer the criminal justice system - judges, prosecutors, police - often hold the pervasive view that women are responsible for violence committed against them or that they deserve to be punished for non-conforming behaviour. So even when a woman does overcome these barriers and report that she has been the victim of a violent attack, she may well meet with an unsympathetic or skeptical response. In the few cases in which a suspect is identified and brought to trial, cases of violence against women often founder unless there is clear and unavoidable evidence of force, illustrating to all that the victim "fought back". The perpetrators of violence against women can thus commit their

[25] CRC, article 3(1).
[26] CRC, articles 18, 19, 20.
[27] CRC, article 30.
[28] International law prohibits discrimination on the basis of gender and race. The protection against discrimination also extends to "social origin, property…or other status," ICESCR, article 2(2), ICCPR, article 2(2).
[29] Report of the Special Rapporteur on Violence against Women, Radhika Coomaraswamy, World Conference against Racism, Racial Discrimination, Xenophobia and Related Intolerance, A/CONF.189/PC.3/5, 27 July 2001, para. 49.
[30] United Nations Declaration on Violence against Women, 1993, fifth preambular paragraph.

crimes safe in the knowledge that they will not face arrest, prosecution or punishment. Impunity for violence against women contributes to a climate where such acts are seen as normal and acceptable rather then criminal, and where women do not seek justice because they know they will not get it.

For Indigenous women in Canada, violence often takes place in a context shaped, in the words of Canada's Royal Commission on Aboriginal Peoples (RCAP), by the power that the dominant society has wielded "over every aspect of their lives, from the way they are educated and the way they can earn a living to the way they are governed."[31] Historically, in most of the Indigenous cultures that are now part of Canada, there were distinct gender roles for women and men but relative equality between them. Through policies imposed without their consent, Indigenous peoples in Canada "have had to deal with dispossession of their traditional territories, disassociation with their traditional roles and responsibilities, disassociation with participation in political and social decisions in their communities, disassociation of their culture and tradition."[32] Colonialism, which has had a profoundly negative impact on Indigenous communities as a whole, has also affected the relations between Indigenous women and Indigenous men, and pushed many Indigenous women to the margins of their own cultures and Canadian society as a whole.[33]

While it is beyond the scope of this report to look at all the ways government policies have impacted on Indigenous women, two historic policies - the dispossession of Indigenous women who married outside their communities and the removal of children to be educated in residential schools - need to be examined because of their profound and lasting impact on social strife within Indigenous communities and on the marginalization of Indigenous women within Canadian society.

RCAP described the legislation governing Indigenous peoples in Canada as being "conceived and implemented in part as an overt attack on Indian nationhood and individual identity, a conscious and sustained attempt by non-Aboriginal missionaries, politicians and bureaucrats - albeit at times well intentioned - to impose rules to determine who is and is not 'Indian.'"[34] The first of these laws, passed in 1857, allowed Indigenous men to renounce their Indigenous status and the right to live on reserve lands in order to assimilate into non-Indigenous society. Women were not given the same choice: women's status would be determined by the choices made by her husband or father. A second law passed in 1869, stripped women of their Indigenous status and their place in their community if they married a man from another community, even if he was also Indigenous. In addition, children born to an Indigenous woman who married a non-Indigenous man would also be denied status. These laws remained in place for more than a century. Finally, in 1985, after a long struggle by Indigenous women, which included bringing a successful complaint to the UN Human Rights Committee,[35] the policies were repealed for being incompatible with protections against discrimination in the new Canadian Charter of Rights and Freedoms.

Over the next decade, more than 130,000 people - mostly women - applied to have their rights and status restored.[36] For the tens of thousands of women who had been affected over the previous century, losing their status meant the loss of independent standing in their community and increased dependence on their spouses. In many cases, the laws led to women losing all ties to their home communities.

During the same period that so many Indigenous women were being uprooted, the federal government was removing large numbers of Indigenous children from their families and communities to attend schools in predominantly non-Indigenous communities. The explicit purpose of providing education outside of the community was to foster assimilation of Indigenous children into European Canadian culture. The first residential schools were opened in the mid-1870s. In the words of the architect of the system, Canadian Member of

Parliament Nicholas Flood Davin, the goal was to remove Indigenous children from "the influence of the wigwam" and keep them instead "constantly within the circle of civilized conditions."[37] The children attending residential schools were not allowed to speak their Indigenous languages or to practice their own customs, eroding their sense of identity and driving a wedge between the children and their parents.

Initially, the schools offered low quality education, geared to industrial trades for boys and domestic service for women. Beginning in the mid-twentieth century, they gradually became residences for Indigenous children attending schools in predominantly non-Indigenous communities. The school system was run in collaboration with Christian churches until 1969. Then, in a phase-out period that lasted through the mid-1980s, the system was run solely by the federal government.

Many children in the schools faced inhuman living conditions caused by chronic under-funding and neglect. Harsh punishments sanctioned by the school authorities included beatings, chaining children to their beds, or denying them food. Cloaked by society's indifference to the fate of these children, individual staff carried out horrendous acts of physical and sexual abuse.[38] Summarizing the history of the residential school system, the RCAP points out "head office, regional, school and church files are replete, from early in the system's history, with incidents that violated the norms of the day."[39] Yet even the most alarming reports of abuse and neglect were largely ignored by the church and government officials responsible for the care of these children:

> The avalanche of reports on the condition of children "hungry, malnourished, ill-clothed, dying of tuberculosis, overworked" failed to move either the churches or successive governments "to concerted and effective remedial action." When senior officials in the department and the churches became aware of cases of abuse, they failed routinely to come to the rescue of children they had removed from their real parents.[40]

In a climate of total impunity, staff carried out their crimes without fear of repercussion. However the consequences for many of the children exposed to repeated abuse stayed with them their whole lives and have impacted subsequent generations. Like other survivors of abuse, many of the residential school alumni have carried a sense of shame and self-loathing. Perhaps most harmfully, they were denied the opportunity to be exposed to good examples of parenting, and instead learned violence and abuse.[41]

With the end of the residential school system, survivors began to come forward to tell stories of abuse and demand justice. In the early 1990s, there were a number of prosecutions of staff who had abused children. Following the 1996 RCAP report the federal government established a $350 million dollar fund to provide healing programs for the victims and their families. Applications for support, however, have greatly outstripped the available resources. Indigenous peoples' organizations also argue that there has been inadequate redress for the loss of culture and identity and the intergenerational impacts of all the forms of abuse suffered in the schools. Although the federal government has apologized for the harm done by the residential school system, it has failed to act on RCAP's recommendation that a public inquiry be held so that the injuries suffered by Indigenous communities can be fully acknowledged.

Indigenous peoples' organizations have pointed out that the erosion of cultural identity and the accompanying loss of self-worth brought about, in part, through assimilationist policies like residential schools and the arbitrary denial of some women's Indigenous status, have played a central role in the social strife now faced by many Indigenous families and communities. In the course of researching this report, Amnesty International heard from many families who described the personal loss and hardship they have experienced as a consequence of these policies. Some described losing all contact with a sister or daughter who simply disappeared after being

[37] Ibid.

[39] Ibid.
[40] Ibid.
[41] Ibid.

put into a foster home or marrying a man from another community. Other women described increasing desperate and dangerous lives shaped by loss of culture, community and self-esteem. These are two examples of the stories we have heard:

- Margaret Evonne Guylee's mother was from the Whitedog Reserve in northern Ontario but had been forced to give up her residence in the community in the early 1930s after getting involved with a non-Indigenous man. Margaret Guylee grew up in poverty in Toronto. She then raised six children herself while living on social assistance. She disappeared in 1965. No missing persons report was ever filed. Her daughter, Carrie Neilson, who was only four when her mother disappeared, says she still carries the pain and bewilderment caused by her mother's sudden and still unexplained disappearance. "We believed for years that we were not any good - after all, why would a mother abandon her children if they were good?"

- Edna Brass is a respected elder and counselor working with Indigenous women in Vancouver. As a child, Edna Brass spent 13 years in residential school. She remembers being teased by the other children about a cleft palate that left scars on her face. She remembers worse abuse at the hands of the staff running the school: "I was sexually abused, I was raped, I was beaten." As a consequence of what she endured, Edna Brass says she lost her ties to her culture and lost her own way in life. She entered into a life of substance abuse and living on the streets. Although she was eventually able to pull her own life together, she says her family still suffers the scars of her own uprooting. Edna Brass says, "I, myself, didn't have a home. I felt like I didn't belong anywhere and my children have felt the same. They don't know my family. They don't know my community. I never felt like my reserve is my reserve. I just try to fit in where I can. My daughter suffered because of this."

These personal accounts illustrate one of the central conclusions of the Royal Commission on Aboriginal Peoples. "Repeated assaults on the culture and collective identity of Aboriginal people have weakened the foundations of Aboriginal society and contributed to the alienation that drives some to self-destruction and anti-social behaviour," RCAP concluded. "Social problems among Aboriginal people are, in large measure, a legacy of history.[42]

It is important to emphasize that the disruption of Indigenous families and communities is not a thing of the past. Even as the residential school system was being transformed and eventually phased out from the late 1950s through the 1970s, provincial and territorial governments began to place a dramatically increased number of Indigenous children in foster homes and state institutions. One study found that the number of Indigenous children in state care in the province of British Columbia rose from 29 children in 1955 to 1,446 in 1965.[43] Despite many changes that have taken place in the field of Indigenous child welfare, the Canadian government recently estimated that Indigenous children are currently four to six times more likely than non-Indigenous children to be removed from their families and placed in the care of the state.[44]

These children are being removed from their families and communities to protect them from abuse and neglect. There are clearly circumstances where such measures are needed to protect the rights and welfare of the child. Unlike the residential school system, child welfare institutions are not intending to break children's ties to their families and communities. In fact, since the early 1980s child services in Indigenous communities are increasingly provided by Indigenous organizations funded by the federal government. However, many Indigenous peoples' organizations and other commentators have noted that Indigenous children are often removed from families who want to care for them, but for reasons such as poverty, substance addiction and other legacies of past government policies, are unable to do so. And they

[42] Ibid.
[43] Ibid.
[44] "Building a Brighter Future for Urban Aboriginal Children: Report of the Standing Committee on Human Resources Development and the Status of Persons with Disabilities," June 2003, p.17.

question why there are not more resources available to help Indigenous families address situations of impoverishment, stress, and poor parenting before they reach the point where children are endangered.[45]

A joint study completed in 2000 by the Department of Indian Affairs and Northern Development and Assembly of First Nations found that on average Indigenous run child services programs receive 22 percent less funding than provincially-funded counterparts serving predominantly non-Indigenous communities. The study also found that there was not enough emphasis on funding early intervention programs so that children's welfare and safety could be assured without removal from their families.[46]

"You put a child into care and they get counseling immediately," one witness told a Parliamentary committee, "but when a biological parent is looking for those sources or that funding to maintain their own family and keep it together, it's not available to them."[47]

The painful loss of ties to family, community and culture is a common element of many of the stories of missing and murdered women that have been reported to Amnesty International, some of which are presented in the case studies that follow below. Such loss is not a necessary consequence of children being removed from their families, or even of being adopted into a non-Indigenous family. Some of these women were clearly raised with love and affection by caring foster or adoptive families. There are many ways that ties to their heritage and identity could have been maintained throughout their childhood or, if they had had the chance, rebuilt in later life. Nor is loss of culture a direct cause of violence. However, for young people in particular, a loss of a sense of identity, belonging and ultimately self-worth needs to be understood and addressed as a critical factor potentially contributing to self destructive behaviour and in vulnerability to exploitation by others.[48]

Indigenous women in Canadian cities: Displaced in their own land

The Canadian government's Royal Commission on Aboriginal Peoples acknowledged in its 1996 report that there have been widespread violations of Indigenous peoples' land and resource rights – including the erosion of more than two-thirds of the land base of Indigenous communities -- since the formation of the Canadian state.[49] The Commission warned:

> Without adequate lands and resources, Aboriginal nations will be unable to build their communities and structure the employment opportunities necessary to achieve self sufficiency. Currently on the margins of Canadian society, they will be pushed to the edge of economic, cultural and political extinction. The government must act forcefully, generously and swiftly to assure the economic, cultural and political survival of Aboriginal nations."[50]

With the loss of traditional livelihoods within Indigenous communities, the opportunities for education and employment in Canadian towns and cities have become a powerful draw for a growing number of Indigenous people. Almost 60 percent of Indigenous people in Canada now live in urban settings.[51] Critically, however, the majority of

Indigenous peoples in Canadian towns and cities continue to live at a disadvantage compared to non-Indigenous people, facing dramatically lower incomes and a shortage of culturally appropriate support services in a government structure that has still not fully adjusted to the growing urban Indigenous population.

In the 1996 census, Indigenous women with status living off-reserve earned on average $13,870 a year.[52] This is about $5500 less than non-Indigenous women. Other groups of Indigenous women, such as Inuit and Métis women, recorded slightly higher average annual incomes, but all substantially less than what Statistics Canada estimated someone living in a large Canadian city would require to meet their own needs.[53] In fact, many Indigenous women living in poverty not only have to look after themselves but also must care for elderly parents, raise children or tend to loved ones in ill-health, often with only a single income to live on. Homelessness and inadequate shelter are believed to be widespread problems facing Indigenous families in all settings.[54]

The difficult struggle to get by is compounded by many Indigenous peoples' experience of racism, both subtle and overt, within the dominant society. As described by the Canadian Panel on Violence against Women: "most Aboriginal people have know racism first-hand - most have been called 'dirty Indians' in schools or foster homes or by police and prison guards. Aboriginal people have also experienced subtle shifts in treatment and know it is no accident."[55]

As a whole, Indigenous people living off-reserve move frequently, more so than other people living in Canada.[56] For some, this is movement to and from their home communities as they try to maintain a connection with their families and cultures. For others, this movement may be a reflection of a kind of rootlessness stemming from the fact that their ties to family and community were severed long ago, perhaps by their loss of membership in their home community or perhaps due to their removal to a residential school or some other form of state care. One consequence of this "churn factor", as it is sometimes called, is that many Indigenous people are not aware of -- or are unable to access -- the services available to them where they live.

In Canada, the federal government is responsible for health and social services on reserve and in Inuit communities, while the provincial and territorial governments provide services elsewhere. This has led to a gap in services for Indigenous people living in Canadian towns and cities. While Indigenous people living off-reserve have access to programs and services designed for the general population, these programs and services are not necessarily aligned to the specific needs of Indigenous peoples, or delivered in a culturally appropriate way.

Over the last decade, the federal government has increasingly recognized the need for programs and services for Indigenous people in predominantly non-Indigenous communities. Funding, however, lags behind the growth in the urban Indigenous population and the delivery of services through various government departments is often uncoordinated. The Federal Interlocutor for Métis and Non-Status Indians pointed out in 2003 that almost 90 percent of the funding for programs designed for Indigenous peoples is spent on reserves, while off-reserve programs for Indigenous people are delivered through 22 federal departments, as well as provincial and territorial agencies.[57] Responding to these comments, a federal subcommittee on Indigenous child welfare described a "jurisdictional

web" in which there is often little coordination or communication "within and between the municipal, provincial and federal levels of government."[58]

Indigenous people have formed a wide range of service organizations to help address the needs of the growing urban Indigenous population, including employment counseling, addiction services, health centers and shelters for women and girls escaping violence. However, most, if not all, report that their work is jeopardized by chronic under funding and the failure of government to provide funding on a stable, multi-year basis. Being dependent on short-term funding diverts energy from vital services to fundraising, or to managing crises when funds don't arrive. Without stable funding, long-term projects are difficult to plan and organizations fear they won't be able to keep their commitments to the people they serve.

In 2000, the Ontario Federation of Indian Friendship Centres - organizations that represent and provide support to Indigenous people outside their own communities - surveyed Indigenous families about their lives in Ontario cities. All those interviewed described the psychological hardship of their struggle to provide for themselves with little support from the larger community. "Words such as low self-esteem, depression, anger, self-doubt, intimidation, frustration, shame and hopelessness were used to describe some of the crushing feelings of Aboriginal children and parents living in poverty. Families are feeling despair as they cannot see any way to 'rise above' their situations."[59]

Prostitution is one means that some Indigenous women have resorted to in the struggle to provide for themselves and their families in Canadian cities. A survey of 183 women in the Vancouver sex trade carried out by the PACE (Prostitution Alternatives Counseling and Education) Society found roughly 40 percent of the women said they got into the sex trade primarily because they needed the money, and an additional 25 percent referred to drug addiction as part of the reason they starting selling sexual services, while many others referred to pressure from boyfriends or family members.[60] Almost 60 percent said they continued working in the sex trade to maintain a drug habit.[61] In the PACE study, more than 30 percent of sex workers surveyed were Indigenous women, although Indigenous people make up less than two percent of the city's population.[62] Indigenous women are believed to be similarly over-represented among sex workers in other Canadian cities.

The UN Committee on the Rights of the Child has expressed concern about "Aboriginal children [in Canada] who, in disproportionate numbers, end up in the sex trade as a means of survival."[63] The non-governmental organization, Save the Children Canada, spoke with more than 150 Indigenous youths and children being exploited in the sex trade. According to their report, almost all the youth and children interviewed described "the overwhelming presence of disruption and discord in their lives, accompanied by low self-esteem."[64] Other factors common to many of the young peoples' lives included a history of physical or sexual abuse, a history of running away from families or foster homes, lack of strong ties to family and community, homelessness or transience, lack of opportunities, and poverty. The report comments:

> Any trauma that detaches children from their families, communities and cultures increases the likelihood of involvement in commercial sexual exploitation. Once a child or youth loses such basic parameters as safety, shelter, and sustenance, their vulnerability forces them into situations whereby the sex trade can become the only viable alternative for survival. III. Violence against Indigenous women: widespread but poorly understood

According to a 1996 Canadian government statistic, Indigenous women between the ages of 25 and 44 with status under the federal Indian Act, are five times more likely than other women of the same age to die as the result of violence.[66] Indigenous women's organizations have long spoken out against violence against women and children within Indigenous communities – concerns that have still not received the attention they deserve.[67] More recently, a number of advocacy organizations, including the Native Women's Association of Canada (NWAC), have drawn attention to acts of violence perpetuated against Indigenous women in predominantly non-Indigenous communities. A number of high profile cases of assaulted, missing or murdered Indigenous women and girls has also helped focus greater public attention – in some instances, very belatedly – on violence against Indigenous women in specific cities. For example:

- A joint RCMP/Vancouver City Police Taskforce is investigating the disappearance of 60 women and one transgender person from Vancouver, British Columbia over the last decade. Sixteen of the missing women are Indigenous, a number far in excess of the proportion of Indigenous women living in Vancouver. A British Columbia man, Robert Pickton, is currently awaiting trial for 22 murder charges related to this investigation. Police and city officials had long denied that there was any pattern to the disappearances or that women were in any particular danger.

- In two separate instances in 1994, 15-year-old Indigenous girls, Roxanna Thiara and Alishia Germaine, were found murdered in Prince George in eastern British Colombia. The body of a third 15-year-old Indigenous girl, Ramona Wilson, who disappeared that same year, was found in Smithers in central British Columbia in April 1995. Only in 2002, after the disappearance of a 26-year-old non-Indigenous woman, Nicola Hoar, while hitchhiking along a road that connects Prince George and Smithers, did media attention focus on the unsolved murders and other disappearances along what has been dubbed "the highway of tears."

- In 1996, John Martin Crawford was convicted of murder in the killings of three Indigenous women, Eva Taysup, Shelley Napope, and Calinda Waterhen, in Saskatoon, Saskatchewan. Warren Goulding, one of the few journalists to cover the trial, has commented: "I don't get the sense the general public cares much about missing or murdered aboriginal women. It's all part of this indifference to the lives of aboriginal people. They don't seem to matter as much as white people."[68]

- In May 2004, a former British Columbia Provincial Court judge, David William Ramsey, pleaded guilty to buying sex from and assaulting four Indigenous girls, aged 12, 14, 15 and 16, who had appeared before him in court. The crimes were committed between 1992 and 2001. In June, the former judge was sentenced to seven years in prison.

- In Edmonton, Alberta, police are investigating 18 unsolved murders of women in the last two decades. Women's organizations in the city estimate that a disproportionate number of the women were Indigenous.

NWAC believes that the incidents that have come to light are part of a larger pattern of violent assaults, murders and disappearances of Indigenous women across Canada. The organization has estimated that over the past twenty years more than five hundred

[68] "Serial killer who roamed Saskatoon met with indifference by police, media: Journalist-author accepts award for book about slain aboriginal women." Edmonton Journal,. 29 November, 2003.

Indigenous women may have been murdered or gone missing in circumstances suggesting violence.

Unfortunately, while there is clear evidence that Indigenous women in Canada face an extraordinarily high risk of violence, significant gaps in how police record and share information about missing persons and violent crimes means that there is no comprehensive picture of the actual scale of violence against Indigenous women, of who the perpetrators are, or in what circumstances the violence takes place. Reports of violent crimes or missing persons may be investigated by municipal police forces, provincial forces, Indigenous police forces or the national police force, the Royal Canadian Mounted Police (RCMP). Police have said that they do not necessarily record the ethnicity of crime victims or missing persons when entering information into the Canadian Police Information Centre database, the principle mechanism for sharing information among police forces in Canada.[69] According to the Canadian Centre for Justice Statistics, in 11 percent of homicides in 2000, Canadian police did not record or report on whether or not the victim was an Indigenous person.[70]

An RCMP task force is currently investigating 40 unsolved murders and 39 long term missing persons cases in the province of Alberta. All but three of the victims are women. These cases were identified in the course of what the RCMP describes as a "comprehensive analysis" meant to identify possible links and create a profile of common risk factors. A spokesperson for the project interviewed by Amnesty International was unable to say how many of the missing women are Indigenous saying there was "not a lot of focus on this."

A 1999 report by the United States Department of Justice provides statistics on a range of violent crimes against Indigenous people in the U.S.A. According to this report, Indigenous women are more than twice as likely as white women to be the victims of violent crime overall and the rates of reported sexual assault are more than three times higher for Indigenous women than non-Indigenous women in the U.S. Roughly 15 percent of all violent attacks against Indigenous people in the US, and 25 percent of sexual assaults, were reported as being carried out by intimates and family members, while the vast majority of perpetrators were either acquaintances or strangers. This is very close to the experience of all other ethnic groups. What is unique about Indigenous women's experience, according to this report, is that fully 70 percent of all violent crimes against Indigenous people in the US - and 90 percent of sexual assaults - are reported to be carried out by non-Indigenous people.[71]

To Amnesty International's knowledge, similar statistics are not available in Canada. This is one example of the kind of information that would help better inform efforts to educate about and prevent violence against Indigenous women. As one study on sexual violence against Indigenous women in Canada concluded:

> Collection of race and crime statistics is encouraged on a larger scale than what is currently available in order that we may better understand trends in both Aboriginal offending and victimization patterns. Crime and victimization policy is often informed by such statistics in order to prevent crime and effect more efficient operation of the criminal justice system. Desperately needed, culturally sensitive and appropriate programming cannot be developed without the statistics to prove there is a need. Additionally, possible discrimination by criminal justice members cannot be pinpointed unless there are statistics that demonstrate there is overrepresentation within the system. By not collecting racial background information, Canadian policy may be reflecting an inherent bias of the racial majority, thereby potentially contributing to over-representation of Aboriginal

peoples within the criminal justice system.[72]

Violence against Women in the Sex Trade

Whether or not prostitution is a criminal act, women in the sex trade are entitled to the protection of their human rights. Concrete and effective measures must be adopted to ensure their safety and to bring to justice those who commit or profit from violence against sex trade workers.

Working in the sex trade in Canada can be extremely dangerous for women, whether Indigenous or non-Indigenous. This is especially true for women who solicit on the streets. In the PACE study, one-third of the women said they had survived an attack on their life while working on the street.[73]

Women in the sex trade are at heightened risk of violence because of the circumstances in which they work, and because the social stigmatization of women in the sex trade provides a convenient rationale for men looking for targets for acts of misogynistic violence.[74]

There are additional concerns around police treatment of Indigenous and non-Indigenous women in the sex trade. The threat of arrest makes many women reluctant to report attacks to the police or cooperate with police investigations. As a result, the perpetrators may be encouraged by the belief that they are likely to get away with their crimes.

Under Canadian law, the act of prostitution is not illegal, but communicating in public for the purpose of buying or selling sexual services, as well as buying or attempting to buy the sexual services of someone younger than 18, being found in a place maintained for prostitution, and procuring or living off the proceeds of someone else's prostitution are all criminal acts.[75] Many in the sex trade say that the threat of enforcement of these laws is used to drive sex trade workers from neighbourhoods where affluent residents are likely to complain, into less visible, and therefore more dangerous areas.[76]

The threat of arrest places sex workers in an "adversarial relationship" with police.[77] Sex workers are reluctant to seek the protection of police for fear of being arrested. In turn, police tend to look on prostitutes with suspicion and mistrust, and may blame them for putting themselves in positions of risk.

The executive director of Regina's Sex Workers' Advocacy Project, Barb Lawrence, told Amnesty International about comments made by one police officer. A sex worker missed an appointment with a Crown Prosecutor to give testimony in the case of a murdered Indigenous woman in Regina. Lawrence, who had set up the meeting, eventually received a call from the sex worker. It turned out that the woman was being held by city police who wanted her to provide evidence on a separate case. The police had refused to believe that she had a meeting with the prosecutor's office. When Lawrence and the prosecutors went to the police station to meet the woman, the arresting officer reportedly said he had no reason to believe the woman's claims, saying "she's just a hooker on the street."

The isolation and social marginalization that increases the risk of violence faced by women in the sex trade is often particularly acute for Indigenous women. The role of racism and sexism in compounding the threat to Indigenous women in the sex trade was starkly noted by Justice David Wright in the 1996 trial of John Martin Crawford for the murder of three Indigenous women in Saskatchewan:

[76] Pivot Legal Society. Voices for Dignity: A Call to End the Harms Caused by Canada's Sex Trade Laws, Vancouver, 2004.
[77] Lowman, Supra, footnote 74, p.1008.

> It seems Mr. Crawford was attracted to his victims for four reasons; one, they were young; second, they were women; third, they were native; and fourth, they were prostitutes. They were persons separated from the community and their families. The accused treated them with contempt, brutality; he terrorized them and ultimately he killed them. He seemed determined to destroy every vestige of their humanity.[78]

Racist Violence and Indigenous Women

The Manitoba Justice Inquiry said of the murder of Helen Betty Osborne:

> Her attackers seemed to be operating on the assumption that Aboriginal women were promiscuous and open to enticement through alcohol or violence. It is evident that the men who abducted Osborne believed that young Aboriginal women were objects with no human value beyond sexual gratification.[79]

As the inquiry recognized, racism and sexism intersect in stereotypes of Indigenous women as sexually "available" to men. This intersection of sexism and racism contributes to the assumption on the part of perpetrators of violence against Indigenous women that their actions are justifiable or condoned by society.

Frontline organizations contacted by Amnesty International confirmed that racist and sexist attitudes toward Indigenous women continue to be a factor in attacks on Indigenous women in Canadian cities.

[78] Transcript of trial, *R v Crawford*, May 31, 1996, p.87. Warren Goulding. *Just Another Indian: A Serial Killer and Canada's Indifference*, Calgary: Heritage House Publishing Company, 2001, p.188.
[79] Aboriginal Justice Inquiry of Manitoba, Supra, footnote 1.

Police, however, are inconsistent in their acknowledgement of this threat. Some police spokespersons told Amnesty International that they believe that "lifestyle" factors, such as engaging in the sex trade or illegal drug use are the most important risk factors, and that other factors such as race or gender are not significant enough to be considered in their work. Other police spokespersons told Amnesty International that they have seen that racism and sexism are factors in attacks on Indigenous women and that they consider Indigenous women as a whole to be at risk.

Over-Policed and Under-Protected

Numerous studies of policing in Canada have concluded that Indigenous people as a whole are not getting the protection they deserve.[80] This conclusion is supported by the testimony of many of the families interviewed by Amnesty International. A few described police officers who were polite and efficient and who, in a few cases, even went to extraordinary lengths to investigate the disappearance of their loved ones. Other families described how police failed to act promptly when their sisters or daughters went missing, treated the family disrespectfully, or kept the family in the dark about how the investigation – if any – was proceeding.

A number of police officers interviewed by Amnesty International insisted that they handle all cases the same and do not treat anyone differently because they are Indigenous. However, if police are to provide Indigenous people with a standard of protection equivalent to that provided to other sectors of society, they need to understand the specific needs of Indigenous communities, be able to communicate with Indigenous people without barriers of fear and mistrust, and ultimately be accountable to Indigenous communities. As some police officers acknowledged to Amnesty International, this is clearly not the case today.

Across the country, Indigenous people face arrest and criminal prosecution in numbers far out of

[80] See, for example: Saskatchewan Commission on First Nations and Métis Peoples and Justice Reform (Saskatchewan Justice Reform Commission), Final Report, Regina, 2004. Aboriginal Justice Inquiry of Manitoba, Supra, footnote 1.

proportion to the size of the Indigenous population. The Manitoba Justice Inquiry suggested that the over representation of Indigenous people in the justice system may partly stem from the predisposition of police to charge and detain Indigenous people in circumstances "when a white person in the same circumstances might not be arrested at all, or might not be held."[81] The Inquiry explained that many police have come to view Indigenous people not as a community deserving protection, but a community from which the rest of society must be protected. This has lead to a situation often described as one of Indigenous people being "over-policed" but "under-protected."[82]

Many Indigenous people feel they have little reason to trust police and as a consequence, are reluctant to turn to police for protection. Police forces were used to enforce policies such as the removal of children to residential schools that have torn apart Indigenous communities. Today, many Indigenous people believe police are as likely to harm as to protect them. Amnesty International has previously drawn attention to incidents in which police in Canada have been responsible for, or are apparently implicated in acts of violence against Indigenous people or apparent reckless disregard for their welfare and safety. These include the 1995 killing of land rights protestor Dudley George by an Ontario Provincial Police officer and the concern that police may have been involved in a series of freezing deaths of Indigenous men on the outskirts of Saskatoon.[83]

The Saskatchewan Justice Reform Commission noted that "mothers of Aboriginal youth have spoken about the apprehension they feel when their children leave the home at night. Their fears involve the possibility of police abusing their children."[84] One Indigenous woman, herself a professor at a Canadian university, told Amnesty International that she has instructed her teenage son to never talk to the police unless she is present.

Protesting against the absence of any permanent police force in many Northern communities, the Inuit Women's Association of Canada has said, "In order to serve all parts of the communities, the police have to know our communities, they must be a part of our communities."[85] Many police forces in Canada now require officers to take courses in cultural sensitivity, cross cultural communication or Indigenous history to help improve their understanding of Indigenous communities. Despite such requirements, the Saskatchewan Justice Reform Commission concluded, "police officers continue to be assigned to First Nations and Métis communities with minimal knowledge of the culture and history of the people they serve."[86]

Despite the efforts of many police forces to hire more Indigenous officers, Indigenous people are still underrepresented in police forces across Canada.[87] Greater effort must be made to hire more Indigenous officers, especially women.

More attention must also be made to integrate an understanding of Indigenous communities into core learning experiences of all officers. For example, the concerns, perspectives and needs of Indigenous communities should be reflected in the operational scenarios used in police training. Officers also need the time and the opportunity within their day-to-day duties to develop the necessary relationships of mutual understanding and trust with Indigenous communities. Unfortunately, many officers told Amnesty International that heavy workloads and frequent, often mandatory, rotations in and out of assignments, present real barriers to officers understanding and being trusted by Indigenous communities.

[87] Ibid, pp. 5-10, 5-11. The Aboriginal Justice Implementation Commission, Supra, footnote 82.

Police forces should work with Indigenous organizations to establish practices and policies that can support not only the learning of individual officers, but also an improved relationship between Indigenous communities and the force as a whole. The Saskatchewan Justice Reform Commission pointed to a number of positive practices within the Saskatoon police force that it felt should be emulated elsewhere. These included the creation of an Indigenous liaison post and regular cooperation with community elders, including having elders accompany officers on some patrols in predominantly Indigenous neighbourhoods.[88]

One of the critical areas for institutional reform highlighted by Amnesty International's research is the way police respond to reports of missing persons. Many Indigenous families told Amnesty International that police did little when they reported a sister or daughter missing and seemed to be waiting for the woman to be found. Police point out that the vast majority of people who are reported missing have run away or chosen to break off ties with family or friends. Most people who have voluntarily "gone missing" in this way do quickly turn up on their own.

However, this does not excuse incidents recounted to Amnesty International where, despite the concern of family members that a missing sister or daughter was in serious danger, police failed to take basic steps such as promptly interviewing family and friends or appealing to the public for information. These steps are particularly urgent when the missing person is a girl, as the State has special obligations to find and protect children at risk. However, every missing person report needs to be carefully assessed to determine the risk to the missing person. Unfortunately, even in large cities, many Canadian police forces do not have specialized personnel assigned to missing person cases. Instead, the task of assessing the risk and the credibility of the family's fears may fall to individual officers with little or no specific training or experience related to missing persons.

To Amnesty International's knowledge, few police forces have specific protocols on actions to be taken when Indigenous women and girls are reported missing. The national police force, the RCMP, does require that a specialized liaison officer be involved in the case when the missing person is Indigenous. All forces should work with Indigenous communities to develop and put in place more specific protocols that are sensitive to the particular concerns and circumstances in which Indigenous women are reported missing.

Because of the vital role they play in society, and the power they wield, it is critical that police be held accountable. That must include accountability for failing to fulfill their duties, as spelled out in official policies, to fully and impartially investigate all reports of threats to women's lives. That issue emerged as a clear concern in the course of research for this report. The families of missing and murdered women need to have greater formal access to the police, for example through the appointment of community ombudspersons, to ensure that their concerns are addressed in an appropriate manner.

The healing journey: justice for missing and murdered Indigenous women

All victims of violent crime have the right to justice. Under international human rights laws and standards, justice is not limited to the prosecution and punishment of the person who carried out the crime. Justice also includes a public acknowledgement of the crime, the opportunity and the ability for the victims of violence and their survivors to heal and to rebuild their lives, and assurance that the crime will not be repeated.

Although the formal court system cannot address all of these needs on its own, it nonetheless plays a vital role in assuring justice in the fullest sense of the word. The Saskatchewan Justice Reform Commission noted that the Canadian court system was imposed on Indigenous peoples without their consent and continues to be looked on with suspicion and mistrust by many.[89] To establish trust in the court system, and ensure that court proceedings reflect an awareness and appreciation of the specific circumstances of Indigenous peoples, the Commission recommended cross-cultural training for all judges and the appointment of Indigenous judges

[88] Ibid., p. A-34.

[89] Saskatchewan Justice Reform Commission, Supra, footnote 84, p.6-3.

in every level of court.[90] The Manitoba Justice Inquiry had early recommended increased recruitment of Indigenous judges and prosecutors and urged cross-cultural training "for all those working in any part of the justice system who have even occasional contact with Aboriginal people."[91]

It is important as well that Indigenous people who come in contact with the law, either as the accused or as victims, receive appropriate assistance in understanding the court system and having their voices heard. Amnesty International notes that in many jurisdictions across Canada a system of Indigenous court workers provides advocates to work on behalf of community members dealing with the justice system. Clear policies and protocols should also be established with respect to the timely provision of information, including autopsy results and coroners reports, to the families of missing and murdered persons.

Official indifference

In 1999, the Canadian government itself told the UN Human Rights Committee that the situation of Indigenous peoples is "the most pressing human rights issue in Canada."[92] Despite this admission, Canada has been repeatedly criticized by UN treaty bodies, including the UN Committee on Economic, Social and Cultural Rights,[93] the UN Committee for the Elimination of Racial Discrimination,[94] the UN Committee on the Rights of the Child,[95] and the UN Human Rights Committee,[96] for its failure to implement comprehensive reforms identified as critical by its own Royal Commission on Aboriginal Peoples. Furthermore, the UN Committee on the Elimination of Discrimination against Women has expressed concern about "persistent, systematic discrimination faced by aboriginal women in all aspects of their lives."[97]

While the federal and provincial governments in Canada can point to numerous programs undertaken to fulfill the rights of Indigenous peoples, the seriousness of these concerns requires that government do more.

Many of the families and frontline organizations interviewed for this report expressed concern and anger at the seeming indifference of Canadian officials and Canadian society for the welfare and safety of Indigenous women. This official indifference is well illustrated by the Canadian government's response to one of the most notorious killings of an Indigenous woman from Canada.

Anna Mae Pictou Aquash was a Mik'maq woman from Indian Brook First Nation, Nova Scotia. On February 24, 1976, in the midst of a protracted and violent conflict involving the American Indian Movement (AIM) and the US Federal Bureau of Investigation (FBI), her body was found on the Pine Ridge Reservation in South Dakota. An autopsy concluded that she had been killed by a single gun shot to the back of her head. Despite the high profile of her death, and intensive FBI operations targeting members of AIM, almost 30 years passed before anyone was charged in her killing.[98]

Anna Mae Aquash's family have expressed frustration that the Canadian government has done little to support them in their three decade long call for justice. Anna Mae Aquash's daughters, Denise and

[98] While this report was being prepared, charges were brought against two former members of AIM in the killing of Anna Mae Aquash. One man was convicted of murder on February 4, 2004. As of October 2004, the second many was awaiting a hearing to determine whether he will be deported from Canada to stand trial in the US. Both men say they are innocent.

Deborah Maloney say they have sent several letters to all levels of the Canadian government but the only response they have ever received was a standard acknowledgement of receipt of their letters. Denise Maloney says, "Any direct contact from any Canadian authorities would be nice. The level of apathy from governmental authorities surrounding my mother's case is disturbing and insulting."

The case studies that follow illustrate some of the patterns of violence that threaten the lives of Indigenous women in Canadian towns and cities. Concrete measures that would reduce Indigenous women's vulnerability to such violence have already been clearly identified by Indigenous women's organizations and by official inquiries and commissions. What remains is for Canadian officials to acknowledge the seriousness of the problem and to commit themselves to immediate action.

IV. Nine Stolen Sisters: Case studies of discrimination and violence against Indigenous women in Canada

As has been noted above, no one knows how many Indigenous women have been murdered or gone missing in Canada over the past three decades. The information that would make it possible to answer that question is simply not available. In Amnesty International's research we have spoken with many women who have experienced violence firsthand, we have interviewed family and friends of women who have been killed or gone missing, and we have talked to front-line organizations who work on a daily basis with Indigenous women who are coping with violence.

The following nine cases have been selected because they represent common themes that have emerged in the course of Amnesty International's research. They have been chosen because they reflect the variety of factors that appear to put Indigenous women at heightened risk. The root causes of discrimination and violence are often complex and are invariably inter-connected. In some instances it is quite clear that Indigenous women are either attacked by individuals or inadequately protected by authorities expressly because of their Indigenous identity. In some cases the Indigenous women who have gone missing or been killed have been working in the sex trade and may have had addictions to alcohol or drugs. All women in such circumstances, not only Indigenous women, face an increased risk of violence and discrimination. The risk that Indigenous women face in these circumstances is often exacerbated by racism and discrimination because of their Indigenous identity.

Amnesty International's research has also pointed to a variety of historical and current factors that have led a disproportionate number of Indigenous women into the sex trade, where they face that heightened risk. A number of the cases recounted in this report demonstrate, in human terms, the disturbing connections among past policies such as residential schools, societal discrimination against Indigenous people, involvement in the sex trade, and deadly violence.

These cases also represent two critical aspects of the reality of violence and discrimination against Indigenous women. In some instances the violence itself is racist and sexist. In other cases it may be the response from the police, other authorities, the media and the general public that is racist and sexist. In yet other cases it is both.

Amnesty International is concerned that all of these dimensions to the problem of violence against Indigenous women give rise to serious human rights concerns, be it racist violence, discriminatory responses to violence, or the consequences of the many discriminatory laws, policies and practices, past and present, that have led to the marginalization of Indigenous peoples in Canada. These cases all speak to the painful human cost of government failure to address those human rights concerns. All dimensions to the problem demand a response from governments across Canada. Yet the first case, a murder occurring more than thirty years ago which resulted in a provincial inquiry into the Manitoba justice system, is a stark reminder of the failure of governments to take adequate action to date.

An unheeded warning:
Helen Betty Osborne - murdered November 12, 1971

> There is one fundamental fact: her murder was a racist and sexist act. Betty Osborne would be alive today had she not been an Aboriginal woman.[99]

Helen Betty Osborne was born in Norway House, a Cree community at the northern end of Lake Winnipeg in the province of Manitoba. In 1969, at the age of 17, she left her community to pursue her education, with the dream of becoming a teacher and helping her people.

At the time, Indigenous children who wanted to graduate from high school had no choice but to leave their communities. The federal government, pursuing a policy of cultural assimilation -- and having decided that Indigenous communities offered no future for young people -- wanted Indigenous children to get their education in predominantly non-Indigenous towns and cities. In Norway House, the local school only provided the first eight of the twelve grades of public school.

For two years, Helen Betty Osborne attended the Guy Hill Residential School outside The Pas. Then in 1971 she moved into The Pas to attend high school.

A provincial justice commission, which would later examine the circumstances surrounding the murder of Helen Betty Osborne, described The Pas, a town of about 6000 people in 1971, as being sharply divided between Indigenous and non-Indigenous residents. "At the movie theatre, each group sat on its own side; in at least one of the bars, Indians were not allowed to sit in certain areas; and in the school lunch-room, the two groups, Aboriginal and non-Aboriginal, ate apart."[100]

According to the Manitoba Justice Inquiry, tensions between the two communities often turned violent, with police failing to intervene. There was also a pattern of sexual harassment of Indigenous women and girls. Police officers who testified before the Inquiry described "white youths cruising the town, attempting to pick up Aboriginal girls for drinking parties and for sex." The Inquiry found that the RCMP failed to check on the girls' safety. The Department of Indian Affairs also ignored the practice, failing to work with the schools to warn Indigenous students of the dangers.

On Friday, November 12, 1971, Helen Betty Osborne went out with a number of friends to a dance. At around 2 am, as she was walking back to house where she was billeted, she was accosted by four non-Indigenous men.

According to the testimony of one of the men, the four had decided to pick up an Indigenous woman for sex. When Osborne refused, they forced her into their car. In the car, she was beaten and sexually assaulted. She was then taken to a cabin owned by one of the men where she was beaten and stabbed to death. According to the autopsy report, she was severely beaten around the head and stabbed at least 50 times, possibly with a screwdriver.

Twenty years later, the Manitoba Justice Inquiry concluded that the murder of Helen Betty Osborne had been fuelled by racism and sexism:

> Women in our society live under a constant threat of violence. The death of Helen Betty Osborne was a brutal expression of that violence. She fell victim to vicious stereotypes born of ignorance and aggression when she was picked up by four drunken men looking for sex.[101]

The Inquiry also pointed out that the life of Helen Betty Osborne might have been saved if police had taken action on a pattern of threats to Indigenous women's safety that was already evident in 1971:

> We know that cruising for sex was a common practice in The Pas in 1971. We know too that young Aboriginal women, often underage, were the usual objects of the

[99] Report of the Aboriginal Justice Inquiry of Manitoba, Supra, footnote 1.
[100] Ibid.
[101] Ibid.

> practice. And we know that the RCMP did not feel that the practice necessitated any particular vigilance on its part.[102]

According to the Justice Inquiry, racism also marred the initial RCMP investigation. Helen Betty Osborne's Indigenous friends were initially treated as suspects. Teenagers were interviewed without the consent or knowledge of their parents. One of Helen Betty Osborne's friends was taken out into the bush to be interrogated. When she hesitated in answering a question, police threw her over the hood of their car. They later took her to the morgue to see her friend's mutilated body. In contrast, police initially failed to act on a tip naming the four non-Indigenous men responsible who took part in the abduction. The men's car was not searched until at least a year later and the Justice Inquiry noted that the car's owner was treated with extreme deference. Although police were eventually convinced that these four non-Indigenous men were responsible for the murder, unlike the Indigenous youths, they were not brought in for questioning.

By the end of 1972, the police concluded that they did not have enough evidence to go to trial. The case then lapsed for more than ten years until an officer placed an ad in the local paper asking for information on the case. This ad resulted in the discovery of new evidence on the basis of which the first charges were laid in October 1986. After these charges were laid, media coverage resulted in new information coming forward. Finally the first of the men charged agreed to testify in return for immunity from prosecution.

In December 1987, one of the four men, Dwayne Johnston, was sentenced to life imprisonment for the murder of Helen Betty Osborne. A second man was acquitted, while the other two men who were present during the abduction and murder were never charged.

The Justice Inquiry determined that the most important factor obstructing justice in this case was failure of members of the non-Indigenous community to bring forward evidence that would have assisted the investigation. The Inquiry concluded that the community's silence was at least partly motivated by racism. The question remains, however, why the police waited more than 10 years to publicly seek the assistance of the community.

Dwayne Johnston has been released from prison on parole. The family of Helen Betty Osborne has brought him into a traditional healing circle so that he can better understand the crime he committed. The family has since become convinced that Johnston, although responsible for a terrible crime, was not the principle instigator of the attack on Helen Betty Osborne.

The Manitoba Justice Inquiry put forward an extensive list of reforms to be undertaken to ensure that the justice system would provide Indigenous people the protection they needed and not contribute to further victimization. The recommendations were wide-ranging and required action from all levels of government. Recommendations included recognizing Indigenous peoples' right to self-government, establishing Indigenous legal systems, addressing outstanding land and resource disputes, recruiting more Indigenous police officers, ensuring independent procedures for investigation and resolution of complaints against police, establishing a special investigations unit to take control of the investigation of possible incidents of serious police misconduct, and increasing services to women escaping situations of violence. Amnesty International is of the view that adopting these recommendations in a manner consistent with international human rights standards would provide Indigenous women with greater protection from violence.

In a book published ten years after the Inquiry made its final report, one of the former Commissioners complained that the federal government had not undertaken any of the recommended reforms within its jurisdiction while the provincial government was still at the stage of studying which recommendations to implement.

> The Aboriginal Justice Inquiry made over 150 recommendations. Almost none of them have been acted upon. There is either the inability to understand the need for improvements or the same century-long governmental inertia. The result is clear; Aboriginal people

[102] Ibid.

> continue to suffer at the hands of an inappropriate justice system.[103]

In 1999, the provincial government convened the Aboriginal Justice Implementation Commission to examine the status of the Inquiry's recommendations. That Commission made a further set of recommendations to the provincial government.[104] Amnesty International was repeatedly told by Indigenous peoples' organizations, lawyers, frontline service groups and others that they believe that the pace of implementation of the recommendations continues to be unacceptably slow.

Not knowing
Shirley Lonethunder - missing since December 1991

> "I also can't help wondering what kind of reaction there would be if these young women were white? What kind of value do we place on human life?"[105]

Shirley Lonethunder, is a Cree woman and mother of two children, from White Bear First Nations reserve in Saskatchewan. In 1991 she was 25 years old and living in Saskatoon. Her family knew she used drugs. According to her brother, she also occasionally worked in the sex trade to make enough money "to get by" and provide for her children. In late November 1991, she told her mother, Doris Lonethunder, she would be starting university in the New Year and asked her to look after her infant son and daughter. She told her brother a different story. She said she had to get out of Saskatoon to avoid the police. The last time her family saw her was on December 20, 1991.

The Lonethunder family didn't realize Shirley Lonethunder was missing until March 1992 when they were contacted by her lawyer, who said she had missed a court date. Until then, her mother thought Shirley Lonethunder simply "went away somewhere." Now Doris Lonethunder began to fear for her daughter. She and her son filed a Missing Person report with the Saskatoon Police that same day

The Saskatoon Police Service's missing persons policy states that investigators have a responsibility to "liaise with complainants" and should request media assistance, if necessary, to help locate a missing person. According to Doris Lonethunder, the police investigator was in regular contact with her at first, phoning every week for approximately a month, then phoning every two weeks. However, the police did not make any public appeals for assistance on the case and the family members felt the police were not very supportive. After about three months, the investigator stopped phoning. Approximately six months after having filed a Missing Person report, Shirley Lonethunder's brother contacted the Saskatoon Police to enquire about any progress in the case. He says that he was told there was no record of the Missing Person report. Saskatoon police declined to answer Amnesty International's questions about unresolved cases, such as Shirley Lonethunder.

In 1992 Doris Lonethunder spoke to an Indigenous healer from the United States who told her that he had had a vision of Shirley's body at a location south of Saskatoon, a short distance beyond the city's limits and therefore in the jurisdiction of the RCMP. At first, Doris Lonethunder hesitated to take this information to the police because she thought the police, who did not believe in "Indian ways", would not take her seriously. In the end, she spoke with an Indigenous officer stationed at the local RCMP detachment, who responded sympathetically and said she would look into this information. About a week later, the officer was transferred, "And that," says Doris, "was it." As far she knows, nothing happened with the information she provided. While internationally-recognized policing standards would not obligate police to act on information of this sort, the sensitivity and understanding that Doris Lonethunder experienced when dealing with the Indigenous officer helped build her trust and confidence. When that disappeared, the trust and confidence slipped as well.

In October 1994, another woman's remains were discovered in the general area where Doris Lonethunder had asked the RCMP to search for her

---

[103] A.C. Hamilton, *A Feather, Not a Gavel: Working towards Aboriginal Justice*, Great Plains Publications, Manitoba, 2001.
[104] The Aboriginal Justice Implementation Commission, Supra, footnote 82.
[105] Janice Acoose, *Iskwewak: Neither Indian Princesses Nor Easy Squaws*, Toronto, Women's Press, 1995.

daughter's body. By the end of the month, RCMP had unearthed two other women's bodies at the same site. The three women were Eva Taysup, Shelley Napope, and Calinda Waterhen. All three were Indigenous women who had been reported missing in 1992 and 1993.

On 12 April 1995, a local newspaper quoted an RCMP officer as stating that the force was considering excavating the grove where the three bodies had been found.[106] The officer indicated more bodies might be out at the site. In almost immediate response the RCMP issued a press release denying having any plans to excavate, stating that they had no indication there might be other bodies at the site.[107] Amnesty International has now been informed by the RCMP that there has been a recent search of the area conducted by the Saskatoon Police Service, including with the use of Ground Penetrating Radar, and that there are plans to search further.

In 1996, John Martin Crawford was convicted of murder in the killings of Eva Taysup, Shelley Napope, and Calinda Waterhen. He was the sole person charged and convicted. Crawford had previously served seven years in prison for abducting and murdering another Indigenous woman, Mary Jane Serloin, age 35, in 1981.

The body of another Indigenous woman, 37-year-old Janet Sylvestre, was found outside Saskatoon in 1994. She had been raped and killed. No one has ever been convicted in her murder.

Commenting on the apparent public apathy over the disappearances and murders of Indigenous women in Saskatoon in the early 1990s, Janice Acoose, a professor at the Saskatchewan Indian Federated College in Saskatoon wrote in 1996:

> I have waited in agonized and frustrated silence for some kind of expression of concern (perhaps even outrage) from members of the community, women's groups, or political organizations. To date, few, if any, have come forward and spoken to the nature of this heinous crime or the need to protect Indigenous women who were so obviously the target of this murderer. And perhaps, most importantly, I waited for someone to come forward and respectfully acknowledge the lives of these four women.[108]

Shirley Lonethunder's family is raising her children. They remain sure that something terrible has happened to her. There is nothing else that would explain the 13-year-absence of a woman who was so close to her family. Her mother says "not knowing is a hard thing to actually deal with." According to Doris Lonethunder, the Saskatoon police have not contacted her directly about her daughter in at least 10 years.

She deserved to be safe
Pamela Jean George - Murdered April 17, 1995

Pamela Jean George was a 28 year-old Saulteaux woman with two young daughters. She was close to her family at Sakimay First Nation, located in southeastern Saskatchewan. Struggling with poverty, Pamela George occasionally worked in the sex trade in Regina.

Professor Sherene Razack of the University of Toronto has carried out a detailed review of the transcripts of the trial of the two men who were eventually convicted of Pamela George's murder. The following details emerge from Professor Razack's review of those transcripts.[109]

On the evening of 17 April 1995, Pamela George agreed to get into a car driven by a 20-year-old white man, Steven Tyler Kummerfield. A second 20-year old, Alexander Dennis Ternowetsky, was hiding in

[106] "Grove may harbour more bodies," Saskatoon Star-Phoenix, April 12, 1995.
[107] Goulding, Supra, footnote 78, at p. 133.

[108] Acoose, Supra, footnote 105.
[109] Sherene Razack, Gendered Racial Violence and Spatialized Justice: The Murder of Pamela George, in Sherene Razack, ed., *Race, Space and the Law: Unmapping a White Settler Society*, Toronto, Between the Lines. 2002, pp. 125-147. Amnesty International has also reviewed the lengthy appeal court decision in this case, *R v. Kummerfield and Ternowetsky*, 163 Sask. R. 257 (C.A.)

the trunk. Both men were university students. They had been drinking, and neither had money to pay her. Kummerfield drove the car to a field two miles past the outskirts of Regina. There, the two men forced her to perform oral sex. They then beat her severely and left her lying face down in the mud. Her body was discovered the next morning in a ditch.

Media reports suggest that the police investigation initially focused on other Indigenous people and people living on the street. One Indigenous man was reportedly interrogated four times. One or two weeks after the murder of Pamela George the Regina Police Service received a tip from a woman who said one of the killers had confided in a friend of hers. She was able to provide the names of Kummerfield and Ternowetsky, who were eventually charged with first-degree murder.

Testimony at the trial indicated that on the night of April 17th the two men tried to pick up another Indigenous woman before they encountered Pamela George. At the trial, that woman testified that she had refused to go with them and they hurled racial slurs at her, reportedly calling her "Indian trash" and "squaw slut."

After the men returned from beating Pamela George to death, they reportedly bragged to friends that they had picked up an "Indian hooker." Both men admitted hitting Pamela George, but said they doubted they had killed her. According to a friend who testified at the trial, Ternowetsky said, "She deserved it. She was an Indian."

The case was tried before a white judge and all-white jury. Little attention was given to the life of the victim, apart from her work in the sex trade. The Crown prosecutor told the jury that Pamela George lived a life far removed from theirs, and they would have to consider the fact that she was a prostitute as part of the case.[110] Mr. Justice Malone instructed jurors before their deliberations to bear in mind that Pamela George "indeed was a prostitute" when they considered whether or not she had consented to sexual activity.[111] The Court of Appeal decision briefly considered the prosecutor and Judge's comments and concluded they "were not made for the purpose of conveying a negative view of the victim to the jury."[112]

Amnesty International is concerned that comments of this nature may reflect social attitudes faced by sex workers in general, and Indigenous sex workers in particular. Professor Razack comments:

> [Not] only did George remain the "hooker" but [the two defendants] remained the boys who "did pretty darn stupid things'; their respective spaces, the places of white respectability and the Stroll simply stood in opposition to each other, dehistoricized and decontextualized. If Pamela George was a victim of violence, it was simply because she was of the Stroll/ reserve, Aboriginal, and engaging in prostitution. No one could then be really held accountable for her death.[113]

The two men were convicted of manslaughter, and sentenced to six and a half years in prison.

A police officer working in Regina at the time told Amnesty International recently that he had been "disgusted" by the verdict. In his opinion, some of the people involved in the investigation and prosecution of the case saw Pamela as a sex trade worker, not a human being. He felt the treatment of this case reflected this attitude from start to finish.

Taken from her family
Janet Henry - missing since June 28, 1997

Janet Henry comes from the KwaKwaQueWak Nation in Kingcome Inlet in British Columbia. She was the youngest in a family of thirteen. Her siblings have many happy memories of their childhood together. Although their mother fell ill with lupis and rheumatoid arthritis and had to undergo many operations, the older children were able to look after their younger siblings. Their father, a logger and fisherman, ensured that the family never went

[111] Ibid,. pp. 151-152.
[112] *R v. Kummerfield and Ternowetsky*, Supra, footnote 110, p. 297.
[113] Sherene Razack, Supra, footnote 109, pp. 145-146.

without. The eldest daughter, Donna Henry, recalls growing up immersed in a very rich culture. When Janet Henry was young, Donna Henry practiced traditional dances and songs with her.

The security the family once enjoyed was short lived. The three oldest children were taken away to residential school. After the death of their father, their mother no longer had anyone to help her care for the younger children. Janet Henry and four of her brothers and sisters were placed in foster homes.

One of Janet Henry's sisters, Sandra Gagnon, describes the break up of the family as the beginning of "a living nightmare." Many of the siblings lost both their ties to their culture and their sense of self-esteem. Their years in residential school or foster homes were followed by alcoholism and depression. Their sister Lavina was raped and murdered when she was 19. Another sibling killed himself.

In the midst of all the trauma the family had been subjected to, Sandra Gagnon remembers how they always expected that Janet would have a bright future ahead of her. "Janet was really a brilliant young woman," she said. "I never could have imagined what happened to her." Janet Henry graduated from high school and attended hairdressing school. She got married and had a daughter, to whom she was devoted.

However, when Janet Henry's marriage broke up in the late 1980s, her husband gained custody of their daughter. Janet Henry was devastated. Donna Henry recalls, "I watched my baby sister spiral." Janet Henry eventually ended up living in Vancouver's Downtown Eastside, a low income neighbourhood known for drug and the street level sex trades. Her family learned that she had begun attending parties where she engaged in sex in exchange for drugs.

It was a dangerous life. Violence against sex workers in the Downtown Eastside is all too common. By 1990, however, women in the Vancouver sex trade, and the families of women who had gone missing from the downtown Eastside, had begun to suspect that there was more to this danger than random acts of violence.

Janet Henry was apparently aware of the danger and therefore phoned her brothers and sisters frequently to let them know she was okay. The last time they heard from her was in late June 1997.

Janet Henry's family quickly became worried about her when her usual telephone contacts with them ceased. Sandra Gagnon and her brother went to the Downtown Eastside neighbourhood looking for her. After a few days, they reported her missing to the police. Because the small amount of money that Janet Henry had was still in her bank account, the family feared the worst.

Sandra Gagnon believes the police initially had one or two suspects in mind and did what they could to follow these leads. However, once these suspects were ruled out, she says the family heard less and less from the police. She speaks positively of the officers who initially investigated her sister's disappearance. However, like other family members whose sisters and daughters disappeared from the Downtown Eastside during this time, Sandra Gagnon feels the city and the police force should have acknowledged the wider pattern of disappearances much sooner and taken concerted action to ensure the safety of women in the Downtown Eastside. "They never took the threat seriously," she says. "I can guarantee you that if it wasn't the Downtown Eastside and they weren't hookers, something would have been done in an instant."

In April 1999 family members of missing women called on the police to issue a reward for information about the women who were going missing in the Downtown Eastside. Although police had recently offered rewards for information about robberies in more affluent neighbourhoods of the city, they initially declined to do so in the case of the missing women. Instead the city suggested offering a $5000 reward for any of the missing women who came forward, implying that they did not believe they had been victims of foul-play. Mayor Owen said, "Police have said there is no indication of crimes. Why don't we start with [the $5000 reward] until we find out that someone is killing these women?"[114]

Under mounting pressure from the families and increasing media coverage of the issue, the police

[114] Maggie de Vries, *Missing Sarah: A Vancouver Woman Remembers Her Vanished Sister*, Penguin Books Canada, 2003, p.234.

force eventually changed its position. The first posters offering a reward for information on the missing women were distributed in July 1999. A small group of officers was assigned to work on the disappearances on an ongoing basis. In 2000, the RCMP joined the review of evidence. A larger task force was formed the following year.

On 6 February 2002, the Vancouver City Police/RCMP Task Force moved into a farm in Port Coquitlam, outside Vancouver and sealed it off. For 21 months, they conducted one of the largest police searches in Canadian history. On the basis of evidence collected at the farm, the Crown initially laid charges against Robert Pickton, the owner of the farm, for the murder of 15 women who had gone missing from the Downtown Eastside, the vast majority of which were women who went missing after 1997.

Robert Pickton's case is expected to come to trial in 2005 or 2006 on at least 22 charges. In the meantime, the investigation of other women missing from the Downtown Eastside continues. By April 2004, the number of cases under investigation by police had grown to 60 women and one transgender person. Nineteen of the missing women are Indigenous.

Janet Henry is not among the women whose DNA has found at the Port Coquitlam farm. One of Janet Henry's sisters went through the clothing and other belongings found by police at the farm but didn't recognize anything of Henry's. Family members continue to hope that their sister is still alive, but are slowly giving up hope. "I go into denial and just keep hoping that maybe she just went far away and she has been unable to get a hold of us," said Donna Henry. But deep down inside, I know. We will probably never see her again."

"A daily part of life"
Sarah de Vries - missing April 14, 1998; confirmed dead August 6

> So many women, so many that I never even knew about, are missing in action. It's getting to be a daily part of life.[115]

Sarah de Vries was born on May 12, 1969. Sarah's mother was an Indigenous woman from the West Coast of Canada, who was also of European and African Canadian ancestry. Her father was an Indigenous man from Mexico. During the first year of her life, Sarah de Vries lived with her mother on weekends and with another family during the week. After ten months, her birth mother decided to give her up for adoption. She was adopted by a white couple in Vancouver.

Her adoptive family remembers Sarah de Vries being a bright and happy child who was always eager for the attention of her parents and her three siblings. She loved to write stories and poetry and kept a journal most of her life. She also loved to swim and some of her happiest times growing up were at a family cottage in Ontario.

"I remember her as being a very happy little girl, adventurous and very interested in the whole world around her," her sister Maggie de Vries recalls. "She was athletic, creative and loved to tell stories."

Despite these happy memories, Maggie de Vries feels that her sister may have missed out on the sense of stability or belonging that she craved and needed as a child. By the time Sarah de Vries was six, her parents' marriage was in difficulty. They separated when Sarah de Vries was nine and two the two older children stayed with their father while de Vries and her younger brother went to live with their mother.

At the same time Sarah de Vries was beginning to think of herself as an outsider between cultures. She was self conscious about the fact that she stood out within her family and within the almost exclusively white neighborhood where she lived. She also struggled to understand why her birth mother had given her up for adoption. Maggie de Vries remembers one time her sister cried for hours when a teacher asked her to draw up her family tree.

In her twenties, Sarah de Vries wrote in her journal:

> Man, I don't understand how the adoption agency could let a couple

[115] This 1995 quote from Sarah de Vries' journal and all other quotations are drawn from her letters and journals as quoted in de Vries, Ibid. and cannot be reproduced without permission from Sarah's family.

> that are both of the opposite colour as the child become this child's legal guardians. I understand that they were not as strict as they are today on things of race, gender and traditions. But, come on, did they honestly think that it would have absolutely no effect on my way of thinking or in the way I present my persona? I'm not accepted into the Caucasian social circle nor am I accepted in the black social circle, for I am neither white nor black... I'm stuck in the middle and outside both. I have no people. I have no nation and I am alone.

At other times de Vries wrote about how much she loved her adoptive family and how conflicted she was about them. She was caught shoplifting near the end of grade five and ran away for the first time shortly before her fourteenth birthday. Yet that summer, she wrote in the family cottage guest book, "I really love you a lot and I am so glad to have been adopted into this family …" And that August she wrote in a letter to her sister,

> I really love you a lot, no matter how mean and nasty I am to you, and when I think how mean I was, I feel really bad, so I LOVE YOU. I wish I could tell Mom how unhappy I am, but I myself don't know. But I do know this. I love you and Mom so much that I start to cry when I think about you.

Over the following year, she ran away many times, often staying out for days at a time. Her parents would look for her but could not prevent her from running away again. She gravitated to downtown Vancouver where, still a child, she supported herself by selling sex.

She clearly struggled with a sense of dislocation and a need to define her identity. She felt lost between two worlds. On the street she found friends and a sense of community

Sarah de Vries began experimenting with drugs and gradually became addicted to heroin and later to cocaine. She also used crack cocaine. In one of her journal entries, she wrote: "Supporting a heroin and cocaine habit is not fun and games; you have to make the money. No money. No drugs. No drugs, you go sick. You go sick, forget trying to pull a trick."

Sarah de Vries kept coming home for brief periods of time until she was eighteen. She also spent time in group homes and in a youth detention centre. During her time on the streets, friends recall that she remained a kind and giving person. She would look out for younger girls, encouraging them to go home. She would also look after homeless people. Friends described her as having an effervescent personality that attracted many people to her.

In December, 1990, Sarah de Vries had her first child, a daughter, who was born addicted to heroin. The next year, 1991, she spent six months in prison. In May, 1996, she had her second child, a son. He was born addicted to heroin and cocaine and spent his first few months in foster care because neither Sarah de Vries nor social services informed de Vries' family about him. At about the same time that her son was born, Sarah de Vries discovered that she was HIV positive and that she had hepatitis C.

Sarah de Vries was aware that other women in the sex trade were dying violent deaths, from overdoses and physical violence. Or were going missing. In December 1995, she wrote in her journal:

> Am I next? Is he watching me now? Stalking me like a predator and its prey. Waiting, waiting for some perfect spot, time or my stupid mistake. How does one choose a victim? Good question, isn't it? If I knew that, I would never get snuffed.

However she could not overcome her drug habits or take other steps to get off the street. Toward the end of her life, she wrote,

> I've sentenced myself to life imprisonment, no chance of parole, no chance of release, no judge, no jury, no pre-sentence inquiry. …I made this big, empty cold, senseless cell, escape proof. And, of course, I

> left no mistakes; in no part of my brilliant architectural plan is there a way for anybody to get in and realize who I really am, not that I know the answer to that question.

Sarah de Vries had a padlocked room in a small house in the downtown eastside where she lived and could keep her things. Having a room of her own and a stable address helped to keep her safe. But in the fall of 1997 she moved out. She had plans to find an apartment with her then boyfriend, but that didn't work out. She then ended up living in hotels, as she had done in her teens and early twenties.

Through all of it, Sarah de Vries maintained contact with her family. She visited her son once in foster care, before he moved back east to live with his grandmother. She saw her daughter every summer when her daughter came to Vancouver and had started drawing an alphabet colouring book for her. She also saw her sister regularly when her sister took her to doctor's appointments.

Sarah de Vries was last seen on April 14, 1998. A close friend tried to report her missing, but he alleges that the Vancouver police refused to take the report because he was not a family member. He contacted de Vries' sister, Maggie de Vries, who filed the report. Maggie de Vries says the police did not interview her about her sister's disappearance until 10 more days had passed.

Maggie de Vries recalls that individual police officers were helpful and clearly working hard to find out what happened to her sister. However, like other relatives of women who disappeared at this time in downtown Vancouver, she is frustrated that the police and the city took so long to acknowledge there was a larger pattern beyond the individual cases and to mobilize a coordinated investigation.

On August 6, 2002, the family was informed by the Task Force that Sarah de Vries' DNA had been found on the Port Coquitlam farm which has been at the centre of the joint Vancouver Police Department/RCMP Missing Women's Task Force investigation into the abduction and murder of women from the Downtown Eastside. As of September 2004, no charges had been laid in her murder. Robert Pickton is expected to come to trial in 2005 or 2006 on at least 22 charges of murder stemming from that investigation.

A target of racism?
Cynthia Louise Sanderson - killed August 30, 2002

Cynthia Louise Sanderson, a 24 year-old Cree mother of two children, lived in the small town of Shellbrook, near Prince Albert, Saskatchewan. She was the youngest of three children. She had her own house and worked part-time jobs but, according to her sister Linda Pechawis "she just got tired of struggling with money" and realized she needed an education to get fulltime employment. In 2002, she was accepted into the Universal Career College, a post-secondary training institution in Saskatoon, Saskatchewan. She moved in with her sister, bringing her four year-old daughter and leaving her seven year-old son in her mother's care since he was still in school.

Cynthia Sanderson started at Universal Career College in April 2002 with the goal of becoming a legal assistant. By June, her attendance was steadily declining. Finally, at the end of the month she talked to her instructor about her alcohol abuse. She admitted herself to a Saskatoon detox centre in July and then a rehabilitation centre at Ahtahkakoop First Nation in August. On August 25th she went to stay with her mother for a week.

On the evening of August 30, 2002, Cynthia Sanderson went out with a friend and her cousin in Prince Albert, 134 kilometres north of Saskatoon. Around 1 a.m. they got into a dispute with a white man, Anthony Barr, outside a bar. Accounts of what happened next vary. According to Sanderson's friends, Barr called out a racist insult. The trio swore back and kept walking. The man followed them in a truck. As Barr drove slowly beside them, they argued and exchanged racial slurs. Barr challenged the two men to a fight. He stopped the truck and got out, but when the two men moved toward him, Barr jumped back into his truck and drove ahead a short distance. After this happened a second time, Cynthia Sanderson apparently ran up to the driver's side of the truck. This time he didn't pull away. One of her friends testified that he heard Barr call her something like "Indian whore." Another said Barr propositioned her. Barr then grabbed Cynthia Sanderson by her jacket and drove away, dragging her alongside the

truck for up to fifteen feet. When she lost her balance, Barr let go, ran over her and sped away. Cynthia Sanderson was taken to hospital where she died as a result of her injuries shortly after 4 a.m.

When Barr returned to the bar later that night, a witness pointed him out to police and he was arrested. After Cynthia Sanderson's death, Barr was charged with criminal negligence causing death and leaving the scene of a crime. The Federation of Saskatchewan Indian Nations (FSIN), an Indigenous advocacy organization, called on the Crown prosecutor to charge Barr with a "hate crime." The prosecutor decided this case did not meet the criteria, but did elevate the charge to manslaughter. At trial, the judge acquitted Barr of the manslaughter charge and convicted him of dangerous driving causing death and failing to remain at the scene of a crime. Barr was sentenced to three years in prison.

Cynthia Sanderson's sister Linda Pechawis says that no one at the hospital tried to contact Sanderson's family while she was still alive. Cynthia Sanderson had contact information for her mother and sister in her day-planner, which she used as a purse. "She didn't have to die alone and scared," stated Pechawis. Cynthia Sanderson's two friends traveled to Shellbrook to contact her mother and take her to the hospital in Prince Albert but they were too late. Prince Albert police informed Amnesty International that a communications "screw up" had occurred between them and the Shellbrook RCMP. The Prince Albert police had contacted the RCMP, who were supposed to inform Sanderson's mother that her daughter had passed away, but she was not told this news. When she arrived at the hospital, she was expecting to find her daughter alive. A police investigator broke the bad news to her.

Linda Pechawis has filed a complaint against the Prince Albert Police Service through the Special Investigations Unit of the FSIN. She says that police officers did later apologize to her for mistakes the force made in the handling of the investigation. While she appreciated their candour, she questioned whether racist attitudes influenced not only the crime but also the police response. "They knew that they didn't do their job," Linda Pechawis told Amnesty International. "Sometimes I really think that her being Native could've been a reason. I hate to say that, but P.A. [Prince Albert], they say, is a pretty bad place for racism."

The Prince Albert Police Service told Amnesty International that there were "never any racist attitudes shown by police in any component of the investigation" and that the first two officers at the scene were "visible members of the First Nation community." An officer with the force, who clearly is concerned that Indigenous women do face high levels of violence, which he termed "cold, racist and sexist" and added that he hopes there will be "positive changes for a seriously at-risk group."[116]

Not a priority
Maxine Wapass - Missing May 17, 2002
confirmed dead in February, 2003

Maxine Wapass was a 23 year-old Cree woman who was very close to her large family. As a little girl, she was raised by her grandfather at Thunderchild First Nation in Saskatchewan. After he died in 1987, when Maxine was eight, she was raised by an aunt.

As a young adult Maxine Wapass stayed with her cousin Marilyn Wapass in Saskatoon but enjoyed returning to Thunderchild First Nation on holidays and whenever the opportunity arose to visit. "All of us tried to be together at Christmas, Easter, Thanksgiving, whenever we can eat, we all get together," said Marilyn Wapass.

Maxine Wapass had no children, but was close to her nieces and nephews. She was especially close to Marilyn Wapass' children; when her cousin was attending university or working, Maxine Wapass would baby-sit them. From Marilyn Wapass' point of view, her cousin helped raise her children.

On 17 May 2002, Maxine Wapass phoned her cousin at work about a trip to the reserve they were planning. Marilyn Wapass told her as soon as she got home from work, they would drive to Thunderchild. Marilyn Wapass recalled that she "wanted to get [Maxine] away from the city" because "she was getting into her drugs pretty bad."

When Marilyn Wapass got home from work, Maxine Wapass was not there. She did not call and she never

[116] Letter to Amnesty International from Prince Albert Police Service, August 30, 2004.

returned. Marilyn Wapass was not worried at first. She knew that her cousin had a lot of friends and she could end up anywhere. Maxine Wapass had talked about getting back together with an ex-boyfriend who lived at Little Pine First Nation so she assumed her cousin had gone to his reserve. Two weeks later, however, he phoned, and asked where Maxine Wapass was. Marilyn Wapass went to Thunderchild and told her mother and everyone else there that she had not seen Maxine Wapass in approximately two weeks. Her mother advised her to go to the police.

From the beginning, Marilyn Wapass says she felt that she and the lead investigator did not have a very good relationship. She was calling the police regularly to pass on information about her cousin and to ask for updates. She says she felt that the investigator "was getting tired of me calling and he had told me that this case wasn't his priority." When the investigator went on holidays, two other officers became involved. Marilyn Wapass felt more at ease: "I felt like they were really doing the best job that they could and they were going out on the street and they were interviewing people and they really wanted to solve the case." In August 2002, the two officers did a television interview about Maxine's disappearance. Shortly after the interview was aired, the lead investigator returned to work and the two other officers did not continue.

Marilyn asked a band councilor from the Thunderchild First Nation, Irma Horse, to be the family's contact with the police. Ms. Horse in turn contacted the Special Investigations Unit (SIU) at the Federation of Saskatchewan Indian Nations (FSIN), a provincial Indigenous advocacy organization, for assistance.

The family also took it upon themselves to try to obtain information about Maxine's disappearance. In the fall of 2002 they raised $5000 for a reward for information, and distributed posters in Saskatoon, throughout Saskatchewan, including reserves, and Alberta. The Thunderchild First Nation paid for newspaper ads in Saskatoon and Edmonton, Alberta.

In November 2002, Maxine Wapass' remains were found in a rural area 16 kilometres west of Saskatoon. The police confirmed her identity three months later, and informed the family on 6 February 2003. Due to the location of the remains, the RCMP became involved in the investigation. A RCMP representative came to Thunderchild and met with the family after the closed-casket funeral.

The FSIN's Senior Special Investigator agreed to liaise with the police on the family's behalf because they felt they were having difficult experiences with the police. He reviewed the file and determined that work was being done, but had not been conveyed to the family. He went to Thunderchild First Nation and met with the family, and later set up meetings between them and the police. He added that, once the family began meeting regularly with the police, some good information came forward from the reserve that the police would not have received if the communication lines had not been opened.

Thunderchild councilor Irma Horse believes that if the FSIN's Special Investigations Unit had not become involved, the case would not have gone anywhere. "Nothing was being done," she said.

In June 2003, the RCMP laid charges against Maxine Wapass's ex-boyfriend. The trial is schedule to commence in late November 2004. Saskatoon police declined to comment on this case, so as to not "jeopardize either the prosecution or the defence."

A family torn apart for the second time
Felicia Velvet Solomon - 16 years old - missing, March 25, 2003 confirmed dead in October, 2003

Felicia Solomon was born on July 21, 1986 at Norway House Cree Nation in northern Manitoba. She was the oldest of six children and a cousin of the late Helen Betty Osborne.[117]

As a teenager, Felicia Solomon lived with her family in Winnipeg where she attended high school. On the evening of March 25, 2003, the 16-year-old did not return home and did not call. Her mother says she phoned the police that evening and again the next day, but the police did not investigate.

On March 27th, Solomon's mother learned that her brother had died. Although she was worried that she had still not heard from her daughter, she felt she had

[117] See case study, Supra, at footnote 100.

to return to Norway House for her brother's funeral. She returned to Winnipeg early on the morning of March 30th and called the police right away. The police did not come to her home until 1:00 a.m that night. She describes the officers as being inattentive, laughing and acting rudely. The officers filled out a missing person report at that time but told her that according to policy they would have to wait 48 hours before they could do anything.

A Winnipeg police spokesperson has told Amnesty that the force responds to missing persons reports based on an assessment of the risk to the missing person and does not have a policy of waiting 48 hours, as many in the public believe. Nonetheless, the family ended up making their own missing persons posters and began putting them up all over Winnipeg. They say they received no help from the police and that the police made no effort to publicize the disappearance. According to the family, the police simply told them "to keep looking around for her."

A little over a month after Felicia Solomon disappeared, the family contacted their Chief and Council at Norway House. One of the councilors, Mike Muswegon, contacted Child Find, a national non-governmental organization based in Winnipeg, which agreed to produce posters. Muswagon also contacted the Assembly of Manitoba Chiefs, the political body representing First Nations in Manitoba, and arranged a press conference.

On June 11th 2003 Winnipeg police river patrol officers found a severed thigh near the water's edge. On June 16th, a man who was walking along the north bank of the river spotted an arm that was severed near the shoulder. In October, DNA testing confirmed that the body parts were those of Felicia Solomon. The rest of her remains were never found. As of August 2004, the crime had not been solved.

Felicia Solomon's family remains frustrated by the attitudes of the police. The family believes they were treated differently than non-Indigenous people would have been. One of the family members commented, "When we listened to the news, when something happened to someone else's child, whether they are white or from any other kind of race or culture, they do everything. It's completely different when an Indian person goes missing. We see that."

Family members also take issue with the stated reluctance of the police they met with to take action as soon as Felicia Solomon's disappearance was reported to them. "In our culture, when a child is missing, you automatically look for that child. Especially when you know your child and you know that they phone." Solomon's mother knew her child. "We shouldn't have to had to wait 48 hours."

Felicia Solomon's grandmother complained that after the family's press conference the media had unfairly labeled her granddaughter a prostitute and gang member because the family was poor and because of the part of the city they live in. She feels that the police inaction was also influenced by these assumptions. "Just because our daughter was on welfare and she lived on the west side doesn't mean that Felicia was a prostitute, or a gang member or that she was a druggie. You know, they label Aboriginal people right away. That's the part that we didn't like and I can't say anything positive about the police because they were no help. We didn't get help. We still don't get help."

Unanswered questions
Moira Louise Erb - missing August 2, 2003; found dead September 17, 2003

Moira Erb was born Marilyn Latender at the Fort Alexander First Nation in Manitoba; she was taken away from her birth mother by a social service agency when she was one year old. Her sister Patsy Fontaine remembered being 7 years old in 1978 and carrying her baby sister out to the car that would take her to a foster family. She did not see Moira Erb again until they were reunited about twenty years later.

Just before she turned two, Moira Erb was adopted into a farm family who had two children of their own. She ran away from home at the age of 16. She passed through a series of youth centres and group homes before ending up living on the streets in Vancouver, where she got involved with illegal drugs and the sex trade. She eventually had a child and later got married. The marriage did not work out. When she left her husband, she started using heavy drugs again. She entered into a relationship with a man with whom she had two sons. This relationship also did not work out and Moira returned to the sex trade. She eventually returned to Manitoba.

A health worker who befriended Moira Erb in Winnipeg described her as "funny, smart, honest and generous." She loved her children and would try to send them a small amount of money whenever she could. Erb's friend said that her heart was breaking because she couldn't be a parent to her children all of the time. However, Moira Erb was also very sick. She had tested positive for HIV/AIDS but her drug addictions were interfering with her taking her medications.

In June, 2003, Moira Erb's daughter came to Winnipeg for a visit and stayed with Erb's father at his farm. Her two sons were also brought to the farm for a brief visit that month. Erb made a promise to get off drugs so that she could see her children more often. She ended up staying off drugs for the month of July and told a friend that she was applying to go back to school.

Moira Erb went missing on August 2, 2003. She told her roommate that she was going to go next door. Then she apparently asked a neighbour to take her downtown. Her roommate looked for her but couldn't find anyone who had seen her. Erb's roommate reported her missing a week later.

On September 17, 2003, Moira Erb's badly decomposed remains were found in a rural area north of the Winnipeg airport near train tracks. The police concluded that her injuries were consistent with being struck by a train. Police do not suspect foul play.

Patsy Lafontaine does not believe that is how it happened. Moira Erb's father also has his doubts. Both point to the isolated location. Both point to the fact that Erb's body was found without any shoes. Both ask: Who took her there? Why? What did they do to her?

Moira Erb's father last had a brief phone message from the RCMP in late January 2004 indicating the investigation was ongoing but providing no updates. Patsy Lafontaine has never heard from the police. Knowing some of the rough neighbourhoods her sister sometimes worked in Patsy Lafontaine has gone to those places herself, and "sat at the corner" to ask questions. She does not believe the police have followed those same leads. In September 2004 the RCMP informed Amnesty International that the case had been "meticulously investigated" and the conclusion reached was that "Ms. Erb died tragically as the result of being struck by a train." The family has no details of the specific findings of any such investigation and continues to have unanswered questions about Moira Erb's death.

V. Conclusions and Recommendations

No one should suffer the grief of having a sister, mother or daughter suddenly disappear never to be seen again. No one should have to live in fear that they will be the next woman or girl to go missing.

Canadian officials have a clear and inescapable obligation to ensure the safety of Indigenous women, to bring those responsible for attacks against them to justice, and to address the deeper problems of marginalization, dispossession and impoverishment that have placed so many Indigenous women in harm's way.

All levels of government in Canada should work urgently and closely with Indigenous peoples' organizations, and Indigenous women in particular, to institute plans of action to stop violence against Indigenous women. The following platform for action is based on the recommendations made by the families of missing women, frontline organizations working for Indigenous women's welfare and safety, and official government inquiries and commissions, as well as standard interpretations of the human rights obligations of governments.

1. Acknowledge the seriousness of the problem

All levels of government, including Indigenous governance structures, should:

-publicly condemn the high rates of violence against Indigenous women – whether within Indigenous communities and society as whole -- and make public their plans to address the crisis.

-undertake a review of outstanding recommendations from Canadian commissions, inquiries and inquests pertaining to the safety and welfare of Indigenous people with a view to ensuring their timely implementation.

- clearly outline the measures taken to address the problem of violence against Indigenous women in Canada in reports to relevant UN human rights bodies, including the Committee on the Elimination of Discrimination against Women, the Committee on the Elimination of Racial Discrimination and the Human Rights Committee.

2. Support research into the extent and causes of violence against Indigenous women

The federal government should ensure adequate funding for comprehensive national research on violence against Indigenous women, including the creation of a national registry to collect and analyze statistical information from all jurisdictions.

In consultation with Indigenous peoples' organizations and organizations representing ethnic minorities, protocols should be developed to ensure that police consistently record and appropriately use data on the ethnicity of the victims and perpetrators of violent crimes.

The federal government should request the United Nations' Special Rapporteur on the situation of human rights and fundamental freedoms of indigenous people and Special Rapporteur on violence against women, its causes and consequences, to jointly study and document patterns of violence against Indigenous women, including in Canada.

3. Take immediate action to protect women at greatest risk

Federal, provincial and territorial governments should ensure adequate, sustained, multi-year funding to ensure the provision of culturally appropriate services such as shelters and counseling for Indigenous women and girls.

Police should work closely with Indigenous women's organizations and other frontline groups to identify and implement appropriate and effective protocols for action on missing persons cases, with a view to developing standards for police response in keeping with the risks to Indigenous women and girls.

Police forces should provide specialized staffing to review and coordinate responses to missing persons cases.

As part of ongoing review and implementation of laws regarding the sex trade in Canada, give police clear instructions to ensure that the fundamental rights of women involved in the sex trade are protected in the course of all law enforcement activities.

4. Provide training and resources for police to make prevention of violence against Indigenous women a genuine priority

All police officers should receive adequate training to ensure an understanding of violence against women in a range of settings including family violence, child sexual exploitation and violence against women in the sex trade.

The scenarios used in police training should incorporate issues of cultural sensitivity and violence against women.

Meetings with Indigenous women leaders and other community members should be organized to build understanding of the specific risks to Indigenous women in Canadian society and establish and strengthen relationships of trust between police and Indigenous communities.

All police departments should review issues of workload, staffing levels and job rotation to ensure officers have the opportunity to become familiar with and can develop relations of trust with the specific communities they are intended to serve and protect.

The actions of police, including compliance with policies on the investigation of missing persons cases, should be subject to independent civilian oversight.

Funding should also be provided for the creation of independent advocates and liaison workers for Indigenous people in contact with police.

Officers found to have failed to act on reports of missing women, or to have carried out biased or inadequate investigation of violence against women, should be subject to appropriate discipline.

Clear polices and practices should be established with respect to the timely provision of information, including autopsy results and coroners reports, to the families of missing and murdered persons.

5. Address the social and economic factors that lead to Indigenous women's extreme vulnerability to violence

The federal government should provide adequate, sustained, multi-year funding for initiatives to deal with the immediate and intergenerational impacts of both the physical and psychological abuse suffered at residential schools, including the loss of cultural identity.

Federal, provincial and municipal governments should subject all social programs to a periodic review to ensure the accessibility and resourcing of programs for Indigenous women and families is at least on a par with those available to non-Indigenous people in Canada.

Federal and provincial governments, with the full participation of Indigenous women, should organize a high level intergovernmental and interdepartmental meeting to ensure proper coordination and information sharing on initiatives to address the safety and welfare of Indigenous women and girls.

In collaboration with Indigenous representatives and organizations, the federal government should take urgent action to address the chronic unemployment and poverty faced by Indigenous women and men both on and off reserve.

The federal government should commit to fully implementing outstanding recommendations of the Royal Commission on Aboriginal Peoples which address poverty and social marginalization of Indigenous people in Canada, as has repeatedly been urged by United Nations treaty bodies.

6. End the marginalization on Indigenous women in Canadian society

All levels of government should work with Indigenous peoples to strengthen and expand public education programs, including within the formal school system, that acknowledge and address the history of dispossession and marginalization of Indigenous peoples and the present reality of racism in Canadian society.

All levels of government should adopt such measures as are necessary to ensure that Indigenous women are consulted in the formulation and implementation of any policy that could affect their welfare and status.

To all missing and murdered women
To survivors
And to all those who fight for justice

Table of Contents

Preface xi
Acknowledgments xv

Chapter One: Introduction 1
Injustice in Indian Country 5
A Note on Specificity 10
A Note on Terminology 10
What Is Justice? 12

Chapter Two: Literature Review and Methodology 15
Framing Jurisdiction Under Federal Indian Policy 15
Race, Gender and Colonization: Intersectionality in Sexual Violence Against Native Women 18
American Jurisdiction and Federal Indian Policy: Exerting Agency and Creating Social Change 21

Chapter Three: Historicizing Jurisdiction in Indian Country 27
Ex Parte Crow Dog—1883: The Original Jurisdictional Conflict 28
The Major Crimes Act—1885 30
The Dawes General Allotment Act—1887 32
Public Law 280–1953 34
Oliphant v. Suquamish Indian Tribe—1978 37
Conclusion 39

Chapter Four: Jurisdiction and Sexual Violence Against Native Women 45
Determining Jurisdiction in Indian Country 46
Federal Declination and Impunity 53
Predatory Violence Against Native Women in the Wake of *Oliphant* 55
The Colonial Context of Sexual Violence: Constructing the Native "Other" 57
The Colonial Context of Sexual Violence: Gendering the Body, Gendering the Land 70
Conclusion: Jurisdiction as Sexual Violence 73

Chapter Five: Examining the Federal Response to Jurisdictional Conflicts in Indian Country: The Tribal Law and Order Act of 2010 79
Framing the Problem, Framing Solutions 80
Western Legal Hegemony 84
The Homogenization of Violence: Racial Identity and Predatory Violence 88

Chapter Six: The Ghost of Kȟaŋǧí Šúŋka and the Enduring Myth of Savage Justice: The 2013 Reauthorization of the Violence Against Women Act 97
Chuck Grassley and the Ghost of Kȟaŋǧí Šúŋka: Analyzing Opposition to Title IX of VAWA 2013 99
Title IX: Policy, Perception and Potential 106
Whose Lives Matter? Domestic Violence and the Construction of the "Other" in VAWA 2013 107
"Safety for Indian Women" as Assimilation for Tribal Governments? Reexamining the Paradigm of "Law and Order" 113
Theorizing Solutions: Radicalizing VAWA 2013 116

Chapter Seven: Differential Consciousness, the Third Space of Sovereignty, and Strategies for Social Change 125
What is Justice? 129
Conclusion 130

CHAPTER THREE

Historicizing Jurisdiction in Indian Country

> Renee Brewer, a victim's advocate for the Citizen Potawatomi Nation remembers a woman who had been assaulted and called the police. With the attacker still hiding in the woman's closet, four different law enforcement agencies argued on the front lawn about whose case it was. As Brewer stated, "Then you wonder why these cases are not getting prosecuted—because the United States government made it as difficult as possible for us to handle our own prosecution on our own land."
>
> —Laura Sullivan[1]

When Europeans first arrived in the Americas, they were simultaneously confronted with a wealth of natural resources and the Native people who owned, occupied and managed these resources.[2] In order to justify the conquest of both the land and the people that they encountered, Europeans needed a way to legitimate the theft of resources from people with a pre-existing right to them. These first justifications came in the form of law.[3]

Using Papal Bulls (decrees from the Catholic Pope viewed as supreme law), the first Europeans in the Americas were able to legalize the colonization of Native lands and the enslavement of Native people.[4] With a legal justification for their presence secured, Europeans were able to continue to settle in the Americas, eventually forming the colonies that would become the United States. And throughout its development, the United States continued to use law to legitimate its own existence as a settler-state on Native land.[5]

The body of law that governs the relationship between Native nations and the United States of America is known as federal Indian policy. Federal Indian policy has defined and codified the legal relationship between Native people and the U.S. federal government through laws, executive orders, and Supreme Court cases.[6] Many Native legal scholars argue that while federal Indian policy may at times appear contradictory, it has always been designed to manage the problematic spaces that Native people occupy vis-à-vis the U.S. settler-state.[7] Because Native people have a pre-contact right to land, their existence has always been problematic in that it threatens American hegemony and stands in the way of complete colonization. In an attempt to remedy the "Indian problem," federal Indian policy has vacillated between policies of removal (relocating Native people "out of the way"), pbysical genocide (annihilating physical bodies) and assimilation (policies that use cultural genocide to assimilate Native people into the fold of American hegemony).[8]

It is against this backdrop of legal violence under colonization that we can begin to situate the emergence of jurisdictional conflicts in the prosecution of sexual violence against Native women. This chapter highlights five specific laws and policies that have directly led to the creation of modern jurisdictional conflicts in Indian country. By positioning these pieces within the trajectory of federal Indian policy, I contextualize the emergence of jurisdictional conflicts as part of a colonial narrative that seeks to divest Native people of their land, resources, and inherent sovereignty as part of managing the "Indian problem." By examining this process, I highlight additional themes that emerge from these specific laws and policies. In doing so, I theorize modern jurisdictional conflicts within a larger narrative of legal violence.

Ex Parte Crow Dog—1883: The Original Jurisdictional Conflict

On August 5, 1881, a Brulé Lakota man named Crow Dog (Kȟaŋǧí Šúŋka) shot and killed Spotted Tail (Siŋté Gleška, also Brulé Lakota) on the Rosebud Indian Reservation. Crow Dog was then tried and convicted for murder by the Dakota Territorial Court and sentenced to death. However, when Crow Dog arrived for his execution, he was told that he was free to go. His conviction had been appealed to the U.S. Supreme Court in *Ex Parte Crow Dog*, who ruled unanimously that the Dakota Territorial Court had no jurisdiction over the Rosebud Indian Reservation. Because this was a crime committed by a Native person, against another Native person in Indian country, the U.S. Supreme Court vacated U.S. territorial jurisdiction and returned it to the Lakota Nation.[9] Under Lakota jurisdiction, instead of the punitive measure of death, the Lakota people called for the restoration of

balance to the community. Lakota law dictated that Crow Dog care for Spotted Tail's family, which included financial and material compensation. Additionally, Crow Dog would no longer be allowed to participate in community activities.[10] Whereas Crow Dog's execution would have done nothing for the Lakota community, Lakota justice effectively addressed Crow Dog's actions while using his life to aid the family that Spotted Tail left behind.[11]

As is almost always the case, local jurisdiction and social control by communities who are most familiar with the needs of their members proved to be an effective mechanism of law and order. As historian Sidney Harring points out in the case of Crow Dog:

> Brule law was functioning and able to settle the dispute [...] It also made sound policy sense: the tribes were best able to adjudicate intertribal dispute [...] whatever the underlying reasons of the killings, the Brule Sioux were in a better position to know and judge them. They had a right to do so. That is the essence of tribal sovereignty.[12]

In addition to making sense from a policy standpoint, it was also the Lakota Nation's legal right to adjudicate the matter. By virtue of the 1868 Fort Laramie Treaty, the Lakota people had the sovereign right to exercise jurisdiction in their communities.[13] While the U.S. Supreme Court agreed, the neighboring white communities were incensed over what they perceived to be "primitive," "uncivilized" tribal justice.[14]

Ex Parte Crow Dog sparked intense outrage by white communities who saw Crow Dog as "getting away with murder."[15] Rather than understand Lakota law as one that was functioning and able to manage the dispute in a restorative way, the white community insisted on capital punishment as the only appropriate mechanism for social control. The unwillingness of the white community to incorporate a Lakota perspective into their understanding of law and order fueled intense fear of lawlessness in and around Indian country. As Native people were constructed as "savage" and "barbarous," Spotted Tail's murder and Crow Dog's subsequent release confirmed these suspicions.[16]

In addition to intense white anxiety over perceived "frontier lawlessness" in Indian country, discourse around *Ex Parte Crow Dog* demonstrates the emergence of a strong civilizing narrative in federal Indian policy. Here, Native justice systems were not only seen as dangerous to surrounding white communities, but also dangerous to Native communities themselves as they allowed savagery to triumph over civilization. As then-Secretary of the Interior Henry Teller noted of Crow Dog's case in 1883:

> [M]any of the [Indian] agencies are without law of any kind, the necessity for some role of government on the reservations grows more and more apparent each day. If it

> is the purpose of the Government [sic] to civilize the Indians, they must be compelled to desist from the savage and barbarous practices that are calculated to continue them in savagery [...][17]

Perceived notions of savagery presented a distinct problem for the federal government. At the time of *Ex Parte Crow Dog*, Indian country was seen as a lawless space that was dangerous to surrounding white communities.[18] In order to address this problem, Native people would need to be civilized. Therefore, white anxiety over Crow Dog's case was not just about fears of lawlessness, but also that the civilization of Native people, as part of remedying the so-called "Indian problem," would be disrupted if Crow Dog was to be left to "uncivilized" "tribal justice."[19] As Deloria and Lytle note:

> [...] to give compensation for a murder instead of invoking the death penalty, was considered a symbol of continued savage resistance to the overtures of a sincere "civilized" efforts to assist the Indians. All that people knew, or understood, was that the federal government was releasing rather than executing an admitted murderer.[20]

In Crow Dog's case, pervasive stereotypes of Native people and profound anxiety over lawlessness created a climate in which Native justice itself was constructed as a threat to proximate white communities and to American hegemony as a whole. As we see from Deloria and Lytle's commentary, there is a dichotomy between civilization and savagery in *Ex Parte Crow Dog* where the triumph of Lakota justice signaled a disruption in the civilizing mission of American law and policy. Within the narrative of perceived lawlessness in Crow Dog's case, a subtext emerges that integrally links the protection of non-Native bodies with a civilizing agenda. This transitory narrative in which Native people can evolve from savagery into civilization through the colonization of their governments by American law serves the dual purpose of addressing the "Indian problem" through assimilation, while also quelling white fears of perceived lawlessness in Indian country.

After *Crow Dog*, the federal government felt it had to act quickly to assuage white American fears of Indian country lawlessness while simultaneously repositioning Native peoples onto the trajectory of civilization. To accomplish these goals, Congress passed the Major Crimes Act.[21]

The Major Crimes Act—1885

Less than two years after the U.S. Supreme Court overturned Crow Dog's conviction, the Major Crimes Act was signed into law. The Major Crimes Act extends

jurisdiction over certain "major" crimes committed in Indian country to the federal government.[22] If the Major Crimes Act had been passed before the murder of Spotted Tail, Crow Dog would have almost certainly been executed. Though only two paragraphs long, the Major Crimes Act is a substantial encroachment on Native sovereignty that continues to impact Native communities today. As negative ideological constructions of Native people were codified into law, the fear of Native savagery facilitated the divestment in Native self-determination that laid the foundation for contemporary jurisdictional conflicts.

Though white fear over perceived lawlessness was central to the creation of the Major Crimes Act, the impetus behind the law was also deeply paternal. As legal scholar Philip Prygoski notes of the Major Crimes Act, "The underlying theory was that tribes were not competent to deal with serious issues of crime and punishment,"[23] signaling that both Native and non-Native communities could only be adequately protected from Indian country violence by the federal government. As Wayne Ducheneaux, former President of the National Congress of American Indians remarked in a 1991 Senate subcommittee meeting:

> [O]ur method of dealing with [murder] was Crow Dog should go take care of Spotted Tail's family, and if he didn't do that we'd banish him from the tribe. But that was considered too barbaric [...] so they passed the Major Crimes Act that said we don't know how to handle murderers and they were going to show us.[24]

Ducheneaux's statement highlights the idea that Native law was read as an absence of law, and that in order for the federal government to complete its civilizing mission, it was necessary to colonize Native justice systems themselves. Ducheneaux implicates the twin narratives of paternalism and civilization present in the creation of the Major Crimes Act. Here, the Act not only "protects" white people from the perceived lawlessness of Native communities, but it also "protects" tribes from themselves. While Native justice was considered "barbaric," Western-style justice would be able to show Native nations how to properly handle major crimes, thereby aiding in their civilization.[25]

Furthermore, in protecting tribes from their own barbarity while mollifying white communities, Congress was also able to address the "Indian problem," by readying Native nations for assimilation into the body of the American politic. As scholars Carol Lujan and Gordon Adams note, the Major Crimes Act was consistent with a trend towards "policies of dependency and systematic assimilation."[26] Here, the Major Crimes Act was not just about protecting the individual interests of neighboring whites who feared Native lawlessness, but it was also about protecting the United States' vested interests in assimilating Native people in the interest of resolving the "Indian problem."

Though passed over one hundred years ago, the Major Crimes Act is still the law of the land today and continues to be one of the first major inroads into Native jurisdictional sovereignty.[27] By trumping Native jurisdiction, the Major Crimes Act overrode treaties established between many Native nations and the U.S. government that stipulated jurisdictional autonomy. For example, though the Fort Laramie Treaty of 1868 guaranteed jurisdictional authority for the Lakota people (as demonstrated in *Ex Parte Crow Dog*), the Major Crimes Act effectively abrogated this provision without the consent of Native constituents. As such, the Major Crimes Act set the stage for further encroachments into tribal sovereignty.[28]

Through its effect on tribal sovereignty, the Act laid the foundation for modern jurisdictional conflicts. The Major Crimes Act drastically affects Native jurisdiction by introducing a separate sovereign into Indian country. As a result of the Major Crimes Act, when a crime occurs, one must first determine the type of crime (major or non-major). Then a two-pronged system of jurisdictional authority must be navigated in which Native nations and the federal government may have either exclusive or dual jurisdiction over the same crime.[29] And, as the following sections will show, subsequent laws and policies have exacerbated problems stemming from the Major Crimes Act, creating additional jurisdictional complexity.

The Dawes General Allotment Act—1887

During the same legislative era as *Ex Parte Crow Dog* and the Major Crimes Act, the General Allotment Act (Dawes Act) of 1887 was passed. While not specifically targeting reservation crime or jurisdiction, the Dawes Act had dramatic and enduring effects on the racial and spatial character of Indian country. Since jurisdiction is first predicated on location, the changing composition of reservation communities under Dawes continues to have deleterious effects on the ability of tribal communities to manage the activities on their land.[30]

The same desire to assimilate Native people into "civilized" Anglo-American society that was present in the Major Crimes Act is a major component in the creation and implementation of the Dawes Act.[31] Under this Act, reservation land that was guaranteed by right of treaty to Native nations as sovereign territory was divided into individual parcels by the federal government. These parcels were then distributed to individual Indian people. Rather than having a large area on which to live communally, many Native nations were divided and individual Indian people were allotted plots of land. The size of an individual Indian's parcel was usually 160 acres, often awarded to male heads of a nuclear household.[32] As former President Theodore Roosevelt put it, this strategy was designed as a "mighty pulverizing engine to break up the tribal mass," by replacing communal landholdings with individual ones.[33]

In an effort to remedy the "Indian problem," the Dawes Act was an assimilative effort to mold Native peoples into Euro-American farmers.[34] While the Major Crimes Act used "law and order" to "civilize" Native people, the Dawes Act used patriarchy and Euro-American gender roles. As Andrea Smith argues in *Conquest: Sexual Violence and American Indian Genocide*, land division under the Dawes Act was designed to inscribe hierarchies into non-hierarchical people in order to better control and assimilate the population as a whole.[35] If Native people could be civilized through agriculture and land privatization, the logic went, they could then be brought into the fold of white American hegemony and cease to be a cultural and financial burden on the United States. And, if Native men could be taught to control Native women under the Dawes Act (through male land ownership, patrilineal inheritance, shifting women out of the public and into the private sphere), then the U.S. could solve the "Indian problem" through dividing and conquering.[36]

While the assimilationist impulse behind the law was genuine, the desire to "civilize" Native people through the Dawes Act was a distant second to the primary goal of appropriating Native land for white settlement. As members of Congress who opposed allotment noted, "The real aim of [allotment] is to get at the Indian lands and open them up to settlement. The provisions for the apparent benefit of the Indian are but the pretext to get at his lands and occupy them."[37] Under the Dawes Act, after all individual Indian parcels were allocated, whatever land was "leftover" was conveniently freed up for the U.S. government to dispose of. This "surplus" land could then be used for railroads, extracting natural resources, and for white settlement.[38] When the Dawes Act was passed in 1887, Indian landholdings were estimated to be approximately 138 million acres. By the time the Allotment Era ended with the passage of the Indian Reorganization Act in 1934, this number had been reduced to 48 million acres—a total loss of approximately two-thirds or ninety million acres. This is an area about the size of Montana.[39]

Though the Allotment Era ended in the 1930s, the effects of the Dawes Act persist. In addition to illegally divesting Native peoples of the land guaranteed to them by treaty, the Dawes Act introduced a large population of white settlers into land previously occupied exclusively by Native nations.[40] Land that was once a large, relatively homogeneous space was divided into small parcels on which Native and non-Native families lived in close proximity. Allotments owned by Native individuals were interspersed with parcels owned by private American citizens, state governments, and the federal government. In jurisdictional terms,

this "checkerboarding" made the boundary between Native and non-Native land shift from being relatively distinct to impossibly entangled.[41] Inheritance policies written into the Dawes Act exacerbate this entanglement through a phenomenon called "fractionation." Because the Dawes Act divided Native parcels equally among children upon the death of the head of household, individual parcels have subsequently gotten smaller and smaller. Today, more than 100 years after the Dawes Act became law, some individual plots have been reduced to less than one square foot of ground.[42]

The implications of the Dawes General Allotment Act in Indian country jurisdiction are profound. As jurisdiction is predicated on the location of a crime, the Dawes Act has made determining whether a parcel in Indian country is governed by tribal, state, or federal entities exceptionally complex. Additionally, the inundation of Indian country with non-Native residents has complicated matters further, as increased interactions between white Americans and Native people form the foundation of subsequent federal Indian policy that challenges Native jurisdictional sovereignty.

Public Law 280–1953

Though policies of outright physical annihilation of Native peoples were abandoned by the middle of the twentieth-century, the U.S. federal government was still deeply entrenched in addressing what it continued to see as the "Indian problem." In exchange for vast tracts of land, the federal government entered into what is known as a "trust relationship" with Native peoples. Under the trust relationship, the federal government became the trustee of Native resources and, in exchange, guaranteed that it would provide vital services to Indian country and protect Native land and sovereignty.[43] While the federal government enjoyed the economic resources it acquired through treaties, by the 1950s it was reluctant to use any of these resources to make good on its responsibilities to Native people.[44] Under the trust relationship, the "Indian problem" endured as Native people stood in the way of complete American hegemony. In an effort to "solve" this "problem" Congress entered into what historians have dubbed the "Termination Era."

Starting in the late 1940s, Congress used federal Indian policy to "terminate" the relationship between the federal government and Native people to "get out of the Indian business."[45] To accomplish this, Congress ignored its own policies that recognized the sovereignty of Native people and the rights that they maintained through treaties, and began to sever the trust relationship, reduce funding to Indian

country, revoke federal recognition of Indian tribes, and relocate Native people to urban areas.[46] It is in this context that Congress created Public Law 280.[47]

Public Law 280 (PL 280) was a driving force in Termination Era policies. According to Deloria and Lytle, the goal of PL 280 was "terminating federal supervision over Indians and their property with the ultimate goals of assimilating them into American society and eliminating the reservation enclaves of Indian culture."[48] Central to this goal was the massive restructuring of criminal jurisdiction in Indian country. Without the consent of tribes or states, PL 280 transferred criminal jurisdiction in Indian country to state governments in six mandatory states: California, Minnesota (except the Red Lake Nation), Nebraska, Oregon (except the Warm Springs Reservation), Wisconsin (except later the Menominee Indian Reservation) and, upon its statehood, Alaska.[49] Although only six states were mandatory PL 280 states, these six states contained 359 of the over 550 federally recognized tribes at the time, affecting over 65% of Native nations.[50] Other states in addition to the mandatory PL 280 states were allowed to opt-in to the system, and since then Nevada, South Dakota, Washington, Florida, Idaho, Montana, North Dakota, Arizona, Iowa and Utah have adopted PL 280.[51] While previous legal statutes had guaranteed Native nations freedom from state jurisdiction,[52] Public Law 280—in its quest to dissolve the federal relationship with Native nations—iguored this and granted states sweeping criminal jurisdiction in Indian country.

Though financial motivations to dissolve federal relationships with Native nations were driving forces behind the law, PL 280 reveals familiar themes of lawlessness as central to its formation. After the Dawes Act ushered in large communities of white settlers in and around Indian country, the new non-Native residents were quick to express profound anxiety over the activities in Indian country, describing Native people as "disorderly and incapable of self-government"[53] and Indian country as places of "rampant crime and disorder."[54] Native justice systems were again constructed as weak and ineffective, while federal jurisdiction was considered distant and limited.[55] While the Major Crimes Act had intended to address concerns of lawlessness in Indian country, transferring jurisdiction to the federal government had merely created a system in which a distant and unresponsive federal government had failed to address law and order at all.[56] This was exacerbated by Termination Era policies that severely cut vital services to Native nations, impeding Native communities from maintaining law and order through the limited jurisdictional authority that they still maintained. Ironically the result was that the very system that had sought to address fears of lawlessness had, in reality, created a very real sense of lawlessness in Indian country.[57]

To address the reality of lawlessness that emerged as the result of its own policies, some scholars note that the federal government could have addressed the issue by strengthening tribal justice systems.[58] Native nations had always had fully functioning systems of law and order, and it wasn't until this system was disrupted that a true sense of lawlessness began to emerge.[59] However, funding Native nations did not fit with an assimilationist paradigm and was especially incongruent with Termination Era policies of dissolving federal relationships with tribes. Instead, the federal government decided to legislate over the problem by passing PL 280 and farming out federal jurisdiction to state agencies. This accomplished several goals of the Termination Era project: it saved the federal government money as it took steps to "get out of the Indian business," it severed federal relationships with Native nations, and it quieted white anxiety over perceived lawlessness by transferring jurisdiction to state authorities.[60]

While Congress acted ostensibly to address white fears of lawlessness, it was readily apparent that dissolving its financial responsibility to Native nations was more important than addressing concerns over law and order in earnest. As one publication put it, "Congress was concerned about satisfying the law and order demands of Anglos living on or near reservations, but only so long as the federal government did not have to pay."[61] The transfer of jurisdiction to state governments under PL 280 turned out to be an unfunded mandate. Under PL 280, state governments were forced to manage crime on reservations, yet did not receive any additional funding to do so. With no funding from the federal government, and with no tax revenues generated from reservations within their boundaries, state governments were reluctant to use any of their resources on law enforcement in Indian country. This had major consequences as Native infrastructure weakened and state governments refused to fill any law enforcement shortfalls. As Goldberg and Champagne note:

> Public Law 280 was supposed to provide the solution to the problem of "lawlessness" by empowering state civil and criminal courts to do what the tribal and federal systems supposedly could not. Ironically and tragically, however, Public Law 280 has itself become the source of lawlessness on reservations.[62]

Called "one of the most bold and discriminating actions against Natives in the legal and judicial system,"[63] PL 280 had devastating effects on Native nations, which continue to manifest today. As an unfunded mandate, state law enforcement in Indian country has become sporadic.[64] As a divestment in tribal sovereignty, Native nations have been unable to exercise local control over the activities in their own community.[65] While this contributes to an overall sense of lawlessness in general, PL 280 also contributes to the creation and maintenance of modern jurisdictional conflicts in particular.[66]

In an attempt to terminate federal responsibility over Native people, PL 280 introduced a third sovereign into the jurisdictional schema in Indian country. While the Major Crimes Act introduced the federal government as a second sovereign (sometimes competing with and sometimes usurping tribal jurisdiction), under PL 280, state governments became a third entity with which to negotiate jurisdiction. While these complications make crime in Indian country more difficult to adjudicate in general, it has a disproportionate impact on Native women, as cases of sexual assault often fall through the cracks.[67]

Oliphant v. Suquamish Indian Tribe—1978

As a direct result of Allotment Era policies, the Port Madison Indian Reservation located in northwest Washington is home to a large number of non-Native residents. By the 1970s, approximately 63% of the reservation was owned by non-Native individuals, living alongside Native families on a checkerboard of individual parcels.[68]

In August 1973, Mark David Oliphant, a non-Native resident, allegedly assaulted a Suquamish tribal police officer and resisted arrest. Oliphant was arrested and charged by tribal police.[69] Though Oliphant is a non-Native person, treaties with Native nations have consistently recognized Native jurisdiction over non-Native perpetrators. This jurisdictional language was often repeated in treaties with various tribes. For example Article V of the 1785 Treaty of Hopewell with the Cherokee states:

> If any citizen of the United States, or other person not being an Indian, shall attempt to settle on any of the lands [...] which are hereby allotted to the Indians [...] such persons shall forfeit the protection of the United States, and the Indians may punish him or not as they please.[70]

After his arrest, Oliphant appealed his case to local courts who rejected it, citing the inherent sovereignty of the Suquamish to maintain law and order within their communities.[71] This was in accordance with previous case law, as well as with treaties signed by other tribes. Oliphant then appealed this decision to the U.S. Supreme Court in *Oliphant v. Suquamish Indian Tribe*, and on March 6, 1978, the Supreme Court reversed the lower court's decision. Ruling that Native nations do not have the legal right to arrest and prosecute non-Native offenders, the court sided in favor of Oliphant in a six to two decision.[72]

The Oliphant decision colonized the inherent (and dually codified) right of pre-constitutional Native nations to govern the people and activities on their own land, and was thus a devastating blow to tribal sovereignty.[73] Under *Oliphant*, Native nations were prohibited from exercising jurisdiction over non-Native individuals on Indian land. While the authority to maintain local control within a society is central to maintaining law and order, the Oliphant decision denies Native communities this basic tenet of self-determination. As Lujan and Adams note, "Oliphaut strikes directly at the heart of a tribe's ability to protect itself by institutionalizing discourses that deny tribal police the protection and authority that every other community in America bestows on their police."[74]

The background and discourse around the Oliphant case reveals familiar themes of racism and paternalism. At the time of Oliphant's arrest, the Suquamish had a fully functioning Western-style court system. Yet, as a white American, Oliphant was relieved of his responsibility as a Suquamish community member. Despite the fact that the Suquamish had "elevated" themselves to the level of American judicial hegemony, the federal government viewed them as somehow short of truly entering American civilization. The outcome of *Oliphant* indicates that even the "civilizing" project of previous federal Indian policy was not enough to trump the enduring myth of Native savagery, and begs the question: what, if anything, can?[75]

Paired with the myth of Native savagery, white anxiety over Native lawlessness endures in *Oliphant*. In the majority opinion, Justice William Rehnquist cited a previous case, *In re Mayfield* to justify his ruling against the Suquamish:

> In *In re Mayfield* (1891) the Court noted that the policy of Congress had been to allow the inhabitants of the Indian country "such power of self-government as was thought to be consistent with the safety of the white population with which they may have come in contact, and to encourage them as far as possible in raising themselves to our standard of civilization."[76]

In *In re Mayfield*, white fears of the perceived violence and danger of Native communities were enmeshed with the civilizing mission inherent to the assimilationist paradigm of federal Indian policy. *Mayfield* indicates that divesting Native nations of their inherent and pre-existing sovereign right to exercise jurisdiction in their own communities served a dual purpose: it protected white bodies, while also delivering Native people into civilization. Rehnquist's decision to use the racist language of *In re Mayfield* in *Oliphant* reflects this—his argument essentially being that since the U.S. Supreme Court has already acted in favor of protecting white interests and "civilizing" Native nations, that the current court must follow suit. Despite noting in *Oliphant* that "Congress never expressly forbade Indian tribes to impose criminal penalties on non-Indians,"[77] Rehnquist still insisted on leveraging

the power of the U.S. Supreme Court to effectively do so. Here, Rehnquist chose to engage with the vague and racist statute set in *In re Mayfield*, rather than uphold tribal sovereignty which had been clearly expressed in the form of many constitutionally binding treaties.

The Oliphant decision is one of the most significant blows to tribal sovereignty in American history and is a major factor in the development of modern jurisdictional conflicts. As one scholar notes, "Today, thanks to *Oliphant*, non-Indians know that practically no one has criminal jurisdiction over them on the Indian reservations,"[78] creating a climate in which violence against Native people is often met with impunity. Like PL 280, *Oliphant* illustrates the colonial irony that the *fear* of lawlessness by white communities creates a very *real* sense of lawlessness for Native people in Indian country.

Conclusion

The epigraph at the beginning of this chapter tells of a victim's advocate recounting a night when four different law enforcement officers chose to argue over jurisdiction rather than confront the perpetrator or address the needs of the survivor. The advocate states, "Then you wonder why these cases are not getting prosecuted—because the United States government made it as difficult as possible for us to handle our own prosecution on our own land."

This chapter argues that the U.S. government has, indeed, made it as difficult as possible for Native people to manage their own prosecutions on their own land. Though control over the activity on one's land is fundamental to community safety, the U.S. federal government has consistently encroached upon this sovereign right, transforming law and order in Indian country from something that was once local and efficient, to one that is distant and largely ineffective. While some legal scholars treat jurisdictional conflicts as collateral damage from a complicated yet necessary system needed to address the "unique" legal relationship between the federal government and Native nations,[79] I have demonstrated that this is not the case. Instead, jurisdictional conflicts are the direct result of federal Indian policy that has consistently used legal violence as a method to colonize Native land, assimilate Native people, and "solve" the "Indian problem."

Additionally, a closer examination of these five pieces of law and policy reveals more subtle themes. *Ex Parte Crow Dog*, the Major Crimes Act, the Dawes General Allotment Act, Public Law 280, and *Oliphant v. Suquamish Indian Tribe* each demonstrate that the policies most directly responsible for the creation of modern jurisdictional conflicts are also marked by paternalism, a civilizing mission,

investment in white American hegemony, protection of white bodies from the perceived threat of Native savagery, the protection of white economic and social interests, divestments in tribal sovereignty, and the colonization of Native justice systems. In turn, it becomes impossible to separate the motivations behind these policies from their results, as jurisdictional conflicts *themselves* emerge as marked by these themes. Thus, when four law enforcement agencies argue on the front lawn of a Native woman's home as her attacker remains hidden in the closet, hundreds of years of federal policy are inscribing legal violence on her and her community. Paternalism, divestments in tribal sovereignty, and investments in white American hegemony are literally part of the violation that this woman experiences as her attack is met with impunity. Jurisdictional conflicts, the history of federal Indian policy, and legal violence can therefore not be separated. While this affects all Native people in Indian communities, this type of legal violence often affects Native women in particular. The next chapter illustrates the way these laws shape the experience of Native women in Indian country, arguing that sexual violence against Native women today is structured by this history of legal violence against Native communities as a whole.

CHAPTER FOUR

Jurisdiction and Sexual Violence Against Native Women

> It's rape tourism, right here in Oklahoma, South Dakota, Alaska, and any place where the confusing mess of jurisdictional issues allow perpetrators to hide. Are there even words to describe this evil?
>
> —Andy Ternay[1]

Chapter Three demonstrates that legal violence has been used as a colonial tool to "solve" the social, political, legal, and physical aspects of the "Indian problem." However, to give the impression that law has been the *principal* tool of colonization would be incorrect. In fact, just as legal violence was present at first contact, so too was sexual violence against Native women.[2] While federal law constructed Native communities as unfit for political sovereignty, social constructions of Native women by colonizers portrayed Native women as having no right to corporal sovereignty.[3] By using sexual violence as a weapon, colonizers attempted to control Native nations as a whole by targeting Native women in particular. In this context, both sexual and legal violence became fused in a comprehensive colonial approach to address the problematic space that Native communities have always occupied vis-à-vis the American settler-state.

By reading sexual violence in tandem with law, I argue that non-Native criminal impunity in Indian country is not simply collateral damage from a legal system that by nature must be complex. Instead, I demonstrate the ways that modern

jurisdictional conflicts are the direct result of federal policy that has *always* been characterized by both legal and sexual violence against Native people. In this chapter, I theorize sexual violence in a colonial-legal context, while demonstrating the real effects that jurisdiction has on contemporary Native women. By highlighting the way that jurisdictional conflicts disproportionately affect Native women by allowing impunity for sexual assault, I support my thesis that the confluence of legal and sexual violence present since European contact continues to maintain and inscribe colonial violence on the bodies of Native women in Indian country today.

Determining Jurisdiction in Indian Country

Regardless of her racial identity, when a woman is sexually assaulted outside of Indian country, jurisdiction is relatively straightforward. If it happens on state land, for example, it generally falls under state jurisdiction and goes to a district court (see Figure 1).[4] When a woman is sexually assaulted in Indian country however, the jurisdictional scheme is quite different. In Indian country—because of the Major Crimes Act, Public Law 280, *Oliphant*, and recently the Violence Against Women Reauthorization Act of 2013—the type of crime, exactly where it occurred, the racial identity of the perpetrator and victim, and the nature of their relationship to each other and to the community all play key roles in determining jurisdictional authority.[5]

Because of the Major Crimes Act, when a crime is committed in Indian country, the type of crime (major or non-major) must be determined. Sexual assault is always considered a "major" crime and the Major Crimes Act applies.[6] Here, the Major Crimes Act immediately introduces a second sovereign in addition to the Native nation. While non-major crimes may fall under the sole jurisdiction of the tribe, major crimes introduce either the state or the federal government as a second sovereign that may have either sole jurisdiction over the crime or may share jurisdiction with the tribe. In cases of dual jurisdiction, double jeopardy does not attach because the crime falls under the jurisdiction of separate sovereigns.[7] To determine which second sovereign (the state or the federal government) is introduced under the Major Crimes Act, it is vital to determine exactly where the crime occurred.

If it is determined that all or part of a crime was committed in Indian country, it must then be determined whether or not the land on which the crime was committed is subject to Public Law 280 (PL 280). If it is determined that the assault occurred in Indian country subject to state jurisdiction under PL 280, then the Major Crimes Act introduces that state as a second sovereign. In these cases, depending on the racial identity of the parties involved and the nature of their relationship to each other and to the Native community, the state either maintains sole jurisdiction over the crime or dual jurisdiction shared with the tribe. If it is determined that the assault occurred on land not subject to PL 280, then the second sovereign introduced by the Major Crimes Act is the federal government. Then, depending on the racial identity of the parties involved and the nature of their relationship to each other and to the Native community, the federal government either maintains sole jurisdiction over the crime or dual jurisdiction shared with the tribe.[8]

Determining PL 280 status is often difficult. While the 1953 law initially forced the transfer of federal jurisdiction to six mandatory states, subsequently other states have been allowed to opt in and out of PL 280 status.[9] Some Native nations were once under PL 280 jurisdiction but retroceded from it, creating exceptions to state jurisdiction under PL 280 in some cases. This is the case in the Umatilla Reservation in Oregon, for example, that was once under PL 280, but has since retroceded Oregon state jurisdiction.[10] Also, many states have only limited jurisdiction under PL 280. This means that a state could technically be a PL 280 state, but only have jurisdiction over air and water pollution and no jurisdiction over sexual assault (as is the case in Arizona). Or, a state might have PL 280 jurisdiction over sexual assault, but only if it occurs on highways (as is the case in South Dakota). Alternatively, a PL 280 state might have jurisdiction over civil cases, but not criminal cases (as is the case in Iowa), in which a civil suit against a rapist would fall under state jurisdiction, but a criminal case would not.[11]

Additionally, some reservations are not entirely within the bounds of a given state, sometimes crossing between PL 280 and non-PL 280 states, and even crossing between national borders. Such is the case of the Navajo Nation that spans Arizona, New Mexico and Utah, and the Mohawk Nation of Akwesasne that falls within New York in the United States and the provinces of Ontario and Quebec in Canada. Because of numerous variations and exceptions, determining if state jurisdiction under PL 280 applies can be very complicated.[12]

Yet another difficulty in determining jurisdiction comes from the Dawes Act. The division of Native land under the Dawes Act not only introduced a large white population into Indian country, but also created a checkerboard pattern of land ownership. This process of "checkerboarding" means that the boundaries of Indian country often encompass many tracts of land that are not legally part of Indian country. Because of checkerboarding, even if a survivor knows exactly where she was assaulted within the bounds of a reservation, it is often extremely difficult to find out if that particular parcel of land is technically part of Indian country.[13] As one assistant U.S. attorney remarked, "If it's a parcel of property in a rural area, it may take weeks or months to determine if it's Indian land or not;

investigators usually cannot determine this, they need attorneys to do it by going through court and title records to make a determination."[14]

These difficulties are exacerbated for crimes where the survivor is unable to determine exactly where the assault took place. In cases in which women are blindfolded, drugged, intoxicated, knocked unconscious, and/or transported in moving vehicles, mapping the exact place(s) where the assault occurred can be nearly impossible. Such was the case for two Native women in Oklahoma in 2005:

> In both cases, the women were raped by three non-Native men [...] Because the women were blindfolded, support workers were concerned that the women would be unable to say whether the rapes took place on federal, state, or tribal land. There was concern that, because of the jurisdictional complexities in Oklahoma, uncertainty about exactly where these crimes took place might affect the ability of these women to obtain justice.[15]

Compounding the difficulty of using location as a determinant in Indian country are the identity politics at work in the wake of the Oliphant decision. After the U.S. Supreme Court stripped Native nations of their ability to arrest and prosecute non-Native perpetrators in *Oliphant v. Suquamish*, the racial identities of the parties involved in Indian country crime have become central to determining jurisdiction. Once the type of crime, the location of the crime, and the applicability of PL 280 are determined, the racial identity of the parties involved must be verified to determine jurisdiction.[16] If the perpetrator is non-Native, the victim is Native, and it is determined that the crime occurred in Indian country subject to PL 280, then the state has jurisdiction. If the perpetrator is non-Native, the victim is Native, and it is determined that the assault occurred in Indian country not subject to PL 280, then the federal government has jurisdiction. If both the perpetrator and the victim are non-Native, the state has jurisdiction regardless of PL 280 status. If the assault occurs in Indian country subject to PL 280, the perpetrator is Native, and the victim is Native, then both the state and the Native nation in which it occurred have concurrent jurisdiction. If the assault occurred in Indian country not subject to PL 280 and both the perpetrator and victim are Native, then both the federal government and the Native nation in which the crime occurred have concurrent jurisdiction (see Figures 2–6).[17] Each scenario is also shaped by the relationship between the perpetrator/victim and the perpetrator/Native nation in that in some cases the tribe may extend limited jurisdiction over non-Native perpetrators under Title IX of the Violence Against Women Reauthorization Act of 2013 (VAWA 2013) when it otherwise would not.

While determining the exact location of an assault and PL 280 applicability can be incredibly difficult, determining the racial identity of those involved can be equally problematic. Despite making sweeping regulations governing the authority to manage crimes that involve "Indians" and "non-Indians," both Congress and the U.S. Supreme Court have failed to provide a consistent definition of who an "Indian" is. In fact, there are dozens of different definitions of the term "Indian" under the law.[18] As Pevar notes:

> Each government—tribal, state, and federal—decides who an Indian is for the purposes of that government's laws and programs. This can result in someone being an Indian under tribal law but not under federal law, under federal but not tribal law, under tribal but not state law, and so forth.[19]

Native identity in the United States is complicated and is often found at the confluence of racial, social, ethnic, and political elements. Often, Indian identity is not simply a matter of blood quantum or enrollment, but also a complex matrix of representation, recognition and active participation[20] that is variously recognized by tribal, state and federal governments. Based on physical appearance, someone may be labeled as "White" or "Black" but may also be an enrolled member of a Native nation. Phenotypically, someone may appear to be Native but have no Native ancestry. Alternatively, someone might be of Yaqui or Tohono O'odham ancestry but was born on the Mexican side of their ancestral homelands, rendering them "non-Indian" in the eyes of the federal government. Similarly, someone might be enrolled in a Native tribe that is not federally recognized, possibly making them "Indian" for the purposes of a state government but not the federal government. Determining Native identity may take a serious investment in not only researching legal enrollment but also in talking to individuals, community members, as well as researching family and oral history. Despite this, law enforcement officials are required to determine the Indian/non-Indian racial identity of the parties involved in a crime in order to adjudicate it.

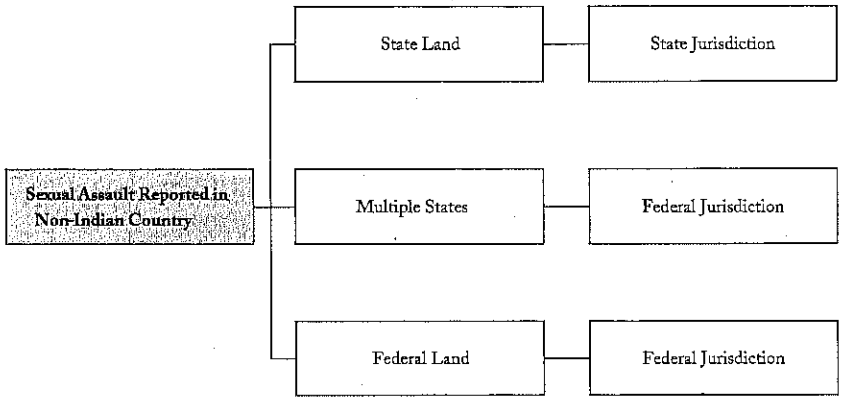

Figure 6. Jurisdiction for Sexual Assault In Non-Indian Country.[23]

Using racial identity as a criterion for arrest and prosecution is a significantly flawed approach to adjudicating crime. In addition to subjecting law enforcement officials to the complex task of determining a racial identity that is not clearly defined, using race as a jurisdictional determinant further marginalizes Native communities by collapsing ethnic identities while giving perpetrators another avenue to manipulate the criminal justice system.

The confusion created when ethnic and racial identities are enmeshed is readily apparent in the 1990 U.S. Supreme Court case *Duro v. Reina* in which Albert Duro of the Torres Martinez Desert Cahuilla Indians was accused of killing a teenage boy in the Salt River Pima Maricopa Indian Community. Here, Duro was clearly an "Indian" yet was not a member of the Native nation in which he committed the crime. This created confusion as it raised the question of whether or not non-member Indians were considered "Indians" for the purposes of jurisdiction.[24] In response, Congress passed the "Duro Fix," which provided that for the purposes of jurisdiction, all Native people—regardless of Native membership—share legal standing as "Indians" for the purposes of prosecution in Indian country.[25]

Considering that each Native nation has its own culture, history, laws and government, folding unique ethnic identities into a monolithic "Indian" racial identity is marginalizing for Native communities. On one hand, the collapse of ethnic identity is paradoxical in a jurisdictional scheme that clearly values the identity of perpetrators; on the other, it is predictable given the history of federal Indian policy. As noted in the previous chapter, federal Indian policy has been designed to protect the civilized "Us" from the savage "Other." The "Other" in this case was all "Indian" people whose savagery was defined simply by failing to be

Euro-American. Though each Native community is unique, they all became the "Indian" "Other" in the eyes of the federal government under the Duro Fix.

Using race as a jurisdictional determinate is additionally problematic when perpetrators use identity politics to avoid arrest. In some cases, suspects have exploited *Oliphant* and the Duro Fix by strategically enrolling or disenrolling themselves from their Native nations to manipulate jurisdiction and sidestep prosecution.[26] The idea that someone can be an Indian while committing a crime, and somehow be a non-Indian while being adjudicated for that crime, is a testament to the arbitrary nature of using racial identity as a criterion for prosecution in Indian country. Or, as was the case in *Oliphant*, the idea that someone could live in a community, assault a member of that community on community land, at an event hosted by that community, yet not be held accountable for their actions by that community, demonstrates the way that identity politics systematically strip Native peoples of their ability to exert meaningful control over the people and activities on their land.

Finally, since the Violence Against Women Reauthorization Act of 2013 (VAWA 2013), the type of assault, the relationship between the perpetrator and the survivor, and the relationship between the perpetrator and the Native community must also be defined in order to determine jurisdiction. While Title IX of VAWA 2013 challenges *Oliphant* to allow tribes to prosecute some non-Native perpetrators, it continues to complicate matters by using the nature of the perpetrator/victim and perpetrator/community relationship as determinants in jurisdiction (see Figures 3–5). Under VAWA 2013, tribes may exert some limited jurisdiction over non-Native offenders if: the perpetrator is an intimate, dating or spousal partner; or if the perpetrator has ties to Indian country as a resident, employee, or romantic partner of a Native community member. This most recent development in Indian country jurisdiction is theorized at length in Chapter Six, however the jurisdictional mechanics resulting from VAWA 2013 will be considered throughout this chapter.

Federal Declination and Impunity

Sexual assault cases in general are difficult to prosecute, but Indian country jurisdiction has exacerbated this challenge, leading to exceedingly high declination rates.[27] In Indian country, criminal proceedings often start with a "mini-trial" to determine jurisdiction.[28] From these mini-trials it could take weeks or months to determine whether jurisdiction is federal, state, tribal, or a combination of two or

more sovereigns.[29] In the meantime, perpetrators can flee and evidence can be lost, mishandled, or degraded—all of which contribute to high declination rates.[30]

When criminal investigations focus on jurisdiction, evidence collection and interviewing people of interest are often postponed. And, if one sovereign entity does collect evidence, it may be thrown out by another agency that may have different standards for chain of custody, search warrants, and evidence collection. Until recently,[31] Indian Health Service (IHS) hospitals had no standard protocols for collecting sexual assault forensic information from Native women who had been raped, and often, this information was not collected at all. When evidence was collected, it was often mishandled or destroyed, and therefore inadmissible in court.[32]

Additionally, although the federal government has a responsibility for providing health care and other basic services to many Native communities, up until recently, IHS facilities often did not have sexual assault forensic examination kits. In some cases where Native women were raped in Indian country but taken to non-IHS hospitals, they were expected to pay for their own rape kits—which can cost between $700–$800.[33] This is a service that is usually provided free of charge for individuals who are part of a state investigation into sexual assault.

When evidence and investigation take a back seat to jurisdiction, it means that perpetrators are rarely arrested. In cases where a warrant is issued, often so much time has elapsed that perpetrators have fled.[34] In some cases, determining jurisdiction and collecting enough evidence for an arrest has caused law enforcement authorities to wait up to four years to arrest someone suspected of sexually assaulting a Native woman.[35]

As a result of Native advocacy around these disturbing trends, the federal government passed the Tribal Law and Order Act (TLOA) in 2010. This law was, among other things, designed to: increase intergovernmental communication by facilitating coordination between tribal, state and federal law enforcement bodies; prepare IHS facilities by developing uniform procedures and granting resources to manage sexual assault cases; and encourage accountability by tracking and publishing federal declination rates.[36]

The TLOA appears to have significantly lowered declination rates for sexual assault in Indian country.[37] However, while the TLOA signaled measured improvement in declination rates, they still remain disproportionately high. As Chapter Five will demonstrate, the TLOA legislated *over* the problem of jurisdictional conflicts without addressing the underlying issues that shape crime in Indian country. While the TLOA may have ameliorated some problems in the short term, it cannot dismantle the root problem in the long term, leaving us continuing to grapple with high rates of sexual assault against Native women.

Because of enduring problems with jurisdiction, often cases still do not result in arrests or referrals to state and/or federal governments. And even when jurisdiction can be determined, and enough evidence is collected for cases to be taken on by the federal government, attitudes and perceptions of Indian country also contribute to high declination rates. As former U.S. Attorney Margaret Chiara noted:

> I've had [assistant U.S. attorneys] look right at me and say, "I did not sign up for this" [...] they want to do big drug cases, white-collar crime and conspiracy. And I'll tell you, the vast majority of judges feel the same way. They will look at these Indian country cases and say, "what is this doing here? I could have stayed in state court if I wanted this stuff." [...] It's terrible indifference, which is dangerous because lives are involved.[38]

While the federal government colonized tribal jurisdiction under the rhetoric that Native people were incapable of managing serious crimes, today the United States often refuses to manage the duties it has appropriated. From a federal perspective, it appears that when crime in Indian country endangers white Americans sweeping legislation should be passed. However, when crime in Indian country affects Native women, it can be ignored in favor of what is seen as more important matters that primarily affect non-Native people. In other words, while crime in Indian country is too important to be left to Native people, it is not important enough to take resources away from white-collar crime. As federal prosecutors construct prosecuting sexual violence in Indian country as being inconsequential, they send the message that the lives and bodies of Native women are not valuable or worthy of protection. And, outside of the Native community itself, it appears that no one has heard this message louder than non-Native men.

Predatory Violence Against Native Women in the Wake of *Oliphant*

When traveling through Indian country, rather than falling under the jurisdiction of a sovereign by implied consent (such as when one crosses the border from one U.S. state to another, or travels from the U.S. to a foreign country), Indian country post-*Oliphant* is a space where the majority of non-Native people may enter a foreign sovereign, yet have no accountability to that sovereign. Jason O'Neal, the tribal police chief of the Chickasaw Nation, shows us what this reality looks like for tribal law enforcement in an interview with National Public Radio's Laura Sullivan. The interview takes place on Chickasaw land outside of a gas station convenience store:

Laura Sullivan:	Here's a guy walking into the store now. If he goes in there and he steals a carton of cigarettes, what happens to him?
Jason O'Neal:	If he's an Indian, he would go to jail.
LS:	If he is a non-Indian, what happens to him?
JO:	We would simply let him go and forward a report to the U.S. attorney.
LS:	And what happens to those reports?
JO:	Well, I really couldn't tell ya. I don't think I've ever been called back on one of them.[39]

Despite the fact that members of the federal government have recognized that "tribal justice systems are ultimately the most appropriate institutions for maintaining order in tribal communities,"[40] both state and federal governments continue to play competing roles in Indian country jurisdiction, creating a space in which law enforcement officers like O'Neal may be powerless to adjudicate crime committed by non-Native perpetrators. As one Native woman noted, because of this non-Native sexual predators have "targeted Indian country, reservations, rancherias and communities as the very best place to prey on Native women."[41]

In general, rape is an overwhelmingly intra-racial crime. For example, approximately 90% of Black women report being assaulted by a Black assailant and at least 70% of White women report being assaulted by a White assailant.[42] However, the Native community is the one glaring exception. For Native women, 86% of sexual assault is perpetrated by non-Native men, and four out of five Native survivors of sexual assault describe their attacker(s) as white.[43] This striking anomaly in sexual assault statistics does not exist in a vacuum. Rather, these statistics are dramatically shaped by the colonial context of jurisdiction in Indian country.

While all sexual assault is by nature violent, it does operate in different contexts. As discussed in Chapter One, the complicated system of jurisdictional authority in Indian country not only specifically privileges non-Native identity, but it also specifically marginalizes Native identity in cases of sexual violence. While jurisdiction over the sexual assault of *non*-Native women in Indian country defaults to the state, the involvement of a *Native* victim signals the interest of three separate sovereigns who may compete for jurisdiction—compromising the investigation of each—or decline to investigate, denying the Native survivor recourse for her assault.

As a result of the jurisdictional conflicts created by federal Indian policy, non-Native (overwhelmingly white) men become aware that their racial identity signals legal impunity, and in turn specifically seek out *Native* (as opposed to non-Native) women in *Indian country* as opposed to state land. One article in the *Native American Times* described sexual predators as viewing Indian country

as "feeding grounds,"[44] where white men "can do whatever they want."[45] Another blog states "if you want to rape [...] somebody and get away with it, do it on an Indian reservation."[46] Others have described Indian country as a "free-for-all,"[47] where "rapists are allowed to roam reservations, attacking women and young girls without real fear of being punished."[48] And as Deborah Blossom (Western Shoshone), acting director of the Great Basin Women's Coalition Against Violence stated, "Our women are open game. So many are violated and they tell us no one will do anything."[49]

The ease with which non-Native men may sexually violate Native women sends the message that the bodily integrity of Native women is not to be respected, that crime against Native women simply does not matter, and that Native women by their very racial and gender identities are inherently rapable. Viewing sexual violence through this predatory lens reveals that the disturbing rates of sexual assault against Native women today are in fact only contemporary manifestations of a colonial legacy hundreds of years in the making.

The Colonial Context of Sexual Violence: Constructing the Native "Other"

Sexual violence against Native women, while virtually unheard of prior to European contact, became an immediate reality in the first interactions between American Indians and Europeans.[50] Journal entries by early colonizers and letters from early settlers in the Americas detailed the ways that Native women were singled out for systematic rape.[51] Often, these assaults were characterized as collateral damage—that in the primary project of seizing Native land, European colonizers were also able to seize Native women. However, a more nuanced examination reveals that sexual violence against Native women was—and continues to be—central to the colonial experience.

As noted in Chapter Three, when Europeans first arrived in the Americas they confronted lands and resources that they were eager to make their own. At the same time, they also confronted Native peoples with distinct social, political and legal rights to these resources. Legal justifications thus quickly lent themselves as tools to legitimate the theft of the land and resources desired by European colonizers. However, just because something is legal, doesn't mean that it's moral.[52] For example, if murder were legal, most of us still wouldn't kill others because we recognize that other people share our humanity. Therefore appropriating Native land at the expense of Native people had to be naturalized through more than just law. It is in this context that ideological constructions of Native people emerged

as a corollary to moralize European conquest itself.[53] By portraying Native people as savage, barbaric, and sub-human, European colonizers were able to justify their legal actions.[54] As author Thomas Jimson notes:

> When you set about to dispossess a people of their land and source of livelihood, unless you have no conscious at all, one must find an excuse to safely hide from the truth of pain and suffering you are inflicting on innocent peoples [...] If, indeed, [Indians] were human beings [...] then they were in fact a lesser type of humanity who had no rights to life, land, or liberty.[55]

Jimson's passage demonstrates how ideology structured the legalization of what would otherwise be considered theft and murder. And, while these notions were levied against entire Native nations, they were highly gendered as narratives of conquest often focused on the perceptions of Native women.

At the same time that Europeans confronted Native communities with pre-existing rights to lands and resources, they also encountered Native women who were central political actors in the nations that governed these resources. And because many Native communities were matrilineal, women were often the ones who controlled and regulated the lands and resources that colonizers wanted.[56] Here, women's political and economic power threatened the primary goals of European colonization. Therefore, as Native activist Brenda Hill (Siksika Blackfeet) notes, "Attempts to destroy tribal sovereignty began with the destruction of women's sovereignty."[57]

As colonizers realized that divesting entire communities of their resources necessitated the disenfranchisement of Native women in particular, constructing the Native woman as a dangerous "Other" was a crucial tool of conquest. As political equals in their communities, Native women not only played central roles in civic life, but also made affirmative decisions about their bodies, gender expression, and sexuality. In contrast, Western Euro-patriarchy excluded women from the public sphere, and policed the bodies and sexuality of women.[58] As a result, European encounters with women who were not dominated by men became the foundation on which the subhuman status of Native women (and by extension entire Native communities) was built. In this context, European constructions of Native communities as savage were both gendered and sexualized, as many contact-era accounts indicate. For example in a 1525 letter to the Council of the Indies, Dominican Friar Tomas Ortiz remarked of Native people:

> They are more given to sodomy than any other nation. There is no justice among them. They go naked. They have no respect either for love or for virginity. They are stupid and silly. They have no respect for truth, save when it is to their advantage. They are unstable. They have no knowledge of what foresight means [...] They are incapable of learning.[59]

In this passage, Native communities were classified as having no justice, as unintelligent, and as sexually immoral. Such ideological constructions lent themselves to colonists eager to justify the appropriation of Native resources. If Native people had no justice, the logic went, they were by nature dangerous and violence against them became an act of self-defense. If they were unintelligent, then they were not able to manage their own resources, thus naturalizing European appropriation. If their bodies were not dominated by Christian morals, then they were available for domination by Western Europeans, which normalized gender violence against Native women. And indeed, from first contact, this mindset justified sexual violence against Native women, enslavement, and the appropriation of Native lands and natural resources.[60]

While Native people in general were seen as dangerous and sexually perverse, Native women were particularly vilified. Not only did Native women present a moral danger through perceived sexual perversion, but also their sexuality was presented as a physical danger to men. This is documented throughout the writings of Amerigo Vespucci, an Italian explorer, cartographer, and namesake of the Americas. From 1497 to 1504, Vespucci wrote a series of journal entries and letters regarding his alleged[61] voyages to the so-called New World. In one letter he described the unbridled lust of Native women as being so powerful that it led to the sterilization of men. Vespucci wrote, "[Native] women, being very libidinous" would engorge men's genitals to the point that they would "lose their virile organs and remain eunuchs."[62] Vespucci went on to illustrate that Native women's innate savagery and insatiable hunger for men drove them to literally consume European men. In a letter from his alleged third voyage, Vespucci recounted:

> [We] saw a [Native] woman come from the hill, carrying a great stick in her hand. When she came to where our Christian stood, she raised it, and gave him such a blow that he was felled to the ground. The other [Native] women immediately took him by the feet, and dragged him towards the hill [...] they all ran away towards the hill, where the women were still tearing the Christian to pieces. At a great fire they had made they roasted him before our eyes, showing us many pieces, and then eating them.[63]

Vespucci's piece communicates the savagery of Native communities as a whole through the cannibalistic appetite of Native women for European men. This narrative of consumption was highly sexualized throughout Vespucci's writings. In the same piece, he went on to portray Native women's desires as not only leading

to literal emasculation and consumption, but ultimately to the moral corruption of "Christian" (European) men:

> [Native men] marry as many wives as they please; and son cohabits with mother, brother with sister, male cousin with female, and any man with the first woman he meets.[64] [...] The women as I have said go about naked and are very libidinous, yet their bodies are comely; but they are as wild as can be imagined.[65] [...] When [Native women] had the opportunity of copulating with Christians, urged by excessive lust, they defiled and prostituted themselves.[66]

Vespucci's description of the perversion of Native people generally, is structured by the danger of Native women's sexuality specifically. The choice of Native women to "defile" and "prostitute" themselves, when framed through its impact on European men, shows that Native women not only posed a threat to men's physical bodies, but also to their Christian morals. In Vespucci's eyes, as Native women lusted after Christians, it threatened the morality of European men who may succumb to Native women's unrelenting sexual urges. And because Europeans perceived Native women as choosing to *embrace* this savage sexuality, they then became constructed as having no bodily integrity at all.

As Cherokee anti-violence activist Andrea Smith points out, prostitutes are rarely believed when they report that they have been raped.[67] This is because prostitutes are constructed as always inviting sex and therefore maintain no bodily integrity. Similarly, this construction of Native women as having no sexual mores appeared to invite sexual assault and naturalize rape by European colonizers. As Michele de Cuneo, an Italian nobleman on Columbus's second voyage wrote:

> While I was in the boat, I captured a very beautiful Carib woman, whom said Lord Admiral gave to me, and with whom, having taken her into my cabin, she being naked according to their custom, I conceived desire to take pleasure. I wanted to put my desire into execution but she did not want it and treated me with her finger nails in such a manner that I wished I had never begun. But seeing that, (to tell you the end of it all), I took a rope and thrashed her well, for which she raised such unheard of screams that you would not have believed your ears. Finally we came to an agreement in such manner that I can tell you she seemed to have been brought up in a school of harlots.[68]

In this passage, the very identity of this woman as Native played an active role in her rape. As a Native "Other" she was objectified and able to be "given" to the perpetrator. As it was her "custom" to be naked, and it was this nakedness that invited her rape, her very identity as a Native woman naturalized her sexual assault. Because she did not fit European gender roles and cultural norms, the

woman in this passage was constructed as having no bodily integrity and therefore her assault became justified in the eyes of her rapist. In fact, the author felt so vindicated by his actions he was able to conclude that despite her initial resistance, she ultimately enjoyed her violent assault.

Of course "enjoying rape" is a contradiction in terms, but the audacity of the author to frame his assault as such illustrates the extreme nature of colonial attitudes towards Native women. If Native women are seen as a threat to men, then violence against them becomes an act of self-defense. If Native women are constructed as lascivious, then all sexual activity is invited and ultimately enjoyed. And finally, if Native women appear to choose to live in bodies that are not yet subdued by patriarchy, then they are available to be dominated by European men.

Despite the notion of Native women "defiling" and "prostituting" themselves to European men while ultimately enjoying sexual assault, the reality is that Native women actively resisted rape. This was illustrated in the previous passage and is supported by many additional narratives. For example in 1552's *The Devastation of the Indies: A Brief Account,* Dominican Friar and Spanish historian Bartolomé De Las Casas recounted both the violence committed against Native women as well as the extent to which they were willing to resist it:

> One Spaniard took a maiden by force to commit the sin of the flesh with her, dragging her away from her mother, finally having to unsheathe his sword to cut off the woman's hands and when the damsel still resisted they stabbed her to death.[69]

This example, while tragic, shows the extent to which Native women resisted sexual violence.[70] And like the previous example, De Las Casas's account challenges the notion that Native women enjoyed or passively accepted sexual assault.

Over 200 years later, Franciscan Friar Junípero Serra recorded similar accounts as he presided over the missionary conquest of what would become the American state of California. During his tenure, he noted the rampant sexual assault of Native women by Spanish soldiers and attempted to intervene by documenting the attacks. One such document from 1773 reads:

> When both men and women at the sight of [Spanish soldiers] would take off running [...] the soldiers, adept as they are at lassoing cows and mules, would lasso Indian women who then became prey for their unbridled lust.[71]

Serra's advocacy ultimately made little difference in the lives of Native women who were terrorized by Spanish soldiers, as his dependence on them to police California Indian people outweighed his desire to end sexual violence.[72] Despite Serra's

ineffective campaign, his 1773 letter reveals a spirit of resistance as Native women actively engaged agency to avoid sexual assault.

Antonia Castañeda "Sexual Violence in the Politics and Policies of Conquest: Amerindian Women and the Spanish Conquest of Alta California" documents this and other forms of resistance throughout California's mission history in which Native women evaded sexual assault by fleeing, hiding, and campaigning against the missionary system in its entirety. For example, in 1785 a young Tongva spiritual leader named Toypurina was able to unite six disparate Native communities and organize an armed rebellion against the San Gabriel Mission. The rebellion centered on Native oppression under the missions as a whole, but was particularly inspired by the gendered persecution of Toypurina herself whose power as a cultural and political leader was seen as particularly threatening by Spanish colonizers.[73]

These passages not only show the prevalence of sexual assault during the early eras of colonization, but also the force with which Native women exerted agency against it. Yet, despite this clear tradition of resistance, colonial constructions of Native women continued to portray them as licentious and therefore lacking bodily integrity. As this next section will show, these initial perceptions of Native women have continued to impact their corporal sovereignty, as the trajectory of American colonial expansion continues to be structured by sexual violence.

Figure 7. Indian Female of the Arrowauka Nation.

John Gabriel Stedman, *Narrative of a Five Years' Expedition*—1796

The Taíno of the Arawak Nation were among the first Indigenous people to encounter Columbus. John Gabriel Stedman's written accounts of Arawak women include numerous references to nudity and to a perceived lack of bodily shame. Michele de Cuneo's journal entry from Columbus's second voyage (discussed earlier in this chapter) demonstrates how these perceptions of Native women justified sexual assault in the eyes of European men. Livinus Hulsius, *Collection of Voyages and Travels*—1599

(*Above*) This illustration from Livinus Hulsius' *Collection of Voyages and Travels* accompanies Sir Walter Raleigh's sixteenth-century account of the so-called New World. Here, a nude Native woman stands casually in the foreground. In the background, nude men and women are coupled in various stages of intimate encounters. The scene reflects European notions of Indigenous Americans as untamed and hypersexual. The perception that Native women willingly displayed their bodies, engaged in casual sexual relationships, and thus lacked sexual mores, contributed to the European assumption that they could then make no claims to bodily integrity. Courtesy of the John Carter Brown Library at Brown University.

(*Opposite*) *In The Four Continents* a bare-breasted, armed Native woman personifies America for a European audience. In her left arm she holds a human leg, severed at the thigh and ankle. In the background, Native people butcher a man and roast his leg on a spit—a common theme in contact era imagery used to communicate savagery and danger. A poem accompanying the image conveys America as a land of extraordinary wealth that is inhabited by a people of "barbarous rudenes [sic]." The author positions Christianity as a source of intervention where God's "Grace" will dress the nude barbarian and where the "Sunshine of Godds love [sic]" will cast out the "gloomy Shades of Death [sic]." © The Trustees of the British Museum.

The Colonial Context of Sexual Violence: Gendering the Body, Gendering the Land

The social construction of Native women as sexually promiscuous and therefore sexually violable helps to contextualize the widespread rape of Native women within the larger project of colonization. As Europeans and later Euro-Americans conceptualized the "New World," it was envisioned in very gendered and sexualized terms. Through colonists' eyes, Native land was "virgin," "bountiful," "unbridled," "untamed," and "free for the taking."[75] Not coincidentally, the Indigenous female bodies on this land were imbued with the same sexualized discourse. Here, under Euro-American colonization, the construction of Native women as having no *corporal* sovereignty over their own bodies became fused with attitudes towards Native people as having no *political* sovereignty over their own land.

In Kirkpatrick Sale's *Conquest of Paradise: Christopher Columbus and the Columbian Legacy,* the author demonstrates the ways that the colonization of the Americas was seen largely in gendered terms as perceptions of Native land went hand-in-hand with perceptions of Native women's bodies. Sale notes that America became "the succulent maiden to be seduced, deflowered, and plundered by a virile Europe [...]"[76] Here, the technological prowess of Europe was substituted for male sexual prowess as the rape of Indian land became the rape of Indian women. Sale goes on to argue:

> [T]he masculine attitude toward the feminine, the acquisitive toward the desired, the dominant toward the weak, the civilized toward the natural: the women of America were as much a part of the bounty due the conquering Europeans as the other resources in which it luxuriated [...] attitudes toward sex and women [were] every bit as exploitative and instrumental as those toward nature: Mother Earth and earth mother were all one, and all to be used.[77]

As the author indicates, conflating Native land with Native sexuality was central to colonization, as the conquest of Native land was structured by the conquest of Native women.[78] As bodies became objects analogous to what was to be consumed, Native land—like Native women—became something to be conquered, domesticated and subdued by Euro-American men.

After the formation of the United States, European attitudes towards land became increasingly entrenched in federal Indian law. Perhaps the most significant example of this is the 1823 U.S. Supreme Court decision in *Johnson v. M'Intosh* where the court ruled that private citizens could not purchase land directly from Native people.[79] Chief Justice John Marshall who delivered the majority opinion in the case supported the ruling by arguing that Native nations did not have

complete legal authority over their own land because they had failed to privatize it.[80] After *Johnson,* Native people were henceforth considered merely "occupants" of lands that they wandered over but never actually owned.[81] By contrast, through the capacity to dominate the earth through extraction and privatization, Europeans (and later Euro-Americans who inherited the land after American independence) became the rightful "owners" of American land.

Under *Johnson,* Native people's rights to their land were minimized because of their failure to dominate it. Similarly, the logic of sexual violence is itself structured from these European perceptions of land and political sovereignty. Under Euro-American colonization, Native women were seen as having no bodily integrity and a savage sexuality that appeared to invite rape. As bodies were constructed as analogous to land that had yet to be dominated and was therefore for the taking, Native women were constructed as simply occupants of a body that was destined to be dominated by European power.[82] Because Native sexuality, like Native land, was "free" and "unbridled," it was not for Native women to control. Instead Native women's bodies became something that should be subdued at the hands of Euro-American men. Like land, ownership of Native bodies could only come from patriarchal domination and the inscription of violence.[83]

While the conflation of land and bodies may appear to portray sexual violence against Native women merely as an aspect of colonization, Native scholar Andrea Smith illustrates that instead it is central to it.[84] In *Conquest,* Smith cites Paula Gunn Allen to argue:

> [C]olonizers realized that in order to subjugate indigenous nations they would have to subjugate women within these nations. Native peoples needed to learn the value of hierarchy, the role of physical abuse in maintaining that hierarchy, and the importance of women remaining submissive to their men.[85]

Smith goes on to note, "Thus in order to colonize a people whose society was not hierarchical, colonizers must first naturalize hierarchy through instituting patriarchy."[86]

As Smith and Allen argue, in order for Euro-Americans to successfully colonize Native resources, they had to successfully subjugate Native women. Sexual violence against Native women thus became a tool with which to inscribe hierarchies on non-hierarchical peoples in order to control communities as a whole.

Sale, Smith, and Allen's analyses indicate the way that the early conflation of Native sexuality, Native bodies, and Native resources informed the colonial process. As Euro-American hegemony expanded, it continued to signal widespread sexual violence against Native women as rape became incorporated into colonial law and policy. Spanish Dominican Bartolomé De Las Casas, for example,

described how the wives of male Native leaders were strategically raped as a method to control entire Native communities.[87] Later, the Doolittle Report of 1867 issued by the U.S. federal government detailed the ways in which sexual violence against Native women was integrated as a weapon of war in the military conquest of Native peoples.[88]

Violence against Native women was in fact so extreme that Native women were not just sexually assaulted, but murdered and then mutilated. The federal government's own reports reveal that after the Camp Grant massacre of 1871, Native women were found "lying in such a position, and from the appearance of their genital organs and of their wounds, there can be no doubt that they were first ravished and then shot dead."[89] And after the Sand Creek Massacre of 1864, Lieutenant James Connor remarked that he "heard of numerous instances in which men had cut out the private parts of [slain Native women] and stretched them over their saddle-bows and wore them over their hats while riding in the ranks."[90]

As these examples show, Native women were not only raped and murdered, but their sexual organs literally became objects that were appropriated by white men as symbols of conquest. And as the federal government waged war against American Indians in westward expansion, large-scale violence against Native women became incorporated as an active strategy. For example, prior to ascending to the presidency, then General Andrew Jackson waged war against Native nations in the American South to free up land for the Southern plantation economy. As part of his military strategy, he is said to have instructed his troops to specifically kill women and children to "complete" the "extermination."[91] Similarly, as Colonel John Chivington prepared to invade Cheyenne and Arapaho land to protect the interests of white settlers during the Indian Wars, he advised his troops to specifically kill Native women and children because "nits make lice."[92]

Both Jackson and Chivington's statements illustrate the gendered aspects of colonization that identify Native women as the ultimate threat to the settler-state. As the colonization of the Americas has primarily been about the appropriation of Native resources and the expansion of Euro-American cultural hegemony, those who have stood in the way of this project were considered problematic and polluting to the body politic.[93] As the bearers of future generations who would continue to make claims over the economic resources of the Americas, Native women's fertility posed a constant threat.[94] Therefore solving the "Indian problem" necessitated targeting Native women and their ability to reproduce.[95]

In *Conquest*, Andrea Smith illustrates that reproductive violence against Native women is still part and parcel to federal Indian policy today. Her work shows the way that Native women's fertility has been targeted through environmental racism, forced/coerced sterilization and adoption, and medical testing of dangerous drugs.

Here, Smith shows how Indian Health Service policies sanctioned the widespread surgical sterilization of Native women without informed consent and also limited Native women's fertility by experimenting with dangerous contraceptives like Norplant and Depo-Provera.[96] Smith's research confirms my personal experience as a Case Worker for the Washoe Tribe in which I encountered clients who had been forced or coerced into medical procedures that rendered them sterile, as well as with my experience at Sacred Circle's *Women are Sacred* conference, in which Native women shared their stories of forced adoption. Andrea Smith also builds on existing environmental racism research to note that the colonization of Native land with toxic debris simultaneously colonizes Native women's bodies and reproductive organs.[97] As Smith and others show, when radioactive waste sterilizes Native women and/or causes debilitating birth defects and stillborn babies, the colonization of the land *is literally* the colonization of Native women's bodies.

Conclusion: Jurisdiction as Sexual Violence

As a settler-state, the United States—by definition—can only exist through the consumption of Native lands and resources. As such, the existence of Native people with rights to those lands and resources is an existential threat. As this chapter shows, "solving" the "problem" of Native political autonomy directed colonial violence towards Native women in particular. Here, the nation-state has attempted to disempower entire communities *politically* by attacking women *corporally*.

Nez Perce/Tejana scholar Inés Hernández-Avila tells us, "It is *because* of a Native American woman's sex that she is hunted down and slaughtered, in fact, singled out because she has the potential through childbirth to insure the continuance of the people"[98] (emphasis in original). Through their ability to reproduce, Native women may usher into the world successive generations of Native people who will continue to threaten the legitimacy of the settler-state. As such, the nation-state has consistently hunted down Native women to be demoralized, dismembered and disappeared.

Today, Native women continue to be singled out and, in fact, hunted down by non-Native men in the colonial space that is Indian country.[99] Today when white men target Native women for sexual violence in Indian country, this is both an individual action of sexual violence, as well as a larger, societal act of colonial violence. As individual men learn of their privileged racial statuses and use this privilege to specifically target and inscribe sexual violence on Native women, it becomes impossible to separate the individual predator from the predatory society that has preyed upon Native women since contact.

Euro-American colonization was made possible through legal violence that codified Native people as barbaric and incapable of maintaining control over their own lands and resources. As part of this process, in an attempt to "solve" the "Indian problem," federal Indian policy created modern jurisdictional conflicts. The Major Crimes Act, the Dawes Act, Public Law 280, and *Oliphant v. Suquamish Indian Tribe* are all acts of legal violence marked by investments in American hegemony and legitimated through the construction of Native people as savage and backwards. Similarly, the creation of Indian country and the establishment of a nation-state that may create such policies could not have occurred without violence against Native women. "Indian country" itself was forged from legal violence and warfare, both of which were structured by the logic of sexual violence as a tool to disempower entire communities. And it is in these spaces—created from the construction of Native women as savage and therefore rapable—in which they are again violated with impunity. Therefore, when a white man targets Native women for sexual violence in these spaces, he does so with the force of 500 years of colonial history.

In this way, we must see jurisdictional impunity in the prosecution of sexual violence against Native women not simply as the unintended consequence of a complex but necessary legal structure, but instead as a colonial phenomenon that actively *maintains* and *inscribes* colonial violence on the bodies of Native women. As such, addressing American jurisdiction and the sexual violence that characterizes it requires us to call Euro-American colonization itself into question. As jurisdictional conflicts and sexual violence continue to plague Indian country, Native women, Native communities, non-Native organizations and the U.S. federal government are crafting solutions. Based on our understanding of the way that sexual, legal, and colonial violence operate within jurisdictional schema in Indian country, the remainder of this book turns its attention to evaluating solutions in an attempt to contribute to the anti-violence movement in Indian country.

22. See Figure 6 for exceptions. U.S. military jurisdiction may also act as a fourth sovereign (as in the case of *Elk v. U.S.*).
23. There are some exceptions to this when the federal government shares jurisdiction with the state for certain crimes (e.g., hate crimes committed exclusively on state land that also violate federal civil rights laws). In that case, the state and the federal government would have concurrent jurisdiction as separate sovereigns and double jeopardy would not attach. As noted in Figure 1, U.S. military jurisdiction may also play a role for certain crimes.

61. In the introduction to *The Letters of Amerigo Vespucci*, translator Clements R. Markham discusses whether or not Vespucci actually made the journeys that he describes in his written accounts. Markham notes that many scholars (both contemporaries of Vespucci as well as modern historians) agree that some of Vespucci's letters were fabricated. For the purposes of this research, the veracity of Vespucci's accounts is somewhat moot. While his actual experiences may be questioned, there is no doubt that Vespucci's writing did significantly impact European/Euro-American attitudes towards the so-called New World. Since my discussion focuses on European/Euro-American *perceptions* of Native people, Vespucci's writing (fabricated or not) is therefore relevant. See Clements R. Markham trans. *The Letters of Amerigo Vespucci and Other Documents Illustrative of His Career* (New York: Burt Franklin, 2011).

CHAPTER FIVE

Examining the Federal Response to Jurisdictional Conflicts in Indian Country: The Tribal Law and Order Act of 2010

> I know that too often, this community has heard grand promises from Washington that turned out to be little more than empty words. And I pledged to you then that if you gave me a chance, this time it would be different.
>
> —PRESIDENT BARACK OBAMA AT THE SIGNING OF THE TRIBAL LAW AND ORDER ACT[1]

On May 15, 1994, Lisa Marie Iyotte (Lakota) was brutally beaten and raped on the Rosebud Indian Reservation. She went to an Indian Health Services hospital to receive treatment for her injuries, but no doctors talked to her about her rape. Federal authorities did not interview her. Ms. Iyotte wanted to pursue her case, but federal attorneys declined to prosecute it. The man who attacked her went on to assault another woman and rape a teenage girl before he was finally arrested. He was never charged for the assault and rape of Ms. Iyotte.[2]

Sixteen years later, Lisa Iyotte found herself at the White House sharing her story in front of a national audience. In a devastating speech, Ms. Iyotte described the way that she was systematically denied justice in a society that let her case "fall through the cracks."[3] However, she remained hopeful that future legislation could help women like her find justice. As Ms. Iyotte concluded her speech, she introduced President Barack Obama who proceeded to sign the Tribal Law and Order Act of 2010 into law. At the signing, President Obama recognized the epidemic of sexual violence against Native women in Indian country stating, "when one in

three Native American women will be raped in their lifetimes, that is an assault on our national conscience; it is an affront to our shared humanity; it is something that we cannot allow to continue," and that despite a history of empty promises from the federal government, "this time it would be different."[4]

The Tribal Law and Order Act of 2010 (TLOA) is the result of advocacy from both Native and non-Native community organizations and individuals, as well as media attention from organizations like Amnesty International.[5] Hailed as an astounding victory by many,[6] the TLOA is the first comprehensive bill aimed at addressing jurisdictional conflicts in Indian country with a focus on addressing sexual violence against Native women. While most non-Native sources applaud the TLOA as "a huge victory for human rights,"[7] some in the Native community are reserved in their celebration of this new law. Highlighting the apparent contradiction of using federal Indian law to fix a problem created by federal Indian policy, many Native women problematize the Act. While the TLOA is variably supported and opposed by those in the Native community, many Native women conceptualize the TLOA as an important "step in the right direction" that will take continued advocacy to perfect. This chapter examines the ways that the TLOA addresses jurisdictional conflicts in Indian country as well as the way it is conceptualized by the Native community. In doing so, I measure the TLOA against a master narrative of federal Indian policy in order to discuss if—as President Obama promised—this time it will indeed be different.

Framing the Problem, Framing Solutions

This research demonstrates that jurisdictional conflicts are part of a master narrative of federal Indian policy characterized by divestments in Native sovereignty and investments in American hegemony. Here, even when trying to solve perceived issues in Indian country, the federal government often exacerbates problems for Native people by continuing to colonize Native justice systems. Public Law 280 is just one of many examples demonstrating that when legislation to address law and order in Indian country is done in a way that divests in tribal sovereignty, it may exacerbate the problem it is trying to solve, creating even more problems in Native communities. Keen attention to the TLOA is therefore vital as it can indicate if the federal government has broken with its tradition of compounding problems in Indian country. By measuring the TLOA against the backdrop of federal Indian policy that I have developed, while incorporating the perspectives of Native women and Native communities, we can begin to contemplate the possibility of legislating a solution to jurisdictional conflicts and sexual violence in Indian country in a way that both invests in and enfranchises Native communities. To do this, I examine the way that the TLOA frames problems and solutions to sexual violence in Indian country, as well as its efficacy as articulated by Native women and nations.

Though jurisdictional conflicts have been operating in the lives of Native people in Indian country for over a century, the extreme nature of this problem has only recently reached larger audiences. Though Native people have been lobbying members of Congress for decades to draft legislation to address this issue, it wasn't until the Amnesty International report *Maze of Injustice* was released in 2007 that lawmakers crafted such legislation in the form of the TLOA. In creating *Maze*, Amnesty International—a non-Native human rights organization—worked actively with Native women and Native community organizations to draft a Native-centered report. From this initial collaborative project, media outlets like National Public Radio, *The Denver Post*, and Current TV began publishing information on sexual violence against Native women in Indian country.[8] Increased awareness of the issue outside of Native communities helped pressure Congress to take action, and on July 29, 2010, the TLOA was signed into law.

Major findings identified in the Act include: rates of sexual violence against women are extremely high in Indian country; jurisdictional conflicts negatively impact public safety in Indian country, and these conflicts have been exploited by criminals; and tribal justice systems are "often the most appropriate institutions for maintaining law and order in Indian country."[9] To address these findings, the major goals of the TLOA are to: increase coordination between federal, state and tribal entities; empower tribal governments; and reduce the prevalence of sexual violence against Native women.[10]

In order to achieve these goals, the Act takes several approaches: grant making to tribal governments; information sharing between tribal, state and federal entities; implementing standardized procedures for data and evidence collection; creating new federal liaison positions; and increasing tribal sentencing authority.[11] The TLOA makes large grants available for Native nations to enhance their tribal justice systems by providing funding for the hiring and training of new police officers, the purchase of new equipment such as computers, weapons and vehicles, and the construction of detention facilities. To facilitate information sharing, the TLOA establishes a program where Native nations may gain access to national crime databases. Additionally, the TLOA requires the Department of Justice to publish declination rates for crimes originating in Indian country and improves the collection of reservation crime data in general. The TLOA implements standardized procedures in Indian Health Service facilities to respond to sexual assault cases and also requires specialized "family violence" training for law enforcement

officers and prosecutors to better work with Native survivors. The TLOA also establishes the Office of Tribal Justice and creates several new federal positions and committees that work to facilitate communication between the federal, state and tribal governments when handling cases that originate in Indian country. Furthermore, the TLOA allows Native nations in PL 280 states to call on the federal government when state governments do not adequately address crimes that originate in Indian country. And finally, the TLOA expands tribal sentencing authority to up to three years in jail and up to a $15,000 fine for any single offense (up from one year and $5,000 since the Indian Civil Rights Act was amended in 1986).[12]

The TLOA represents an important point of departure from the dominant narrative of federal Indian policy. Breaking from its decidedly non-democratic tradition of excluding Native people from creating the legislation that would then control their lives, members of Congress actively worked with Native leaders to craft the TLOA. Representative Herseth Sandlin from South Dakota and Senator Byron Dorgan from North Dakota convened several Senate committee meetings to hear from Native representatives about how they conceptualized problems and solutions to jurisdictional conflicts and sexual violence against Native women in Indian country.[13] Unlike the vast majority of federal Indian policy, the TLOA marks a distinct shift in that it begins to incorporate Native voices into the legislation that directly affects Native communities. This Native-centered shift in thinking is further indicated by the Act itself that requires many federal agencies to act "in consultation" with Native nations when making decisions about law enforcement in Indian country.[14]

While this may represent an important break from earlier federal policy, we must problematize the way that Native people were variously included and excluded from this process. While consultation with Native people marks an improvement from a tradition of deciding what is best for Native people without asking them, the Act fails at truly giving agency to Native communities themselves. Despite the TLOA's insistence that its goal is to "empower tribal governments [...] to safely and effectively provide public safety in Indian country,"[15] the federal government still had the final say in the authorship of this Act. The TLOA was written by non-Native legislators and was passed in a Congress with only one member who is enrolled in a Native nation.[16] While perhaps more familiar with the needs of Native nations through consulting certain Native leaders, Native communities did not shape this legislation in a way that truly reflects tribal sovereignty. As *Indian Country Today* recognized, "Much of the impact of the TLOA will be lost in bureaucratic regulations and administration if tribal communities and leaders do not have significant voice in the planning and organization of justice programs."[17] Whereas the TLOA offers mere consultation with a handful of Native leaders, a true method to empower tribal communities could have included joint or co-authorship of the bill by members of Native nations selected by the communities themselves.

Concern over complicated bureaucracy is frequently expressed in the Native community regarding the TLOA. One of the cornerstones of the TLOA is increased collection of reservation crime statistics as well as the publication of federal declination reports for crimes that originate in Indian country. While these statistics have been much sought after by Native women and Native communities who want to leverage them to draw attention to the problem of sexual violence against Native women, if the compilation of these statistics is not coupled with attention to the issues that produce sexual violence against Native women, this approach will do little to create meaningful change. As Carrie Garrow, Chief Judge of the St. Regis Mohawk Tribe noted, "Endless bureaucracy and more data collection is a way of *not* dealing with the problem" (emphasis in original).[18] Essentially, reporting how many cases are declined is not an effective measure to ensure that cases are prosecuted since compiling statistics and declination reports do nothing to address sexual violence at its source.

While "consulting" Native nations may be a step in the right direction, the Act does little to make Native nations full partners in the law. Again, though Native nations are to be "consulted" as the law is implemented, many of the aspects of the law that involve coordinating Native people do not actually involve Native people. For example, a central tenet of the TLOA is facilitating the adjudication of crimes that occur in Indian country between the federal, state, and tribal governments. To do this, the TLOA establishes the Office of Tribal Justice and creates several liaison positions to increase communication between these entities. Unfortunately, these positions are to be filled by assistant U.S. attorneys appointed by the U.S. attorney in each district that includes Indian country.[19] Rather than providing for Native nations to appoint their own liaisons that represent their nation's best interests, the TLOA insists on appointing more U.S. attorneys who may not be in touch with the needs of the Native community in that area, or accountable to the Native communities that they serve. Again, while creating these positions and consulting with Native nations may be seen as an improvement, it still highlights a common theme: while the federal government may intend to incorporate Native people in crafting solutions in Indian country, it continues to insist on centering itself in the formation and maintenance of these solutions.

Additionally, many Native women have called the funding for the Act into question. While the TLOA ostensibly makes millions of dollars available for Native nations to invest in their tribal justice systems, many remain skeptical as to whether or not this funding will actually become available. As Kimberly Craven

(Sisseton–Wahpeton Oyate) writes in an editorial in the *Indian Country Times*, "It is critical that Congress also appropriate the money that is needed to implement this law. Until that is done, these are probably just words on a piece of paper."[20] Virgil Wade, a criminal defender in the Salt River Pima-Maricopa Indian Community says, "I don't know that it has the teeth that it's going to need," referring to the fact that the funds to pay for the TLOA aren't guaranteed.[21] The skepticism towards fund allocation is warranted. For example, as Muskogee activist Sarah Deer points out, the Tribal Justice Act of 1993 was supposed to provide over fifty million dollars *per year* for tribal justice systems, yet when the act expired seven years later, only five million dollars had been appropriated *in total*.[22]

Appropriating funds for the TLOA can be problematic, not only because funding for the Act is not guaranteed, but also because, as with all federal grants, tribal nations must apply for them. This places Native nations in a position where they must meet certain—and often hegemonic—standards for fund allocation. While the TLOA does allow funds to be used for "alternatives to incarceration," the Act dedicates a large part of its funding towards the construction of new juvenile and adult detention facilities.[23] Other sections of the Act authorize grants for the purchase of police equipment such as weapons.[24] In this way, funding for Native nations is framed in terms of increased resources for Western-style law-and-order systems that value punishment and incarceration, along with increased police presence to guarantee safety. As Native activist Jessica Yee (Mohawk) notes:

> A thing that somewhat troubles me about the bill is a lot [sic] on criminalization and penalization. I'm a prison abolitionist in many senses and I'm very aware of how many Indigenous people are in the criminal justice system unfairly; but more importantly, that these entire systems are not our laws and not our systems.[25]

Here, many Native women agree that increased state violence will not help eradicate violence caused by the state. As one Native woman so succinctly noted, "We can't arrest our way out of this problem."[26]

Western Legal Hegemony

In addition to increased funding for police weaponry and detention facilities, the TLOA grants Native nations greater authority to make arrests, sentence perpetrators, and access national criminal databases. This is important because tribal police will now be able to run background checks to determine if someone is a convicted criminal or sex offender. However, access to these systems is predicated on tribal police becoming "consistent with standards" accepted by the federal government.[27] In other words, tribal police must subscribe to hegemonic standards of Western law enforcement procedures in order to have access to this vital information. Furthermore, while the Act encourages agreements between tribal law enforcement officers and local police, this is at the discretion of the attorney general who "may provide technical and other assistance to state, tribal, and local governments" to enter into "mutual aid, hot pursuit of suspects, and cross-deputization agreements."[28] While the TLOA is ostensibly about encouraging cooperation between the federal, state, and tribal entities, it does so with a top-down approach by appointing attorneys and federal liaisons to oversee relationships, rather than directly addressing cooperation on an everyday level. And the only section of the Act to directly address coordination between tribal and local police dictates that it will be at the attorney general's discretion. Here, the only way that tribal police officers may arrest non-Native assailants is through entering into a cross-deputization agreement with local authorities. Cross-deputization has been problematized by many Native women, notably Eileen Luna-Firebaugh (Choctaw/Cherokee), who notes that they force tribal police to adhere to Western legal standards in order to be seen as legitimate by local authorities.[29] In order for tribal police to exercise even a modified form of jurisdictional and local control under the TLOA, non-Native law enforcement officers must train and certify them. Here non-Native law enforcement agencies are modeled as ideal, thereby implying the inferiority of Native justice systems.

In addition to forcing Native nations to ascribe to Western notions of justice, the way that the TLOA structures sentencing authority is an example of the ubiquitous fear of Native justice systems that structures federal Indian policy. In 1968, the federal government imposed mandatory sentencing restrictions on tribal governments under the Indian Civil Rights Act of 1968 (ICRA).[30] Stemming from federal paternalism to protect Native people from their own governments, the ICRA initially limited tribal governments to imposing sentences of no more than six months in jail and a $500 fine per offense on those who were convicted in tribal court. The TLOA increased these limitations to three years and $15,000 respectively.[31] However, in order to hand down sentences in excess of one year and a $5,000 fine, the Tribal Law and Order Act states that a tribal court must provide the defendant with counsel "at least equal to that guaranteed by the United States Constitution," who is licensed to practice law in the United States, and that the judge presiding over the trial must also be licensed in the United States. All of this must be "at the expense of the tribal government."[32] Not only do sentencing limitations indicate the federal perception that Native people must be protected from their own governments, but the fact that in order to even operate within these limitations tribal nations must also subscribe to Western hegemonic systems of

justice, demonstrates that the federal government clearly does not intend to invest in tribal sovereignty in a meaningful way. As one Native woman in an *Indian Country Today* editorial blog observed:

> This piece of legislation contains sections that once again diminish tribal sovereignty! Tribes can only increase incarceration IF they provide certain protections for defendants. Specifically, judges and public defenders must be lawyers. Also, they must follow American legal procedures. Not all tribes currently provide these types of services in their tribal court systems, neither do they have the resources to comply with these requirements. Once again, another example of the guardian ward relationship being reinforced [emphasis in original].[33]

Another woman, identifying as Turtle Mountain Ojibwe observed:

> I applaude [sic] the passing of the new Law and Order Act for Indian country, however after reading through the act more carefully, discovered that in order for tribes to pass and enact this new Bill we once again lost more of our sovereignty. According to this ACT [sic], tribes who decide to implement this new Law and Order Act are required to follow State law and court procedures, rather then [sic] tribal laws and court procedures. Just one more example of the Federal Government taking our rights away in the disguise of helping, what a shame, but to be expected.[34]

In these quotes, Native women problematize the relationship between the federal government and Native nations as one that has been marked by paternalism and attacks on tribal sovereignty. Again, we see the common theme that Native governments become legitimate only when they become more like the hegemonic ideal of Western government. Despite stating that tribal justice systems are the best place to adjudicate crimes in Indian country, the TLOA frames them as effective only when these systems are shaped to mirror American models. Additionally, the fact that tribes are forced to pay the cost of conforming to Western justice systems leads many Native women to refer to the TLOA as an "unfunded mandate."[35] Furthermore, there is a provision under the increased sentencing section of the TLOA that describes how after four years the attorney general will recommend, "whether enhanced sentencing authority should be discontinued, enhanced, or maintained at the level authorized under this title."[36] In other words, once the federal government determines whether or not tribes have been "effective"[37] in their use of enhanced sentencing laws, the federal government will paternalistically decide whether or not they should be allowed to continue to have increased sentencing authority.

As Chapter Three demonstrated, federal law and policy has sought to manage the "Indian problem" by delivering Native people out of savagery and into

civilization. So far we have seen how the TLOA views "strengthening tribal justice systems" as synonymous with using federal funding to force tribal justice systems to mirror Western government, and that after a period of time the federal government will assess whether or not tribal governments can be trusted with increased responsibility. This not only reveals a paternal narrative, but also a civilizing one. From a federal perspective, the TLOA's efficacy is framed in part through its potential to create competency in tribal justice institutions through federal intervention. This by definition assumes the inherent *in*competency of tribal justice as it exists now, and places the TLOA on the colonial legal trajectory of using federal Indian policy to manage the "Indian problem" through Western law as a civilizing force.

Assimilation as part of the civilizing project of federal Indian policy is found throughout the non-Native legislative discourse around the TLOA. Rather than framing sexual violence as the direct result of colonization and the formation of the United States, sexual violence originating in Indian country is often divorced from its colonial context. Framed paternalistically in terms of delivering Native people into the safety of the America dream, the rhetoric around the TLOA is characterized by phrases such as all Native people deserve to enjoy the "fullest protection of *our* laws,"[38] (my emphasis) and that "every American has the right to live in a safe community," even our "First Americans."[39] At the 2009 Tribal Nations Conference where he announced his support for the TLOA, President Obama emphasized his commitment to the nation-to-nation relationship between Native nations and the federal government so that tribes can "be full partners in the American economy, and so your children and grandchildren can have an equal shot at pursuing the American Dream."[40] While this type of rhetoric may sound pro-Indian, it fails to be truly pro-sovereignty. As many Native scholars point out, the American economy could not have been built without the colonization of Native people, and as such, realizing the "American Dream" is not always a goal of Native peoples.[41] Additionally, framing the TLOA as something that gives Native people the fullest protection of American laws demonstrates the failure of the federal government to understand that federal laws have actually *created* the impunity through which Native women are preyed upon in Indian country. What many in the Native community are demanding is not equal protection *under* American law, but the right to protect themselves *from* American law, through self-determination and sovereignty over their own lands, laws, and justice systems.

Additionally, many in the Native community are skeptical of being forced to adopt a Western justice model that appears to be dysfunctional by its own standards. As noted in Chapter One, Cherokee scholar Andrea Smith argues that the Western criminal justice system generally functions at the point of crisis *after*

violence has occurred.[42] And Sarah Deer (Muscogee Creek) notes, "I'm always concerned about 'law and order' language. It certainly doesn't protect or help white women, so it's not going to help Native women. We have to make sure that the systems we set up are Native women-centered."[43] Full inclusion and equal protection under the law of the very institution that has divested Native people of their lands and resources are not necessarily the goals of Native communities. While the federal government may continue its mission to deliver Native people into civilization by incorporating them into American legal hegemony, Native communities articulate solutions in terms of sovereignty and centering Native women in their anti-violence strategies.

The Homogenization of Violence: Racial Identity and Predatory Violence

As this chapter indicates, while the TLOA is framed as being liberatory for Native people, it is in fact deeply hegemonic and fits within a narrative of federal paternalism. Yet this analysis stands apart from what is by far the most problematic aspect of the TLOA. Despite admitting that "tribal nations are the best place to handle issues of tribal law and order," and despite the fact that specific pieces of federal Indian law and policy have clearly created jurisdictional conflicts, the TLOA does absolutely nothing to address these policies or address the dynamics of interracial violence that characterize the majority of sexual assault against Native women.

The TLOA specifically acknowledges that more than one in three Native women will be raped in her lifetime and that violence against Native women is 2.5 times that of the national average.[44] American politicians quote these statistics in virtually every speech as they pledge their support of the TLOA. But despite being published in many of the same reports that reveal these startling facts, one statistic you will not find in federal political discourse is the fact that while rape is an overwhelmingly intra-racial crime in the United States, 86% of Native women who are raped report that their attacker is a non-Native man, 80% of whom are white. If politicians were to acknowledge that interracial rape is rare in non-Native communities yet routine for Native women, they would be forced to address the history that has created these disparate statistics. However, doing so would require a discussion of American colonization and is thus inconvenient to the settler-state. As such, the interracial aspect of sexual violence and jurisdictional conflicts is never addressed. While truly addressing jurisdictional conflicts would mean crafting legislation that bolsters a Native nation's ability to address *all* violence against Native women, the TLOA instead focuses on strengthening tribal policing of the

mere 14% of *intra*-racial sexual assault in Indian country. In ignoring the interracial aspect of sexual violence against Native women by racing the perpetrators of violence in Indian country as Native, the TLOA both strengthens tribal justice systems to police and incarcerate their own Native people disproportionately while continuing to deny Native nations the authority to exercise control over those who commit the vast majority of sexual assault against Native women.

One of the cornerstones of the TLOA is "strengthening tribal justice systems," accomplished primarily through increased funding for policing and prisons. However, because the Tribal Law and Order Act does not overturn *Oliphant*, all of the funding that would go to tribal governments under the TLOA would—by definition—only be used to police Native people. Here, all of the federal money used to "strengthen tribal justice systems" would specifically go to prosecuting and incarcerating Native people exclusively. As Native scholar Luana Ross points out, the criminalization of Native identity and legacies of historical trauma have led to an astounding over-representation of Native people in the criminal justice system as it is.[45] The TLOA would then only invest in tribal justice systems to the extent that they might further police and jail their own members, while doing little to address the root causes and realities of sexual violence against Native women.

Despite the fact that virtually every scholar points to federal Indian policy like the Major Crimes Act, the Dawes Act, Public Law 280 and *Oliphant v. Suquamish* as the cause of jurisdictional conflicts in Indian country, the TLOA refuses to address them. In fact, the Act *protects* and *strengthens* pre-existing law and policy by amending the Indian Civil Rights Act and by explicitly protecting the ruling in *Oliphant*. Without mentioning the case by name, Section 206 removes any doubt over the TLOA's impact on *Oliphant* by stating, "Nothing in this Act confers on an Indian tribe criminal jurisdiction over non-Indians."[46] In doing so, Section 206 affirms *Oliphant* as case law and reiterates the federal government's position that state and/or federal entities are the true arbiters of justice for the majority of crimes committed against Native women in Indian country.

Because the TLOA explicitly protects the root causes of jurisdictional conflicts, it can never adequately address them. Instead, the TLOA appears to be another case of legislating over the problem, rather than addressing it directly. This fits neatly into the master narrative of federal policy in which the government enacts a series of reactive policies out of a fear of Native justice systems, rather than meaningfully investing in these systems. As Native women and Native communities conceptualize the TLOA, they often comment on this tendency. For example, Diane Enos, president of the Salt River Pima-Maricopa Indian Community in Arizona, states of the TLOA, "You've got Congress people scared stiff of seeing tribes get authority over non-Indians. I'm not sure that they understand why, but

it's almost a knee-jerk reaction."[47] As Native activist Sarah Deer notes of the passage of the TLOA:

> I should just be satisfied with celebrating this victory, but I'd really like to see Congress take on this issue of non-Indian perpetrators [...] I think there's a fear that tribal governments will be harsher on non-Indians. I think that's a racist idea at its core [...] the idea that tribal people can't be fair. If you take racism out of the picture, then what the rule is doesn't make sense.[48]

Both Deer and Enos's statements frame true solutions to jurisdictional conflicts and sexual violence in terms of investments in tribal sovereignty, while positioning the TLOA as reactive to the fear of Native justice systems. Noting the reactionism and fear that characterizes aspects of the TLOA, Native women and Native community members consistently incorporate an analysis of sovereignty into their perceptions of the TLOA. As Rose from South Dakota comments in *Indian Country Today*:

> I feel confident the tribes can handle their own affairs and what would happen if we went to Senator Dorgan's home state and tried to enforce a law upon the citizens? It's so tragic for the Indian Nations. This is just another pretext of repressive policy and example of the guardian-ward relationship.[49]

Furthermore, Tsoo'woo Naibi comments in *Indian Country Today*:

> We are a strong people whose heritage is based on a balance between individual autonomy and strong community ties. We still have the power to achieve this, and can better achieve it if the U.S. steps out of our affairs.[50]

At the Tribal Nations Conference of 2009 when President Obama announced his intentions to sign the TLOA, he stated, "I believe that Washington can't—and shouldn't—dictate a policy agenda for Indian country. Tribal nations do better when they make their own decisions. That's why we're here today."[51] Yet one is left to wonder if a TLOA that purports to invest in tribal justice systems, and notes that tribes are the best institutions to maintain law and order in Indian country, actually incorporates the kind of self-determination that President Obama claims to support. At every turn Native women and Native communities articulate that sovereignty and self-determination is absolutely vital in shaping a better future for themselves. Yet the TLOA insists on continuing to invest in the "guardian"/"ward" relationship codified in the 1830s that defined Native people as child-like "wards"[52] of the paternal federal government.

Like federal Indian policy before it, the TLOA acts out of a colonial fear of the inferiority of tribal justice systems and paternalistically dictates the ways in which Native nations may exert authority over the people and activities on their land while increasing state violence against Native people through policing and incarceration. Despite President Obama's promise that "this time it would be different," it appears that the TLOA still embodies many of the problems of traditional federal Indian policy that sought to manage the "Indian problem" by divesting in Native sovereignty and investing in American hegemony. While the Act reveals an understanding of the issue that is congruent with the findings of this research—that sexual violence against Native women in Indian country has reached epidemic proportions and that jurisdictional conflicts play a major role in this violence—the solutions proposed in the TLOA do little to address the problem at its core. Instead, the federal government continues to vest federal and state authorities—often the most distant, unresponsive, and unaccountable entities—with jurisdictional authority over crimes in Indian country. At the same time, the interracial aspect of sexual assault is erased, as the federal government refuses to acknowledge its role in the creation and maintenance of these conflicts.

Despite the obvious shortcomings of this Act, it would be a mistake to universally condemn it. In spite of its limitations, Native women and Native organizations also offer praise of the TLOA. Native women like Lisa Iyotte, whose story we heard at the beginning of this chapter, describe how this act can help prevent cases from "falling through the cracks." Jessica Yee, a Native blogger for Ms. Magazine stated "As a Native feminist without apology, I'm thrilled that the Tribal Law and Order Act of 2010 has been passed to protect Native women from violence."[53] Other Native women have stated "I think now the women finally have a voice [...] I sit with women who cry and are mad because the feds didn't want to pick up the case. This bill, I think, would give women more of a right [...]"[54] These statements do not come as a result of ignorance of the true content of the Act, but instead support for the TLOA comes from a willingness to engage in what Chela Sandoval refers to as a "differential consciousness."

In *Methodology of the Oppressed*, Sandoval argues that social movements are often framed with an either/or approach of choosing one organizing strategy over another.[55] In the either/or paradigm, organizing within competing power structures often positions women as having to choose between adversarial approaches to social change. However, what Sandoval engages in *Methodology* is the idea that women of color can and do negotiate seemingly oppositional power structures, refusing to choose one or the other. Instead, they strategically navigate opposing spaces with a willingness to engage in multiple approaches even if these approaches may at first appear to conflict.[56] She refers to this type of consciousness as a "differential" in

that it "enables movement 'between and among' ideological positionings."[57] Much like a transmission differential in a car, activists can shift between different approaches in the face of changing terrain to strategically navigate contemporary institutions to shape a better world for themselves and their communities. So rather than completely embrace the TLOA as the ultimate solution to sexual violence and jurisdictional conflicts, or alternatively reject the TLOA as worthless because it fails to frame solutions in ways that are truly liberating for Native communities, Native women invoke a differential consciousness to leverage the potential benefits of the TLOA while also acknowledging and addressing its shortcomings.

We see differential consciousness employed by many Native women as they discuss the TLOA. As Nicole Mathews (White Earth Ojibwe), executive director of the Minnesota Indian Women's Sexual Assault Coalition stated, "I think that the Obama administration has really taken some great steps to improve safety for Native women in Native country [...] But there is more work ahead. Now we have to take steps to make it a reality."[58] Lucy Simpson (Navajo) an attorney for the Indian Law Resource Center continues, "The Tribal Law and Order Act that Obama just passed provides a little step in the right direction."[59] Muscogee activist Sarah Deer states, "[T]his took three years. It's really been 500 years, but three years of putting it on paper. There are ten or twelve more steps we need to do, of course, but now it feels like we can change the world." She goes on to say, "This [Act] is a very, very tiny beginning, but now I really believe it can be done. I don't know if I will see it in my lifetime, but I'm committed to making sure I do the work anyway."[60] In another piece, she also states, "I see the [TLOA] as a foundation [...] I worry sometimes that people expect a 'quick fix' to problems that have been ongoing for over a century. While the TLOA didn't contain all the fixes (or dollars) that would be ideal, we now have a starting point."[61]

By invoking a differential consciousness, Native women conceptualize the TLOA, not as a "quick fix," but instead as a framework from which they can base future activism both within *and* outside of existing institutions. These Native women acknowledge that there is still much more work to be done, but rather than reject a piece of legislation because it is problematic, they are willing to strategically leverage it to shape a better future. While many acknowledge that solutions to sexual violence in Indian country will likely not come from the very government that has consistently inscribed violence on Indian people, it doesn't necessarily preclude Native activists from using each potential asset as they work to create a world that is safe for Native women. And, as we look at other sites of activism, this ability to invoke a differential consciousness becomes central to framing solutions to jurisdictional conflicts and sexual violence.

ONE

Knowing through Numbers?

The Benefits and Drawbacks of Data

THE HEADLINES BEGAN TO APPEAR IN 1999. *American Indian and Alaska Native Women Experience the Highest Rates of Interpersonal Violent Crime in the United States.* During the past fifteen years, I have followed these headlines and their accompanying stories with great interest. It is irrefutable that, based on the available data, violent crime is experienced by Native women at per capita higher rates than almost all other groups in the United States. I have yet to see data that suggest otherwise. The most commonly quoted statistic is probably "1 in 3 Native women will be raped in her lifetime"—a figure originally derived from a 1998 report examining data from the National Violence Against Women Survey. This single statistic has garnered more attention than any other, inspiring investigative reporting, federal policy reform, a damning international human rights report, and an award-winning novel by renowned Ojibwe novelist Louise Erdrich, *The Round House.*

The data sets and corresponding reports that have been circulated throughout the nation have accomplished many things in the past fifteen years. Legislators made the issue a priority. Government agencies funded pilot projects. Journalists representing mainstream newspapers such as the *New York Times* and the *Washington Post* visited reservations to interview Native women. National Public Radio and PBS have broadcast extensive multipart reports about the problem. On July 29, 2010, President Barack Obama noted that the "one in three" reality "is an assault on our national conscie

it is an affront to our shared humanity; it is something that we cannot allow to continue."[1]

Numbers are powerful players in American politics; the statistics about violence against Native women are almost always referenced in federal reports about rates of crime in Indian country and have served as valuable sound bites during the past ten years of reform. Without the publication and circulation of somber statistics, the federal law reform of the past few years would likely not have happened. In that sense, the data are invaluable, but numbers in and of themselves offer nothing in the way of long-term solutions to the crisis. Because of that, it is critical to develop a tribal-centric analysis of the knowledge we have about Native women and rape. This chapter explores the origin, nature, and application of statistical data related to violence against Native women and is followed by a discussion of the intangible harm rape does to the psyches of Native women and the survival of tribal nations. In the end, I consider the value and utility of our "knowledge" and encourage the continued development of research initiated by and for Native women.

How Do We Know What We Know? The Challenges of Collecting Data in Indian Country

It is notoriously difficult to gather data about Native people—on any topic. The dearth of data on Native people is not simply the result of indifferent researchers. In practical terms, Native people make up such a small percentage of the American population that a valid random sample is difficult to come by. In national studies, if data do not constitute a "statistically significant sample," then they are simply pooled with data from other groups of people who do not constitute a statistically significant sample and categorized as "other." This is commonly seen in criminology studies that classify Americans as "White, Black, and Other."[2] In more recent decades, criminologists and other social scientists have determined that the "other" should be more delineated so as to reveal additional nuances about the variety of American experiences with crime. Native people, however, have been largely overlooked in criminology. This changed in 1999, when the Bureau of Justice Statistics, a subdivision of the U.S. Department of Justice, issued a report titled *American Indians and Crime*.[3] The report combined a

variety of different sources of federal data and noted a highly disproportionate level of victimization in the lives of Native people—specifically, the rate was two and a half to three times higher than for the nation generally. Since 1999 a variety of reports and studies have come to the same conclusion—namely, that Native women in particular suffer the highest rate of per capita rape in the United States.[4] Amnesty International investigated the high rates of rape, and media attention to the problem intensified after the release of its report *Maze of Injustice* in 2007.[5]

Where do the victimization data come from? Most of the data are collected by the federal government through surveys.[6] Prior to the development of victimization surveys, the government "counted" crimes by calculating the number of police reports that had been filed. However, because more than half of violent crimes in the United States are never reported to police, relying on law enforcement report data does not yield accurate results about the true extent of violent crime. Surveys such as the National Crime Victimization Survey (NCVS) and National Violence Against Women Survey (NVAWS) were designed to provide a more accurate picture of crime in the United States. The "victimization survey" method is produced by contacting a random sample of households in the United States and inquiring about their experience with crime.[7] If a survey respondent indicates that she has been a victim of crime, she is then asked a series of questions about the type of crime, the race of the perpetrator, the location of the crime, and other details.

The sample sizes for Native people in recent national surveys have become large enough that American Indian/Alaska Native (AI/AN) data have become "statistically significant" and some tentative conclusions can be drawn. Starting in 1999, the prevalence data have been consistent in concluding that there is a very high rate of crimes experienced by Native people generally, and Native women more specifically. I am not aware of a single study (federal, state, or tribal) containing a statistically significant group of AI/AN in which the data do not suggest that Native people suffer the highest rates of victimization in the United States. However, the data we have still leave part of the story unwritten. Below, I consider what the data have led investigators to conclude, and the significance and relevance of those findings.

Data Dump: What Do We Know?

Despite the strength of the data in affecting legal reform, we still know surprisingly little about the nature of sexual assault in the lives of Native women. Here's what we *do* know: the national data tell us that Native women experience the highest per capita rate of rape in the nation.[8] National Crime Victimization Survey data consistently reveal a very high rate of rape against Native women, an average annual rate of 7.2 per 1,000 persons, compared to 1.9 per 1,000 persons for all races. The "one in three" statistic was originally published in a 2000 report on the National Violence Against Women Survey, which concluded that 34.1 percent of Native women will be raped during their lifetime (meaning that the more accurate statement is *more* than one in three Native women).[9] In 2010 the Centers for Disease Control and Prevention issued a report on the results of the National Intimate Partner and Sexual Violence Survey, which found that 49 percent of Native women report a history of sexual violence.[10]

Dr. Ronet Bachman, a statistician at the University of Delaware, is the national expert on interpreting NCVS data as it relates to violence against Native women. She has published additional findings from the data that serve as an important supplement to the federal reports.[11] Using an aggregated data set covering the years 1992–2005, Bachman and her coauthors uncovered some important trends about the qualitative nature of the sexual assault Native women experience.[12]

For example, the level of physical violence Native women experience during rape is significantly elevated when compared to that experienced by other races. For example, when asked whether aggressors physically hit them during the assault, over 90 percent of Native women responded affirmatively, compared to 71 percent of white victims.[13] In a related question, 25 percent of Native women victims report that their perpetrator(s) used a weapon, compared to 9 percent of white women.[14] Thus, there appears to be a particularly brutal physicality in assaults on Native women—a significant elevation that warrants further attention.

Unfortunately, based on my experience, none of these numbers are shocking. Nor do many Native women find these numbers

shocking. Rape, in particular, is experienced at such high rates in some tribal communities that it becomes "normalized." Native women know that there is a high likelihood of experiencing rape at some point in their lives, and preparing for this inevitable violence resembles a full-time job. It is part of the daily lives of Native women, "normalized" but never acceptable. Charon Asetoyer (Comanche) and other women from reservations have explained the severity of rape this way: Native women "talk to their daughters about what to do when they are sexually assaulted, not if they are sexually assaulted, but *when*."[15]

In terms of the prevalence rates themselves, most experts I have spoken to (and by experts I mean the grassroots advocates and activists from tribal communities) almost universally assert that the federal statistics represent at best a very low estimate. Actual rates of sexual assault against Native American women are actually much higher. Through my work in Native communities, I heard more than once, *I don't know any woman in my community who has not been raped.*

Lingering Questions: What We Do Not Know

Despite the fact that fifteen years have passed since the initial release of *American Indians and Crime,* we still have remarkably little information about Native women and rape. Some generalized conclusions can be drawn from the available information but it must be remembered that the gatherers and publishers of these numbers are researchers from academia and the federal government. Australian criminologists Chris Cunneen and Simone Rowe refer to this kind of data as "legal-bureaucratic knowledge," and they maintain that it often does not consider the "implications of Indigenous approaches . . . to the production, analysis and presentation of quantitative, statistical Indigenous data."[16] It is as though Native women must repeatedly cite Western data for there to be a legitimate critique of the status quo.

Although the victimization survey method is a dramatic improvement over the older methodology of counting police reports, obvious shortcomings remain. The National Crime Victimization Survey has not typically included homeless people (or people living in shelters) as part of its population sample—and Native people

are overrepresented in the homeless population. Moreover, while victimization surveys certainly uncover more crime than do police reports, many victims likely will not disclose—even to a stranger—that they have been victims.

Using these data to describe the scope of the problem in individual tribal nations is problematic because each community is different. Tribal governments have struggled for over a century with the "one size fits all" federal approach to problem solving in tribal communities. Our tribal communities are often lumped into a single category (e.g., "Indian country" or "Native people"), which does not account for the wide disparity in specific problems faced by individual sovereign nations. Most of the time, we do not have specific data about individual tribal communities, and of course the crime rates vary widely among various tribal nations.

The Controversy over Interracial Rape Statistics

Much of the national conversation about statistics on violence against Native women has centered on the rates of "interracial" rape statistics, which become critically important when discussing legislative reform. As a baseline, the vast majority of rapes in the United States are intraracial, meaning that victims are usually attacked by persons of their own race. The only exception to this general rule is AI/AN women, who report that the majority of assailants are non-Native. The original 1999 Bureau of Justice Statistics report concluded that about nine in ten American Indian victims of rape or sexual assault had white or black assailants.[17] Another report indicated that over 70 percent of the assailants were white.[18] The numbers have fluctuated over the last decade, but the majority of Native women interviewed in these national studies consistently report that the majority of their perpetrators are non-Native.[19] This is an anomaly in American criminology; violent crime in America is almost always intraracial.[20]

Interracial statistics have significant policy implications for tribal criminal jurisdiction and all reform efforts related to tribal jurisdiction. As I discuss in-depth in chapter 3, tribal governments were stripped of power to prosecute and punish non-Indians for crimes committed in Indian country in 1978, when the Supreme Court

issued a notorious decision in *Oliphant v. Suquamish Indian Tribe*.[21] In *Oliphant*, the court relied on a curious doctrine known as "implicit divestiture" to conclude that tribal courts had lost certain attributes of sovereignty—in particular, the criminal authority over nonmembers—owing to historical presumptions of federal lawmakers. From a survivor's perspective, the *Oliphant* decision means that non-Native men who rape Native women on tribal lands completely escape tribal criminal sanctions. (One hole in *Oliphant*, by the way, was addressed in 2013 legislation for domestic violence victims, but not for rape victims. The 2013 legislation is the focus in chapter 7.) Many have asked whether *Oliphant* is the reason most Native women experience such a high rate of interracial crime. It is a compelling question, but I am not sure we have the precise answer, because we do not have pre-*Oliphant* data about the rate of interracial rape experienced by Native women.

There is a noteworthy amount of skepticism, cynicism, and confusion about the accuracy and utility of interracial statistics.[22] Some commentators simply claim that the data are wrong—that somehow a glitch in the data-gathering system is to blame. Some of that skepticism might be based on the fact that most violent crime in the United States *is* intraracial. Why would the experience of Native women be different? I have noticed that some skeptical politicians will try to claim the statistics are being manipulated to further tribal sovereignty interests, but these same politicians usually do not provide alternative data. Perhaps they are too uncomfortable with the fact that white men are still raping Native women with impunity.

Another important conversation in light of these statistics is the culpability of Native men as perpetrators of rape. A small number of tribal nations are so remote or closed that non-Native people are largely absent from the community. So when the data suggest most perpetrators are white, those tribal members may be understandably skeptical of the data's accuracy. If the data do not reflect the reality in a particular community, then that community's members view the data with skepticism. When we focus too heavily on interracial statistics, we may lose sight of the fact that there remain a significant number of Native men involved in these crimes. The colonial connection necessarily frames rape as a crime committed by colonizers against the colonized. But the reality is that Native

men and boys have also become perpetrators of sexual violence. We cannot absolve Native men from responsibility—even if they represent the minority of perpetrators. We also cannot forget that Native men and boys are also victims of rape—at a much higher rate than their counterparts in other races.

The other wrinkle is that the national interracial data often do not distinguish between on-reservation crime and off-reservation crime.[23] Knowing where these crimes occur is critical because, due to a complicated legal history, the jurisdiction of tribal governments is much more limited than the jurisdiction of the state and federal systems. Tribal governments currently have jurisdiction only over crimes committed in Indian country.[24] Some skeptical policy makers have challenged the accuracy of the non-Indian perpetrator statistics as reflecting the "urban" reality but not the reservation reality. Most Native people do not live on land subject to tribal jurisdiction. Those who are skeptical of federal reform will sometimes contend that since tribal nations do not have jurisdiction over crimes occurring off-reservation, the urban-based interracial statistics should not influence policy making. The argument is that if these numbers do not reflect what is happening on reservations, they pertain to what is happening off the reservation, so tribal jurisdiction is irrelevant and restoration of tribal authority is thereby not justified.

For me, it boils down to simple justice: even if one non-Native man rapes one Native woman on one reservation, the tribe should be able to assert criminal jurisdiction over that case. I do not see the need to "prove" that most perpetrators on reservations are non-Native. However, studies showing that most perpetrators of violence against Native women are non-Native are certainly a compelling reason to address the 1978 *Oliphant* decision directly. Ultimately we really cannot say for certain whether most Native women who experience crime on tribal lands are more likely the victims of Native people or of non-Native people. However, whether the rate is 20 percent non-Native or 80 percent non-Native, tribal nations should have full authority to respond to crimes committed by all persons. Future studies in this area should include this critical point so that we can address skepticism about the data.

Even when someone dismisses the data by suggesting that the numbers reflect the urban experience but not reservation settings,

we are still left with a problematic situation. If the data are more accurate in the urban settings, shouldn't we be concerned that most Native women in urban settings are reporting this high rate of interracial crime? Again, remember that most crime in the United States is intraracial. Since we know that Native women are reporting a high rate of interracial crime (this fact alone is difficult to rebut), this suggests there is a significant American problem regardless of tribal jurisdiction. At the very least, these numbers should justify further inquiry by social scientists and activist groups into the lives and experiences of urban Native women.

For example, what factors make it more likely than not that a Native victim in an urban setting will be attacked by a non-Native? If Native women are being targeted by rapists, there may very well be racially motivated components to some of these crimes. There is a sense that a "rapeability" factor stems from the United States' long history of anti-Indian and anti-woman policies, which have become part of the fabric of our society.[25] As Deborah Miranda notes, "Indian bodies are inferior bodies. Indian women's bodies are rape-able bodies. Indian bodies do not belong to Indians, but to those who can lay claim to them by violence."[26] Predators may target Native women and girls precisely because they are perceived as marginalized and outside the protection of the American legal system.

In short, the data we currently have do little more than "prove" that Native women experience extremely high rates of rape. But do we need more data in order to move forward? Bachman's report concludes: "We contend that new resources directed at counting 'how many' American Indian and Alaska Native women are victims are misguided. . . . The limited resources that are available would be better invested in developing intervention and prevention programs."[27] I agree with this sentiment because even if contradictory data came out next week suggesting that "only" one in four Native women will be raped in her lifetime and "only" 20 percent of the offenders were non-Native, we would still be faced with a serious harm to tribal nations that needs and deserves critical attention. A continued emphasis on the aggregate data about the rate of rape committed against Native women may serve to eclipse long-term victim-centered solutions.

The Ripple Effects of Trauma

I want to move now to a more important question: "What harm is rape doing to tribal nations?" Answering this question requires a more difficult inquiry than number crunching because each dehumanizing number in a data set represents a woman's life. Each woman's life is connected to many other women's lives—daughters, sisters, mothers, cousins, and friends.[28] Trying to conceive of the community harm that is done by extremely high rates of rape can be overwhelming. Louise Erdrich's novel *The Round House* tells the story of the rape of one Native woman from the perspective of the woman's thirteen-year-old son, a perspective that underscores the ripple effect. In the novel, both son and father suffer greatly in processing the experience that their mother and wife has suffered. Their lives are forever changed, which in turn, changes the other people in their worlds.

I approach this topic with some degree of trepidation because this kind of exploration has not always benefited Native people. Native communities are too often portrayed as traumatized, broken, and dysfunctional—all stereotypes of inferiority that neglect to honor the resilience and survival of the people by focusing on the bad rather than the good. Nonetheless, many of the challenges experienced by Native people today can be connected to the experience of rape, and the failure to confront these issues will be to the detriment of all Native people. There has been a growing trend among Native women's organizations to share painful information in ways that also celebrate and honor the strength in Native cultures. A prime example is the Barrette Project of the Minnesota Indian Women's Sexual Assault Coalition. MIWSAC, a grassroots coalition of tribal anti-rape organizations, created the project as a public awareness exhibit. The "living memorial" exhibit (and its companion book) is made up of beaded and quilled barrettes, each accompanied by the testimony of a Native woman or girl affected by rape. The exhibit thus contains elements and images of honor, beauty, and strength while simultaneously offering up difficult truths. MIWSAC's description of the project is particularly instructive in this regard:

> We utilize beaded barrettes because they represent so much to us as Native women; pride and beauty—a piece of our dance regalia—the love we feel when clipping a barrette in our daughters hair—or fear and helplessness, knowing that the same barrette may have been jerked from her hair as she was being assaulted. It is because we feel that beaded barrettes carry with them this strong symbolism that we wanted to use them as a physical representation of our stories, that we share on our traveling memorial—red, velvet covered boards with the stories and barrettes displayed.[29]

MIWSAC and related organizations have provided a platform for Native women to tell their stories on their own terms, and these perspectives, I believe, carry more significant information than any statistical report. LeAnn Littlewolf (Leech Lake Band of Ojibwe) describes the experience of widespread rape in the lives of Native women:

> The issue of sexual violence is too familiar. I can reach out around me and see so many faces of women I know who have lived through this incomprehensible experience. I can feel its deep reach into the lives of women and see the way it unfurls its effects into our families and to our communities. This is the Native way, as we find ourselves inextricably connected. And yet, being raped disconnects everything. The violation cannot be explained and this makes it impossible to reconcile. It changes the very reality of life.[30]

It is, of course, impossible for statistics themselves to convey the incredible amount of pain and trauma experienced by survivors of rape. The devastating long-term impact of rape has been well established in a variety of fields, including psychology, medicine, sociology, ethnography, and anthropology. Feminist philosopher Claudia Card writes that rape "breaks the spirit, humiliates, tames, [and] produces a docile, deferential, obedient soul."[31] The harm is simultaneously physical and spiritual, and is perhaps best captured by phrases like "soul murder"[32] and "spiritual murder."[33] Unresolved trauma can often be the source of substance abuse and addiction—frequently described as "self-medicating" in the world of anti-rape activism. Mainstream studies of the aftermath of rape have concluded that survivors are at a high risk for developing mental and

physical problems as a result of the assault.[34] For Native women, the widespread nature of rape infiltrates every aspect of life. Renowned psychiatrist Judith Lewis Herman, who has dedicated her career to studying the experience of sexual assault survivors, has described the impact of rape as having lifelong implications: "resolution of the trauma is never final; recovery is never complete."[35]

Context is always critical. Imagine living in a world in which almost every woman you know has been raped. Now imagine living in a world in which four generations of women and their ancestors have been raped. Now imagine that not a single rapist has ever been prosecuted for these crimes. That dynamic is a reality for many Native women—and thus for some survivors, it can be difficult to separate the more immediate experience of their assault from the larger experience that their people have endured through a history of forced removal, displacement, and destruction. All these events are attacks on the human soul; the destruction of indigenous culture and the rape of a woman connote a kind of spiritual death that is difficult to describe to those who have not experienced it. It is not only Native women who have been raped but Native nations as a whole.

Survivors not only struggle to cope with their own feelings but also bear the burden of society's judgment. There is no one "right" way to respond to being raped. Myriad reactions are justifiable and "logical" in the aftermath of an assault, and most of the counterintuitive behavior people observe is shrouded in the shame and confusion experienced by survivors. Victim blaming is not just external—feelings of self-blame and guilt can be even more overwhelming than the trauma itself. Survivor and professor Susan Brison explains this dynamic aptly when she writes, "It can be less painful to believe that you did something blameworthy than it is to think that you live in a world where you can be attacked at any time, in any place, simply because you are a woman."[36]

Several studies have found self-blame to be a significant factor in the recovery and general well-being of survivors.[37] If she was assaulted outside her home, a survivor may fear leaving her home, or if she was assaulted in her home, she may never want to return home. If someone she trusted raped her, she may doubt her own intelligence, decision-making ability, and sanity. Rape victims often struggle with "triggers" or memories of the assault associated with sight, smell, and sound. If the rapist was a doctor or nurse, a

survivor may avoid necessary medical care. If the rapist was a police officer, she may never call for help again (and may teach her daughters not to call, either—no matter how bad things may seem).

In short, rape affects more than the individual victims; it has an impact on the entire community. Women play significant roles in tribal communities, culturally, spiritually, and politically, and have been referred to as the "backbone" of tribal sovereignty.[38] Sovereignty thus suffers when the women suffer. The fact that over one-third of Native women have been traumatized by rape inhibits their ability to contribute productively to the community. The insidious and cyclical nature of sexual violence compounds the trauma, particularly in communities where there has been no effective intervention for centuries.

This is not to say that women who experience sexual assault are doomed to a life of despair and pain. On the contrary, Native women survivors who have shared their stories of survival with me have impressed upon me their strength of will and resolve in the face of brutality and oppression. Native women can indeed survive and heal after rape, but the immediate and lingering aftereffects of the crime can result in significant (if temporary) impairments in their lives. I seek to acknowledge and document the devastation left in the wake of rape, and to address how tribal legal systems might play a role in responding to this devastation.

What We Need to Know

The most important research being done on rape in the lives of Native women takes place under the auspices of locally initiated and implemented projects. The surveys, roundtable reports, and safety audits that are done in local communities are much richer in terms of information because of the depth that can be achieved with methodology that reflects the unique experiences of particular tribal communities.[39] These kinds of studies do not often appear in academic journals because the Native women who conduct and publish them are not particularly concerned with how the outside world understands their trauma. (Or, as one elder chided me, "It's nobody else's business.") These localized research projects are designed to craft customized, tribal-specific interventions. However, the distribution of such reports (when appropriate) can serve as examples or models for other tribal communities. For example,

in 2013 the White Buffalo Calf Woman Society (an organization dedicated to ending violence against women in the Sicangu Lakota nation) released two important reports that focused inward on the real experiences of Lakota women.[40] Tribal members developed the survey instruments with the assistance of social scientists. These kinds of reports typically contain much richer information about the unique needs of survivors in that community than any outside survey could ever capture. The WBCWS studies provide insight into what the community members are truly experiencing without revealing any private information. Consider the value of the following data points:

> The majority of those polled felt domestic violence (92.8%), sexual assault (92.8%), and teen dating violence (91.2%) were all problems on the Rosebud Reservation. A lower percent (82.0%) thought that stalking is a problem. . . . More than three-quarters (77.5%) of all female respondents who had experienced both domestic/dating violence and sexual abuse or rape had considered or tried hurting themselves.[41]

This information is far more valuable to the tribal leaders than aggregate national data available from the federal government. When Native women design studies that reflect their own concerns, then the research will truly advance change.

Conclusion: Categories of Knowledge

There are different categories of knowledge. There is the kind of knowledge we gain from years of careful study, consulting as many experts as possible and analyzing the empirical data. Then there is the kind of knowledge we gain from experiencing something; a visceral knowledge that can invoke the physical senses and the genius of memory. I find Athabascan scholar Dian Million's description of this dynamic as "felt theory" particularly worthwhile because it honors and values the real, lived experiences of Native women as legitimate sources of knowledge.[42] Both categories of knowledge are critical for addressing rape.

I hesitate to call one form of knowledge more "Western" and one more "Native." Such binary distinctions tend to oversimplify the worldview and reinforce the stereotype that Native people somehow

do not value quantitative scientific study. In my experience, Native people are no less interested in empirical data than other people.[43] Western science, however, has largely operated from a place of patriarchal oppression that both steals data and disrespects fundamental tenets of basic kinship protocol. If Native people distrust scientific data, it is because it has largely been used to critique Native society and reinforce dehumanizing stereotypes. As Linda Tuhiwai Smith explains, " 'Research' is probably one of the dirtiest words in the indigenous world's vocabulary."[44] The scientific process and the use of the data can seem dehumanizing, exploitative, and pointless.

So while gathering empirical, scientific data has been critical in convincing the outside world to take notice of the crisis, we must not forget local realities. National numbers are flat; they lack dimension and stifle future exploration. For Native women, surviving rape is a journey with texture and dimensions that are shaped by history, language, and ceremony.

TWO

What She Say It Be Law

Tribal Rape Law and Indigenous Feminisms

THE PEOPLE OF MY NATION, the Mvskoke, have always governed themselves pursuant to laws. Like most tribal nations, the Mvskoke people relied for millennia on sacred oral traditions and ceremonies both to establish and enforce legal standards. These laws were not written down. In fact, for many Native people, reducing laws to writing weakened their power by limiting accessibility to a few and losing the value of rhythm and intonation. Europeans utterly failed to understand this kind of system. Seeing no judges, courtrooms, or attorneys, settlers assumed that Native people were without law. This assumption made it morally palatable to impose foreign laws upon Native people, and also facilitated the application of racial epithets such as "uncivilized" and "savage." Starting in the early nineteenth century, federal Indian agents encouraged, cajoled, manipulated, and bribed Native people into reducing their laws to writing, while simultaneously mandating the development of an American-like system to replace tribal legal traditions. The earliest written laws of tribal nations thus provide fascinating case studies on how the clash of culture and ideas played out in everyday legal relationships.

Mvskoke leaders started writing down laws much earlier than most other tribes. By the early nineteenth century, Mvskoke people were largely intermarried and intermingled with Scottish immigrants. Federal officials encouraged and expected assimilation, and writing down laws (in English) was a central component of

these efforts. Some of the earliest known Mvskoke written criminal laws date to 1825, when Chilly McIntosh, the son of a well-known Mvskoke chief, handwrote fifty-six criminal laws in English to satisfy the local Indian agent that the Mvskoke people were law-abiding. The thirty-fifth law clearly addresses gendered violence. While the crimes were not labeled with any particular title, it is safe to say that this is the first written Mvskoke rape law:

> And be it farther enacted if any person or persons should undertake to force a woman and did it by force, it shall be left to woman what punishment she should satisfied with to whip or pay what she say it be law.[1]

Several interesting concepts emerge from this forty-three-word sentence, although the syntax is confusing and the word rape itself is never used. The word "force" (used twice) is an important clue that this passage describes a physical attack and the law clearly refers to women as victims (although it does not indicate the gender of perpetrators). There is a clear reference to corporal punishment ("whip or pay")—which is consistent with observed Mvskoke law in practice in the early nineteenth century. Perhaps most remarkable component of this law is the last six words: "what she say it be law." This phrase, suggesting a rape victim had legal standing to participate in sentencing decisions, is fundamentally inconsistent with Anglo-American rape law in the same time period.[2]

For most of American legal history, rape was framed as a *property* crime perpetrated against men.[3] In fact, the phrase "marital rape" was an oxymoron in American law until the early 1990s (married women had no legal right to deny sex to their husbands). In 1825, most state laws often required two eyewitnesses to convict a man for rape—a woman's word alone could never be sufficient. In addition, settler women were not allowed to be attorneys, judges, or jurors, meaning there could literally be no female voice to "say the law." Yet the 1825 Mvskoke law—in the same era—ends with the phrase "what she say it be law." Somehow, despite the persistent effort and pressure to develop an American-style government and legal system, the Mvskoke law suggests a legal tradition that acknowledged the decision-making capacity of women. This does not mean the Mvskoke people were feminists in the modern

sense of the word, but it does tell us the precolonial legal system likely operated with a fundamentally different worldview.

The pressure to assimilate laws and governments continued (and continues today), and less than fifty years later, the Mvskoke rape law read as follows: "Be it enacted, That should any person be convicted of rape, he shall for the first offense receive fifty lashes, for the second offense he shall suffer death."[4] Several fundamental changes are expressed in less than fifty years. Note that the gender-neutral 1867 law does not mention a victim at all. The voice of Mvskoke women appears to have been lost or at least eclipsed through the forced Americanization of the Mvskoke people.

With Mvskoke law as a starting point, this chapter considers the relevance of precolonial responses to sexual violence in tribal nations by exploring general foundational structures and belief systems about gender that existed prior to the imposition of foreign legal structures. This chapter will also consider the limitations of mainstream American feminism in developing solutions to violence against Native women and how Native women's perspectives can be muted by the dominant discourse about patriarchy. This chapter closes by exploring the role of contemporary tribal jurists in documenting and enforcing tribal-specific gendered justice.

Gender Equity in Traditional Law

Patriarchy is largely a European import. Native women had spiritual, political, and economic power that European women did not enjoy. That power was based on a simple principle: women and children are not the property of men. I am guarded about pan-Indian essentialisms suggesting tribal nations were all "matriarchal" and therefore rape free—Plains Cree Métis scholar Emma LaRocque cautions that "it should not be assumed that matriarchies necessarily prevented men from exhibiting oppressive behavior toward women."[5] I often provide forty-five- to fifty-minute lectures on Native women and rape, and I have sometimes been guilty of overgeneralizing and overromanticizing precolonial gender roles—if for no other reason than time constraints. Still, there are some common themes in tribal histories and epistemologies that serve as counterpoints to patriarchy. Women exercised power in ways that weren't always readily recognized by a non-Native observer

because they did not always perform tasks associated with European leadership.

Power should not be confused with pure equality. Tribal societies were generally not gender neutral. In fact, gender was often explicitly prescribed in the division of duties, based on a dualistic scheme with a significant emphasis on balance. Often, this duality is presented in a reductive way (e.g., "The women farmed while the men hunted"). In reality, it would be more accurate to say "most women farmed" and "most men hunted"—there were always exceptions based on personal abilities, ceremonial expectations, or the need to balance responsibilities.

Exploring a particular tribal epistemology can illuminate some specific ways in which this gendered balance was achieved. In Mvskoke culture, "The balance of male and female principles permeates all Creek thinking. The balances, therefore, involve the division of various powers, functions, and privileges."[6] This framework for gender can also be described as *nonbinary complementary dualism*, wherein binary gender lines are fluid without fixed boundaries. This is evidenced by the role that Two-Spirit or gender nonconforming people played. Sometimes a man would perform a woman's role, and vice versa.

In a gendered epistemology, all persons have valued roles and duties, which balance one another; "dualism embraces difference in principle, not as division but rather as complementarity."[7] It is a versatile description that continues "to offer exceptional sanctuary to an attitude about gender that cherishes a wide arena of personal autonomy and freedom."[8] Women and men often had separate duties, but the separation took the form of horizontal distinctions rather than a vertical hierarchy of authority. The gender lines, as part of a creation story or cosmology, are set up to complement each other, to provide "equilibrium."[9] In some cosmologies, gendered identity is transcended by those with particular spiritual gifts.[10]

Even the fundamental foundation for Native identity was women centered; many tribal kinship systems are organized around a matrilineal clan system whereby a child's primary identity is based on the mother. In matrilineal societies, women are often vested with the power to name the leaders of the clan who then execute the chosen laws of the people. Property was conveyed through women, and they often chose the leaders of their tribal councils. In some

political structures, like that of the Haudenosaunne, women held "veto" power over decisions to go to war based on their willingness to provide food for warriors.

Many traditional tribal gender laws have been lost or damaged through assimilation (particularly Christian assimilation). It is difficult to re-create or reimagine how precolonial systems adjudicated rape, but there are clues in historical records that affirm the presence of significant anti-rape sentiment in most tribal cultures. One of the most significant clues comes from tribal constructs of sexual autonomy and bodily integrity. In the Lakota culture, for example, Mark St. Pierre and Tilda Long Soldier write, "the woman owned her body and all the rights that went with it."[11] European settlers were fascinated and sometimes horrified by the sexual autonomy of Native women. Their journals and observations, especially those from the eighteenth and nineteenth centuries, provide important (though often flawed) information about women's sexuality in Native communities. In Europe and early America the legal system was used to limit, penalize, and punish sexual choices of women. Not so in tribal nations. In 1722 Diron D'Artaguiette, a French settler, wrote that young Native girls "are the mistresses of their own bodies" as though this were somehow a noteworthy observation.[12] Many European settlers judged cultural values about women's sexuality as savage and primitive if not altogether inhuman. French Jesuits, who were the primary European contact for many tribal nations, were "baffled and sometimes horrified" by the sexual and political autonomy exhibited by indigenous women.[13] Christian missionaries and federal agents used Native women's autonomy as justification for conversion and assimilation. Native women who expressed and celebrated their sexuality had no place in mainstream America and were often shamed and marginalized. Many Europeans were alarmed by the powerful role played by Native women within their nations, and efforts were made to reduce the status of Native women through numerous means.[14] Missionary records from throughout the continent indicate that many religious groups formally imposed severe consequences on Native women who dared exercise independence and sexual autonomy.[15]

Likewise, Europeans were often fascinated by the anti-rape cultures they encountered, particularly when they discovered that Native men did not rape women war prisoners.[16] For example,

Laurel Thatcher Ulrich (the Harvard historian who coined the phrase "well-behaved women seldom make history") writes that the Puritans were "amazed at the sexual restraint of Indian men, who never raped their captives."[17] Even Europeans who wrote disparagingly about Native people noted that Native people abhorred sexual violence. Brigadier General James Clinton of the Continental Army told his troops in 1779, "Bad as the savages are, they never violate the chastity of any women, their prisoners."[18] Another account comes from George Croghan, who testified about Indians in the Middle Atlantic colonies in the late eighteenth century: "I have known more than onest thire Councils, order men to be putt to Death for Committing Rapes, wh[ich] is a Crime they Despise."[19] Despite the proliferation of "captivity narratives" in the nineteenth century, which were framed with the intent to dehumanize the brutish behavior of Indians, there is very little historical documentation of Native men perpetrating rape against white women.

Precolonial Responses to Rape

There is, of course, no database of stories or laws that we can consult to understand how tribal nations articulated and enforced rape laws. We do have anecdotal evidence that tribal nations took rape seriously enough that punishments in some regions included corporal punishment, banishment, and even the death penalty.[20] Native women's activists have documented the traditional response of tribal communities to violence against women.[21] Ojibwe scholar Lisa Poupart explains:

> According to the oral traditions within our tribal communities, it is understood that prior to mass Euro-American invasion and influence, violence was virtually nonexistent in traditional Indian families and communities. The traditional spiritual world views that organized daily tribal life prohibited harm by individuals against other beings. To harm another being was akin to committing the same violation against the spirit world.[22]

While my research is generally consistent with Poupart's conclusion, I hesitate to claim that all tribal cultures were entirely 100 percent "rape free." But the frequency of the crime was low, in part

because of the immediate and severe consequences for disrupting balance in society. Evidence lies in both the experience of Native women prior to contact as well as the behavior of Native men, as recorded by European explorers, settlers, and traders.

Historically, tribal nations, as sovereigns, exercised full jurisdiction over crimes against women. Crimes such as rape, domestic violence, and child abuse may have been extremely rare, but when they did occur, tribal systems provided a powerful system of social checks and balances that held offenders accountable for their behavior.[23] Unlike the American legal system, wherein victims of violent crime have historically had no voice in the criminal justice process,[24] most indigenous legal systems were victim centered. Tribal governments strived to provide a sense of spiritual and emotional recovery from violent crime, by providing both material goods and spiritual sustenance designed to restore the victim to her previous place in life. Although no system is perfect, indigenous philosophies of justice generally provide more protection and healing to victims than the American system.[25] Moreover, many "responses" to rape were incorporated naturally as part of the way in which people lived. There were political consequences as well. In Iroquois culture, a man could not achieve a leadership position if he had ever raped a woman.[26] As Dakota scholar Elizabeth Cook-Lynn explains, "Men who caused stress in the community or risk to the survival of the tribe by dishonoring women were held accountable by the people. They could not carry the sacred pipe, nor could they hold positions of status."[27] Many of these principles need to be revitalized and enforced.

As tribes began to develop written laws in response to pressure from the U.S. government, it is possible that some of the values that had been transmitted orally found their way into the early written laws. The Mvskoke law described at the beginning of this chapter is one such example. When compared to the European and early American laws on rape, which often punished women for the actions of rapists, the tribal response to sexual assault was comparatively victim-centric and respectful of survivors.[28]

American Rape Law

Nineteenth-century American rape laws, based in large part on the common law of England, treated women as subordinate, at best, or as chattel at worst.[29] They were not intended to protect women as much as they were intended to control them, preserve chastity, and curtail their sexual independence. And as part of the colonial project, Europeans imposed their own expectations and standards for appropriate female sexuality on tribal people. In Spanish law, women were considered to be the legal subjects of their fathers, brothers, or closest male relative.[30] Through the process of assimilation and acculturation, many of these European constructs of gender and sexuality have become incorporated into some contemporary indigenous communities. Reclaiming an indigenous jurisprudence of rape, therefore, requires a reexamination of tribal conceptions of sexuality, independence, and autonomy. This is a topic that I discuss more thoroughly in chapter 8.

The origins of sexual assault law in the American system developed as an offshoot of property law.[31] The traditional American legal paradigm of rape (a stranger attacking a virgin) did not address the experience of most women, as rape law placed women in the same category as inanimate property. Legal scholar Michelle Anderson has carefully studied these early paradigms, and has a described a culture which is fundamentally at odds with sexual autonomy:

> Historically, [Anglo-American] rape law raised unique procedural hurdles for rape victims that victims of other crimes did not have to surmount. Derived from English common law and applicable in most jurisdictions until the mid to late 1970s, these formal rules embodied clear presumptions against women who complained of having been raped. These rules included absolute exemptions from criminal liability for men who raped their wives. They included requirements that the victim establish that she resisted her attacker to the utmost, freshly complained of having been raped and corroborated her testimony with other evidence. They included biased suppositions about victims who had previously engaged in sexual intercourse outside of marriage. Finally, they included special cautionary instructions read to the jury to warn them of the fallibility of the testimony of those who allege they have been raped.[32]

Until the mid-twentieth century, most state systems only criminalized rape when the victim was a white woman and left indigenous women and other women of color with no recourse.

At the same time, the colonial mind-set could not conceive of a legal wrong in raping a Native woman. As a result, Native women were devalued and debased, and their abuse was seen as being outside the law.[33] In a 1909 congressional debate regarding punishments for perpetrators of sexual assault against Native women, U.S. Representative George W. Norris of Nebraska stated on the floor of the House of Representatives, "the morals of Indian women are not always as high as those of a white woman and consequently the punishment should be lighter against her."[34] Accordingly, in 1968, the Ninth Circuit Court of Appeals (ruling on an Arizona case) upheld a law that imposed a harsher penalty for the rape of a non-Indian woman than for that of an Indian woman,[35] presumably because Congress viewed Native women as immoral and therefore unworthy of protection.[36] While this particular legal distinction is no longer on the books, the legacy of official disparate treatment is apparent from the statistics we see today.

Advancing Native Feminisms

Starting in the mid- to late twentieth century, Native women activists sometimes clashed with liberal feminists on the issue of "equality." Tribal cultural values often do not strive for the utopian ideals of pure equality in the form of a gender-neutral society. This contemporary tension between Native and non-Native feminists can be traced back to the "clash" between Europeans and Indians during colonial expansion over the two groups' fundamentally different epistemological views on the nature of gender and the appropriate roles of women in society.[37] Today's mainstream feminist theories about rape are often responding to a culture grounded in a patriarchy of European origin. When tribal governments respond to gendered violence, though, they are responding to a phenomenon fully entrenched in abusive colonial power. Thus, the many solutions proposed by mainstream feminists, who focus on patriarchy as the cause of gendered violence, are often a poor match for the responses of tribal societies.

Skeptics may contend that whatever matrilineal/matrilocal aspects of Native society existed have largely been abandoned or lost as a result of hegemony and assimilation, and it is merely hopeful idealism to suggest we could rekindle concepts of precolonial gender balance. In response to that concern, this chapter concludes by highlighting a few published tribal court decisions that offer evidence that women-centered values and practices still exist, in some form, in some of today's tribal legal systems. Such cases demonstrate that the effort to sustain and revitalize precolonial gender norms is not merely an academic exercise. Reviewing these cases can illuminate tribal courts as one avenue of confirming or reestablishing respect for women in contemporary tribal communities. Many tribal judges have, at least from outward appearances, based their legal analysis on standards established by American common law. What I have highlighted are cases in which tribal jurists have resisted this patriarchal tradition and tapped into unique tribal conceptions of gender to resolve disputes.

Contemporary tribal court cases addressing gender issues demonstrate a unique tribal perspective or way of thinking about legal cases dealing with gender that is based on tribal customs and traditions. The cases in this section focus on matrilineal clans, family law, criminal law, and property. Cases dealing with child custody, divorce, and sexual assault exemplify these principles of gender equity. These cases are not presented as tribal feminism in action but rather as acknowledgment of gendered law that could be explored further in the efforts to intervene in entrenched gendered violence.

Kinship Circles: Women at the Center

Matrilineal descent may be one of the salient gender characteristics that has survived over the centuries in some communities. Many Native people may not know much about their language or precolonial government structures, but still retain a strong connection to their clan and matrilineal ancestry. The following tribal court cases demonstrate that clan identity is still relevant enough to appear as a central focal point in some tribal judiciaries. If one is using a strictly Western lens, some of these custody/kinship cases may look like a

preference for women, but only if one characterizes gendered analysis as centered on rights as opposed to responsibilities.

Hepler v. Perkins is a 1986 child custody decision from the Sitka Community Association Tribal Court in Alaska.[38] The case ultimately turns on a Tlingit matrilineal society and values based on the mother's clan responsibilities. In *Hepler,* a Tlingit mother from Sitka attempted to regain custody of her child from the non-Indian father and grandparents. Both mother and child were Sitka tribal members. The descriptions of familial and clan relationships are distinctly those of the Sitka Tribe and are based on the role of mothers within the Sitka community. The mother and child were living away from the tribal community when the paternal grandparents went to the state of Washington to gain custody of the child. The mother asked the Tribal Court of the Sitka Community Association to rule on whether under customary tribal law the tribe continued to assume responsibility for her child even when she and her child were away from Sitka. The Tribal Court of Sitka referred the case to the Court of Elders to rule on this important issue of clan jurisdiction over children of female members.

The Court of Elders found that

> children of female members of a clan are children of the clan regardless of where or under what circumstances they may be found. Clan membership does not wash off, nor can such membership be removed by any force, or any distance, or over time. Even in death clan membership continues, and in re-birth is it renewed.[39]

Based on the tribal custom of female clan membership and their responsibility to care for children, the Tribal Court decided that it had inherent authority to protect the clan relationship, even when a child was not currently living within the tribal territory.

The Sitka case demonstrates the continued relevance of matrilineal descent, which is intertwined with the power Sitka women have in the tribal community. In a matrilineal society, clan membership is determined through the mother. As described by the elders, clan membership does not "wash off" and is not diluted by distance. The court ruled in favor of the Indian mother, based not on an assumption that the mother was a more nurturing or effective

parent but based rather on Sitka values about clan membership and clan responsibility for children.

In the Matter of JJS is a 1983 adoption case from the Navajo Nation with a similar acknowledgment of clan identity.[40] The District Court of Window Rock in the Navajo Nation located in northern Arizona made a decision to grant custody of a neglected child to the mother's extended family. After considering Navajo customary law, the court awarded custody of the neglected child to the maternal relatives, based on the principle that "the Navajo view of the relationship of children to parents is not one of a simple parent and child relationship, but an entire pattern of expectation and desirable action surrounding children."[41] There is a distinct relationship between Navajo children and their parents based on reciprocal expectations and relations. Children are highly valued in Navajo society as "an integral part of a functioning self-reinforcing and protecting group."[42] This group consists of a large extended family based on matrilineal society. A child can be adopted by the extended family for an indeterminate amount of time in order to retain the family and clan ties. The entire extended family is expected to care for the child as a natural part of community and clan obligations.[43]

Instead of using federal law to decide the case, the court relied on Navajo tradition that dictates the importance of the extended family in raising a child. The bonds between children and grandparents are extremely important, and the court reflected these values by allowing the child to stay with his or her extended family.

The Navajo Nation Supreme Court has also infused contemporary divorce law with traditional gender norms. One example is the 1997 case of *Naize v. Naize* in which the court ordered that the husband pay alimony and attorney's fees to the wife based on Navajo custom and tradition, which dictates that you "do not throw your family away."[44] In exploring these obligations, the court noted that in traditional Navajo marriage, the husband moves into the wife's home upon marriage, and the joint efforts of the man and woman work to benefit the family. Moreover, the court concluded:

> If the marriage does not survive, customary law directs the man to leave with his personal possessions (including his horse and riding gear, clothes, and religious items) and the rest of the marital property

> stays with the wife and children at their residence for their support and maintenance. Whatever gains the marital property generate[s] goes to support the wife and children and to a lesser extent the wife's close relatives.[45]

With these words, the court upheld the wife's request for spousal maintenance. The court decided to grant spousal support to the female divorcée based on Navajo customary law that indicates that the marital home, all possessions within, and the children belong to the women. The ex-wife's request for attorney fees was also upheld.

However, the Navajo Supreme Court reversed one aspect of the maintenance decision of the lower court, which ordered the ex-husband to provide wood and coal to his ex-wife for the remainder of her life. The Supreme Court referenced another Navajo custom in reversing this decree, noting that divorce should have "finality," and a lifetime obligation was inconsistent with this tradition. Customary law dictated that to restore balance and harmony after the divorce, each party should return to his or her own home and leave the other person alone. In this case, the Navajo court relied entirely on Navajo customary law and traditions regarding the position of women within Navajo society.

In 1993 the Tribal Court of Appeals for the Sicangu Lakota (Rosebud Sioux) Tribe in South Dakota carefully considered the role of gender imbalance in a child custody case captioned *Spotted Tail v. Spotted Tail.*[46] The court reviewed a custody decree in a domestic violence case and concluded that the trial court correctly awarded custody to the mother in a divorce case. The mother in this case was apparently accused of abandoning her children and thus of being unfit for custody. However, the court based its decision on the welfare of the children, which it ruled should never be subservient to the interests of the parents. In this case, the mother had to flee from the abuse of her children's father. She tried to make contact with her children, but her husband denied her access and demonstrated a pattern of dominion and vengeance over both the children and the mother.

The tribal court put the interests of the children first, instead of focusing on alleged shortcomings of the parents. Despite the fact that the mother had not been able to parent for several years, the court considered how domestic violence affected her access to the

children. Domestic violence cases are especially challenging for mothers who have suffered abuse at the hands of their partners, because judges often unfairly consider the mothers to be a threat to their children. But in *Spotted Tail*, the court noted that the evidence "reveals a father who was domineering, abusive, and revengeful, who seemed bent on keeping the children away from their natural mother."[47] This case alludes to the special place children and women hold within most tribal communities. Children's interests are of primary concern to the tribe, because they represent future generations and the continuation of the tribal community.

Contemporary Accountability: Rape in Tribal Court

Tribal courts have also considered gender norms in the context of rape cases. In *Winnebago Tribe of Neb. v. Hugh Bigfire* (1998), the Winnebago Supreme Court was asked to use the American concept of "equal protection" in a sexual assault case in which the tribal code differentiated between men and women. The male defendants argued that men and women should be treated equally under the law. The court rejected this argument, explaining that

> under traditional Winnebago customary law, gender differences commonly were drawn for the punishment of offenses related to sexual misconduct because of the natural biological differences in this area between the sexes, the different consequences of misconduct for men and women, and different roles ascribed by the tribal tradition to men and women (without creating any hierarchy or cross-gender disrespect). . . . Ho-Chunk tradition recognizes and respects different roles for males and females in the Winnebago Tribe, and particularly, tolerates and encourages different responses to sexual misconduct for men and women.[48]

After considering research into the tribal gender values through consultation with tribal members, elders, and research on Ho-Chunk customary law, the Winnebago Supreme Court concluded that gender differences constitute a natural part of Ho-Chunk life, and that men and women have different roles to provide for each other in relationships. The equal protection claims failed because the charges against the males made them more accountable, which

children. Domestic violence cases are especially challenging for mothers who have suffered abuse at the hands of their partners, because judges often unfairly consider the mothers to be a threat to their children. But in *Spotted Tail*, the court noted that the evidence "reveals a father who was domineering, abusive, and revengeful, who seemed bent on keeping the children away from their natural mother."[47] This case alludes to the special place children and women hold within most tribal communities. Children's interests are of primary concern to the tribe, because they represent future generations and the continuation of the tribal community.

Contemporary Accountability: Rape in Tribal Court

Tribal courts have also considered gender norms in the context of rape cases. In *Winnebago Tribe of Neb. v. Hugh Bigfire* (1998), the Winnebago Supreme Court was asked to use the American concept of "equal protection" in a sexual assault case in which the tribal code differentiated between men and women. The male defendants argued that men and women should be treated equally under the law. The court rejected this argument, explaining that

> under traditional Winnebago customary law, gender differences commonly were drawn for the punishment of offenses related to sexual misconduct because of the natural biological differences in this area between the sexes, the different consequences of misconduct for men and women, and different roles ascribed by the tribal tradition to men and women (without creating any hierarchy or cross-gender disrespect). . . . Ho-Chunk tradition recognizes and respects different roles for males and females in the Winnebago Tribe, and particularly, tolerates and encourages different responses to sexual misconduct for men and women.[48]

After considering research into the tribal gender values through consultation with tribal members, elders, and research on Ho-Chunk customary law, the Winnebago Supreme Court concluded that gender differences constitute a natural part of Ho-Chunk life, and that men and women have different roles to provide for each other in relationships. The equal protection claims failed because the charges against the males made them more accountable, which

coincided with traditional male roles of respecting women within the community.[49]

Fort Peck v. Martell (2000) is another tribal court case that involves interpreting tribal rape law.[50] The defendant, Martell, coerced a young girl to leave the reservation with him by promising her drugs and alcohol, and then he raped her outside tribal territorial jurisdiction. The defendant argued that the crime took place off-reservation (in Havre, Montana), thus falling outside the jurisdiction of the tribal court. The Fort Peck Court of Appeals ruled that key elements of the crime took place on the reservation, namely, the "coercive methodology" used by the defendant. This is an innovative analysis of the crime, framing rape as a series of actions for which the perpetrator should be held accountable, a ruling that reflects an understanding of rape that is typically absent from American law.

Conclusion: Reclaiming Indigenous Feminisms

The tribal cases in this chapter suggest that some contemporary tribal courts are seeking to address gender issues in a distinctly indigenous way. By reclaiming their own tribal perspectives on gender, they are engaging in a unique ethic of decolonization—an ethic that balances traditional views on morality with contemporary needs and problems. Of course, tribal courts are not the only tribal entities that continue to consider how precolonial conceptions of gender can inform contemporary issues. Tribal courts are, however, the living manifestation of tribal law, and the fact that women's roles are respected and valued is indicative of a larger movement to stop violence.

Analyzing the 1825 Mvskoke law is a useful exercise because it illuminates uniquely Mvskoke values that can help shape contemporary tribal rape law. While the actual substance of the law has little applicability today, it is through these traditions that tribal nations have the opportunity to revisit traditional gender roles and determine how the values of protecting women and holding perpetrators accountable have relevance for today's tribal laws.

At the Mercy of the State

Linking Rape to Federal Indian Law

IN NOVEMBER 2013, the Indian Law and Order Commission, a national bipartisan independent investigatory body created by language in the Tribal Law and Order Act of 2010, released a report titled *A Roadmap for Making Native America Safer.* Among its many conclusions was the assertion that "more lives and property can and will be saved once Tribes have greater freedom to build and maintain their own criminal justice systems." The report's recommendations are part of a larger contemporary movement to disentangle federal law from tribal law. Tribal governments have struggled to respond to rape because federal Indian law has placed both legal and practical barriers in the exercise of criminal jurisdiction.

Today's tribal legal systems operate under bizarre constraints imposed under even more bizarre conditions, creating a patchwork of various federal and tribal laws that work in tandem to utterly obfuscate justice. Nowhere does this patchwork affect the day-to-day lives of Native people more directly than in the area of criminal law. Native people are both overvictimized and overincarcerated at significant rates, and nearly everyone who has worked in Indian country can tell you that the criminal justice framework is to blame.

Tribal sovereignty is a critical component to addressing gendered violence in tribal communities today, because a sovereign political entity has duties to protect citizens from abusive power. Seneca legal scholar Robert Odawi Porter writes that political sovereignty for tribal nations is expressed through three core components: belief, ability, and recognition.[1] Using this structure in the

Linking Rape to Federal Indian Law

IN NOVEMBER 2013, the Indian Law and Order Commission, a national bipartisan independent investigatory body created by language in the Tribal Law and Order Act of 2010, released a report titled *A Roadmap for Making Native America Safer.* Among its many conclusions was the assertion that "more lives and property can and will be saved once Tribes have greater freedom to build and maintain their own criminal justice systems." The report's recommendations are part of a larger contemporary movement to disentangle federal law from tribal law. Tribal governments have struggled to respond to rape because federal Indian law has placed both legal and practical barriers in the exercise of criminal jurisdiction.

Today's tribal legal systems operate under bizarre constraints imposed under even more bizarre conditions, creating a patchwork of various federal and tribal laws that work in tandem to utterly obfuscate justice. Nowhere does this patchwork affect the day-to-day lives of Native people more directly than in the area of criminal law. Native people are both overvictimized and overincarcerated at significant rates, and nearly everyone who has worked in Indian country can tell you that the criminal justice framework is to blame.

Tribal sovereignty is a critical component to addressing gendered violence in tribal communities today, because a sovereign political entity has duties to protect citizens from abusive power. Seneca legal scholar Robert Odawi Porter writes that political sovereignty for tribal nations is expressed through three core components: belief, ability, and recognition.[1] Using this structure in the

context of rape, political sovereignty might be best articulated as, "Our tribal nation *believes* it has the legal and moral authority to respond to rape. Our tribal nation has a *strong system* in place to hold offenders accountable. Neighboring nations *recognize* our authority and respect our decisions about responding to rape."

All three aspects of Porter's construction of sovereignty have been damaged by colonialism. The federal government has systemically stripped power from tribal nations, leaving tribal nations without effective legal remedies that are grounded in tribal law. Understanding how this process has diminished the power of tribal governments is a critical step in the process of strengthening today's tribal criminal justice systems. I will explore the complicated calculus of contemporary criminal jurisdiction in Indian country and demonstrate how the dysfunction of federal Indian law has created barriers that continue to make Native women particularly vulnerable to rape. For the purposes of this chapter, I will limit the discussion to the most significant federal actions that have an impact on the tribal response to rape.

A Brief History of Federal Indian Law, from Columbus to Today's Reforms

Understanding the historical context in which federal Indian law developed is critical to any proposal for reform. In the context of rape in tribal communities, then, it is also necessary to examine the history of rape committed by European men against Native women. In raping Native women, European men were certainly breaking tribal law. This fact mattered little to the colonists and rapists, who completely misunderstood, ignored, and otherwise disrespected existing tribal legal systems.

We can begin our historical investigation with the arrival of Christopher Columbus in North American in 1492. An iconic symbol of colonization, Columbus's arrival represents not only the beginning of the destruction of indigenous cultures but also the moment when European men introduced rape as a major tool of that destruction. A passage from the diary of one of Columbus's aristocratic friends who accompanied him on the second voyage describes one such encounter:

> When I was in the boat, I captured a very beautiful Carib woman. . . . Having brought her into my cabin, and she being naked as is their custom, I conceived desire to take my pleasure. I wanted to put my desire to execution, but she was unwilling for me to do so, and treated me with her nails in such wise that I would have preferred never to have begun. But seeing this . . . I took a rope-end and thrashed her well, following which she produced such screaming and wailing as would cause you not to believe your ears. Finally we reached an agreement such that, I can tell you, she seemed to have been raised in a veritable school of harlots.[2]

The symbolism of this boastful passage and its arrogant entitlement is extremely important, for it exemplifies the logic of colonists who would continue to deploy rape as a tool of conquest. Historian Albert L. Hurtado notes of the nineteenth-century California gold rush, "Part of the invading population was imbued with a conquest mentality, fear and hatred of Indians that in their minds justified the rape of Indian women."[3] The same men who brought the trauma of rape with their physical presence also represented the powers that would ultimately put a stranglehold on the type of tribal authority they would recognize.

Indian "Uprisings" as a Response to Sexual Exploitation

Throughout the nineteenth century, tribal leaders often protested and resisted when women and children were mistreated. Indeed, many tribally initiated conflicts and "uprisings" were responses to kidnapping and sexual mistreatment of women. One example comes from the 1862 U.S.–Dakota War in Minnesota, popularly referred to as the "Sioux Uprising." While many historians describe the precursor to this war as hunger and anger about delays in distribution of treaty-promised annuities and supplies, a closer review of the record also reveals Dakota concerns that the Office of Indian Affairs had "failed to investigate charges of . . . mistreatment of Indian women by white men."[4] Jerome Big Eagle, one of the Dakota warriors condemned to die by the military after the war, received a reprieve from President Abraham Lincoln and was exiled to a prison camp in Iowa, where he was ultimately pardoned by President

Lincoln in 1864. He spoke to an author in 1894 and told him that just prior to the uprising, "some of the white men abused the Indian women in a certain way and disgraced them, and surely there was no excuse for that." Attacks on Native women and children aggravated the already tense relationships between frontier communities and Indian tribes. Violent "uprisings" often came after nonviolent attempts had failed and all legal procedures available to Native tribes were exhausted. Indians did kill whites, though clearly acts of violence were measures of last resort.[5]

The Problem of Jurisdiction

In law, jurisdiction is a term of art referring to government power, usually centering particularly on the power of the courts. There are three main categories of jurisdiction in the American legal system: territorial, personal, and subject matter. As sovereign nations, tribes exercised full jurisdiction in all three contexts. Tribal governments exercised inherent authority over territory, people, and relevant subject matters as developed through cultural practices and legal norms.

In the United States, tribal jurisdiction (at least that recognized by the federal government) has suffered greatly in the past 150 years at the hands of unilateral federal laws passed with no input or vote from tribal leaders. In a variety of contexts (including legislative and judicial), the federal and state governments have drastically diminished recognized tribal power. As a result of this complicated federal legal scheme, tribal governments have been denied jurisdiction over the vast majority of sexual violence that happens to Native women. This chapter focuses on four of the most significant laws in the lives of Native rape survivors today: the Major Crimes Act, a federal law passed in 1885;[6] Public Law 280 (PL 280), a federal law passed in 1953);[7] the Indian Civil Rights Act (ICRA), a federal law passed in 1968;[8] and the 1978 U.S. Supreme Court decision in *Oliphant v. Suquamish*.[9] This combination of federal laws and policies has created one of the most complicated jurisdictional frameworks in the American law.[10] Professor B. J. Jones, who has served as a judge for a variety of tribal courts in North Dakota, South Dakota, and Minnesota, notes that in the midst of jurisdictional uncertainty, the "security of women is compromised and the legal

system is diminished in the eyes of both victims and offenders."[11] The limitations I describe here are not unique to the crime of rape but rather apply to all criminal cases. However, I explore the ways in which Native rape survivors experience the criminal justice system, in order to highlight the ways in which the system can aggravate trauma for individual victims.

Federal Intrusion: Major Crimes Act

In 1885 Congress passed the Major Crimes Act (MCA), which forcibly imposed the federal criminal justice system on tribal communities and still has significant relevance for Native rape survivors today. The MCA provides the federal government with criminal authority on many contemporary reservations, meaning that a rape survivor will navigate a federal criminal justice system if she reports the rape to law enforcement.

The impetus for the MCA was non-Native outrage over a controversial 1883 U.S. Supreme Court case, *Ex Parte Crow Dog*.[12] *Crow Dog* did not involve rape on its surface, but the statutory response to the case changed the framework under which rape would be addressed by tribal nations. *Crow Dog* began as a Lakota homicide case in the Dakota Territory (now parts of Montana and western North and South Dakota), when Crow Dog, a Brulé leader, killed Spotted Tail, a rival Brulé leader. The Lakota people exercised their inherent authority over intratribal crime and adjudicated Crow Dog in a traditional setting, imposing traditional penalties. Unsatisfied with the perceived leniency of the tribal sanctions, federal officials subsequently arrested and prosecuted Crow Dog in the federal territorial court, a process that concluded with a death sentence. Crow Dog petitioned the Supreme Court, arguing that he was not subject to U.S. authority as a citizen of a foreign government accused of violating foreign law on foreign soil.

When I lecture about this case, at this point I usually ask the audience whether they think Crow Dog won or lost his case in front of the Supreme Court. Most people guess that Crow Dog surely must have lost the case given the hostile relationships between tribal and federal officials at that point in history. Most people are surprised when I tell them that Crow Dog actually won in front of the Supreme Court and was subsequently released from federal

custody. In freeing Crow Dog, the Supreme Court reviewed federal law (as it existed in 1883) and somewhat reluctantly concluded that tribal nations continued to operate as independent sovereigns. Ultimately, the court found that the only government with authority to respond to that particular homicide was that of the Lakota people. The non-Indian population was outraged and demanded that Congress intervene to change the laws governing tribal-federal relationships to ensure that Native defendants would be prosecuted in the Anglo legal system.[13] Responding to this public outcry, Congress passed the MCA, which unilaterally imposed the federal prosecutorial framework on the territories of tribal nations. The MCA provided the federal government with the authority it had requested in *Crow Dog*. The practical effect was that federal officials could now prosecute defendants like Crow Dog in federal court—because Congress said they could. A great article written by Judge B. J. Jones and attorney Chris Ironroad explains that laws like the MCA endorse a federal "tautological rationale" (we have jurisdiction because we say so).[14]

Although it is unlikely that Congress (or the outraged public for which it purported to speak) was particularly concerned with the plight of Native women who had been raped, the MCA included rape in its original list of offenses that could trigger federal prosecution (along with other "major crimes" like murder and kidnapping). The list of crimes over which the federal government can assert authority has been expanded over the years, but child sexual abuse was not added until 1986.[15]

Since the efforts of the government were designed to extinguish the very existence of tribal nations, it is more likely that Congress intended to infiltrate and control the indigenous populations through increased legal authority.[16] However, tribal nations have successfully sustained authority over rape (and other major crimes) by arguing that the doctrine of inherent sovereignty requires Congress to divest tribes of concurrent jurisdiction in clear language. The MCA never explicitly divested tribal nations of authority over the enumerated crimes.[17] Tribes therefore technically retain authority over *all crimes* (including those listed in the MCA), subject to the limitations noted later in this chapter. A tribal nation and the federal government thus share "concurrent" jurisdiction over the crimes, and in theory can operate independent of one another

Although some have argued that the MCA was meant to supplant tribal authority, tribal nations prosecuted crimes such as rape and homicide in the twentieth century, and federal courts have recognized that tribes retain inherent jurisdiction over crimes enumerated in the Major Crimes Act.[18]

The federal government has largely controlled the development of contemporary tribal legal systems, and tribal governments have not consistently exercised concurrent jurisdiction over violent crimes. Many tribes do not pursue cases against rapists, or will wait until a declination from a federal or state prosecutor before proceeding with an official tribal response. Thus, the practical impact of the Major Crimes Act is that few tribes have pursued prosecution of crimes such as murder and rape for more than one hundred years. Instead of a rape case being handled within a community that applies the laws, beliefs, and traditions of its people, rape cases became the domain of the federal government. Until recently, there was no acknowledgment of this critical obligation of the federal criminal justice system, and the vast majority of rape cases in tribal communities were rarely adjudicated in federal criminal court. A simple summary of the MCA from the perspective of Native rape victims is as follows: on reservations where the MCA applies, federal law enforcement agencies (FBI and BIA) work in conjunction with prosecutors from the U.S. Attorney's Office to respond to rape. This means a rape survivor who reports the crime will necessarily interact with federal representatives carrying the official badges of colonization.

State Intrusion: Public Law 280

Approximately seventy years after Congress passed the MCA, federal jurisdiction over criminal matters (as established by the MCA) was transferred in 1953 to some state governments through a federal law known as Public Law 280 (PL 280).[19] PL 280 was part of a larger mid-twentieth-century federal effort to ultimately "terminate" recognition of tribal nations—an official government policy that has since been abandoned. The termination policy was designed to eliminate federal recognition of Indian nations and force Native people to assimilate into the mainstream U.S. population. PL 280 relinquished federal control over Indian territories in certain states

(Alaska, Oregon, California, Nebraska, Minnesota, and Wisconsin), turning the law enforcement authority over to the state governments. In communities affected by PL 280 and similar laws, the federal government's authority to respond to rape has been replaced by the authority of the state government.

Neither the states nor the tribes, however, consented to this arrangement, and states were not provided with any additional resources with which to enforce crimes in Indian country. As a result, PL 280 has led to widespread criminal justice dysfunction in those states.[20] This dysfunction was exacerbated when the federal government decided not to fund the development of tribal courts in these states. Many reservations thus operated without any consistent criminal justice system.

Moreover, a history of hostile relations between states and tribes has limited the possibility of cooperative law enforcement ventures. Today, states and tribes are often engaged in protracted litigation about issues related to natural resources, taxation, gaming, and, increasingly, child welfare. Although the obligation to provide criminal justice services to tribal governments is not often questioned, it is understandable that victims of crime might see the state government as a political body that challenges the rights of Native people on a regular basis.

Though the termination policy of the 1950s has largely been abandoned, the legacy of PL 280 remains for many tribal governments. For tribal nations located within the boundaries of states affected by PL 280, criminal activity and violence fall under the authority of the state. However, many of the states have not responded with effective law enforcement, leaving tribal communities at the mercy of criminals who prey on the vulnerable. For all practical purposes, tribal governments in PL 280 states have historically been at a distinct disadvantage when it comes to crime control.

Like the MCA, PL 280 did not specifically divest tribal governments of concurrent jurisdiction over crime.[21] However, the practical impact of PL 280 has included a weakening of tribal justice systems and a lack of response to criminal behavior, leaving many victims of crime without recourse in either the state or the tribal system. Native rape victims affected by PL 280 are beholden to a state criminal justice system that may have expressed outright hostility to tribal rights such as treaty hunting and fishing rights.

Capping Tribal Sentences: Indian Civil Rights Act of 1968

A third federal law that has limited tribal governments' ability to address rape is the Indian Civil Rights Act of 1968, which places a cap on tribal sentencing authority. Congress passed ICRA in an era generally known for progressive legislation. Unfortunately, the Indian "Civil Rights" Act is largely a misnomer, for it actually restricts tribal court authority in several significant ways. ICRA serves as another example of federal statutory imposition of assimilated tribal justice systems because it requires that tribal governments enforce American legal norms as enshrined in the language of the Bill of Rights. The story of this federally imposed sentencing restriction is particularly noteworthy because of the context in which Congress passed the law.

Native people aligned with other social justice movements in the late 1960s to raise concerns about police brutality and disparate treatment in the American legal system. But the effort to address the inequities that Native people faced took a curious turn. Instead of concentrating on the racial discrimination and political disenfranchisement suffered by Native people in the state and federal systems, Congress focused on overstated abuses by tribal court systems—a legitimate problem, to be sure, but abusive tribal governments were no more or less common than abusive state governments. Federal lawmakers were motivated to pass ICRA when they learned that tribal governments are not bound by the U.S. Constitution (a principle confirmed by the U.S. Supreme Court in 1896).[22] Of course, tribal governments have never been hostile to civil rights; principles of individual autonomy and systemic checks on government are hardly the exclusive brainchild of the Western world. In truth, ICRA is a Eurocentric response to challenges that developed in tribal courts due to forced assimilation and hegemony.

ICRA mandates that tribal governments enforce certain individual rights in tribal court—and those rights are defined using selected language from the First, Fourth, Fifth, Sixth, and Eighth Amendments to the U.S. Constitution. Tribal courts are the primary enforcers of ICRA, but there is a mechanism for federal review in limited circumstances (thereby perpetuating colonial control over tribal courts). One practical outcome of ICRA is that defendants

actually have more protection in tribal court—because both ICRA and any tribal constitutional or statutory civil rights laws will apply.

In addition to the civil rights provisions, ICRA imposes a limit on the punishment a tribal court can impose. When the law first passed in 1968, incarceration was limited to six months and fines were limited to five hundred dollars.[23] Thus, from the American legal perspective, tribes were limited to misdemeanor (minor crimes) jurisdiction. Later, as part of drug control legislation, ICRA was amended to allow tribes to sentence offenders to one year of incarceration, a five-thousand-dollar fine, or both—which still amounts to a misdemeanor under American law.[24]

ICRA is almost always discussed in the context of a criminal defendant. I raise the issue from the perspective of a rape victim. Consider that almost all sex crimes in American law are categorized as felonies. Even though the MCA had not divested tribes of felony jurisdiction, the ICRA sentencing restriction reflected a common belief that tribal governments could not (and would not) exercise authority over serious, felony-level crimes (such as rape). While tribal governments did not typically rely on incarceration as a response to violence, American law responds to violent crimes with long periods of imprisonment; ICRA has furthered the myth that tribal governments have no power to respond to felony-level crimes. Assimilated tribal justice systems will often resist prosecuting extremely violent crimes, having internalized the Anglo-American belief that incarceration or monetary sanctions are the only possible response to violence. As with the Major Crimes Act and PL 280, however, there was no explicit divestiture of jurisdiction. Therefore, tribes can prosecute rape—but have not been able to imprison the defendant for more than one year per offense. This restriction was "lifted" again in 2010 (chapter 7 explores the Tribal Law and Order Act, which authorized tribal courts to impose sentences up to nine years in certain situations).

ICRA does not affect a tribal government's ability to impose alternate or traditional sentences, such as banishment, community service, probation, counseling, or public apologies. Nonetheless, the limitation on the ability to incarcerate has had a disparate impact on victims of rape and other violent crime. Native women who are victimized often discover that their tribal nation lacks strong contemporary laws or prosecutorial policies on felony-level

criminal behavior. If the federal or state systems choose not to prosecute, the victim is left at the mercy of the perpetrator.

Rehnquist on (non)Sovereignty: *Oliphant v. Suquamish*

A fourth jurisdictional barrier is the 1978 Supreme Court decision in *Oliphant v. Suquamish*, which divested tribal courts of criminal jurisdiction over non-Indians.[25] This decision has created a practical vacuum of justice for victims who have the misfortune of being attacked by a non-Indian. Since the *Oliphant* decision, tribal nations have lacked the power or authority to prosecute crimes committed by non-Indians—at least as far as the federal government is concerned. As a result, any tribal government that prosecutes a non-Indian for a crime risks a federal review and reversal of the conviction (basically, the federal courts will see such a conviction as void *ab initio*).

This decision has created a crisis situation in some tribal communities, because non-Indian sexual predators, drug manufacturers, pimps, and other violent people are attracted to Indian country as they perceive it as a location in which crimes can be committed with impunity.[26] Pedophiles and sexual predators also commit crimes within Indian country because of the vulnerability of the citizens and the jurisdictional gaps. If a non-Indian rapes a Native woman, the tribe has absolutely no criminal jurisdiction to punish the offender. Tribal police may be able to arrest a suspect if they are cross-deputized with a local or state government, but the tribal government cannot criminally prosecute that offender.

Tribal leaders and others have vocalized their concern about the federal government's low rates of prosecution of rape and other violent crimes.[27] Certainly there have been prosecutions of non-Indian rapists in federal and state courts since 1978, particularly in some areas where the federal or state government has developed strong relationships with the tribal governments.[28] But when comparing the numbers of Native women who are experiencing rape with the number of prosecutions, we find a significant disparity. In some cases, it is difficult even to gain access to prosecution statistics that specify Native victims, because American Indians and Alaska Natives are often classified in the "other" racial category. In

the case of the federal government, different bureaucracies located in various departments have completely separate ways of counting and classifying sexual violence against adults. The Tribal Law and Order Act and Violence Against Women Act were designed to enhance the federal government's approach (see chapter 7). The *Oliphant* decision does not limit the ability of a tribal government to impose civil sanctions on a non-Indian.[29] Civil sanctions are a weak substitute, however, for the important punitive power imposed by a criminal justice system for a crime such as rape.

Poverty and Sovereignty: How the Lack of Resources Undermines Legal Effectiveness

In addition to the multitude of legal barriers restricting tribal governments from responding to rape, there is an insidious practical limitation to stopping rape—tribal nations are notoriously underresourced. More than one Native woman has said to me, *even if jurisdiction is restored, my tribal government doesn't have the money to implement a comprehensive anti-rape strategy.* In the past fifteen years, multiple federal government reports have concluded that high tribal crime rates are due in part to the impoverished condition of tribal criminal justice systems. In particular, the United States Civil Rights Commission issued a report in February 2003 that strongly critiques the lack of resources allocated to tribal governments.[30] The report, however, covers many different kinds of resource limitations, including law enforcement and tribal justice systems. Despite the prevalence of crime, law enforcement in Native communities remains inadequate, with understaffed police departments and overcrowded correctional facilities. There are fewer law enforcement officers in Indian Country than in other rural areas and significantly fewer per capita than nationwide. In addition, per capita spending on law enforcement in Native American communities is roughly 60 percent of the national average.[31] These resource limitations have resulted in inferior systems of justice at the tribal level. Even a reported rape may not result in a comprehensive investigation, because staffing shortages and low morale at the tribal level can interfere with their respective counterparts at the federal or state level. Despite these limitations, a few tribal governments have successfully prosecuted rape, such as the Standing Rock Sioux Tribe and the Navajo Nation.[32] Overall,

tribal governments face numerous barriers in adopting strong anti-rape laws and procedures. The barriers are both legal and practical, and the solutions will require additional widespread reform of federal law to restore tribal authority over violent crime.

Aside from the problem of relying on the federal government to prosecute rapists who prey on Native women, there are numerous practical problems, including geographical distances and language and cultural barriers. The length of time between an assault and the sentencing, assuming a conviction is achieved, can be significant. Federal prosecutors are often very selective about the cases they pursue, leaving many victims without recourse. Federal prosecutorial decision making is "largely hidden from public scrutiny," and many victims feel abandoned.[33] Indeed, most rapes in the United States are never reported to law enforcement. Professor Michelle Anderson, who has studied the legal response to rape in America, writes that "women have little to no faith in the formal structures of police power to remedy violence motivated by gender animus."[34] Several General Accounting Office reports released during the past ten years also bear out this reality. In 2012 the GAO reported that U.S. Attorneys declined to prosecute 67 percent of sex crimes.[35]

It is clear that federal laws and policies are insufficient to address the fundamental needs of Native women living in tribal communities, who have not been able to trust the federal or state systems to respond to their experience. That is why deliberate restoration of tribal authority is crucial for long-term change. Decision-making authority and control over violent crime should be restored to indigenous nations to provide full accountability and justice to the victims. Even as systemic federal agency reform is taking place, there will always be the foundation of wide gaps created by a system originally designed to destroy, not heal. Tribal jurisdiction (both civil and criminal) must be completely restored without restriction. Nothing less will do.

Indigenous girls and the violence of settler colonial policing

Jaskiran K. Dhillon
The New School, New York

Abstract
In cities and towns across Canada, Indigenous girls are being hunted, harassed, and criminalized by local law enforcement agents and the Royal Canadian Mounted Police. These normalized outbreaks of state control, often punctuated by the use of deadly force, are not isolated incidents in an otherwise just and fair social order. Rather, they are reflective of Indigenous girls' daily realities embedded within the structure of an *ongoing* settler colonial social context that has strategically invented the criminal justice system to secure and maintain settler sovereignty. As such, this paper aims to redirect our critical analysis of the policing and caging of Indigenous girls through the geopolitics of settler colonialism. In the wake of mass protests against colonial state violence throughout 2014, resistance decrying the justice system and insisting that #BlackLivesMatters and that Indigenous lives matter, I argue that we have an urgent need to listen to the stories that Indigenous girls have to tell. These are not just any stories, but narratives that profoundly destabilize the hubristic portrayal of Canada as a humanitarian nation cleansed of settler colonial rule.

Keywords: *Indigenous girls; settler colonialism; policing; colonial state violence; gender; criminality*

Introduction

> "Look with your wire / cutters, she / says. Look what the world has done to you."
> No'ukahau'oli Revilla, *Say Throne*

The rain was torrential. Hopscotching across puddles, we dashed through the umbrella-laden street until reaching the weighty doors of the Empire State Building. Iconic in its grandeur and notable for its ability to grant a striking aerial view of New York City, this structure houses the headquarters of Human Rights Watch (HRW), a prominent global organization documenting human rights violations worldwide.

I was accompanying Annabel Webb, co-founder of the Vancouver based NGO Justice for Girls, to a meeting with the Women's Rights Division of HRW. We were there to discuss the possibility of HRW conducting an investigation in Canada, specifically an inquiry into police violence in the lives of Indigenous girls. HRW had never before launched an examination of human rights abuses in Canada—the deceptive and widely circulating narrative equating this settler colony with a humanitarian nation imbued with justice and equality, ever present—and we were there to persuade them that this was both necessary and urgent.

The team at Justice for Girls, and a number of their allies, including scholars like myself as well as organizations such as the Native Women's Association of Canada, had been working diligently over many years to document instances of police brutality and failures in the protection of Indigenous girls by the Canadian state. However, despite all of the fierce advocacy and careful, meticulous research, including petitions to the international community, the staff at JFG felt as though they hit intractable institutional blockage whenever they attempted to draw attention to these issues in Canada, colonial walls that would simply not move. In the face of such barricades, they appealed to HRW to lend the organization's influential credibility and resources to reveal how Indigenous girls were under siege by police and other law enforcement agents—to offer a crucial corrective to the optics of erasure and make legible how police (state) violence has reached terrifying velocity under settler colonialism. Indigenous girls, we argued at that meeting, were living with incomprehensible colonial gender violence in their day-to-day existence, in the viciousness of everyday life taking place in the back alleys, shadowed corridors, *and* open streets of white settler society.

At one point during the meeting, when the Director of the Women's Division asked whether British Columbia, where the investigation would be carried out, was unique in its treatment of Indigenous girls, I spoke directly to instances of police violence that I have witnessed through my longstanding work in Saskatoon. "This is not just happening in BC," I told her, "this is an entire circulation of networked settler state power that targets Indigenous girls in egregious and insidious ways, wherever they are. Sometimes this is dressed up as "crime prevention"[1] and sometimes it is camouflaged under the guise of "community policing." Regardless of the way it is classified by the state, or the province in which it takes place, it is still

[1] See Dean (2005) for an analysis of "state protection."

abhorrent colonial gender violence." Eventually HRW agreed to carry out the investigation, resulting in the 2013 report *Those Who Take Us Away: Abusive Policing and Failures in Protection of Indigenous Women and Girls in Northern British Columbia, Canada*.

Building on the foundation of this collective work and pushing its critique several steps further into the realm of critical praxis and decolonization, this article begins from the premise that in cities and towns across Canada, Indigenous girls are being hunted, harassed, and criminalized by local law enforcement agents and the Royal Canadian Mounted Police. These normalized outbreaks of state control, often punctuated by the use of deadly force, are not isolated incidents in an otherwise just and fair social order. Rather, I contend that they are reflective of Indigenous girls' daily realities embedded within an *ongoing* settler colonial social context that includes the strategic (historic) invention of the criminal justice system to police (quite literally) the borderlands of possession and dispossession. As such, this article aims to redirect our critical analysis of the policing and subsequent caging of Indigenous girls through the geopolitics and broader horizon of settler colonialism. In doing so, it offer alternative frames for interrogating this violence with the aim of dismantling it. In the wake of mass protests against colonial state violence throughout 2014, resistance decrying the justice system and insisting that #BlackLivesMatters and Indigenous lives matter, I argue that it is crucial for us to learn how to listen to the stories that Indigenous girls have to tell. These are not just any stories, but narratives that profoundly destabilize the hubristic portrayal of Canada as a humanitarian nation cleansed of settler colonial rule.

Before proceeding, I wish to clarify the social and political location from which I author this piece. I write this from the complicated position of a woman of colour born and raised on Cree territory in Saskatchewan, the daughter of immigrant parents fleeing from their own colonial inheritance in Northern India. Growing up on this land and being educated by its people has undoubtedly shaped the way I see and understand the world. I have learned a great deal over the years about the ways in which Indigenous histories and struggles have been elided within dominant anti-racism discourses of social change. People of colour are situated in and through incongruous terrain in Canada as collectives, marginalized by a white settler nationalist project while at the same time being invited to take part in the pervasiveness and harm of ongoing settler colonialism (Lawrence and Dua, 2005). Following Razack (2015), I contend that, "rather than focus on our individual histories of dispossession and migration, and thus handily avoid the question of what it means to live in a settler colonial state, people of colour and white settlers alike must confront our collective illegitimacy and determine how to live without participating in and sustaining the disappearance of Indigenous peoples" (p. 27). This is not simply a matter of "giving back" or offering patronizing charity in the face of grossly unjust social, political, and economic realities or a facile acknowledgment of the stolen land upon which settlers reside. Rather, it requires that we attempt to think through what it means to embody the practice of "standing with" Indigenous peoples, finding common ground with Kim TallBear's call for conceiving and enacting scholarship and advocacy that seeks a shared conceptual ground amongst a community of people working towards similar political ends (TallBear, 2014).

Decolonization can only happen in concert with Indigenous peoples, and this requires all of us to think long and hard about the relationships we have to these struggles. Perhaps more importantly, it requires that we be honest about them.

Working as an advocate for youth in both British Columbia and Saskatchewan for over a decade also created a host of moments through which I was able to bear witness[2] to colonial state violence enacted against Indigenous girls. In turn, I have been confronted with the question of what to do with this knowledge, knowing full well that inaction is complicity within the context of unequal power relations, regardless of how much you try to convince yourself otherwise. Brutal assaults on the lives of Indigenous girls continue while many of us willfully ignore what is happening. The isolation persists. The exploitation and violence continues to be positioned, strategically, as a problem of their own making. Thus, while the accounting I offer in the following pages is a partial and preliminary one, it is a first step towards a larger community-based research and advocacy project under development in Saskatoon (happening in the wake of a $4.3 million dollar increase in the police budget for the hiring of additional officers, I might add). I envision it as a provocation to expand and deepen how we think about the violence of settler colonial policing in the everyday lives of Indigenous girls and to inform future decolonial advocacy that centres their leadership, lived realities, and stories more robustly.[3] In doing so, I hope to contribute to, and augment, all of the important work that is already being undertaken by Indigenous women and youth in this area (see, for example, Clark, 2012; Hunt, 2015; Allooloo, 2014; L. Simpson, 2014; Wilson, 2013; Laboucan-Massimo, 2015; Smiley, 2012; Kingsley and Mark, 2001; and various initiatives through the Native Youth Sexual Health Network and the Indigenous Young Women's National Council) and to act in solidarity with Indigenous peoples resisting colonial state violence in its multiple forms.

The remainder of the article unfolds as follows. I begin by theoretically situating this critique within the frameworks of settler colonialism and critical anti-racist and Indigenous feminism, making clear how Indigenous girls' violent encounters with the police are intertwined with the politics of territorial seizure characteristic of settler colonies, as well as the maintenance of settler sovereignty. Next, I sketch a number of lived realities on the ground that demonstrate the gravity of settler colonial violence enacted against Indigenous girls through the institution of policing. This section draws on findings from the HRW report, my cumulative work as an advocate for Indigenous youth, as well as ethnographic research carried out on the prairies between 2006 and 2013. In the next section, I trace the linkages between settler colonial policing and the horrific reality of murdered and missing Indigenous women and girls in Canada; I push against portrayals of these material and political manifestations of colonial gender violence as separate issues. Finally, I conclude with a call to action that strategically positions the eradication of colonial gender violence at the epicenter of Indigenous critical praxis and decolonization.

[2] See Farmer (2005) for a more in-depth discussion of the politics of bearing witness (p. 25).

[3] For further information regarding this increase in the budget of Saskatoon City Police, see Waldner (2015).

Policing Indigenous bodies on stolen land

Building a deeper, anti-colonial critique of the violent policing of Indigenous girls requires being vigilant about the way we unravel the normative frameworks that structure the everyday in a settler colonial reality intent on mutilating Indigenous bodies, dislocating them, holding them in captivity, and ultimately, making them disappear.[4] It requires, in other words, adjusting the critical aperture through which we render competing truth claims about Canada and the stolen land where its contested sovereignty rests. "We know the happy stories that the settler state tells about itself," writes Billy-Ray Belcourt (2015), "stories about multiculturalism, about reconciliation, about nationalism, about gay-friendliness" (p. 9). In line with these "happy stories," the settler state of Canada also fashions tales about the safety, protection, and purported care for all of its citizens. Resurrecting social and political histories of conquest, territorial seizure, and dispossession, however, brings an alternative image into view—it forces us to think differently about what is really going on.

The (ongoing) need for positioning encounters between Indigenous peoples and the criminal justice system, including the police, within the larger context of settler colonialism is as urgent as it ever was. As a nation, we are masters of historical erasure, experts of institutional cover up. This crystalized for me, once again, at a conference about the criminalization and incarceration of Indigenous women and girls where I presented a talk on the violence of settler colonial policing in Saskatoon in May of 2015—the talk that became the foundation for this article.[5] Hosted by the College of Law at the University of Saskatchewan, the two-day event was designed to bring together scholars, activists, policy makers, government agents, and those with lived experiences to collectively consider the issues of racism within the justice system and the disproportionate representation of Indigenous women and girls in Canadian prisons. I listened to numerous presentations and, apart from a couple of exceptions, there was a surprising and notable absence of discussion about colonial state violence within the context of settler states. The majority of conversations focused on issues of over-representation (which while certainly important, misses the point about the historic role played by criminal justice system with respect to Indigenous peoples), how prison personnel needed to do a better job of treating "prisoners"

[4] Sherene Razack's (2015) *Dying from Improvement: Inquest and Inquires into Indigenous Deaths in Custody* deftly takes up the notion of the "disappearance" of Indigenous peoples in Canada. In her chilling words, "The idea of a disappearing race is also productive for settler subjectivities. Through it, settlers are able to feel Indigenous disappearance and to imagine their own superiority" (p. 5).

[5] The day following my talk, I was approached by a young white woman (she self-disclosed as an emergency room nurse at one of the local hospitals) who told me she found my critique of state violence and policing in the lives of Indigenous girls too "aggressive." She explained that she worked closely with many police officers, some of them were her friends, and that "they are trying their best to work with a community that has a lot of problems." I responded by arguing that my "aggressiveness" and anger was derived from years of bearing witness to the atrocities enacted against Indigenous girls by police and other state actors. From where I was standing, unapologetic, affective outrage to this ongoing colonial injury was the only response that reflected any kind of humanity. Her hostility towards me for bringing forth this critique, however, clearly indexed the power of settler colonial machinery to (re)instate notions of white settler benevolence, even in the face of mounting empirical evidence that clearly indicates otherwise.

with care, and strategies for making the criminal justice system more responsive to Indigenous communities. Even the conversations about the criminalization of Indigenous women and girls were noticeably truncated.

My aim here is not to unproductively criticize the organizational efforts aligned with this conference. Indeed, we need venues where we can think through the intellectual, political, and material problems of Indigenous peoples' encounters with the criminal justice system in rigorous ways. What I am concerned about, though, is that without an *explicit and deep* anti-colonial analysis we run the risk of reinscribing the narrative of white settler benevolence (the state is trying hard to improve the situation for Indigenous peoples) *and* a colonial subjectivity that keeps white settler power in tact. The dispersal and dissemination of ideas, theories, and notions of cause and effect about Indigenous women and girls' over-representation in prison generated in these spaces of authoritative knowledge production, then, serves a pedagogic function for both those in attendance and a wider public. It helps to determine what comes into view and what recedes or vanishes altogether, a decidedly vital camouflaging technique when a state has been built through occupation. Robert Nichols (2014) captures this succinctly when he says, "When the critique of incarceration rests upon the over-representation of racialized bodies within penal institutions, this tactically renders carcerality as a dehistoricized tool of state power—even if distorted by the pathological effects of a racist society—displacing an account of the continuity and linkages between carcerality, state formation, and territorialized sovereignty" (p. 444).

In step with these concerns, I contend that it is crucial to locate Indigenous girls' experiences with policing within the distinct political, ideological, and material formation of settler colonialism and to vociferously interrogate the colonial violence enacted against Indigenous peoples by state institutions—an anti-colonial spin on Weber's insight into state monopoloy over legitimate violence (Weber, 1994). Drawing on the work of scholars who have traced the itineraries of "the colonial present" (Gregory 2004) in settler nation states (Alfred, 2009; Coulthard, 2014; A. Simpson, 2014; Turner, 2006), then, I regard Canada first and foremost as a settler colony marked by the on-going dynamics of colonialism. In the tradition of this scholarship that ruptures the myth of the two founding fathers, the emergence of Canada is configured as a narrative of conquest based on the doctrine of *terra nullius,* the principle of "empty lands," and no longer as a mystical migration story. The principle of "empty" lands served, historically, to unlock the ideological gates and secure the secular and religious rationalizations leading to the "legal" dispossession of Indigenous peoples from their original territories and the subsequent implementation of laws and social policies that institutionalized the forced assimilation of Indigenous peoples and elevated the cultural and social status of white settlers.

The goal of settler colonizers is to create a new social and political order with the ultimate aim of securing a permanent hold on specific, conquered locales. Ongoing dispossession is also indexed by the persistent seizure of Indigenous land and displacement of peoples for the purposes of capital development and natural resource extraction which is carried out through, as Glen Coulthard (2014) in *Red Skin White Masks* indicates, "settler state policies aimed at

explicitly undercutting Indigenous political economies and relations to and with land" (p. 4). Structural decolonization, as both a political and practical undertaking, exists *entirely* outside the purview of a colonial social order—there is *no* intention to return stolen territory. Settlers come to stay.

To successfully build a settler colony, however, there is a surreptitious, recurring need to disavow the presence of the Indigenous "other" and effectively repress, co-opt, and extinguish Indigenous alterities (Povinelli, 2002). As Tuck and Yang (2012) remark, "the settler positions himself as both superior and normal; the settler is natural whereas the Indigenous inhabitant and the chattel slave are unnatural, even supranatural" (p. 6). The emergence of settler nation-states, in this sense, embodies a distinctly sovereign charge and claims a "regenerative capacity" to conquered territory (Veracini, 2010, p. 3) that aims to destroy, replace, rename, classify—to assimilate in all of the ways that mitigate threats or resistance to the process of growing settler dominance. Through this process, power is consolidated across social institutions and legal mechanisms that reorganize geography, access to land, cultural practices, family and kinship networks, spirituality, identity, and ultimately political subjectivity (Cannon & Sunseri, 2011).

Patrick Wolfe's (2006) work is especially instructive in illuminating the staying power of the settler colonial present. Tracing the footsteps of colonial settlement through what he calls the "logic of elimination," Wolfe argues that this logic, which seeks to contain and regulate all things Indigenous, may change in form, but ultimately remains continuous through time (p. 387). When explaining the variance in elimination strategies, he writes, "the positive outcome of the logic of elimination can include officially encouraged miscegenation, the breaking down of native title into inalienable individual freeholds, native citizenship, child abduction, religious conversion, resocialization in total institutions such as missions or boarding schools, and a whole range of cognate biocultural assimilations. All of these strategies, including frontier homicide, are characteristic of settler colonialism" (p. 388). Accordingly, "invasion is a structure rather than an isolated event" and the particular manner in which elimination takes place, both in terms of target and methods, changes with the specificity of the historical moment in which we find ourselves. At the heart of the matter, though, lies this reality: the continual existence of Indigenous peoples in Canada constitutes a direct conflict with settler control and the related political entitlements ensconced in settler governance. They have not been eliminated, nor wholly assimilated. They continue to fight for what is theirs.

With respect to undertaking a critical appraisal of violent policing in the lives of Indigenous girls, the lens of settler colonialism importantly serves to re-establish essential linkages between the everyday lives of these young women and the dynamics of colonial power in which they are entangled. In other words, while the lived realities of Indigenous girls may be positioned by state agents, youth workers, and law enforcement officers to be outside the scope of the larger political questions of Indigenous sovereignty and self-determination (characterized instead as a matter of immediate crisis response, individual failure, and fragility),[6] scholars of settler colonialism enable us to collapse the distance between these seemingly disparate sets of

[6] See, for example, Parliament of Canada's report from October 2003 called "Urban Aboriginal Youth Strategy."

issues and place them in direct conversation with one another. Indigenous girls, then, operate as young Indigenous people in a *distinctly* settler colonial space where their very resistance and survival stands in opposition to fully consummating settler ownership and legitimacy—they stand in the way of settler colonialism and question the existence of the settler state as *a fait accompli*.[7] Part of my preoccupation in this article, then, is with uncovering how forms of colonial state violence, including policing targeted at Indigenous girls, intertwine with the historiography of a Canadian settler state whose nationalist project continues to rest on stolen land.

It is also important to flag that when critiques of policing are absent of a settler colonial framing, it is much easier to position the actions of a few police officers as a case of "a few bad apples." Critique rooted in the social and political histories of Indigenous peoples places front and center the *fundamental* role the institution of policing has played in colonial state formation. Moreover, set against the broader reality of persistent occupation, displacement, dispossession and environmental wreckage, it follows colonial logic that the criminal justice system would only be extended, enhanced, and strengthened to further control, undermine, and terrorize Indigenous polities (Government of Saskatchewan, 2011). Policing is an essential state vehicle through which conquest becomes inscribed on the ground. Indigenous peoples, thus, experience policing itself as a colonial force, an apparatus of capture *imposed externally* by a government they have not authorized and do not have effective participation within—one of the indicators of militarized surveillance and discipline (Nichols, 2014, p. 446).

Repositioned through the channels of settler colonial social and political histories, the Royal Canadian Mounted Police (previously the North-West Mounted Police) can be viewed as a constitutive entity designed to carry out genocidal extermination, subjugation, and physical containment of Indigenous communities.[8] The actions of this police force were directed by Ottawa's policy of coerced assimilation (Jacobs, 2012; Dickason & McNab 2002). Mounties, as they are popularly known in Canada, were deployed on the Canadian frontier to facilitate Indigenous peoples subjection to colonial law and to "ensure the negation of Indigenous sovereignty and to implement effective policies of containment and surveillance" (Nettelbeck and Smandych, 2015, para. 3). The RCMP were well positioned for this task; Ottawa had invested in them the power to arrest, prosecute, judge, and sentence offenders, making any notion of the legal protection of Indigenous people under the British Crown a complete illusion (Graybill, 2007). In 1920 when residential school became compulsory, the RCMP was part of the settler state's front-line foot soldiers that guaranteed the attendance of Indigenous children. Gendered racism and the underlying colonial ideologies of white superiority and "Indigenous

[7] See A. Simpson (2014) for an excellent analysis of the politics of refusal and nested sovereignty.

[8] On this point, Razack (2015) explains, "from its inception as a colonial police force, the Northwest Mounted Police, which would become the Royal Canadian Mounted Police (RCMP), assisted in the securing the territory, ultimately transforming its largely military function into a domestic policing of the settler's town, a town surrounded by reserves (p. 14).

savagery," as fabricated by a newly emerging Kanata to legitimate the theft of land and natural resources,[9] are therefore encoded in the operation of the Canadian criminal justice system; they *are* the cruel, unjust, and bloody historical roots of its inception as a social institution *and* they are the roots that make possible the contemporary, ongoing reproduction of the desecration of humanity in the lives of Indigenous girls.

Bleeding out: Colonialism, gender and violence in the everyday

A critical analysis of settler colonial policing in the lives of Indigenous girls would be both harmful and limiting without emphasizing how colonial relationships are highly gendered and sexualized. And once we have established this understanding, it follows that contemporary police interactions with Indigenous girls are building on a historical pattern of gender violence. "The roots of sexual violence in Canada are as deep as colonialism itself," argues Sarah Hunt (2010, p. 27). Elsewhere, I have written that, if you are an Indigenous girl, these mephitic roots strangle life and sanction the invisibility of violence against you.[10] It is structural exploitation offered up in plain sight yet systematically denied, a deliberate bleeding out of decolonial futurity in both past and present.

Tracing the linkages between then and now brings to the surface how sexual violence, and the concomitant disempowerment of Indigenous women and girls, was an integral part of nineteenth-century strategies of domination and *carries forward* to the present day through the foundational violence of the state and state's complicity in sanctioning the invisibility of gender violence against Indigenous women and girls. The condoned invisibility works in concert with individual acts of male violence (Razack, 2002) and reinscribes a dehumanized and racialized Other (the Indigenous woman or girl) that can be violated at will with minimal or no consequences. Further, the Canadian regulation of Indigenous identity through the gendered notions of "Indianness" produced through the Indian Act has generated, as Bonita Lawrence (2003) writes, "unimaginable levels of violence, which includes, but is not restricted to, sexist oppression" (p. 5). This legislation also eradicated traditional leadership in Indigenous communities through the creation of band governments, which in turn systematically restricted Indigenous women's role in politics and reinforced politics as a strictly male domain.[11] In stark contrast to the highly patriarchal character of European society prior to colonization, Indigenous

[9] The *Report of the Aboriginal Justice Inquiry of Manitoba* speaks to the long history of punitive measures carried out by police and state agents against Indigenous populations in Manitoba and Saskatchewan, including the capturing and executing of "rebels" associated with the North-West Rebellion of 1885 (Aboriginal Justice Implementation Commission, 1991, p. 593).

[10] See Dhillon's (2014) "Eyes Wide Open" as part of the online compilation series *#ItEndsHere* created by Indigenous Nationhood Movement in response to the disappearance and murder of Loretta Saunders in New Brunswick, Canada.

[11] Sangster (2002) offers compelling insight into the preoccupation of the Canadian state with Indigenous girls' sexuality as well as the state's desire to limit Indigenous girls' exposure to cities.

societies for the most part were not male dominated. Women served as leaders across the domains of the political, spiritual, and military; many societies were matrilineal. In her book *Conquest: Sexual Violence and the American Indian Genocide*, Andrea Smith (2014) skillfully advances this argument when she says, "putting native women at the center of analysis compels us to look at the role of the state in perpetrating both race-based and gender-based violence. We cannot limit our conception of sexual violence to individual acts of rape—rather it encompasses a wide range of strategies designed not only to destroy peoples, but to destroy their sense of being a people" (p. 3). The project of colonial sexual violence, then, establishes the ideology that Indigenous women and girls' bodies are inherently violable and by extension, that Indigenous lands are available for the taking.

In *Mohawk Interruptus: Political Life Across the Borders of Settler States,* Audra Simpson (2014) explains how Indigenous girls' bodies have historically been rendered less valuable because of what they are taken to represent: land, reproduction, kinship and governance, an alternative to heteronormative and Victorian rules of descent. "Their bodies carry a symbolic load," she argues, "because they have been conflated with the land and are thus contaminating to a white, settler social order" (p. 156). State failures to respond to instances of abuse, and the implementation of social policies that eclipse the layered realities of Indigenous women and girls, brings into relief how the state itself is the driving force behind violence enacted upon Indigenous peoples historically and in the present, the primary perpetrator in fact (Clark, 2012). In a similar vein, Downe (2006) declares, "the abuses experienced by Aboriginal girls over the past 130 years are not isolated occurrences; they are connected through a pervasive colonial ideology that sees these young women as exploitable and often dispensable" (p. 3).

Augmenting this critique, scholars working in the field of girlhood studies are calling for the need to reconceptualize Indigenous girlhood in light of the way it is shaped under a western neocolonial state and in the midst of overlapping forms of colonial violence targeting Indigenous girls (de Finney, 2014, p. 8). This means exploring the ways that Indigenous girls themselves unpack persistent stereotypes of what it means to be an Indigenous young woman growing up in a settler state—and the paradox of invisiblity/hypervisibility that accompanies this existence—and situating their everyday processes of resurgence within and against this colonial matrix. In a critical webinar entitled "Self Governance for Our Bodies and Communities: Responding to Colonial Based Gender Violence," (part of the Idle No More series) representatives from the Native Youth Sexual Health Network and the Indigenous Young Women's National Council exemplify de Finney's (2014) emphasis on Indigenous girlhood. The young women in this webinar speak courageously and insightfully about Indigenous girls' experiences with colonial gender violence and the various forms of "unconventional leadership" that Indigenous girls are demonstrating in their communities to actively resist and respond to structural violence. They also outline the variance in colonial gender violence faced by Indigenous girls, both historically and in the present. Alexa, for instance, clarifies: "colonial gender based violence has many, many forms. Sometimes it's easier for me to try to think about it as a trickster and all of the many ways that a trickster appears. Colonial gender based violence is the state taking children away from

their homes, whether that was the child welfare system, the 60s scoop, residential schools, or even just when young Indigenous people have to move away from their homes to get access to supplies and education or resources. It's that deliberate removal of children and breaking down of family and rooting into our communities more hate and violence than love."

In concert with the voices of the Indigenous young women speaking out in the webinar, I contend that state violence directed at Indigenous girls is a mirroring back of the white settler society of Canada—a mediation between past and present, a jump between historical and lived. It is the material manifestation of the difference between "the truth that is told and the truth that is sold" (Marker, 2003, p. 362). I purposefully write in opposition, then, to those who would de-race and de-gender the experience of what it means to be an Indigenous young woman living in Canada.[12] Settler colonizers have inscribed hierarchy and domination on the bodies of Indigenous peoples through patriarchal gender violence and the day-to-day experiences of Indigenous girls are not exempt from this practice. Rather, as Leanne Simpson (2014) reminds us, "white supremacy, rape culture, and the real and symbolic attack on gender and sexual identity and agency are very powerful tools of colonialism, settler colonialism, and capitalism, primarily because they work very efficiently to remove Indigenous peoples from our territories and to prevent reclamation of those territories through mobilization" (para. 9). As such, Indigenous girls' experiences speak volumes to the power of colonial gender violence that has, from the point of first contact, systematically subjugated Indigenous women and girls and symbolically positioned them as bearers of a counter-imperial order and consequently, a direct threat to colonial rule (Smith, 2005). Their contemporary encounters with settler colonial policing only shatter the ostensible temporality of this violence.

Dispatching colonial power: Badges, guns, and flashing red and blue lights

As previously mentioned, this article builds on the collective work undertaken by Justice for Girls and Human Rights Watch. *Those Who Take Us Away* (Human Rights Watch, 2013) is a chilling testimony to the persistent usage of violence by law enforcement agents to capture and injure the bodies of Indigenous girls, to even take their breath away. Dissecting the relationship between the RCMP and Indigenous women and girls in ten towns across Northern British Columbia, it documents not only how Indigenous women and girls are *under-protected* by the police but also how they have been *subjected to* gross levels of state violence through the dispatching of colonial power vis-à-vis the institutional of policing—reports of physical abuse by both police and judges, sexual assault, the terrorizing of Indigenous communities through hyper surveillance, unjust detainment for intoxication, racist threats, and zero accountability for police misconduct litter the pages. As a case in point, a young Indigenous woman, Sophie, explains her

[12] These points are underscored by my previous research highlighting the problematics associated with the homogenization of the urban youth experience in general (Dhillon, 2011).

run-in with police after they showed up in a field where gang members were chasing her. The RCMP picked her up and dragged her to the back of a police car and the following unfolded:

> "I was yelling at them saying: "I was the one who called for help. Why are you guys chasing me?" And they didn't say anything else… They roughed me up. They handcuffed me and put me in the back of the police car and would not allow my mother to come and see me… One of them came and said [through the police car window], "keep kicking and see what happens"… He punched me in the face more than six times. Half of his body was in the police car. Both my mom and sister saw him punch me. Then they came over and saw my face swollen up. I said, "Look what they did to me!" (Human Rights Watch, 2013, p. 50).

What crystalizes into plain sight through this young woman's testimony radically dispels the myth that we live in a post-racial/post-colonial social reality.[13] Her story, and many others throughout the report, paint a clear picture that violent policing practices serve a profoundly regulatory function in settler states like Canada, a way to attach colonial power to the flesh and bones of Indigenous bodies.[14]

While I do not have space to provide an exhaustive overview within the limited scope of this article, there are several key points emerging from the report that merit restatement. I include these points as reminders of the stakes we are up against in thinking through strategies of critical praxis and decolonization. Moreover, as Nichols (2014) reveals, while North American settler colonies may be positioned as colonial spaces that "have moved from openly coercive and violent relations with [I]ndigenous communities towards a more flexible docile politics of recognition and assimilation," this move is "coeval with the growth of a whole shadow system of hard infrastructure that is every bit as material, physical, and coercive as ever" (p. 448). These findings are not just findings. They are grave windows into the capacious power of settler colonial governance and the tremendous harm that is incurred when we disregard the high degree of interaction between the everyday realities of Indigenous girls and the criminal justice system—it remains a primary locus of settler social control.

To briefly summarize the central insights set forth by *Those Who Take Us Away* regarding policing brutality and failures in protection of Indigenous women and girls by Canadian police:

- There is excessive use of force used against Indigenous girls by the police including physical beatings, the breaking of limbs, and attacks by police dogs during arrest and while in custody.

[13] Wang (2012) speaks to this point of collective delusion with respect to living in a post-racial/post-colonial world.

[14] In the parlance of Razack (2015), "The violence state actors visit on [I]ndigenous bodies imprints colonial power on the skin, as much as the branding of slaves or the whipping and abuse of children in residential schools did. Such a branding declares Indigenous bodies, and crucially their lands, to be settler property, and simultaneously announces that Indigenous people are subhuman, the kind that one can only deal with through force" (p. 6).

- The deployment of tasers—electric shock weapons—has been undertaken in response to threats deemed "low level."
- Inhumane conditions in city cells where Indigenous women and girls are held for public intoxication. They are kept for extended periods without food, in cold temperatures and can be released in the middle of the night inadequately clothed.
- Repeated allegations of rape and sexual assault by police officers, including one case where an Indigenous woman was taken to a remote location outside of town and raped by four police officers.
- Verbal denigration is commonplace, with repeated references to racist and gendered slurs.
- Failure to respond to calls from Indigenous women and girls regarding domestic abuse and shoddy investigative work, if it is carried out at all.
- Displacement of blame onto Indigenous girls by police officers in instances of violence, domestic and otherwise.

HRW, in partnership with Justice for Girls, launched the report in three cities across Canada in early 2013. Ottawa was first with the official press conference on Parliament and meetings at the RCMP headquarters. Prince George, the city in British Columbia's north that served as the geographical center of the study, with the support of the Carrier Sekani Tribal Council, was second. The third was a prairie launch (February 2013) I organized in Saskatoon in collaboration with the Elizabeth Fry Society and local Indigenous activists. Saskatoon was chosen, in part, because of the notorious reputation of the Saskatoon City Police as perpetrators of violence against Indigenous communities, including attacks on Indigenous youth, and the well cited statistics depicting the disproportionate representation of Indigenous peoples—men, women and children—in Saskatchewan jails.[15] It is a setter urban center well versed in the technologies of colonial statecraft where "policing remains devoted to evicting Indigenous bodies from the prairie city, and the imprinting of colonial power on both Indigenous men and women continues apace in gendered ways" (Razack, 2015, p. 22).

The launch took place at the Indian and Metis Friendship Center in Saskatoon's downtown in February of 2013. There were a number of speakers on the panel, including myself, Meghan Roads (the primary researcher from HRW and author of the report), representatives from organizations working on issues of murdered and missing Indigenous women and girls, one of the founders of Idle No More, and the executive director from the Elizabeth Fry Society. After brief opening remarks we opened the floor for a question and answer period. Over a hundred people, including police officers, were in attendance. Various media outlets covered the event ("Women's," 2013; Johnson, 2013; "Landscape," 2013; "Report," 2013).

[15] The infamous and horrific Starlight Tours are, of course, a central piece of this well-earned reputation. See Wright's (2004) *The Commission of Inquiry into the Matters of the Death of Neil Stonechild* and "Ten Years Later" (2014) for recent discussion of ostensible changes in the Saskatoon City Police as a result. Also see Hubbard's (2004) NFB film "Two Worlds Colliding."

Not surprisingly, after the formal presentation of findings numerous women and girls approached me to ask if HRW would be conducting a similar investigation in Saskatchewan. They also had stories to tell about police brutality and failures in protection that were occurring both in Saskatoon and outside of it, in the transit spaces between reserve and city. One Indigenous girl asked me for my phone number so she could call me to share her experience in private, out of the public exposure of the day's event. She was scared, she said, to say anything when the police were so close by. She called me the next day to explain how she had been severely beaten by a police officer when he came after her in the parking lot of a strip mall in Saskatoon's Westside. "I don't even know why he came after me," she said, "I think he thought I was planning to steal something. He called me a little bitch and threw me onto the ground and kicked me really hard. I was hurting all over." When I asked her if she had told anyone about this experience after it happened, she explained that she felt as though there was no where she could go for help. Apparently, no one was going to believe her anyway.

Prairie policing

The story of police violence recounted by this young Indigenous woman is consistent with my longstanding work as a youth advocate and ethnographer researching state interventions in the lives of urban Indigenous youth in Saskatoon.[16] In the remainder of this section, I share snapshots of my ethnographic fieldwork that reveal the gravity of settler colonial policing in the lives of Indigenous girls in this prairie city. To be clear, my interest here is in prioritizing the state's ongoing and manifold strands of assault on Indigenous girls in order to *make visible* the profound restrictions and harm that comes from everyday, routinized violence inherent in particular social, economic, and political formations, and in this case, specifically settler-colonial ones.[17]

Indigenous girls carry history, memory, and otherwise futures within their bodies, within their varied experiences of colonial occupation and their resistance to it. This came across loud and clear one morning when I entered a community and youth organization in Saskatoon where I was conducting a portion of my fieldwork. I walked into the office space that serves as a sort of headquarters for a program supporting Indigenous youth in custody (both open and secure). Case workers are assigned to each youth file and the case worker is supposed to offer support to the youth as she or he transitions from youth detention out into the "real world." This support can take the shape of assistance in enrolling into community education programs, finding housing, attending probation meetings, and seeking employment. On this particular morning, a young

[16] This ethnographic research has culminated in my first book titled *Prairie Rising: Indigenous Youth, Decolonization, and the Politics of Intervention*, forthcoming with University of Toronto Press.

[17] I am being attentive here, to Eve Tuck's (2009) important words about the danger of producing "damage-centered" research (p. 409). My aim in this article is to indict the state – not to create portraits of damage.

Indigenous woman named Sherry[18] was seated next to a desk when I stepped in the room. I had seen Sherry a few times before, but on this day she looked visibly different. There was a large, blackish bruise on her face, although her long brown hair concealed a part of it, and her arm was in a sling. She was dressed in jeans and a simple t-shirt, some kind of mobile device was clutched in her hand. She looked visibly upset, her eyes were narrowed, her mouth in a frown. She wasn't speaking. Sherry's caseworker, Pauline, was sitting behind her desk sipping coffee and typing on her keyboard.

When I saw Sherry, I immediately, of course, asked what happened. Pauline responded in a matter of fact tone, "Oh, it's the cops. They are harassing her again. It happens all the time once you get involved with Corrections and Public Safety." I learned that Sherry had been out walking in the Westside, later in the afternoon the previous day, when she was stopped by two male police officers and accused of breaching her probation orders. According to Pauline, Sherry had tried to explain that she was not in breach of her probation orders but the cops didn't believe her and started accusing her of lying. The situation "escalated," that is how Pauline described it, and Sherry eventually contacted Pauline from St. Paul's Hospital, where she ended up to get her arm and face examined after the altercation with the police. "They let her go, but they roughed her up before they did," Pauline told me. When I asked Pauline what she was going to do to take this matter up, she told me that the only recourse she had was to go to the police station and file a formal complaint. But that, she said, would be very time consuming and often didn't result in anything being done. During this conversation Sherry simply sat still. Dead silent.

What can we make of Sherry's silence? Was her silence imposed from above, from below? What is our role in witnessing these events and making sense of them? All of these questions are fundamental to how we think about what it means to place Indigenous girls' experiences at the centre of critical investigations into settler colonialism. At the moment in which all of this was unfolding, I did not feel like it was my place to ask Sherry to speak or to share her viewpoint on her violent interaction with the city police. I opted not to scratch at the surface of her silence, to be respectful of her decision to remain quiet on the matter. But, I also did not assume that her response reflected stoicism or a lack of awareness about what was happening. I did not assume that there was not a powerful eloquence about the situation that would be uttered if I ever had the opportunity to listen to her. My prior experiences alongside youth in the past suggested quite the opposite. In fact, this entire exchange further reinforced in my mind why it is so important to create avenues for Indigenous girls to speak out safely and with all of the necessary supports. The last thing I wanted to do in this situation was increase this Indigenous young woman's vulnerability and exposure. Nonetheless, I was left thinking about what we might learn from youth like Sherry about the ways Indigenous girls are creatively navigating and negotiating the terrain of state violence if there were more spaces for them to share their knowledge. How might this allow us to interrogate settler colonialism in more complex ways and, in turn, reveal different pathways to decolonization?

[18] All names in this section have been changed to preserve anonymity.

Reflecting further on this encounter, I would also like to suggest that the violence Sherry experienced in this instance contains two discrete parts. The first one relates to the violence she has endured at the hands of the Saskatoon City Police, an egregious violation in its own right. And the second is wrapped up in Pauline's individuation and dismissal of Sherry's encounter with settler colonial violence, thereby legitimating it as part of routine behavior and misrecognizing (Bourdieu & Wacquant, 2004) it because of its predictability and familiarity. In *Violence and War and Peace*, Scheper-Hughes and Bourgeois (2004) describe how "structural violence is generally invisible because it is part of the routine grounds of everyday life and transformed into expressions of moral worth" (p. 4). For Pauline, the experience of this young woman had become entirely normalized to the point that it did not warrant additional time or attention—or even a report to her Director of Programming. It was expected. It was simply what happened. Even when I pressed the issue further, asserting that this was happening to other Indigenous girls too, she didn't seem to think there was anything she could do. She offered no explanation beyond acknowledging that this was "the way things were," nor did she consider the possibility that her own actions of turning a blind eye to the young woman's experience may, in some way, be contributing to a lack of police accountability and in turn, the relentless and vigilant policing of Indigenous youth in the Westside. At best, the underlying message communicated to this young woman was: exercise fortitude when challenged by the onslaught of racist police provocation and coercive force. Suppress your feelings of anger and vulnerability. Keep your head down. Stay out of trouble.

My point here is not to direct all of the blame towards Pauline—she is one caseworker operating within a system of structural, colonial violence—but instead to draw attention to the blatant acceptance of violent policing practices enacted against Indigenous young women in Saskatoon and to redirect us back to the importance of looking at settler colonial gender violence through the social dynamics of everyday practices, which reveal how larger orders of social force come together with micro-contexts of local power to shape material realities on the ground (Kleinman, 1997). In fact, the violation of personal liberty and insidious debasement of human dignity recounted by this Indigenous young woman, in addition to her experience of racism and public humiliation, was not news to me. Having done research and advocacy in Saskatoon for years, this story while stunning in its level of injustice is also stunningly prosaic in its *repeated* occurrence as an act of settler colonial surveillance. On numerous occasions, I have found my senses met with the following scene: a Saskatoon City Police cruiser pulled over on the side of 20th Street (or on more isolated roads, in back alleys, next to forsaken train tracks) with an Indigenous youth standing in the shadow of circulating red and blue lights, arms raised above the head or clasped behind the back. Personal belongings, sometimes broken, have been strewn about the unforgiving ground. One or two police officers are usually engaged in some form of rough "questioning," voices are often raised. The interminable power of the criminal justice system well evidenced by the material presence of guns, slash resistant gloves, bulletproof vests, handcuffs, batons, and split second radio back up. Sometimes there are dogs. The potential use of deadly force by these public-safety sentries, in instances of perceived threat, imagined or

otherwise, looms large. They hold the authority to trigger the deployment of lethal violence to maintain the safety and protection of a white Canadian citizenry, to shut down by any means necessary those whose very presence threatens the social, political, and economic structures that have birthed white power and privilege.[19] They are the city's front line drones of white settler defense. And in moments like these, time becomes dilated. Anything can happen.

Numerous youth workers have corroborated the high incidence of racial profiling and surveillance by city police that has been revealed, anecdotally, by Indigenous youth in Saskatoon. When I interviewed a Cree worker involved in counselling Indigenous youth approaching the end of their prison sentence, he told me it was commonplace for Indigenous youth to recount instances of being stopped by the police to the point of feeling deeply harassed because of the style of their clothing and the colour of their skin. He revealed, "If you live in the *core*, it's almost a certainty. They [Indigenous youth] always seem to be conscious of the presence of police. It doesn't matter where we go in the city, they are always looking out for them."

The reference this youth worker made to the geographical specificity of heightened police surveillance also signals the way that the "core neighbourhood" in Saskatoon has become coded as "Indigenous space," a frontier where "law has authorized its own absence and where the police can violate Indigenous peoples with impunity" (Razack, 2015, p. 23). Idylwyld Drive is the borderline that cuts the city longitudinally, bisecting Saskatoon into the east associated with prosperity and wealth, and the west (also known as Alphabet City because the Westside avenues have no names, just letters) associated with poverty, crime, and suffering—often tagged "ghetto territory." "This spatialized relationship," remarks Joyce Green (2011) "maintains the focus on the [I]ndigenous as needing to be controlled, for racism suggests they are ultimately not fit for civilized society" (p. 238). The targeting of Indigenous girls, and Indigenous youth more generally, by police, then, is interlinked with a criminalization of the neighbourhoods where Indigenous families live, and a deliberate categorization of these communities as simultaneously "native and degenerative" (Razack, 2002). Whiteness is able to move freely into these "projected crime zones" as a matter of exercising power over "Indigenous deviance" and ensuring the quarantining of Indigenous bodies. In the words of Razack (2015), "to mark and maintain their own emplacement on stolen land, settlers must repeatedly enact the most enduring colonial truth: the land belongs to the settler, and Indigenous people who are in the city are not of the city. Marked as surplus and subjected to repeated evictions, Indigenous people are considered by settler society as the waste or excess that must be expelled" (p. 24). In Saskatoon, the processes of gentrification, the spatial politics of safety, and the ongoing displacement of Indigenous peoples on *Cree territory within the city*, have further fuelled white invasion into Indigenous urban space.[20]

[19] As Albert Memmi (1965) asserts, "privilege is at the heart of the colonial relationship" (p. xii).

[20] For a brief glimpse into gentrification on the Westside of Saskatoon, see Casey (2014).

Bringing the propensity of this ongoing domination into razor sharp focus, a Metis youth worker and activist disclosed the following during one of our interviews in 2007. His recitation of how the criminal justice system works as a mechanism of settler state control, and the ways Indigenous girls are particularly susceptible to the violence of this institution, warrants being quoted at length:

> "When it comes to the city police and the aboriginal youth I have worked with for close to fifteen years, or even longer… well, I have seen the abuse from city police. I've seen the ego, the attitudes, the complete injustice. I understand why young Indigenous people don't trust the police. It's all right to take some Aboriginal girl into a back alley and get a blowjob from her because what is she going to do? Because with most of these kids it's always us against them, it's us against the system. The judges don't care. The cops are a big part of the problem. The majority of the justice system in this province, in this city, is broken. I would love to see what would happen if a 14-year-old aboriginal girl told a white judge that it was me against the white cop. The cop is always going to win."

And of growing concern is the now swarming police presence in community spaces where Indigenous youth are *supposed to feel safe* through the model of "crime prevention through social development." Bronwyn Dobchuk-Land's (2015) research in Winnipeg lends considerable insight into this more recent configuration of settler colonial state power. Analogous to Winnipeg in this regard, community organizations in Saskatoon, including Indigenous organizations, are increasingly being asked to welcome police into the spaces they are trying to construct as "safe spaces" for youth.[21] Ironically, this means that Indigenous girls, and youth more generally, are encountering settler police agents even in the places where they are supposed to access youth programming—initiatives ostensibly designed to "help" them. Youth community organizations, emergency rooms, the office of a social worker, the corridors of school, recreational centers, and the street are all fair game. In Saskatoon, you can even find police, the very same state entity that was created to aid Indigenous extermination, *leading* rallies and discussions on murdered and missing Indigenous women and girls.

Thus, the persistent sensation of being hunted, of monitored movement, of freedom being truncated through institutional caging *is central to* the daily reality of being a young Indigenous woman in Saskatoon. It is not an anomaly. It is not the fictitious creation of a youthful imagination on overdrive. Through their existence as *Indigenous* girls, these young people constitute a direct threat to an already existing settler social order. A large part of the way this threat becomes contained is through state mechanisms of criminalization, policing, and incarceration that function as both regulators and producers of socially constructed notions of normativity and deviance against which Indigenous youth sociality can be measured. Judith

[21] This movement has intensified with police programs like such as the Serious Habitual Offender Comprehensive Action Plan (SHOCAP)—read targeted enforcement. The Saskatoon Police Service SHOCAP Unit, in partnership with agencies serving youth throughout the city, "*tracks* [emphasis added] the activity of a select group of young persons" (Saskatoon Police Service, n.d.).

Butler (2015) argues, within the context of black conquest in the United States, that "one way that this [white dominance] happens is by establishing whiteness as the norm for the human, and blackness as a deviation from the human or even as a threat to the human, or as something not quite human" (para. 22). Similarly, young Indigenous lives have been constituted by the Canadian state as "throw aways," lives that are expendable in the quest to maintain settler control, subaltern lives that represent everything Canada does not want to become. Racism's ratification as a way of seeing, as a mode of dominant "public perception" (para. 6) that is both recurrent and customary, everyday and systemic, gendered and sexualized (Jiwani, 2006), fuels the construction of these binaries of value on human life and, in turn, standardizes heinous state techniques of subjugation. Settler colonies are heavily reliant on the reproduction of this longstanding controlling technology because of their need to consistently extinguish Indigenous alterity—to stand firm in the march toward the endpoint of successful "elimination."

Hence, it comes as no surprise to anyone working with Indigenous girls that incidents of "conflict" with law enforcement agents are common markers of lived experience—this is where criminalization and caging enter the picture. In urban centers where Indigenous youth come into more direct and frequent contact with state institutions, clashes with the criminal justice system take on even more heightened levels. According to a report presented to The Commission on First Nations and Metis Peoples and Justice Reform:

> For Saskatchewan Aboriginal youth, conflict with the justice system was primarily urban. Similar to the Canadian data, most Aboriginal youth in Saskatchewan committed their offence of alleged offence in a city, and most planned on relocating to a city upon release. Many of the Aboriginal youth experienced conflict with the justice system in the city even though they lived on reserve. (Government of Saskatchewan, 2004, p. 104)

Incarceration rates mirror the intensity of settler colonial confrontation between Indigenous youth and the criminal justice system, although it is important to reinforce that incarceration is part of a *continuum of violence* in the criminal justice system as a whole, which begins with initial police "contact," followed by arrest, detainment, court proceedings, sentencing, jail time, and, eventually, probation orders. In 2004, the Canadian Department of Justice conducted a snapshot of Indigenous youth in custody. The report confirmed the disproportionate representation of Indigenous youth in prison, although scholars and youth advocates have been reporting this phenomenon for some time.[22] While they comprise only five per cent of the population, Indigenous youth make up 33% of young people in custody. The highest rates of incarceration are in northern and central Canada, and Saskatchewan is among the most punitive provinces, second only to the Northwest Territories (and Saskatchewan, along with Manitoba, holds the greatest number of police per capita across all of the provinces). In Saskatchewan, an astounding 87% of Indigenous women and girls make up the female prison population (Native

[22] For a list of publications regarding the criminalization and incarceration of Indigenous girls in Canada, please see Justice for Girls (n.d.).

Women's Association of Canada, 2012) and *young Indigenous youth are more likely to go to prison than finish high school* (Assembly of First Nations, 2012). Neve and Pate (2005) have argued, in fact, that the prairie provinces have witnessed some of the most egregious examples of criminalization of Indigenous women and girls. They note:

> Aboriginal women continue to suffer the devastating impact of colonization. From residential school and child welfare seizure, to juvenile and adult detention, Aboriginal women and girls are vastly over-represented in institutions under state control….in the Prairie Region most of the women and girls in prison are Aboriginal. (p. 27)

The concluding remarks emerging from Canada's 2012 periodic review, with regards to the country's adherence to the United Nations Convention on the Rights of the Child, also reiterated the criminal justice crisis signalled by the over-representation of Indigenous youth in Canadian jails (United Nations, 2012).

And the violence does not stop there.

This is not an unexplainable phenomenon

Tina Fontaine. Loretta Saunders. Cindy Gladue. Pamela George. Bella Laboucan-McLean. These names are the halting signposts of colonial gender violence in Canada. They are part of a growing, state-generated epidemic of murdered and missing Indigenous women and girls across Turtle Island. An unmistakable rendering of settler state power juxtaposed against its claims of benevolence and post-colonial calm.

In January of 2015, the Inter-American Commission on Human Rights (IACHR) released a 127-page document outlining the egregious levels of violence experienced by Indigenous women and girls in Canada. According to the report, the number of murdered and missing Indigenous women and girls is overwhelming in its scope, tallied at approximately 1200 cases. Indigenous women and girls are 8 times more likely to die of homicide than non-Indigenous women (2014, p. 49). Given that Indigenous women and girls comprise only 4.3% of the overall Canadian population, this revelation is particularly alarming.

I would caution, however, about the danger of getting caught in the numbers game—the constant focus on numbers does a particular kind of work in limiting the focus of the problem. It is vital, I would argue, that we remember that these numbers are not just abstract figures or horrific, sensationalized stories that appear in newspapers or across TV screens in the form of nightly news. Every single one of those 'numbers' corresponds to a life. These statistics are Indigenous girls and women who were integral parts of their communities, human beings who withstood brutal assaults on their bodies and spirits, and daughters, mothers, sisters, students, cousins, aunties, friends, and partners whose lives were extinguished in unconscionable ways. This vicious story of elimination, then, casts light on the devastation and collective wreckage endured by so many Indigenous families and communities across Turtle Island who are suffering

immense loss and righteously demanding justice for their loved ones, and for Indigenous peoples more broadly. But it also renders a clear, ominous picture of where Indigenous women and girls stand in the eyes of the settler colonial state of Canada.

It is my contention that Indigenous girls and women continue to "disappear" and be murdered in Canada because the state is actively engaged in ensuring this continues to happen. Violence against Indigenous women and girls is, after all, the *modus operandi* of the Canadian criminal justice system. This is not an unexplainable phenomenon. It is not a mysterious "crime problem." It is a reworking of the gender violence that has been targeting Indigenous girls and women since the point of first contact, since before Canada became Canada. It is the effect of a criminal justice system that was instrumental in the historical disempowerment of Indigenous women and girls, and a system that is relentless in its pursuit of colonial gender violence as a central feature of settler sovereignty. "Gender violence and murdered and missing Indigenous women are a symptom of settler colonialism, white supremacy and genocide," attests Leanne Simpson (2014), "symptoms of the dispossession of Indigenous peoples from our territories." The settler state of Canada has something very material to gain—the continual seizure of territory coupled with a dismantling of Indigenous political efforts centered on decolonial mobilization—with the continuance of colonial gender violence. And it is made real through a number of cunning technologies of governance, of which settler colonial policing plays an important part. Stated otherwise: as a central component of the criminal justice system, perhaps one of the most fundamental, settler colonial policing has a great deal to do with this epidemic of murdered and missing Indigenous women.

For example, state omissions lead to killings and disappearance without consequence—the complete and utter failure of the police, specifically, to respond to violence against Indigenous girls and women has created a culture of impunity for men to rape and murder at will. State actions (including violence) work in concert with targeted acts of male violence that are effectively borne of state neglect and complicity. Both the provincial police and the RCMP have failed to adequately prevent and protect Indigenous women and girls from a continuum of violence (the extinguishment of life itself being the concrete endpoint) and have aborted the responsibility to thoroughly investigate acts of violence when they are committed.[23] "Family members of murdered and missing women have described dismissive attitudes from police officers working on their cases, a lack of adequate resources allocated to those cases, and lengthy failure to investigate and recognize a pattern of violence" (Inter-American Commission on Human Rights, 2014, p. 12). Confirming allegations of Indigenous women and girls exclusion from state protection, the Report on the Aboriginal Justice Inquiry has also reiterated the ways that police have come to view Indigenous peoples not as a community deserving protection, but a community from which white society must be protected. This has led to a situation often described as one of Indigenous communities being "over-policed" but "under-protected"—

[23] The story of Bella Laboucan-McLean is particularly revealing in this regard. For the details of her case, please see Klein (2014).

positioning Canadian white society as in need of *protection from* Indigenous nations (Aboriginal Justice Implementation Commission, 1991).

Furthermore, as opposed to serving as sources of assistance and help, Indigenous women and girls are often scared to reach out to police for fear that they will be further violated through terrorizing policing practices or have to contend with the outright omission of their accounts of violence. In her exploratory research on girls in city cell lock up in Vancouver, Sue Brown (2011) heard a young Indigenous woman say,

> "So as far as just being like out on the street corner and running into police officers and stuff. They really treat women out there like shit. They really really do. And it is sad because most of the women out of there are so young. And it is like, you know, they are still very impressionable, and no one wants to be out there. I don't give a shit what anybody says. Nobody truly wants to be that way. And when you run into cops, you know, and they call you a "fucking whore" or… you know, tell you to "get your fucking ass off the street" well, I mean, that is not helping" (p. 151).

The projection of criminality cast onto Indigenous women and girls also further fuels state failure to protect them and solidifies the elision of their lived experience. During an interview of policing in the lives of Indigenous girls, Annabel Webb explained how the positioning of Indigenous girls as "criminals' makes them more prone to becoming targets of male violence. She remarks,

> "The criminalization of Aboriginal girls is defined by a pervasive assumption of delinquency, one that ensures that girls will come into frequent contact with police and are more likely to be questioned, searched, arrested, detained, and subjected to the brutality of criminal justice procedures such as strip searches, imprisonment and solitary confinement. *Perpetrators, whether they happen to be police officers or other men in the community, act with impunity because the positioning of Indigenous girls as "criminal" means that the first impulse of criminal justice response to her victimization will be to question the child's credibility.*"

Thus, breakdown in police protection and investigation, coupled with the projection of criminality onto Indigenous girls, *works to sustain* violence against Indigenous women and girls because male perpetrators believe they will be exempt from legal ramifications as a result of their actions (and they often are). Natalie Clark's intersectional based policy analysis of violence in the lives of Indigenous girls, which draws extensively on cases studies of indigenous girls' experiences, further reveals how state policies fail to protect Indigenous girls from victimization (Clark, 2012, p. 136).

The utter failure of the Canadian public to stand up and demand answers in relation to violence against Indigenous women and girls is an indication of the value Canadian society

places on their lives.[24] In many ways, they serve as the "unmournable bodies" (Cole, 2015), bearing the lethal consequences of Canada's quest to maintain the territorial power and the broad reaching control required to keep Canada a sovereign, industrial, and capitalist nation.[25] On the disposability of life in the context of relations of domination, Inuit/Taino writer Siku Allooloo (2014) attests, "the fact that society sees Indigenous women and girls as violable, as eligible targets of assault and domination, as "less than human" or, as weak, isolated and defenseless is, to my mind, the heart of the issue (para. 4).[26] It follows, then, that murder and other forms of colonial gender violence are the state's most concrete triumphs over Indigenous resurgence in the greater geopolitics of settler colonialism (Balfour, 2014).

Recasting decolonization and Indigenous freedom

A critical politics of encounter with settler colonial policing in the lives of Indigenous girls necessitates thinking through a sustained politics of decolonial transformation. Indeed, as eloquently captured by Ashon Crawley (2015) when reflecting upon Black life in the United States, "the quotidian, ordinary, everyday nature of these violent incidents should produce within us a restlessness, a desire to exist *otherwise*" (para. 4). What actions will we take to dismantle colonialism's death grip on the lives of Indigenous girls? How do we reimagine Indigenous critical praxis and decolonization when colonial gender violence sits at the center of strategies for political change? How do we ensure we are addressing the multifaceted dimensions of colonial gender violence vis-à-vis settler colonial policing in a manner that includes queer Indigenous bodies? What will Indigenous peoples' self-organizing and self-governing look like when Indigenous women and girls are leading the struggle against settler colonial rule? These are big questions, but they are questions we need to ask if we are in this fight for the long haul and if we are in it to win.

---

[24] For a glimpse into white Canada's perception of Indigenous peoples' struggle for self-determination please see Angus (2013).

[25] Echoing this sentiment, Naomi Klein spoke the following words at a speech on murdered and missing Indigenous women and girls she delivered in Toronto, Ontario on December 18, 2014: "Here is one link to consider: the greatest barrier to our government's single-minded obsession with drilling, mining and fracking the hell out of this country is the fact that Indigenous communities from coast to coast are exercising their inherent and constitutional rights to say no. Indigenous strength and power is a tremendous threat to that insatiable vision. And Indigenous women really are "the heart and soul" of their communities. The trauma of sexual violence saps the strength of communities with terrifying efficiency. So let us not be naïve. The Canadian government has no incentive to heal and strengthen the very people that it sees as its greatest obstacle" (para. 45-47).

[26] Following in step, Judith Butler (2015) explains, "[w]hat we see is that some lives matter more than others, that some lives matter so much that they need to be protected at all costs, and that other lives matter less, or not at all. And when that becomes the situation, then the lives that do not matter so much, or do not matter at all, can be killed or lost, can be exposed to conditions of destitution, and there is no concern, or even worse, that is regarded as the way it is supposed to be" (para. 2).

As I mentioned at the start of this piece, as a non-Indigenous person growing up on Cree land in Saskatchewan I am in no position to be directive towards Indigenous nations about shifting political strategies and the multivariant forms of resistance to colonial occupation that already exist. What I can offer are some speculative points for consideration that I believe we should take seriously as we go about the hard work of decolonization and bending the light toward political actions and social practices that advance Indigenous freedom. These are thoughts based on important, vital lessons I have learned from Indigenous and non-Indigenous comrades alike, and are reflective of my own insights as a person of colour who knows she is living on stolen land. They are by no means exhaustive or complete. They are a series of loose starting points for deliberative dialogue about inciting the world to be otherwise than it is. And they are an ethical articulation of the political responsibility I have inherited as someone who carries a Canadian passport and calls Canada home. I hope we can build from them.

The first, and perhaps most obvious, point is that colonial gender violence is alive and well. It has not recessed into historical record or taken a back seat to other forms of violence enacted upon Indigenous nations. What all of the preceding pages tell us, rather, is that there is a war on Indigenous women and girls across Turtle Island. And an awareness of the material, everyday violence that is a core feature of being an Indigenous woman or girl in Canada pushes us, as Sarah Hunt (2015) adeptly urges, to rethink conceptions of what is politically significant within the context of Indigenous struggles for sovereignty and self-governance. It calls for a suturing together of the micro dynamics of daily life with macro political struggles for land. It demands that we bring gendered violence, police brutality, carcerality of everyday life, death of kids in care, and a willing negligence of Indigenous communities into the realm of the political and that our strategies of defense are always attentive to this materiality (Hunt, 2015, p. 4). In concrete terms, this also means that we must be moved to mobilize every time an Indigenous woman or girl is subjected to state violence and to support Indigenous communities to develop alternative pathways for addressing violence in their own communities in ways that minimize state contact. “It’s in all our best interests to take on gender violence as a core resurgence project, a core decolonization project, a core of any Indigenous mobilization,” says Leanne Simpson (2014, para.10). I believe this call to action is clear and also points to the way that those of us committed to eradicating colonial gender violence must operate in consensual allyship with the formidable Indigenous women and girls already paving the way.

A second and related point involves recognizing the importance of engaging critical praxis that exists outside the so-called justice and freedom offered through state mechanisms of recognition and redress. Glen Coulthard (2014) captures this succinctly when saying, “the politics of recognition in its contemporary liberal form promises to reproduce the very configurations of capitalist, racist, patriarchal state power that Indigenous peoples’ demands for recognition have sought to transcend” (p. 3). While I recognize the need for ongoing advocacy to change social policies and practices from within domestic government agencies and institutions (and this means we need people working in these spaces with a politicized understanding of Indigenous-state relations and the stronghold state institutions have on Indigenous girls), as well

as legal international bodies, I would argue it is shortsighted to assume that the state is simply going to step in and right its wrongs, regardless of how many more inquires are called or reports commissioned. If, as numerous scholars and activists have pointed out, the state is the chief perpetrator of violence in Indigenous nations, its institutions, agencies, and programs cannot be the place where justice is found, nor can strategies for eradicating colonial gender violence be rooted in these power structures. "There is no freedom to be found in a settler state, either one that would seek to give it or take it away," writes Jarrett Martineau (2014, para. 19). Alternatively, there must be a turning away from state prostrations of assistance and a *turning towards* the longstanding strength, artistic practice, intergenerational wisdom, and epistemologies that are central to Indigenous ways of life. There must be an arsenal of resistance to colonial gender violence that is rooted within nations themselves. A futurity and decolonial terrain, in other words, that operates on Indigenous frequencies.

And third, there is an urgent need to *decolonize* and *politicize* youth studies, youth programming, and almost every single initiative out there in Canada that addresses "the needs" of Indigenous youth in general, and Indigenous girls specifically. Youth studies scholars and social policy-makers have, in fact, paid very little attention to the ways that the distinct political and material formation of settler colonialism has mediated the scope and discourse through which we understand Indigenous youth experience in Canada (Lesko and Talburt, 2012). Decolonizing and politicizing this work includes a giant step away from the grossly homogenized renditions of Indigenous youth experience in the quest for Indigenous sovereignty—an elimination of the cursory, lip service attention paid to the diverse nature of the materiality of the social (Farmer, 2004). Settler colonialism impacts bodies differently depending on their social markings. Indigenous youth differentially experience injustice, a lack of protection, policing, social regulation, and state intervention, containment, and disciplinary punishment – these things operate in different ways depending on who you are. In a striking example of this diversity of experience, Billy-Ray Belcourt's (2015) recent talk, *Queer Indigenous Poltergeists*, at the North American Indigenous Studies Association Meeting in Washington D.C. in 2015, highlighted the fundamentally affective impact of settler colonialism on queer Indigenous bodies that serves as "an affective rupturing of our attachments to life, to each other, and to ourselves." In doing so, his incantation that summons the figure of the queer Indigenous poltergeist demands that we re-think the criteria for membership in a decolonial future and pay heed to the numerous ways that settler colonialism winds itself around Indigenous bodies, including through the destructive work of heteronormativity.

This also means decentering the author/researcher/advocate as the single voice of authority. If we are to understand the hidden and insidious dimensions of violent settler colonial policing in the lives of Indigenous girls, *then we need to listen to them*. If we are going take seriously the leadership role that can be assumed by Indigenous youth in the fight for Indigenous self-governance and ways of living, then we need to identify concrete ways to bring those opportunities into being. We need to take direction from the Indigenous young women in the Native Youth Sexual Health Network and the Indigenous Young Women's National Council

who are demonstrating, everyday, how Indigenous girls are *already* leaders in the struggle to end colonial gender violence, and we have to think strategically about how we can actively support them in expanding and growing this work.[27] A solid effort must be made, then, to avoid becoming tangled in Laura Berlant's (2011) web of cruel optimism and implementing tokenistic inclusionary efforts. Indigenous youth, after all, are the lived connections among history, extant colonial realities, and the unfolding of what comes next—they are, as Alexa from the Native Youth Sexual Health Network powerfully renders, the "bridges between our ancestors and the people that are ahead of us." It's time we back them in the fight for the future; a future, I would argue, that is intimately bound up with their fight for the present.

POLICING THE PLANET

Jordan T. Camp is a Postdoctoral Fellow in the Center for the Study of Race and Ethnicity in America and the Watson Institute for International and Public Affairs at Brown University.

Christina Heatherton is an Assistant Professor of American Studies at Trinity College.

8. POLICING THE CRISIS OF INDIGENOUS LIVES: AN INTERVIEW WITH THE RED NATION

Christina Heatherton

The Red Nation is a Native-led council of Indigenous and non-Indigenous activists committed to the liberation of Indigenous people and the overthrow of colonialism and capitalism. Based in Albuquerque, New Mexico, the council centers Indigenous agendas in direct action, advocacy, mobilization, and education from the perspective of the Indigenous Left. Members Melanie Yazzie (Diné), Nick Estes (Lakota), Sam Gardipe (Pawnee/Sac and Fox), Paige Murphy (Diné), and Chris Banks were interviewed in June 2015.

Heatherton: As of 2014, New Mexico has led the nation with the highest rate of police killings. The Albuquerque Police Department has one of the highest rates of fatal police shootings, eight times as high as the NYPD. Native people are statistically most likely to be killed by law enforcement. How do you explain this violence against Native communities here in New Mexico?

Estes: The Red Nation was partially formed out of the anti–police brutality movement. All of us here were involved in some way. For Native people in Albuquerque, forms of everyday police brutality are largely about the policing of Indigenous bodies in a space. It follows the thinking that Native people don't belong in this space. The police, especially the Albuquerque Police Department, manage the crises of colonialism, colonization, and occupation through the constant criminalization of Indigenous bodies, especially homeless and poor people. Settlement and colonization are never complete processes; they always have to be reenacted. Policing this crisis of Indigenous lives happens in the present and also in the future.

Yazzie: Colonization presumes the disappearance and the finality of settlement, but Indians are ubiquitous. The fact that we're present makes us

anachronisms. We're not supposed to be here, but we're here in really large numbers. That increases the amount of violence necessary to contain us. This violence is not just from the cops, but also from citizens. Last summer two Diné men known as Cowboy and Rabbit were brutally beaten to death. This violence obviously doesn't only affect Native people; other homeless people and poor people of color especially are treated as totally disposable. Native people here experience the violence of anti-Indian common sense as an everyday thing. We call Albuquerque a border town since the city is surrounded by Indigenous land and has a large Indigenous population inside it—55,000 Native people, maybe more. As a border town it's also an important site in the production of anti-Indian common sense.

Heatherton: How do you define anti-Indian common sense?

Yazzie: Nick and I developed the concept by drawing on Dakota scholar Elizabeth Cook-Lynn, one of the most important scholars in Native American intellectual history in the last forty years. She coined the term "anti-Indianism," which she defines as "that which treats the Indians and their tribes as if they don't exist." She also describes it as that which disavows and devalues Indian nationhood—which demonizes and insults being Indian in America. Through the term, we can see how the weight of history is placed upon Native people's shoulders, as if anything bad that has transpired is our own fault.[1]

Estes: One way we use anti-Indianism as common sense draws from Antonio Gramsci, the Italian Marxist theorist who described "common sense" as an ideology not necessarily actively theorized but more like a knee-jerk response. People don't necessarily think that Indians aren't supposed to exist, it's just normalized in how they perceive their reality. People can celebrate and mourn the passing of the Indian, but they can't actually confront the existence or the persistence of Indigenous life in cities because Indians don't "belong" here.

Heatherton: How do you confront anti-Indian common sense here in Albuquerque?

Gardipe: For the Indian on the street, we don't have a place to actually exist or have social lives and hash things out within the Indian community.

We have a place here that's more or less a tourist attraction with Pueblos. It's basically full of artwork, pottery, and food supposedly made by Natives of the Southwest. However, if a street person walked in, he'd probably be turned away, because he's seen as an embarrassment to Natives. I get a little scrutinized when I walk in there because I have long hair and I'm obviously an Indigenous person, but I'm not a "mainstream Indian." They like to see the ones in suits and ties with short hair.

Heatherton: Your group often uses the term "unnatural deaths" to place the police killings within a larger political economy of extreme poverty, unemployment, and homelessness. How do you understand these connections?

Estes: Private property has more value and sanctity than Native lives. Unnatural deaths result from private property laws that prohibit everyday behavior in public. Whether it's eating, sleeping, defecating, urinating, having an untreated mental illness, for example, these behaviors are all criminalized because they are enacted on somebody else's property. Being unable to sleep, stop, drink, rest, or urinate are forms of what could be considered torture. When Native people enter Gallup or Albuquerque, they're made to stay in constant motion. Because of property laws, they can't loiter, panhandle, sleep in public, or perform basic bodily functions because these are all criminalized behaviors. As a consequence they have to constantly be moving. People walk up to ten or twenty miles a day. Often people can't sleep within the city where they have access to resources such as shelter, food, or other basic needs. They end up going to what people here call "the bush." We've found that a lot of people die as a result of this constant movement and constant policing because they are forced to live outside of society, on the outskirts of the city, while actually depending on the city for life.

An unnatural death can mean anything from dying from exposure, which happens quite frequently, to being beat up by vigilantes or by the police, possibly resulting in some sort of injury that means they can't work and therefore lose their job. It could mean getting their personal identification confiscated and destroyed by the police and losing the ability to work, access to medical services or secure housing. When we talk about unnatural deaths, it can be anything from the extreme forms of violence to the "slow death" of poverty or homelessness that always goes unaccounted for.

Banks: The pervasive view in Albuquerque is that the right place for Native people is on the reservation. If Native people are off the reservation, they seem to have no claim to rights or to citizenship. Police uphold this view that Native people have no rights they are bound to respect. Native people are seen as a disposable part of the population. This is related to the federal government's lack of respect for the sovereignty of Native land, which they view as existing for plunder. In their view, either the Native population will be exploited for their cheap labor or they will be absorbed by prisons. In that way, they have everything in common with other oppressed nations living in the United States, such as African Americans and Latinos. Thinking about them as a disposable part of the population explains their targeting by the police. The *Albuquerque Journal* recently reported that 12 percent of Native adults in Albuquerque experience chronic homelessness, which is a crisis if there ever was one. No one in the city is sounding the alarm or asking how we can mobilize resources to address this.

Murphy: I grew up in a border town in Gallup. It's common to see homeless Natives walking in the street. It's normal to see Natives sleeping on the street. In the news, it's normal to hear about homeless Natives dying due to exposure, especially in the wintertime, Native people freezing to death in the cold. No one really thinks twice about it, because it's an everyday normal thing—the violence that saturates a town like Gallup.

When I see Native people homeless in a town like Gallup, what I see are the failures of capitalism. You've got all of these different failures of capitalism: people who don't have access to jobs, people who don't have access to health care, people who don't have access to education. You just fall into these cracks. I guess you could call them pipelines to incarceration or to homelessness. Gallup is dire and decaying. When you see a town like that, you have to start questioning the system that allowed these things to happen, a system that will turn its back on Natives while they're in these dire circumstances. I see it in my families.

This is why I really like the Red Nation, because we all have these same stories. Every Native person that I meet knows what it's like to have alcoholism rip and tear your family apart. Every Native woman I have ever met has been sexually assaulted. They say that the statistic is three out of four Native women—

Yazzie: One in three.

Murphy: One in three. They say that one in three women are sexually abused in their lifetimes, but it's definitely higher than that. A lot of the Native people I know who have been sexually assaulted don't report it. I didn't report it when it happened to me. These numbers are extremely high. In a town like Gallup, a lot of women go missing. There are thousands of Native women who have gone missing and people don't talk about it. It's not breaking news. None of these problems get any attention. If they were to get attention, then you'd have to say, "Capitalism is failing." Capitalism has always failed Native people.

Yazzie: It's premised on our elimination.

Murphy: Exactly. These circumstances are dire. People are dying every day. Despite the rate of violence, there's no mobilization. No one is going out in the street. People are so used to it that their reaction isn't outrage. My mom tells me, "This is just the way it is. It's always gonna be this way." But by existing, we discredit the system and question the system. That's why I'm involved in the Red Nation.

Heatherton: Like the Black Panther Party, the Red Nation also has a ten-point program. Your fifth point is "an end to the discrimination, persecution, killing, torture, and rape of Native women." Can you say more about how this is central to your program?

Yazzie: I'm an Indigenous feminist. As I'm one of the co-founders of the Red Nation, there was no way this was not going to be in the agenda. That's the simple answer. All of the different subjects that we've included, whether it's LGBTQ2 (Lesbian, Gay, Bisexual, Transgender, Queer or Two-Spirited) people, women, the poor, the youth, and so forth, all of these groups are categories of Indigenous subjects under occupation by the United States that are completely marginalized and silenced. They are marginalized not just by the common sense of settler colonialism but also within Indigenous-led social movements. You never see young people or women or the poor or trans Native people at the helm of these movements. Traditionally, they are very patriarchal and quite sexist forms of social organizing. We are foregrounding these voices not as a simple politics of representation as though we merely needed someone with a uterus. We're feminists. That means we organize ourselves to confront the heteropatriarchy in organizing culture as well as in tribal government

structures. We recognize the logic of heteropatriarchy as a form of violence disproportionately enacted on feminized bodies, whether Native women's bodies, queer bodies, or other Indigenous bodies.

Estes: I've been involved in a lot of environmental movements back home, especially in the anti–Keystone XL Pipeline movement. One thing I find fascinating is how non-Native people gravitate towards Indigenous causes that are "safe." They go to sites of extraction where the exploitation and monetization of nature is comprehendible to them. But capital is also reproduced in urban centers like border towns. Four out of five Native people live in urban centers. What would it mean if those same allies who came out to places they consider "Native spaces" instead came to places that aren't considered Native spaces, like Albuquerque? What if they rallied around us every time a Native trans woman was murdered on the street? Or every time a child was victimized in school? What if they protested every time a woman was violated in some way? If there was that same kind of reaction, in a city or a border town, what would that mean? The reason why Native youth, Native LGBTQ, Native women are central to these struggles is that they are made vulnerable by capital, not just at the sites of extraction, but also at the sites of its reproduction, the urban centers where a majority of Native people live.

Yazzie: Capital is reproduced through colonial violence. If you center the life of a Native trans sex worker, and there are many in Albuquerque, that person will have a subject position that has been reproduced through colonial violence. The logic of capital as it's reproduced through that person, or through a Native woman's body, is going to be so much more visible than when it appears in a white man or in many cases a Native man. In the Red Nation we are forced to talk about all of these forms of violence at the exact same time, because that's literally how people live their lives.

Heatherton: Like the Black Panther Party, your ten-point program also includes a demand for appropriate education, health care, social services, employment, and housing, what you call a "living social wage." How is this demand central to your organizing against capitalist colonialism?

Estes: The first point of our ten-point program is the reinstatement of treaty rights. That's what makes American Indians, Native people, distinct.

Our treaty rights don't begin or end on the reservation boundary. When we cross the reservation boundary, we do not lose our rights. In Albuquerque alone there are 291 reasons why this is important, all based on treaties, because there are 291 federally recognized Native nations living in Albuquerque right now. That is a very powerful thing, politically speaking. Those are 291 guarantees for adequate health care, adequate education, and adequate social services. Those are basic human rights, and they aren't anything new. When we talk about the not-so-sexy battle for health care and education, it's based on treaties. That's where we're drawing our inspiration from when we talk about health care. Police brutality is more mainstream now. It's a really important struggle because of the ways in which we're having this conversation. We also need to do the hard groundwork of guaranteeing that these historic rights and historic obligations are fulfilled to keep a bare minimum of life and dignity for Native people.

Heatherton: The very last line of your ten-point program is "For Native peoples to live, capitalism and colonialism must die."

All: Yeah!

Banks: The Red Nation came into existence to fill a void. We wanted to provide a vehicle for struggle, to mobilize Native people, and, in a way, to be a catalyst to bring people into motion to fight. Like Paige said, homelessness, lack of access to health care, and poverty are often talked about as irrational outcomes of a rational system. Our perspective is the exact opposite, that these are actually quite rational outcomes of the irrational system that we live in.

This ten-point program, specifically the call for a living social wage, is a programmatic demand that serves the purpose of building into people's consciousness that these are not entitlements or the privileges of the few, but really human rights. We demand and fight for them, but we also believe that the current system will not actually be able to grant them. Our demands and our fighting will expose the system for what it is. They will expose the limits of the "democracy" that we live in and the limits of the capitalist system. That's really our goal.

Yazzie: Native people aren't living if we're living to die. We're produced so that we can reproduce the violence necessary for the accumulation of

capital that is never ours. The capital is for a small group of people. We use the term "meaningful standard of living" in point eight of our tenpoint plan. "Life" is at the root of that point because we mean it. Native people aren't living. In the capitalist-colonialist system, we are really only born so that we can be churned up, spit out, bludgeoned to death, killed by exposure, ripped apart by dogs, run over by cars, mangled by alcohol, or raped several times in our lives. That's really what life is like. That's not living. A meaningful standard of living would be a really basic step to allow Native people to begin to develop enough well-being to mobilize in any sort of way, and to create the kind of change we're envisioning in the Red Nation. We're not the kind of activists who say, "Our vision is to end colonialism and capitalism, and the way to do this is to burn down buildings, or whatever."

Murphy: Really? That's why I joined.

All: [*Laugh*]

Yazzie: We start where we're at. Where we're at sucks. It's incredibly violent. We want to allow Native people to live and to breathe just a little bit. We're genuinely interested in mobilizing poor people. We're a bunch of Marxists. We have a materialist approach, not an idealistic approach. We care about people. If you care about people then you have to deal with the messiness of life.

Estes: An idealized position envisions Native people as living this "authentic" Indigenous life, riding bareback in the mountains with the wind flowing through their hair, herding sheep, and hunting a buffalo, all at the same time. Despite the popular imaginary, four out of five Native people do not live on reservation land. That is a reality we have to confront. Albuquerque is Indigenous space. Gallup is Indigenous space. Rapid City is Indigenous space. The demands for reasonable housing, a living social wage, adequate social services, and adequate health care are not unreasonable. They are very, very reasonable. They are basic human rights that can be fulfilled. This is the richest, most powerful country in the world and it has people living in fourth world conditions. That's where Indigenous peoples are. To even begin to imagine an alternative future, an alternative to capitalism, an alternative to colonialism, and to facilitate that end, you have to have the ability to live. It's a future-oriented project. We're actually continuing a long struggle of Native people and moving it

into the future. We're very progressive in that sense. We also understand that we want to work from the material conditions in which we find ourselves, not some imagined, idealized past where we're riding bareback, herding sheep, and killing buffalo.

Heatherton: All at the same time.

Estes: All at the same time.

Heatherton: You have a wonderful saying that "solidarity is not hard." Why is this an important organizing principle?

Murphy: The labor movement in the 1930s started off with a program like ours. This was a time of intense struggle. Workers got together. They put a list of demands together, including unemployment benefits and social security. This was really the work of the communists. At the time, people thought that these demands were totally unrealistic. But they won them through intense struggle. When all the workers stand together, it radicalizes people. You're able to see the system in a real way. If workers withhold their labor, then the capitalists have no power. We're materialists. We're Marxists. This program is a starting block to what we're trying to achieve. People may see things like access to education, free health care, social services, unemployment, and think that it will never happen. Through intense struggle and by bringing people out into the streets, we will be able to turn these demands into reality.

Estes: We've all worked in solidarity with Palestine, with the #BlackLivesMatter movement, and with other police brutality movements as well. When someone puts out a call, you respond. It's not about serving yourself as an individual. It's about using your body as a vehicle, putting it in the street, or writing a letter, or whatever, and standing behind other oppressed groups of people. I don't know any other way to explain it except that "solidarity is not hard." Get your shit together and get out there.

Murphy: Now more than ever, people are starting to bridge struggles together. We've done a lot of work around Palestinian solidarity, Muslim solidarity against Islamophobia, and against police brutality. All of these struggles are related. Everyone is fighting capitalism in their day-to-day

lives whether they want to admit it or not. When you're struggling to make rent, you're fighting against capitalism. When you're looking for a job and you can't find one, you're struggling against capitalism. People every day are fighting against capitalism. When we link these struggles, that's when they're able to see it.

Yazzie: Another group we're building right now is Diné Solidarity with Palestine, since you can't end the occupation in Palestine unless you end the occupation of Indigenous land in the US. It's a globalized system of settler colonialism. If we're going to engage in solidarity, we have to center the Indigenous agenda. That's what the Red Nation is about. No one else centers the Indigenous agenda. It always gets lost or marginalized. If we actually center our own agenda and proceed with solidarity efforts from that position, what does that look like? I'm not terribly interested in solidarity paradigms that don't center Indigenous interests or an Indigenous critique of colonialism and capitalism.

Banks: We approach our work by thinking about how our activities can deepen the multinational character of an anti-racist struggle. We don't water down demands for self-determination, we try to raise the consciousness of the broader social justice movement. The Red Nation is trying to fill a vacuum, not just within society but also within the existing social justice movement that only pays lip service to the Native struggle. We're trying to build unity on a much different basis, on a deep understanding of self-determination, and that doesn't contradict in any way the need to build a broad-based, multinational, working-class movement.

Heatherton: Final thoughts?

Estes: Settlement is never a complete process, and we're here to make sure that it never gets completed. Colonization is a failed project, because they didn't kill us all.

Yazzie: That's why they have to constantly police us.

Estes: It's through 500 years of resistance that we have our existence in the present. That's what keeps us going. It's a beautiful thing, as much as it condemns us to this constant struggle. It's something that has to be fought. Otherwise, what did our ancestors die for?

Human Rights Watch is dedicated to protecting the human rights of people around the world. We stand with victims and activists to prevent discrimination, to uphold political freedom, to protect people from inhumane conduct in wartime, and to bring offenders to justice. We investigate and expose human rights violations and hold abusers accountable. We challenge governments and those who hold power to end abusive practices and respect international human rights law. We enlist the public and the international community to support the cause of human rights for all.

Human Rights Watch is an international organization with staff in more than 40 countries, and offices in Amsterdam, Beirut, Berlin, Brussels, Chicago, Geneva, Goma, Johannesburg, London, Los Angeles, Moscow, Nairobi, New York, Paris, San Francisco, Tokyo, Toronto, Tunis, Washington DC, and Zurich.

Summary and Recommendations

The Tachie reserve in northern British Columbia. In Carrier, the indigenous language in Tachie and many indigenous communities in northern BC, the literal translation of the word for police is "those who take us away." An RCMP report on the historical involvement of the police in Canada's residential school system found that "The police were not perceived as a source for help but rather as an authority figure who takes members of the community away from the reserve or makes arrests for wrong-doing."

THOSE WHO TAKE US AWAY

Photographs © 2012 Samer Muscati/Human Rights Watch

On December 5, 2012, a man walking his dog found the murdered body of 16-year old Summer Star (C.J.) Fowler in a ravine near the British Columbia (BC) town of Kamloops.[1] The Gitanmaax[2] teenager from Hazelton in northern BC, remembered as a sweet girl with a beautiful smile by her family, had been visiting friends a few days previously and was just hours away from taking a bus back home when she disappeared and was ultimately killed in circumstances still under investigation by police.[3] Speaking at a news conference, her father said, "We would just like to stop this violence … We want some answers and we don't want this case to be another they stick under the rug."[4]

A woman wears a T-shirt with a slogan about police brutality in Prince George, British Columbia. In ten towns across northern British Columbia, Human Rights Watch documented failures in policing and protection of indigenous women and girls.

(above) Photographs of a 17-year old girl's injuries after a member of the Royal Canadian Mounted Police repeatedly punched her while she was handcuffed in British Columbia in 2011.

(left) Dog bite wounds are shown on the left leg of a 12-year old girl who was attacked by a police dog in 2012 when police searched for and arrested her after she was reported to have sprayed someone with bear mace. [Photos provided by the girl's mother to Human Rights Watch for publication.]

(opposite page) A community worker in a northern British Columbia town holds underwear that she distributes to women on the street, some of whom reported to her having been raped by police and having their underwear taken.

C.J. Fowler is just one of several hundred indigenous women and girls who have been murdered or gone missing across Canada over the last several decades. By the time government funding for data collection on missing and murdered indigenous women and girls ended in 2010, the Native Women's Association of Canada (NWAC) had documented 582 such cases nationally. Many happened between the 1960s and the 1990s, but 39 percent occurred after 2000, or about 20 a year. If women and girls in the general Canadian population had gone missing or been murdered at the same rate, NWAC estimates the country would have lost 18,000 Canadian women and girls since the late 1970s.

The province of British Columbia has been particularly badly affected by violence against indigenous women and girls and by the failure of Canadian law enforcement authorities to deal with the phenomenon. Cutting through the small communities policed by the Royal Canadian Mounted Police (RCMP) in northern BC is the Highway of Tears, a 724-kilometer stretch of road which has become infamous for the dozens of women and girls who have gone missing or been murdered in its vicinity.

The high rates of violence against indigenous women and girls have drawn widespread expressions of concern from national and international human rights authorities, which have repeatedly called for Canada to address the problem. But these calls for action have not produced sufficient change and indigenous women and girls continue to go missing or be murdered in unacceptably large numbers.

The failure of law enforcement authorities to deal effectively with the problem of missing and murdered indigenous women and girls in Canada is just one element of the dysfunctional relationship between the Canadian police and indigenous communities. This report addresses the relationship between the RCMP and indigenous women and girls in northern BC and documents not only how indigenous women and girls are under-protected by the police but also how some have been the objects of outright police abuse. The report further documents the shortcomings of available oversight mechanisms designed to provide accountability for police misconduct and failure to protect.

In ten towns across the north, Human Rights Watch documented RCMP violations of the rights of indigenous women and girls: young girls pepper-sprayed and Tasered; a

12-year old girl attacked by a police dog; a 17-year old punched repeatedly by an officer who had been called to help her; women strip-searched by male officers; and women injured due to excessive force used during arrest.

Human Rights Watch heard disturbing allegations of rape and sexual assault by RCMP officers, including from a woman who described how in July 2012 police officers took her outside of town, raped her, and threatened to kill her if she told anyone. Human Rights Watch strongly urges an independent civilian-led investigation of these allegations with the aim of achieving criminal accountability for the alleged crimes. Human Rights Watch would eagerly cooperate with such an investigation to the extent we are able to without compromising the safety and privacy of victims.

For many indigenous women and girls interviewed for this report, abuses and other indignities visited on them by the police have come to define their relationship with law enforcement. At times the physical abuse was accompanied by verbal racist or sexist abuse. Concerns about police harassment led some women—including respected community leaders—to limit their time in public places where they might come into contact with officers. The situations documented in this report—such as a girl restrained with handcuffs tight enough to break her skin, detainees who had food thrown at them in their cells, a detainee whose need for medical treatment was ignored—raise serious concerns about tactics used in policing of indigenous communities in BC and about the police's regard for the well-being and dignity of indigenous women and girls.

Incidents of police abuse of indigenous women and girls are compounded by the widely perceived failure of the police to protect women and girls from violence. Not surprisingly, indigenous women and girls report having little faith that police forces responsible for mistreatment and abuse can offer them protection when they face violence in the wider community. As a community service provider told Human Rights Watch, "The most apparent thing to me is the lack of safety women feel. A lot of women, especially First Nations women we see never feel safe approaching the RCMP because of the injustices they've experienced … The system is really failing women."

One aspect of this is the apparent apathy of police towards the disappearances and murders of indigenous women and girls that has been such a persistent and well-publicized stain on Canada's human rights record. Less well-publicized but equally pernicious have been the shortcomings of the police in their response to domestic violence.

Two unidentified women hitchhike in northern British Columbia.

The RCMP has instituted progressive policies addressing violence in domestic relationships, but it appears the police do not apply those policies consistently when policing in indigenous communities. According to survivors of domestic violence and the community service providers who work with them, indigenous women and girls often do not get the protection afforded by these polices. Women who call the police for help may find themselves blamed for the abuse, are at times shamed for alcohol or substance use, and risk arrest for actions taken in self-defense. Similarly, despite policies requiring active investigation of all reports of missing persons, some family members and service providers who had made calls to police to report missing persons said the police failed to promptly investigate the reports.

When they experience abuse at the hands of the police or when the police fail to provide adequate protection, women and girls have limited recourse. They can lodge a complaint with the Commission for Public Complaints against the RCMP, but the process is time consuming and the investigation of the complaint will likely fall to the RCMP itself or an external police force. Fear of retaliation from police runs high in the north, and the apparent lack of genuine accountability for police abuse adds to long-standing tensions between the police and indigenous communities. The title of this report "Those Who Take Us Away," is a literal translation of the word for police in Carrier, the language of a number of indigenous communities in northern BC.

The Independent Investigations Office (IIO), a recently established provincial mechanism for civilian investigation of police misconduct, offers some promise, but most complaints will fall outside the office's mandate, which is limited to incidents involving death or certain serious bodily injuries. The exclusion of rape and sexual abuse from this definition represents an unacceptable discriminatory omission on the part of the provincial legislature. It sends a loud message that assaults on women are not important.

Canada has strong legal protections around violence against women and the federal and provincial governments have made some attempts to address murders and disappearances of indigenous women through studies, task forces, and limited funding initiatives. However, the persistence of the violence indicates a need for deeper, coordinated interventions to address the systemic nature of the problem.

In northern British Columbia, a highway sign warns girls of the dangers of hitchhiking along the Highway of Tears.

At a community center in Prince George, BC, Georgia I. (a pseudonym) said that she was raped by a member of the Royal Canadian Mounted Police almost 40 years ago as a 16-year old returning home from a pizza parlor. "I'm looking at filing an application to the Attorney General about the rape. He [the perpetrator] is still on the force...how many other young girls has he hurt, as he hurt me?"

A photo hangs in Phoenix House, a women's crisis shelter in Prince George, British Columbia, honoring Celynn Cadieux. Cadieux, now deceased, spoke out against the child sexual exploitation she and others experienced by provincial court judge David Ramsay, who died in jail after pleading guilty in 2004 to sexual assault, breach of trust, and buying sex from a minor.

A swing set stands on the former grounds of the Lejac Residential School, one of the compulsory boarding schools for indigenous children that operated until 1976 and a site of reported sexual and physical abuse.

A woman from Haida Gwaii said police detained her as a child in Prince Rupert and then shipped her to Port Alberni residential school where she survived physical and sexual abuse. "The cops took me right off the streets ... I was walking home ... I always remember, it was 5 after 9.... The cops grabbed me, threw me in their car. Grabbed me by the hair, threw me into their cell, and I was in there for about three days, almost got raped by a couple of ladies.... This was in the 50s. I got shipped to Port Alberni then."

Mabel Jack holds up a photograph of her son and his family who have been missing since 1989. “I want everyone to know what happened to my family.... I still miss them. Some people—friends—they ask me how I am. I said, “I'm okay, but I'm not ... I hurt more than anybody else.”

Community members participate in a spirit healing walk in Burns Lake, British Columbia, in remembrance of missing and murdered women.

In Terrace, British Columbia, a woman discusses how police told her it was “too early” for them to do anything when she reported that her grandniece (whom she considers her granddaughter) had been missing for 14 hours. She said she told the police: “There are enough girls missing out there already, I want to know where my granddaughter is.”

A woman shows a paper she has kept displaying the photos of women, some of whom she knew, who disappeared from the downtown eastside of Vancouver, British Columbia, in the 1990s.

The memorial stone for the Downtown Eastside's missing and murdered women located in Crab Park, Vancouver. The stone reads: "The heart has its own memory, dedicated July 29 2007. In honor of the spirit of the people murdered in the Downtown Eastside. Many were women and many were Native aboriginal women. Many of these cases remain unsolved. All my relations."

RECOMMENDATIONS

TO THE GOVERNMENT OF CANADA

- **Establish a national commission of inquiry into the murders and disappearances of indigenous women and girls before the end of 2013; ensure the inquiry's terms of reference are developed with leadership from affected communities and that they include the examination of the current and historical relationship between the police and indigenous women and girls, including incidents of serious police misconduct, and the systemic socio-economic marginalization of indigenous women and girls that predispose them to high levels of violence;**
- **With leadership from indigenous communities, develop and implement a national action plan to address violence against indigenous women and girls that addresses the structural roots of the violence as well as the accountability and coordination of government bodies charged with preventing and responding to violence;**
- **Establish independent civilian investigations of reported incidents of serious police misconduct, including incidents of rape and other sexual assault, in all jurisdictions;**
- **Cooperate with the United Nations Committee on the Elimination of Discrimination against Women's inquiry into the issue of missing and murdered indigenous women and girls, including by granting permission for a site visit, and provide similar cooperation to other international human rights bodies that may seek to engage the government on these issues;**
- **Ratify the American Convention on Human Rights and the Inter-American Convention on the Prevention, Punishment, and Eradication of Violence Against Women (Convention of Belém do Pará).**

TO THE PROVINCIAL GOVERNMENT OF BRITISH COLUMBIA

- **Ensure that a public inquiry takes place into the violence experienced by indigenous women and girls in northern British Columbia. The inquiry could be part of a national commission of inquiry or a standalone inquiry for the province. The inquiry should include both the murders and disappearances of indigenous women and girls along Highway 16 and police abuse of indigenous women and girls. The inquiry's terms of reference should be defined in cooperation with indigenous communities, and adequate financial and victim supports for non-government community participation and interests should proportionately equal those provided for government and police;**
- **Expand the mandate of the Independent Investigations Office to include authority to investigate allegations of sexual assault by police;**
- **Provide adequate shelters and social services for victims of violence, including in rural areas and with specific culturally-sensitive services;**
- **Renew the commitment to implementing the recommendations of the 2006 Highway of Tears Symposium, updated, as necessary, in cooperation with northern indigenous communities;**
- **Expand non-incarceration options for publicly intoxicated individuals, including sobering centers where medical personnel can provide appropriate care.**

TO THE ROYAL CANADIAN MOUNTED POLICE

- **Collect and make publicly available (as ethically appropriate) accurate and comprehensive, disaggregated data that includes an ethnicity variable on violence against indigenous women and girls in cooperation with indigenous community organizations and the National Centre for Missing Persons and Unidentified Remains (NCMPUR); the development of NCMPUR should be part of a national RCMP strategy for the elimination of violence against indigenous women and girls that ensures consistency in data collection, immediate reporting, and access to information by police, coroners, and medical examiners;**
- **Expand training for police officers to counter racism and sexism in the treatment of indigenous women and girls in custody and to improve police response to violence against women and girls within indigenous communities; such training should be developed through collaboration between indigenous and human rights organizations, the Canadian Police College, and the Department of Public Safety Canada; and focus specifically on Canada's colonial history that has predisposed indigenous women to suffer from gross levels of violence and on human rights norms, including women's and girls' rights to live free from violence and discrimination and be treated with dignity and respect in custody;**
- **Ensure that properly trained officers are stationed at detachments in the north for a sufficient amount of time to develop strong relationships with the local community;**
- **Eliminate searches and monitoring of women and girls by male police officers in all but extraordinary circumstances and require documentation and supervisor and commander review of any such searches; prohibit cross-gender strip searches under any circumstances;**
- **Prohibit the use of conducted energy weapons (Tasers) on youth and re-examine the rules for the use of police dogs and pepper spray on youth with a view to limiting their use to extraordinary circumstances that are then documented and subject to supervisor and commander review; all RCMP and municipal police policies on conducted energy weapons, police dogs and pepper spray should be made publicly accessible;**
- **Enforce existing rules mandating that parents or guardians be contacted immediately in the case of their child's arrest and that youth not be detained in cells with adults or children of the opposite sex;**
- **Consider, in consultation with indigenous communities in northern British Columbia, changing the criteria for cases to be investigated by the E-PANA task force to include a greater number of the murders and disappearances of women in the north;**

- **Develop a timeline for NCMPUR to complete and implement specialized and standardized protocols for police response when indigenous women and girls are reported missing or found murdered; these protocols should be part of the national RCMP strategy and be made in cooperation with indigenous organizations; protocols should include:**
  - **Oversight and accountability mechanisms that track a police investigation of a missing or murdered indigenous woman or girl from the time such an incident is reported;**
  - **Clear, publicly available communication standards for informing family and the general community about the progress of an investigation as it proceeds, and what they can or are expected to do to contribute to an investigation during its different phases;**
  - **Goals to involve an Aboriginal liaison officer in all cases of missing and murdered indigenous women and girls to work with affected families and the police;**
  - **Goals to review police response to missing and murdered indigenous women and girl cases at regular intervals to compile and make public a report on best practices and lessons learned that can then contribute to more successful police investigations and community response in the future.**

TO THE UN HUMAN RIGHTS COUNCIL

- **Raise the issue of violence against indigenous women and girls in Canada as part of the United Nations Human Rights Council's Universal Periodic Review;**
- **Encourage Canada to launch a national inquiry into the murders and disappearances of indigenous women and girls.**

Methodology

Human Rights Watch undertook the research on which this report is based after Justice for Girls (JFG), a Vancouver-based organization advocating for the rights of girls in British Columbia, submitted a briefing paper to Human Rights Watch in November 2011 describing human rights violations against indigenous teen girls in northern British Columbia.[5] In collaboration with JFG, Human Rights Watch conducted five weeks of field research in British Columbia in July and August 2012, most of which was spent traversing Highway 16 from Prince George to Prince Rupert, and Highway 97 between Prince George and Williams Lake. The Carrier Sekani Tribal Council passed a resolution welcoming Human Rights Watch into the territory and supporting the research. Human Rights Watch attended the annual general meeting of the Carrier Sekani and spoke with community members about police treatment of girls and women, and the murders and disappearances along Highway 16.

In total Human Rights Watch conducted 87 interviews for this report. We spoke with 42 indigenous women and 8 indigenous girls,[6] ranging in age from 15 to late 60s, in the communities we visited. The interviews were arranged with the assistance and coordination of advocates, organizations, and local community members who connected us to individuals they believed to have information pertinent to police treatment of indigenous women and girls. Human Rights Watch also interviewed19 community service providers, including staff at domestic violence transition houses and homeless shelters, and youth outreach workers; community leaders; and family members of victims of violence or police mistreatment. In addition, we spoke with seven current and former officers of the "E" Division of the Royal Canadian Mounted Police (RCMP) in three interviews arranged through unofficial channels.

Human Rights Watch researchers were assisted by two indigenous leaders and women's rights experts: Mavis Erickson and Sharon McIvor. Erickson is an attorney, former Elected Tribal Chief of the Carrier Sekani Tribal Council (CSTC), and representative for the CSTC on

[5] Justice for Girls, "Human Rights Violations against Indigenous Teen Girls in Northern British Columbia," November 2011, on file with Human Rights Watch.

[6] The term "girls" in this report refers to female persons under 18 years of age, consistent with the definition of child under article 1 of the United Nations Convention on the Rights of the Child. The age of majority in British Columbia, however, is 19 (*Age of Majority Act*, RSBC 1996, c 7, s 1(1)).

issues related to missing and murdered indigenous women. She is a Nadleh Whut'en band member and a citizen of Nak'azdii near Fort St James. McIvor is an attorney, co-founder of the Canadian Feminist Alliance for International Action, and an instructor at the Nicola Valley Institute of Technology. She is a Lower Nicola Band member and brought a ground-breaking constitutional challenge to sex-discrimination in the Indian Act in *McIvor v. Canada*.[7]

The individual women, girls, and family members interviewed for this report were fully informed about the nature and purpose of our research and how we would use the information they provided. Human Rights Watch obtained verbal consent for each of the interviews. No incentives were provided to individuals in exchange for their interviews. The majority of the interviews were conducted in private with only the researcher and a single interviewee present, but in a number of cases interviewees chose to speak with family members or advocates present. Four of the interviews were conducted by phone; the rest were in-person. The interviews with individual women and girls were open-ended discussions of the experiences the women, girls, and family members had had with the police and what, if any, recommendations they had for improvements in policing. Care was taken to ensure that interviews about past traumatic events did not further traumatize interviewees, and where appropriate, Human Rights Watch offered interviewees referrals to local organizations providing counseling and other services.

In several towns we visited, women and girls who expressed interest in meeting and talking to Human Rights Watch later withdrew their request to be interviewed. They cited fear of exposure and potential retaliation from police as inhibiting factors. Community service providers noted that the fear of exposure is particularly acute in the small towns of the north where police and community members would be likely to identify a person by a few details of their story. Consequently, Human Rights Watch has not identified the precise

[7] In 2009, the BC Court of Appeal ruled in *McIvor v. Canada* that section 6 of the *Indian Act* was unconstitutional and discriminatory under section 15 of the *Canadian Charter of Rights and Freedoms*. *McIvor v. Canada* (*Registrar of Indian and Northern Affairs*), 2009 BCCA 153, http://www.courts.gov.bc.ca/jdb-txt/CA/09/01/2009BCCA0153err2.htm (accessed December 18, 2012). This litigation resulted in 2010-2011 court-ordered legislative reform process that has made 45,000 indigenous women and their descendants newly eligible for status registration. Notwithstanding this ground-breaking litigation victory, thousands more were left behind by the 2011 legislative amendments to the *Indian Act*. The case of *McIvor v. Canada* is the subject of an ongoing petition under the complaints protocol of the International Covenant on Civil and Political Rights. Sharon McIvor and Jacob Grismer, "Communication Submitted for Consideration under the first optional protocol to the International Covenant on Civil and Political Rights," November 24, 2010, http://povertyandhumanrights.org/wp-content/uploads/2011/08/McIvorApplicantsPetition1.pdf (accessed December 18, 2012).

location of interviews, and where necessary we have also redacted details from victim and witness accounts in order to reduce the risk that they will be identified. We have also used pseudonyms for all victims and family members interviewed. Nonetheless, certain accounts in this report that have previously received public attention may be recognizable, a possibility which was discussed with the women and girls involved as part of their full and informed consent to their participation in the research. The names of community service providers and others have also been withheld where their relationship with police would otherwise have prevented them from speaking freely.

Due to concern for the privacy and security of interviewees, Human Rights Watch did not inform the RCMP of our intention to conduct the research in advance or approach detachments for interviews during the field research. In September 2012, Human Rights Watch wrote to the RCMP to advise the national headquarters and the "E" Division in British Columbia of our research and to solicit the police force's input to a series of questions raised by the research. The RCMP responded in November 2012 with answers to our questions and associated policy documents. Human Rights Watch reviewed those materials and they have been taken into account in the report's analysis. Human Rights Watch did not include details of particular incidents in its letter on September 2012 due to the deep seated fear of retaliation on the part of victims if they were identifiable to those accused of perpetrating the abuses. Human Rights Watch is committed to pursuing the issues raised by this report with authorities and to addressing particular situations of concern with British Columbia's Independent Investigations Office (IIO) to the extent we are able to without compromising the safety and privacy of victims.

We have also communicated with the British Columbia (BC) Minister of Justice and Attorney General Shirley Bond and IIO Director Richard Rosenthal regarding the limitations of the mandate of the IIO.

Terminology

> Indigenous communities, peoples and nations are those which, having a historical continuity with pre-invasion and pre-colonial societies that developed on their territories, consider themselves distinct from other sectors of the societies now prevailing in those territories, or parts of them. They form at present non-dominant sectors of society and are determined to preserve, develop, and transmit to future generations their ancestral territories, their ethnic identity, as the basis of their continued existence as peoples in accordance with their own cultural patterns, social institutions, and legal systems.
>
> —Martinez Cobo, Special Rapporteur of the Sub-Commission on Prevention of Discrimination and Protection of Minorities, United Nations Commission on Human Rights[8]

This report primarily uses the term "indigenous" to refer to the women and girls interviewed for this report. We recognize, however, that other terms, such as "First Nations" and "Aboriginal" are commonly used in British Columbia and Canada. We also recognize that there are many unique identities and cultures within the indigenous communities of British Columbia which are not captured by a single term. We have chosen to use "indigenous" because it is the terminology used by the United Nations and applicable human rights standards.

In order to ensure accuracy, we have not changed the terms used by interviewees and in source material. For example, we refer to the number of Aboriginal women and girls in Canada, because that is the term used by Statistics Canada in the study cited. For ease of reference we include the following definitions of relevant terms, excerpted from a glossary provided by the government of Saskatchewan:[9]

---

[8] UN Commission on Human Rights, Report of the Special Rapporteur of the Sub-Commission on Prevention of Discrimination and Protection of Minorities, Martinez Cobo, Study of the Problem of Discrimination against Indigenous Populations, E/CN.4/Sub.2/1982/21/Add.8, September 30, 1983, Chapter XXI-XXII Conclusions, proposals and recommendations, para. 379.

[9] Human Rights Watch reviewed definitions in a number of glossaries, including the guide to terminology published by the "National Aboriginal Health Organization. Terminology Guidelines," http://www.naho.ca/publications/topics/terminology/ (accessed December 26, 2012). The Saskatchewan provincial government's glossary largely shares those definitions and has been excerpted because it was most suited to a concise glossary of key terms used in this report. Government of

Aboriginal: The term "Aboriginal" is appropriate when referring to matters that affect First Nations (Indian) and Métis peoples. The word is most appropriately used as an adjective (e.g., Aboriginal person).

Aboriginal Peoples: Section 35 of the Constitution Act, 1982 recognizes three groups of Aboriginal peoples -- Indians, Métis and Inuit peoples.

Band: As defined by the Indian Act, a Band is a body of Indians for whose common use and benefit lands have been set aside or monies held by the Government of Canada or declared by the Governor in Council to be a Band. Today, many Bands prefer to be known as First Nations.

First Nation(s): A term that came into common usage in the 1970s to replace the word "Indian". Although the term First Nation is widely used, no legal definition of it exists. The term has also been adopted to replace the word "Band" in the naming of communities.

Indian: The term "Indian" is narrowly defined by the Indian Act. Indian peoples are one of three groups of people recognized as one of Canada's Aboriginal peoples in the Constitution Act, 1982. There are three legal definitions that apply to Indians in Canada: Status Indians, Non-status Indians and Treaty Indians.

Inuit: An Aboriginal people in northern Canada, who live above the tree line in the Northwest Territories, and in Nunavut, Northern Quebec and Labrador.[10] The word means "people" in the Inuit language - Inuktitut. The singular of Inuit is Inuk.

Métis: The term refers to Aboriginal people of mixed First Nation and European ancestry who identify themselves as Métis people, as distinct from First Nations people, Inuit or non-Aboriginal people. The Métis have a unique culture that draws on their diverse ancestral origins, such as Scottish, French, Ojibway and Cree.

Saskatchewan First Nations and Métis Relations, "Aboriginal Community Glossary", 2012, http://www.fnmr.gov.sk.ca/community/glossary/ (accessed December 10, 2012).

[10] Human Rights Watch inserted Nunavut in the definition provided by the Government of Saskatchewan. Nunavut became a separate territory from the Northwest Territories in 1999. The Inuit are 84 percent of Nunavut's population. (Statistics Canada, "2006 Census: Aboriginal Peoples in Canada in 2006: Inuit, Métis and First Nations, 2006 Census: Inuit," April 2011, http://www12.statcan.ca/census-recensement/2006/as-sa/97-558/p6-eng.cfm (accessed January 30, 2012).)

Native: A term used to refer generally to Aboriginal peoples. The term "Aboriginal person" is preferred to "native."

Non-status Indian: An Indian person who is not registered as an Indian under the Indian Act. This may be because his or her ancestors were never registered, or because he or she lost Indian status under former provisions of the Indian Act. Bill C-31 in 1985 has restored Indian status to those who lost it through marriage.

Status Indian (Registered Indian): Refers to an Indian person who is registered (or entitled to be registered) under the Indian Act. The Act sets out the requirements for determining who is a status Indian.

Reserve: Land set aside by the federal government for the use and occupancy of an Indian group or Band. Legal title rests with the Crown in right of Canada.

Treaty Indian: A person affiliated with a First Nation that has signed, or whose ancestors signed, a treaty with the Crown and who now receives land rights and entitlements as prescribed in a treaty.

Map of British Columbia

I. Background

Violence against Indigenous Women and Girls in Canada

Indigenous women and girls are far more likely than other Canadian women and girls to experience violence and to die as a result. Between 1997 and 2000, the rate of homicide overall for Aboriginal women was 5.4 per 100,000, compared to 0.8 per 100,000 for non-Aboriginal women – almost seven times higher.[11] The Canadian government has acknowledged to the United Nations Committee on the Elimination of Discrimination against Women (CEDAW) that the rate of spousal violence against Aboriginal women and girls is more than three times higher than for other Canadian women and that Aboriginal women are eight times more likely to be a victim of spousal homicide.[12] In 2012, the United Nations Committee on the Rights of the Child (CRC) expressed concern about the levels of sexual exploitation of Aboriginal girls and the failure of authorities to fully investigate when those girls have gone missing or were murdered.[13]

The Native Women's Association of Canada (NWAC) collected data showing that nationally, between the 1960s and 2010, 582 Aboriginal women and girls went missing or were murdered in Canada.[14] Data collected as of March 31, 2010, indicate that two-thirds of the cases logged were murders; one-fifth were disappearances; and the remainder were suspicious deaths or unknown.[15] Some cases date back to the 1960s and 70s, but 39 percent occurred since 2000.[16] NWAC's data indicates that the majority of the victims were under the age of 31 and many were mothers.[17] According to NWAC's data, Aboriginal women are more likely to be killed by a stranger than non-Aboriginal women, and nearly

half of the murders are unsolved.[18] Amnesty International published a report on Canada's missing and murdered indigenous women in 2004 that, among other findings, concluded that "Despite assurances to the contrary, police in Canada have often failed to provide Indigenous women with an adequate standard of protection."[19]

The collection of data about the levels of violence against indigenous women is essential for developing an effective response to the violence, but in 2010 the government stopped funding NWAC's data initiative on the murders and disappearances of indigenous women. The government is funding related initiatives as part of the "Missing and Murdered Aboriginal Women strategy," as well as the NWAC "Evidence to Action" project, but it did not renew funding for the organization's statistical monitoring of cases of missing and murdered indigenous women and girls.[20] As a result, no comprehensive sex – and race – disaggregated data to track the numbers of missing and murdered indigenous women and girls since 2010 are available. The government contends that the responsibility for continued data collection will be assumed by the National Centre for Missing Persons and Unidentified Remains (NCMPUR) run by the Royal Canadian Mounted Police (RCMP).[21] The NCMPUR, according to the government, will include "one resource, linked to National Aboriginal Policing *S*ervices, to ensure a focus on the specific issue of missing Aboriginal

The "National Police Support Centre for Missing Persons" noted in the Status of Women Canada news release refers to NCMPUR. (Royal Canadian Mounted Police, "Canadian Police Centre for Missing and Exploited Children," February 23, 2012, http://www.rcmp-grc.gc.ca/cpcmec-ccpede/index-eng.htm (accessed January 30, 2013).) On January 31, 2013, the RCMP launched a website, www.canadasmissing.ca, to "engage the public in reporting tips and information related to ongoing cases." The new site contains a sampling of missing persons and unidentified remains cases from across Canada. (Royal Canadian Mounted Police, "RCMP Launches National Public Website for Missing Persons and Unidentified Remains," January 31, 2013, http://www.rcmp-grc.gc.ca/news-nouvelles/2013/01-31-ncmpur-cnpdrni-eng.htm (accessed February 4, 2013).)

persons."[22] However, there is currently no precedent for the standardized collection of ethnicity data by police forces in Canada.[23] Consequently, it is unclear going forward how the government and the public will have access to information comparable to what NWAC had provided about the number and circumstances of these cases.

While the Canadian government has issued statements and undertaken studies indicating that it appreciates the gravity of the situation, it has stopped short of establishing a public national inquiry into the murders and disappearances of indigenous girls and women or developing a national action plan to address the issue. [24] An inquiry into this issue could provide an opportunity to examine through public hearings the root causes of the violence against indigenous women and girls as well as the law enforcement response, with the full participation of the affected communities. The Assembly of First Nations, the Native Women's Association of Canada, and Canadian Feminist Alliance for International Action are among the many groups that have called for a national inquiry.[25]

Government studies have found that violence against indigenous women and girls is linked to broader, long-standing patterns of discrimination faced by indigenous women and girls

in British Columbia and in Canada at large.[26] Although a thorough discussion of these well documented patterns is beyond the scope of this report, it is important to note that the context in which indigenous women and girls are subjected to violence is one of structural discrimination linked to social and economic inequality, according to government and academic experts.[27] In 2006, 35 percent of Aboriginal women over 25 had not completed high school, compared with 20 percent for non-Aboriginal women.[28] When asked why she did not complete high school, nearly one in five women cited "pregnancy or to take care of children," according to the 2006 Aboriginal Peoples Survey.[29] Also in 2006, 8 percent of Aboriginal girls aged 15 to 19 were parents, compared to 1.3 percent of non-Aboriginal girls in the same age bracket.[30] In British Columbia, the Ministry of Children and Family Development reported that, while Aboriginal children constitute only 8 percent of the province's children, they were 52 percent of all children in government care in 2007-08.[31]

This inequality carries over into women's adult lives, from poverty to unemployment to housing insecurity. In 2005, 30 percent of Aboriginal women were considered low income, compared with 16 percent of non-Aboriginal women.[32] The unemployment rate was twice as high for Aboriginal women as non-Aboriginal women in 2006, and Aboriginal peoples

lost jobs at a higher rate than non-Aboriginal people during the 2008 economic downturn.[33] In 2006, 14 percent of First Nations women and girls lived in crowded homes, a rate more than three times higher than for their non-Aboriginal counterparts.[34] In addition, 28 percent of First Nations women and girls lived in homes in need of "major repairs," compared with 7 percent of non-Aboriginal women and girls.[35]

Residential Schools

The legacy of colonialism and the Canadian government's historical assimilation policy remain an open wound in the north, particularly the inter-generational effects of the so-called residential school system. The residential school system existed from the late 1880s to the 1990s in Canada, although some cite that residential schools existed in Canada as early as the 1830s.[36] Across Canada, approximately 150,000 children were removed from their families and communities and placed in schools where they were forbidden to speak their own languages or practice their culture.[37] Many were also subjected to physical and sexual abuse. In 1920, residential school attendance became compulsory, and the RCMP played a role in ensuring that indigenous children attended. As consequence, a report commissioned by the RCMP found, "The police were not perceived as a source for help but rather as an authority figure who takes members of the community away from the reserve or makes arrests for wrong-doing."[38]

In 2004, the RCMP issued an apology for the police force's part in the residential school system.[39] However, the history of the force's involvement looms large in the relationship between the RCMP and indigenous communities in the north. "My older brother still says that the RCMP is my enemy. They are still the enemy of my community when they come in," one interviewee, whose sister is among the missing and murdered, told Human Rights Watch.[40] In addition, residential school trauma often contributes to some social issues – such as dependence on alcohol or other substances and homelessness – that bring those involved into contact with the police. Beverly Jacobs and Andrea J. Williams write in their article on the links between residential schools and missing and murdered indigenous women and girls:

> Residential school attendance, particularly when accompanied by physical and sexual abuse, has been linked to problems of alcoholism, drug abuse, powerlessness, dependency, low self-esteem, suicide, prostitution, gambling, homelessness, sexual abuse, violence, and, as this paper argues, missing and murdered women. Some Survivors and/or their descendants have been in conflict with the legal system, including the criminal justice system and the child welfare system.[41]

Alcohol and substance use is a problem for indigenous communities in Canada, including in northern BC. Aboriginal youth are at two to six times greater risk for alcohol-related problems than non-Aboriginal youth, and the rate of death due to alcohol use in the Aboriginal population is double the rate in the general population.[42] Many of the police abuses documented in this report occurred in the context of the policing of public intoxication. While public intoxication can give rise to legitimate safety concerns, especially when children are involved, it is no justification for mistreatment of individuals

in custody. Furthermore while incarceration may not always be the most appropriate and effective way of dealing with the problem, in many parts of BC the authorities have failed to provide alternative remedies. A report by the British Columbia Civil Liberties Association (BCCLA) noted the lack of sobering centers in the north, finding that "the challenge for police of dealing with those who are drunk or high in public is a major issue across the north…. Police have become *de facto* medical practitioners across the north for people suffering from alcohol overdoses or acute drug intoxication."[43]

The Shadow of Past Abuses

Beyond the legacy of the residential school system, to understand the relationship between the RCMP and indigenous girls and women in northern British Colombia today, it is important to acknowledge the impact that several historical policing failures have had on the lives of indigenous women and girls.

Judge Ramsay and the legacy of sexual exploitation in Prince George

David Ramsay, a provincial court judge, pleaded guilty in 2004 to sexual assault causing bodily harm, obtaining sexual services from someone under 18 and breach of trust by a public officer.[44] The plea came after indigenous girls came forward to report that the judge had hired them for sex off the street when they were between ages 12 and 17, and had violently abused them in a number of incidents.[45] In one such incident, Ramsay rammed a girl's head into his car's dashboard, raped her, and then left her without her clothes in an outlying area, forcing her to hitchhike into town in the nude.[46] Ramsay later died in prison in 2008.[47] His crimes continue to cast a shadow over law enforcement in Prince George, in

part because of the unresolved questions about who else was involved or knew of the abuse. Allegations were made that as many as ten RCMP officers were involved in sexually exploiting and abusing the girls.

At age 13, Celynn Cadieux became one of Ramsay's victims. She died in April 2007 at the age of 22.[48] Her father Bob Sandbach told Human Rights Watch that police officers were involved in the sexual exploitation of his daughter:

> We were sitting in the car driving to Rock Creek, going to church, she was starting to cry. The only way I can explain it is if your child came to you and said the neighbor's kid took her favorite toy. She is sobbing – the sincerity in her body told me exactly what she said happened… For sexual favors [the police] would stop her on the road and put their hands down her pants saying they were searching her [for drugs] ... She was 18, 17.[49]

The RCMP investigated the allegations of police involvement in the sexual exploitation but only after delays.[50] An RCMP review board dismissed disciplinary action brought against an officer who was alleged to have paid a child $60 for oral sex and then struck her in the face when she insisted he use a condom.[51] The board dismissed the action because it was taken more than one year after the commanding officer became aware of the allegations.[52] Other officers were investigated but none were criminally charged in the matter.[53] Calls from indigenous community leaders for a formal inquiry into the Ramsay situation were not

heeded.[54] In the absence of a public review of the events, the community has little assurance that the guilty were held accountable.

Long after the Ramsay case came to light, reports continue to circulate in Prince George about connections linking the law enforcement and legal establishments with use of children in sex work and other forms of child sexual exploitation. An indigenous woman who had spent a lot of her youth in group homes for children in the custody of child welfare services told Human Rights Watch that four or five years ago she went with a girl from a group home to that girl's court appearance:

> My "sister" worked in the shacks [as a prostitute]. I was waiting for her for 45 minutes to say goodbye to people at the courthouse. I asked, "How do you know these people?" "They're my regulars," she said. Judges, lawyers, police… She killed herself a month before her 19th birthday.[55]

Earlier Incidents of Police Abuse

In the course of our research into the current relationship between police and indigenous communities in British Columbia, Human Rights Watch spoke to several women whose alleged experience of abuse at the hands of the police dated back decades, but who were still waiting for their cases to be taken seriously so they could see justice. The scarring of their experiences and determination to seek redress has not waned as the decades have passed. For example, Human Rights Watch interviewed Georgia I. who wants British Columbia's attorney general, in whose department the IIO is based, to provide justice for her rape almost 40 years ago:

> When I was 16 I was raped by a police officer and became pregnant. I got an abortion because otherwise I would have done it to myself with a coat hanger…. I was working for a police officer who had a pizza joint. Some of his young officers would come in to eat and one night one offered me a ride home. That was the first time he raped me. The second time he caught me. I didn't ask for a ride, but he got me…. I'm looking at filing an application to

[55] Human Rights Watch interview with Ashley G., British Columbia, July 2012.

> the Attorney General about the rape. He [the perpetrator] is still on the force … how many other young girls has he hurt, as he hurt me....[56]

Likewise in a series of incidents in 1990 and 1991, Elaine H. said she was harassed by one police officer and then by a second officer. She described the daily harassment of the first:

> At the time I was a single aboriginal woman from here. I was freshly divorced.... I hadn't dated in 11 years. I went out to a pub with a friend. A gentleman came up trying to be really cute and I said, "I'm sorry, I'm not ready to meet anyone. I'm not interested in male companionship." He was a police officer and he stalked me for a year and a half. He would park outside of my house or pull up next to my car. He'd pull me over anytime.... It got so bad I couldn't go to the grocery store because he'd park behind my car ... if I was at the bank, he'd park behind my car ... if I was at the video store ... anywhere my vehicle went ... this man would pull behind me … he phoned me on my birthday to tell me he was leaving town and to apologize for being a nuisance, as he would call it, I said ... a nuisance ... you stalked me, I became a mom who couldn't even come out of my house because I was too scared to come out....[57]

Elaine H. reported the stalking to the Commission for Public Complaints against the RCMP, but they were dismissive of her complaint and failed to take remedial action.[58]

Human Rights Watch researchers were struck when carrying out this research by the high levels of fear of police among the women interviewed, levels of fear that Human Rights Watch normally finds in communities in post-conflict or post-transition countries such as Iraq where security forces have played an integral role in state abuses and enforcement of authoritarian policies. The palpable fear of the police was accompanied with a notable matter of fact manner when mentioning mistreatment by police, reflecting a normalized expectation that if one was an indigenous woman or girl police mistreatment is to be anticipated.

Missing and Murdered Women in BC and the Highway of Tears

The Native Women's Association of Canada documented 160 cases of indigenous women and girls who went missing or were murdered in British Columbia between the 1960s and 2010, significantly more than any other province or territory in Canada.[59] The province also had the highest unsolved rate of murders of indigenous women and girls.[60] The 724-kilometer stretch of Highway 16 that runs through small rural towns between Prince George and Prince Rupert has come to be called the Highway of Tears, because of the murders and disappearances that have occurred in its vicinity. Since 1969, dozens of women and girls – perhaps more than 40 – have gone missing or been murdered in close proximity to three highways in northern and central BC (Highways 16, 97, and 5).[61] The RCMP includes 18 murders and disappearances in its roster of Highway of Tears cases.[62] However, indigenous community estimates have always been higher than the numbers maintained by the RCMP due, in large part, to the RCMP's requirement for the disappearance or murder to have happened within a mile of Highway 16, 97, or 5 to be included in its E-PANA project, a special task force formed to investigate unsolved cases related to the Highway of Tears. A 2006 report by several indigenous groups about the Highway of Tears referenced community activities in memory of 32 victims.[63] Later estimates have topped 40.[64] Media reports highlight the fact that a number of the victims were hitchhiking at the time of their disappearance, but circumstances in other cases have varied.[65] Indigenous women are

disproportionately represented among the missing and murdered. Of the 18 Highway of Tears victims identified by the RCMP, 10 are indigenous.

Investigations

Human Rights Watch did not conduct a case-by-case review of the Highway of Tears murders and disappearances. We interviewed family members of several victims and community members familiar with the cases (including some that are not on official Highway of Tears lists). We also reviewed media reports about the investigations of cases of missing and murdered indigenous women and girls in order to identify persistent problems in police response. Family members reported their experiences with the police, telling us that they felt the investigating officers were biased against the victims because they were indigenous women and girls. As indicated above, this distrust has roots in experiences of discrimination and neglect that stretch back decades. One woman whose sister was murdered in the late 1960s told Human Rights Watch that "[the police] assumed because she was Indian that she went out drunk and went out and asked for it. She had a tampon and they played it up that she used this for birth control.... Why not treat everyone's case the same way?"[66]

The sister of another young woman who went missing and was ultimately found murdered in the 1990s, said that discriminatory police assumptions misdirected the focus of the search:

> The police said, "Oh, she probably just needed a break from you guys. She probably just ran away." We tried to say that this was out of character, that she could leave any time she wanted and say where she was going. So they never believed us. They had my mom on this wild goose chase. She thought she was going to go to Vancouver because they put it into her head that she might be there. We would have looked local. That really threw things off, instead of looking in our own hometown where she was [found murdered].[67]

[67] Human Rights Watch interview with Patricia L., British Columbia, July 2012.

A number of interviewees pointed to the disappearance of Nicole Hoar in 2002 as a turning point in the Highway of Tears cases. Hoar, a white, 25-year-old tree planter, disappeared after setting out from Prince George in June 2002 with plans to hitchhike to visit her sister. She has never been found. Some community members, including a former police officer, point to Hoar's race as the reason her case garnered extensive media attention, and say that the police also expended more resources on her case.[68] Hoar's family has stood in solidarity with the indigenous families who have lost loved ones on the highway. Some community members were quite pointed in their assessment of discrimination in the effort and approach of the police to the missing women cases. As one RCMP member commented, "The native girls on the highway – I was up there. If they're natives, nobody gives a shit."[69] An elected official told Human Rights Watch, "We may need a particular inquiry about Highway 16 to look at whether we are resourcing that particular investigation appropriately. It took too long for people to connect the dots between the incidents of women going missing."[70]

The police have made some significant improvements in the investigations of these cases. In 2006, the RCMP established Project E-PANA with a dedicated team of investigators to look into cases involving women who went missing or were murdered within one mile of Highways 16, 97, or 5. The 18 cases they identified as meeting that criteria span 1969 to 2006.[71] The RCMP reports that since it started the project, it has investigated 1,413 persons of interest, collected 750 DNA samples, administered 100 polygraphs, and conducted 2,500 interviews.[72] In September 2012, the project announced a major breakthrough in their investigations. DNA evidence conclusively linked a US man, Bobby Jack Fowler, to the murder of 16-year-old Colleen MacMillen in 1974.[73] Fowler died in an Oregon prison in 2006,

after being sentenced to 16 years in prison in 1996 for attempted rape, assault, and kidnapping convictions.[74] He is considered a suspect in two other Highway of Tears cases, a person of interest in seven, and he has been excluded as a suspect in eight.

Accountability

> Unless we have accountability there will be no justice, no closure, no equality.
>
> —Family member of a Highway of Tears victim[75]

A provincial Missing Women Commission of Inquiry that concluded in November 2012 provided important, but insufficient, insight into some of the issues related to missing and murdered indigenous women and girls including the underlying factors that put them at risk and the shortcomings of the authorities' response. The inquiry was established in 2010 to look into the police response to the cases of missing and murdered women in the Downtown Eastside of Vancouver between January 1997 and February 2002 – many of whom were indigenous women, sex workers, and/or drug users – and to make recommendations to improve investigations of missing and murdered women.[76] In his final report, Commissioner Wally Oppal concluded that "the initiation and conduct of the missing and murdered women investigations were a blatant failure."[77] Among other policing problems, he pointed to poor report-taking and follow up on reports of missing women; failure to consider and properly pursue all investigative strategies; and failure of

[76] Missing Women's Commission of Inquiry, "Terms of Reference," 2012, http://www.missingwomeninquiry.ca/terms-of-reference/ (accessed December 18, 2012). Many of these murders and disappearances were ultimately linked to serial killer Robert Pickton. Pickton was convicted of six counts of second-degree murder in 2009 and is currently serving a life sentence. In August 2010, the crown stayed the remaining 20 charges of murder against him. Reports of women missing from the Downtown Eastside of Vancouver started in the early 1980s and yet the police did not have their first discussion of the possibility of a serial killer until 1991. Pickton was arrested in 1997 for an attempted murder, yet the charge was dropped in 1998. Part of the Missing Women Commission of Inquiry's brief was to examine why the 1997 charge was stayed. For additional information, see *R v. Pickton*, 2009 BCCA 299, http://www.courts.gov.bc.ca/jdb-txt/CA/09/02/2009BCCA0299cor1.htm (accessed December 18, 2012); Wally T. Oppal, QC, "Forsaken: The Report of the Missing Women Commission of Inquiry," Executive Summary, November 19, 2012, http://www.ag.gov.bc.ca/public_inquiries/index.htm (accessed December 18, 2012), pp. 4, 29-40.

internal review and external accountability mechanisms. The report identifies overarching reasons for these failures, including discrimination, system institutional bias, and political and public indifference.[78]

The commission included consultations in the north and a study based on those consultations, but the murders and disappearances in the north were not included as part of its formal mandate.[79] The commission's final report included a proposed "measure" that the government develop and implement an enhanced public transit system to provide a safer travel option connecting the Northern communities, particularly along Highway 16.[80] BC's Ministry of Transportation and Infrastructure has announced that it will be developing a targeted consultation plan to address this recommendation.[81] Nonetheless, the core findings of the commission, while illuminating, are specific to Vancouver's Downtown Eastside and do not necessarily translate to the rural north. As one family member of a Highway of Tears victim told Human Rights Watch, "The only thing I would like to see is a public inquiry into missing and murdered women in this area – Prince George to Prince Rupert specifically. There needs to be one specifically for the north. The dynamics are different and the demographics are different."[82]

The Missing Women Commission of Inquiry failed to ensure meaningful participation of indigenous and women's groups including the Native Women's Association of Canada. The commission floundered when many of the nongovernmental organizations (NGOs) granted standing in the inquiry were unable to partake due to the lack of provincial government funding for the legal representation the groups would have needed to participate in the public hearings and review the extensive documentation involved.[83] The majority of civil

society groups representing the interests of the missing and murdered indigenous women then refused to engage with the inquiry, citing concerns that the failure to involve the affected communities in determining the inquiry's terms of reference and the lack of representation for groups during the public hearings had made the process exclusionary and discriminatory.[84]

The resignation of Robyn Gervais, the inquiry's first appointed independent counsel for indigenous interests, over the lack of attention to indigenous communities' concerns – including the entrenched discrimination, poverty, and economic and social inequalities that contribute to indigenous women's exposure to violence – further undermined the inquiry's legitimacy.[85] Gervais told Human Rights Watch:

> We need a national inquiry that really looks at the issue of why are so many indigenous women going missing. We could hear strategies from different provinces, hear from First Nations around Canada about what will work in their communities. We could address the RCMP. Something like the truth and reconciliation commission around residential schools, in a format that would work for communities – meetings, not like a trial – to look at different needs of the communities. Transport and hitchhiking may be problems in one community but not in another.

Policing in British Columbia

Policing falls within the responsibilities of the provincial government. The province of British Columbia has chosen to contract policing in most areas to the Royal Canadian Mounted Police (RCMP), a national police force headquartered in Ottawa, Ontario. Eleven municipalities operate their own independent police departments, but in the rest of the province, where 70 percent of the population resides, the detachments of the British

Columbia "E" Division of the RCMP serve as the provincial police force.[86] In April 2012, the province renewed its contract with the RCMP for twenty years.[87] Human Rights Watch conducted the research for this report in areas policed by the RCMP.

The "E" Division has been heavily criticized for its policing practices by civil liberties advocates and others. The British Columbia Civil Liberties Association conducted a series of workshops in communities across northern and rural BC and released a report in 2011 identifying problems in policing, including poor treatment of aboriginal people, inadequate police accountability, inadequate holding cells in police facilities, and a lack of de-escalation skills among officers for resolving confrontations with members of the public with a minimum use of force.[88] Human Rights Watch saw evidence of the persistence of all these problems while researching this report.

A recent class action law suit brought by RCMP officers alleges gender-based discrimination and sexual harassment within the national police force, raising added concerns about discrimination within police operations. More than 200 current or former female RCMP officers have reportedly sought to join the suit.[89] Corporal Catherine Galliford, who had been a spokesperson for the RCMP in BC, has filed a separate suit alleging harassment over two decades that included groping, unwanted sexual advances, and a range of verbal and physical harassment from other officers.[90] The RCMP has denied her claims. [91] A recent survey of 426 RCMP members found that female members do not have confidence in the process for addressing sexual harassment, fearing retaliation and

lacking assurance that perpetrators will be held accountable.[92] A male indigenous police officer commented that he, too, was exposed to the misogynist attitudes of the police in BC: "They [other RCMP members] used to fax racist and sexist jokes around and wonder why I didn't laugh – I'm First Nations and I have sisters."[93]

Police Complaint Mechanisms

In British Columbia, three bodies with varying jurisdiction handle complaints of police misconduct. First, the provincial Office of the Police Complaint Commissioner addresses complaints against police officers belonging to members of municipal police forces.[94]

Second, the national Commission for Public Complaints against the RCMP (CPC) has jurisdiction over complaints against RCMP members. Since our research took place in areas policed by the RCMP, the CPC would be the option available to the women and girls interviewed for this report. The CPC's role is primarily to monitor the processing of complaints by the RCMP. The main investigative authority resides with the RCMP and the RCMP ultimately determines what remedial action will be taken. When a complaint is received, the RCMP arranges for an investigation according to its procedures (outlined below) and reports back to the complainant.[95] If the complainant is not satisfied, the CPC reviews the RCMP's report and if they find it unsatisfactory, they can investigate the complaint themselves, ask the RCMP to investigate further, hold a public hearing, or review the complaint without further investigation. After taking whichever step is chosen, the CPC prepares an interim report for the RCMP Commissioner who then informs the CPC what actions, if any, will be taken. That result is included in a final report by the CPC, which marks the end of the process.

See also *RCMP Act*, RSC 1985, c. R-10, http://laws-lois.justice.gc.ca/eng/acts/R-10/ (accessed December 13, 2012). Parts VI and VII of the *RCMP Act* detail the duties of the CPC.

In 2011, the provincial legislature created a third body to handle serious allegations of police misconduct, the Independent Investigations Office (IIO).[96] Civil society has hailed the establishment of the IIO as a major step forward in ensuring police accountability. The office became operational in September 2012 and is currently mandated to provide independent civilian "criminal investigations regarding police-related incidents involving death or serious harm."[97] Serious harm is defined by statute to mean "injury that (a) may result in death, (b) may cause serious disfigurement, or (c) may cause substantial loss or impairment of mobility of the body as a whole or of the function of any limb or organ."[98] Significantly, this definition does not provide the office with jurisdiction in most cases of police rape and other forms of sexual assault.

The Canadian authorities need urgently to address this omission if they are to ensure accountability for the worst cases of officer misconduct. The legislation creating the office provided for a potentially broader mandate, stating that reporting to the IIO would be required when a police officer "may have contravened a prescribed provision of the *Criminal Code* or a prescribed provision of another federal or provincial enactment."[99]

However, no regulation exists prescribing the particular provisions, which means that portion of the act is not operational. Minister of Justice and Attorney General Shirley Bond has indicated that the government "will wait until the IIO has been in operation for a sufficient period of time to assess its workload and capacity before deciding whether to expand the IIO's mandate through regulations. Prior to January 1, 2015, a special committee of the Legislative Assembly will review the general operations of the IIO and make recommendations as it sees appropriate."[100]

[100] Email communication from Shirley Bond, Minister of Justice and Attorney General of British Columbia, to Human Rights Watch, December 12, 2012.

The RCMP rules for the reporting and investigation of complaints of police misconduct recognize the jurisdiction of the IIO. The operations manual for "E" Division calls for reporting to the IIO in cases of a major police incident.[101] Where the IIO mandate does not apply or the office declines to investigate, the RCMP operations manual indicates that the preferred course of action is to have an external, non-RCMP police agency investigate.[102] In British Columbia, this could be one of the municipal police forces, or if there is no local force available, then an extra-provincial police force. If that is not possible, another RCMP division can be called in to investigate. In the event none of these resources are available, the independent external investigation will be delegated to the "appropriate 'E' Division resources."[103]

In June 2012, the government introduced legislation (Bill C-42) that would overhaul RCMP officer grievance and discipline procedures; revise the process for addressing sexual harassment complaints within the RCMP; and create a new Civilian Review and Complaints Commission to replace the Commission for Public Complaints Against the RCMP.[104] The new commission's procedures for investigations of serious incidents would largely follow the RCMP rules outlined above, in that the provinces would be given the opportunity to refer an investigation to their own independent bodies like the IIO, or else the RCMP would refer the investigation to an external police force or, as a last resort, investigate itself. The new commission would have the authority to appoint civilian observers to assess an investigation's impartiality if it were taken up by either the RCMP or an external police force.[105] The legislation is pending, and has been criticized by some for its failure to grant

II. Abusive Policing of Indigenous Women and Girls

The following chapter presents qualitative data about police abuse gathered by Human Rights Watch in 10 towns in northern British Columbia, from Prince George to Prince Rupert and as far south as Williams Lake. Human Rights Watch does not contend that this information proves a pattern of routine systematic abuse, but when such incidents take place in the context of an already deeply fractured relationship with the police they have a particularly harmful, negative impact. Some of the accounts of harm done to women and girls by police appear to be the result of poor policing tactics, over aggressive policing, and insensitivity to the welfare and vulnerability of the victims. Others however, such as the alleged sexual assaults of women by members of the police, are deliberate criminal acts and could only be perpetrated by the particular officers in the expectation that they will never have to answer for their crimes.

Obstacles to documenting police abuse include victims' fear of retaliation by police and fear of public exposure, particularly in small towns where victims who provide information may be easily identified. While the testimonies that Human Rights Watch gathered do not establish the prevalence of abuse, they do, together with other studies, raise serious concerns about police practices, police misconduct, and mistrust of police, all of which impact the safety of indigenous women and girls.

Indigenous Girls and Women in the Criminal Justice System

In British Columbia, as in Canada as a whole, disproportionate numbers of indigenous youth, and indigenous girls in particular, come into conflict with the criminal justice system.[107] According to Statistics Canada, in British Columbia Aboriginal girls, although 8 percent of the overall girl population,[108] make up 54 percent of girls held in pretrial custody, 50 percent of girls sentenced to custody, and 48 percent girls on probation.[109]

Victims of abuse, as well as community activists interviewed by Human Rights Watch, believe that RCMP officers bring a general presumption of criminality to their interactions with indigenous girls in the north.[110] Sometimes police appear to target indigenous girls and women for the most trivial of reasons. "I used to use eye make-up and put dots and hearts around my eyes with liquid eyeliner," said Sophie B., a young woman who was punched by an officer in 2011 when she was 17.[111] After filing a complaint about the assault, "they [the police] were telling me that I was gang-related because I had tattoos on my face."

Police insisted on handcuffing a 17-year-old girl, Cara D., when transporting her to the hospital for medical attention after her mother choked her and her grandmother broke her nose during a fight in late 2011. "The cops were calling me 'a little bitch.' …. They told me I had to be handcuffed in the back of the car… The ambulance attendant saw me and was saying to the cops to take the handcuffs off me," Cara told Human Rights Watch.[112] She summed up the approach taken by police. "You're just native scum. Cops still treat great some members of society, but if you're teenage, female and native . . ."[113]

Harriet J., a victim service provider in another town, observed that police routinely incarcerate indigenous girls for intoxication if they are found to have consumed alcohol and are in need of transportation home (a particular challenge in northern communities with almost no public transportation), while white girls in the same situation are likely to be driven home by the police.[114] While it is appropriate for police to intervene when children are intoxicated in public because they are in a vulnerable state, the insistence on incarceration with respect to indigenous girls appears to reflect a discriminatory approach.

[113] Ibid.

[114] Human Rights Watch interview with Harriet J., community service provider (#1), British Columbia, July 2012. The same difference in treatment was noted as happening with respect to adults by an indigenous woman whom police officers turned down a ride home and who later saw the same officers giving a ride to two young white women. Human Rights Watch interview with Cindy A., British Columbia, July 2012.

As indigenous girls grow into women, they remain under intense scrutiny from police. Government statistics from 2008 and 2009 show that 35 percent of women admitted to adult-sentenced custody identified as Aboriginal, even though Aboriginal women and men make up only 3 percent of the adult Canadian population.[115] In British Columbia, Aboriginal women account for more than 30 percent of all female admissions in 2008 and 2009, and yet only make up 4 percent of the general adult female population in the province.[116] In the small towns of the north, a woman's run-ins with the police as a girl, or even those of her older relatives, can set off a cycle of contact with the police. "We're a small community. When officers are new in town, they will take them around and show them which people are a problem. No one gets a fresh chance, even if you want to make a change," said one service provider.[117] An advocate in another town who works with women in prison noted, "Certain last names have been associated with crime for decades, so you're not presumed innocent by the RCMP."[118]

Stark as they are, the statistics on the disproportionate numbers of indigenous women in sentenced custody fail to capture the full extent of the problem. Not included in these numbers is the regular temporary detention of women in the "drunk tank" who are not charged. In community after community visited by Human Rights Watch, women, girls, advocates, and service providers reported that the police appeared to target indigenous people for public intoxication arrests. In some reported incidents, the police abused their discretion by detaining people who were not intoxicated.

One indigenous woman, Jennifer R., told Human Rights Watch:

> Three years ago we were coming home from fireworks. I was with my hubby [then boyfriend]. There were these cops picking on these native guys and

[115] At 35 percent, the disproportionate representation of Aboriginal women is greater than that of Aboriginal men who make up 23 percent of men admitted to adult sentence custody, according to Statistics Canada. Tina Mahony, "Women and the Criminal Justice System," February 24, 2012, http://www.statcan.gc.ca/pub/89-503-x/2010001/article/11416-eng.htm (accessed December 17, 2012).

[118] Human Rights Watch interview with community service provider (#16), British Columbia, July 2012.

girls and they were just throwing them around. They were yanking them around. One would go to walk away, saying, "I'm going home," and they'd pull her back. Another said, "Yeah, sure, I've had some drinks. I'm just trying to make my way home." The officers just talked over them… I've known [those girls] since I was a little girl. I know they are good girls…I felt for them. I know that they are fragile people.

I piped up – I should have listened to my boyfriend, but I knew them. I said, "Let me take them home with me. I'm sober, I don't do drugs." But they ended up taking me too. They held me to the next day (from 11:30 p.m. to 8am). It was cold. And I hadn't eaten and I was so hungry. Didn't give me any food. Just told me to shut up. Only thing she gave me was a cup for water. It just so happened to be me and my boyfriend's first date. Our first date and we went to the drunk tank and we weren't even drunk. They threatened to keep us over the weekend - said something about "fucking natives."[119]

Community service providers decried the reliance on jailing as a means of addressing public intoxication in communities plagued by high alcoholism rates linked to decades of trauma. "The former [head of the local police detachment] would just pick up intoxicated individuals and throw them in the drunk tank," said one provider who had seen the "drunk tank" become a revolving door. "What is going to happen down the road?"[120] The aggressive policing of public intoxication also breeds hostility and creates more occasions for outrage to boil over into violent confrontation. When survivors of the residential school system have interactions with police related to their alcohol use, those interactions may be particularly fraught given the abuse they have suffered by authorities.

Providers lamented that police did not have more knowledge of First Nations history, including residential schools, so that they could see individual behavior and current community problems in context. A lack of appreciation for the context was linked both to over-policing as well as to police misconduct. "When we talk about the RCMP and police brutality [against First Nations women], there is a lack of knowledge of the bigger picture,"

[119] Human Rights Watch interview with Jennifer R., British Columbia, July 2012.

[120] Human Rights Watch interview with community service provider (#1), British Columbia, July 2012.

said one social service provider in northern British Columbia working with the homeless and domestic violence survivors. "Why is she there? She's there because our system has failed her. She may be there just coping."[121]

Abusive Policing Tactics

Excessive Use of Force against Girls

Human Rights Watch documented eight incidents in which police physically assaulted or used questionable force against girls under the age of 18. In four of those cases, the girls themselves described the events to us; in the others, our information came from eye witnesses or from parents or service providers with knowledge of the events. The incidents occurred in seven different communities in the north, and four of the eight occurred in 2012. In two of the cases, the police injured girls who they had been called in to protect.

17-year-old girl assaulted by an officer in the back of a police car, 2011

Sophie B. reported to Human Rights Watch that she was walking through a field from a friend's house when she heard people screaming, and shortly after found herself being chased by gang members. Passing a woman on a balcony she asked her to call the police before she hid behind a fence. More than four police cars came, with at least two police officers in each car. "The cops came. They lifted me up and threw me to the ground… they put my arms behind my back and slammed me on the ground," Sophie said. Sophie's mother, Kathryn S., whom she had called earlier because of the gang, arrived at the area soon after. She told Human Rights Watch, "When I got there [Sophie] was laying down on the ground. I noticed she was in a panic attack. When she saw I was there, she calmed down. But the police officer wouldn't let me take her. That got her upset. They said she was violent because she was kicking around and intoxicated." The police officers then picked Sophie up and dragged her to the back of a police car.

Sophie told Human Rights Watch:

> I was yelling at them saying: "I was the one who called for help. Why are you guys chasing me?" And they didn't say anything else… They roughed me up. They handcuffed me and put me in the back of the police car and

[121] Human Rights Watch interview with community service provider (#4), British Columbia, July 2012.

> would not allow my mother to come see me… One of them came up and said [through the police car window], "Keep kicking and see what happens." … He punched me in the face more than six times. Half of his body was in the police car. Both my mom and sister saw him punch me. Then my mom came over and saw my face swollen up. I said, "Look what they did to me!" My mom said, "It's going to be okay."

But her mother was not sure it was all going to be okay. Following the beating Sophie endured while handcuffed in the back of the police car, the police took Sophie back to city cells for the night. "All that night I couldn't sleep wondering what was going to happen to her. I kept looking at the clock, counting the hours," she recalled. At city cells, male officers pulled the elastics out of Sophie's hair when they brought her in. She remembered that one said, "Stupid Indian," and that another laughed at her. The next day the family picked her up from jail and they went straight to the hospital. Young Sophie's face was swollen and there were cuts all over her gums and cheek from the impact of the punches hitting her face and shredding the inside of her mouth against the braces on her teeth. "I was walking around with a bandana over my face," she told Human Rights Watch. "It was pretty bad… My face was so bad that they let me go at my job at [a restaurant.]" [122] The family filed a complaint and the RCMP detachment initially retaliated by filing charges against Sophie B. for assaulting an officer. The charges were later dropped and, following an investigation by an external police force, the officer was charged with criminal assault. Those charges are currently pending.

A 15-year-old girl's arm broken by police officer during response to domestic violence call, 2012

> I will never forget that day. It's the worst thing I ever did. I wish I didn't call [the police].
>
> Lena G., British Columbia, July 2012

Lena G. called the police and asked for their help in the spring of 2012 when it seemed that an argument was out of control between her 15-year-old daughter, Emily G., and Emily's 22-year-old boyfriend who had a history of abusive behavior.[123] Police had previously been

[122] Human Rights Watch interview with Sophie B., British Columbia, July 2012.

[123] Human Rights Watch interview with Emily G. and Lena G., British Columbia, July 2012.

called regarding incidents in which Emily's adult boyfriend—the father of her infant daughter who had been committing statutory rape by having a sexual relationship with Emily—had strangled and assaulted her. On this occasion, Lena told the operator that her daughter had said that she would rather die than live in her mother's house, but Lena specifically told the operator that she believed this was a teenage expression of frustration rather than a genuine indication of suicidal feeling. By the time the police responded to the call, the argument had settled down, and Emily and her boyfriend were sitting on opposite sides of the room. Emily described how the situation escalated:

> One of the cops saw me and asked what was happening. I said it had calmed down. I was calm. The cop asked if I was taking anything. I guess he saw [my baby's] medicine on the ground. After [telling him no], I told him that I'm really mad, angry, and stuff and I needed to go for a walk. I went to get my purse and he told me to get my jacket so he could bring me outside. He said he was going to take me to mental health. I told him in a raised voice that I didn't need a jacket. I guess I raised my voice.
>
> The officer who had been talking to [my boyfriend], Constable [Name], told me to calm down. He stopped me by stepping front of me. He was holding the curtain open between the part of the room where I was and where [my boyfriend] was. He had his finger in my face in front of my eyes. I was yelling and telling him to fuck off. He just barely touched my face and I pushed it away. I barely moved his finger. He grabbed my arm and pushed me up against the wall. He pulled my arm way back and pushed it so I was up on my tip toes and that was when my arm broke… He let go and the cuffed arm fell with the cuff and then I felt all the pain. I yelled, "What did you do to my arm?" three times. He handed the cuff over to the other cop and he held it while we walked out.

After some discussion among the officers, an ambulance was called to take Emily to the hospital where an x-ray showed that her arm was broken. Later she had to travel with her family to another city for surgery on her arm. "When we left every single bump on the road was like killing me," Emily said.

Although Emily and Lena reported that police made no mention of concern for her mental state at the hospital, the RCMP subsequently told the press that the officers responded to a suicidal teenager and arrested her under the Mental Health Act as well as for assaulting an officer. An external police investigation into the incident is underway.

A 12-year-old girl injured in attack by police dog, 2012

Police arrested Mary H. after an incident in May 2012 in which she reportedly sprayed someone with bear mace at a fair. Her mother, Rachel H., who was present during Mary's police interview, told Human Rights Watch about the incidents surrounding the arrest, during which Mary was wounded by a police dog:

> I'm a mother of five. She's my youngest. She's had some trouble – run-ins with the police over the last year or two [for theft, mischief, non-violent offenses] ... She just turned 13, she was 12 at the time…With this incident, it seems that the police knew who they were looking for – they knew she was 12. They had to have talked to the people she allegedly assaulted, [who] knew her older sister… The officers knew that the bear mace had been used on the victims. She said she had thrown it away when she was running.
>
> She fled the scene and was hiding. She saw the cops with the dogs coming. She shouted, "I'm only 12 years old." The cops didn't give her an opportunity to give herself up. They didn't warn her that they were going to let the dog loose. The compound she was in was behind a locked fence. They had to use a bolt cutter. She was hiding inside a wooden box. She saw a handler with a ball cap. The dog jumped into the box. The officer looked into the box. The box fell over. The dog was on top of her and started to attack her leg… The photos show punctures from the dog's teeth. Her leg was so swollen. It was more than just a dog bite, it was an attack… She couldn't walk or even hop because of the pressure … She had to stay on the couch for a week and had to go to the hospital to have the bandages changed… the scars are going to be there (on her upper left leg) forever.[124]

[124] Human Rights Watch interview with Rachel H., British Columbia, August 2012.

According to Rachel, the police failed to immediately inform her that her daughter had been arrested, as required by law. After arresting Mary at about 11:30 p.m., the police transported her to the hospital where she requested the officers call her mother. They did not call her mother until she was transported to the jail around 2 a.m.

Investigators from a municipal police department – not part of the RCMP – are currently investigating the use of force in this case. Under RCMP use of force policy, police dogs are considered intermediate force. There are no restrictions on the use of police dogs with youth, despite calls from advocacy groups for the police to prohibit their use with children or severely restrict their use to situations presenting a threat of death or grievous bodily harm.[125] While the Vancouver Police Department has released information on police dog incidents involving youth, the RCMP has refused requests from advocacy groups to provide such statistics.[126]

Additional Cases

In addition to the incidents described above, Human Rights Watch learned of other cases of the use of force against girls. They include:

- In April 2012 police officers detaining a 13-year-old, applied the handcuffs "so tight it was peeling the skin off her hand," according to a witness. [127]
- In July 2012 police hit Grace F., a slight 16-year-old, on the back of the head and on both of her legs with a baton, after she and a friend had a verbal confrontation with a couple of officers.[128]
- In 2010, police pepper sprayed the then 14-year-old Hayley A. after a verbal confrontation with officers escalated. Hayley A. had yelled at police officers from the back of a car that had been pulled over during a traffic stop.[129] After they

pepper sprayed her in response, Hayley A said, "I couldn't breathe and I couldn't open my eyes." [130]

Use of Tasers

Police use of Tasers[131] – electroshock weapons, frequently referred to as conducted energy weapons – which are considered firearms pursuant to regulations under the *Criminal Code* of Canada, in response to low level threats has drawn substantial criticism in recent years. Public Safety Canada guidelines state that use of a conducted energy weapon on a young child should be avoided.[132] However, the Commission for Public Complaints against the RCMP has documented extensive police use of Tasers on teenagers, with 194 recorded uses on youth aged 13 to 17 between 2002 and 2009. [133] In 2009, 8.3 percent of reports of the use of conducted energy weapons involved female youths.[134] The analysis did not disaggregate by ethnicity.

In 2007, a constable deployed a 50,000-volt Taser for a full 5-second cycle on a handcuffed 15-year-old girl at a facility for young offenders in Inuvik, Northwest Territories.[135] In 2009 the Commission for Public Complaints against the RCMP deemed the action unreasonable and found that it reflected a continuing "need for the RCMP to clarify to its members and to the public when it is permissible to deploy the Taser. It is clear that confusion in this area continues to reign."[136]

Following an investigation into the death of man Tasered at Vancouver International Airport in 2007, the RCMP reported that, among other steps, it was emphasizing de-escalation in training and that its April 2010 policy on conducted energy weapons clarified

[132] Public Safety Canada, "Guidelines for the Use of Conducted Energy Weapons," October 15, 2010, http://www.publicsafety.gc.ca/prg/le/gucew-ldrai-eng.aspx (accessed October 23, 2012).

[133] Commission for Public Complaints Against the RCMP, "RCMP Use of the Conducted Energy Weapon (CEW): January 1, 2009 to December 31, 2009," June 24, 2010, http://www.cpc-cpp.gc.ca/cnt/tpsp-tmrs/cew-ai/cew-ai-10-eng.aspx (accessed December 17, 2012).

[134] Ibid.

[135] Commission for Public Complaints Against the RCMP, "RCMP Taser use on handcuffed 15-year-old female not justified," December 11, 2009, http://www.cpc-cpp.gc.ca/cnt/nrm/nr/2009/20091211-eng.aspx (accessed October 22, 2012).

[136] Ibid.

they may only be used in situations in which a subject is causing bodily harm or when it is reasonably believed the subject will cause bodily harm imminently.[137]

Despite this a representative of an advocacy group who facilitated a meeting among indigenous girls, ages 12 to 15, reported that two of the girls said they had been Tasered in separate incidents between 2009 and 2011 when each was about 12.[138]

---

[137] Commission for Public Complaints Against the RCMP, "Chair's Final Report After Commissioner's Notice – In-custody death of Mr. Robert Dziekanski, October 14, 2007, involving the use of a conducted energy weapon at the Vancouver International Airport," February 10, 2011, http://www.cpc-cpp.gc.ca/cnt/decision/pii-eip/dziekanski/facn-faac-eng.aspx (accessed October 23, 2012). See also, "Operational Manual – Conducted Energy Weapon," Royal Canadian Mounted Police, April 29, 2010, http://www.rcmp-grc.gc.ca/ccaps-spcca/cew-ai/operations-17-7-eng.htm (accessed October 23, 2012). The change came in response to the Tasering of Robert Dziekanski, a man who was acting erratically in the international arrivals section of Vancouver International Airport, after what the Commission for Public Complaints described as "a very brief encounter." Shortly after he was Tasered, the man died in custody. The Commission concluded that the Taser was deployed prematurely and without appreciation for its nature as a weapon "[b]ecause the RCMP positions the CEW as an intermediate weapon and trains its members that it is appropriate to use the CEW in response to low levels of threat because it is a relatively less harmful means of controlling a subject…" (Commission for Public Complaints Against the RCMP, Chair's Final Report After Commissioner's Notice – In-custody death of Mr. Robert Dziekanski, October 14, 2007, involving the use of a conducted energy weapon at the Vancouver International Airport, February 10, 2011, http://www.cpc-cpp.gc.ca/prr/rep/rev/chair-pre/dziekanski/facn-faac-eng.aspx (accessed October 23, 2012).) A provincial commission of inquiry also found that the use of force was unjustified. (Braidwood Commission of Inquiry, "Use of Taser on Robert Dziekanski not justified, says commissioner Thomas Braidwood," June 18, 2010, http://www.braidwoodinquiry.ca/whats_new/press_release_10-06-18.pdf#zoom=100 (accessed October 23, 2012).) The Braidwood Commission of Inquiry into the use of conducted energy weapons in British Columbia also concluded in 2009 that the threshold for use be revised from "active resistance" to the much higher standard of "causing bodily harm." Although this recommendation was made at the end of the first phase of the Braidwood Commission's Inquiry, which was supposed to exclude the RCMP, the Commissioner said that it would be incongruous for the recommendation not to apply in most of the province which is policed by the RCMP. (Braidwood Commission, "Commissioner's comments on phase one report of Braidwood Inquiry into Taser use in British Columbia," July 23, 2009, http://www.braidwoodinquiry.ca/whats_new/press_release_09-07-23.pdf#zoom=100 (accessed October 23, 2012).) In May 2012, the Legislative Assembly of British Columbia formed a special committee to monitor the implementation of the recommendations from the Braidwood Commission's phase one report (Legislative Assembly of British Columbia, "Special Committee to Inquire into the Use of Conducted Energy Weapons and to Audit Selected Police Complaints," Terms of Reference, December 3, 2012, https://www.leg.bc.ca/cmt/39thparl/session-4/rpa/5-39-4-41-2.htm (accessed October 23, 2012)). In addition, in April 2011, RCMP officers in Prince George, British Columbia, used a Taser on an 11-year-old indigenous boy after an altercation at a group home resulted in the stabbing of an adult employee. An investigation by an external police department found the officers acted appropriately, but no further details about the incident have been disclosed. The Commission of Public Complaints Against the RCMP and British Columbia's Representative for Children and Youth are conducting separate investigations into the incident. "RCMP Taser Case: No Charges For Using Device On 11-Year-Old B.C. Boy," *The Canadian Press*, September 15, 2011, http://www.huffingtonpost.ca/2011/09/15/no-charges-for-using-rcmp-taser-bc-boy_n_965098.html (accessed October 23, 2012).

[138] Human Rights Watch telephone interview with advocacy group representative, October 18, 2012.

Cross-Gender Searches

Human rights standards state that body searches by government authorities or medical personnel should only be conducted by persons of the same sex.[139] However, RCMP policy allows for male officers to search women and girls if another officer is present. "It's a hiccup in policy," said one community advocate for indigenous youth to whom indigenous girls have reported being touched inappropriately by police. "A number of female youth will tell you about being searched by male officers…. girls will say some officers searched them differently."[140]

Human Rights Watch interviews confirm that cross-gender searches take place, although it is unclear whether this is due to female staffing shortages or if the absence of female guards is used as a pretext in some situations.[141] In either case, reports of irregular, inappropriate searches of women by male officers point to the need to correct this policy "hiccup."

Police picked up Jan K. during an altercation in 2010 and took her to the "drunk tank." She told Human Rights Watch that at the police station two male cops took her to a room that appeared to be a janitor's closet where there were no cameras visible. They told her to remove her clothes except for undergarments. Afterwards they gave back the clothes but said she could either have her sweater or a t-shirt but not both.[142]

Conditions in City Cells

In interviews with Human Rights Watch, women and girls raised a number of issues related to conditions in city cells. Women detained in city cells for public intoxication reported being held for extended periods without food,[143] kept in cold temperatures without

[143] Human Rights Watch interview with Nancy M., British Columbia, July 2012 (reported being held for 19.5 hours without food). Others also reported extended periods without food. Human Rights Watch interview with Jan K., British Columbia, July 2012, and Jennifer R., British Columbia, July 2012.

blankets,[144] and released in the middle of the night, sometimes into arctic temperatures, inadequately clothed and in grave danger of hypothermia and frost bite.[145]

Community service providers said that women transferred to city cells for trial, among whom indigenous women are disproportionately represented, can be held four to five days without access to washing facilities. "That's a lot of abuse, especially when they're on their cycle [menstruating]," said one provider. "[They] wear the same clothes that length of time so they are not ready to go to court to defend themselves…You're a mess when you go into court and they're in the same cells as the drunk tank so you could get into a fight with a drunk and then you have more charges."[146]

Fights in city cells take place and women reported a failure on the part of guards to intervene.[147]:

> One night a week ago I ended up in the drunk tank... This lady attacked me in the same cell. There were three of us. She was talking something about her boyfriend and must have thought I said something and came and attacked me. She grabbed me by my hair and pounded me against the cement and I stopped her and then she kicked me and started dragging me around by my hair. And they didn't do anything. They have cameras there. The night guard didn't even come to see what was going on. It was loud. There was screaming... I yelled for help. Guess no cops were there and the night guard never did a thing.[148]

Women reported that they were placed in the cells after suffering injuries and were not provided with medical attention. Anna T. was "jumped" in May 2012 and knocked unconscious with a beer bottle. When the police responded, they took her to the city cells rather than the hospital. She told Human Rights Watch:

[148] Human Rights Watch interview with Naomi F., British Columbia, July 2012.

> I woke up in cells, I'm covered in blood... A cop came over and said, "[Anna], you've been assaulted. We don't know what happened. You got verbal with one of the officers so we detained you." They let me out at 5 a.m. and said, "We'll give you a ride to the hospital." They let me out the door and then just shut it. I waited five minutes and no one came. My nose was broken. I had two black eyes. My hair was balled up in blood… If you have an injured woman, take her to the hospital.

Sexual and Physical Abuse by Police

Rape and Sexual Assault

In 5 of the 10 towns Human Rights Watch visited in the north, we heard allegations of rape or sexual assault by police officers. Human Rights Watch was struck by the level of fear on the part of women we met to talk about sexual abuse inflicted by police officers. Even though Human Rights Watch conducted outreach to women and girls through trusted service providers with long histories of working in these communities, on several occasions, women who initially expressed interest in talking with Human Rights Watch about their experiences of police sexual abuse later declined to speak or did not appear for interviews. Fear of retaliation, a frequent reason why women and girls do not report police abuse in general, is compounded by fear of stigma and feelings of shame in cases of sexual abuse. As a consequence, it was very difficult to gather first-hand testimony to support the allegations we heard.

However, in one town, Human Rights Watch met Gabriella P., a homeless woman, who reported that in July 2012 she had been taken to a remote location outside of the town and raped by four police officers whose names she knew but would not provide. "I feel so dirty," Gabriella said through tears, the first time she spoke with Human Rights Watch. "They threatened that if I told anybody they would take me out to the mountains and kill me and make it look like an accident."[149] Gabriella said that she had been raped by police in similar circumstances on previous occasions. Human Rights Watch was able to find and photograph the remote location, which is inaccessible by public transportation, that Gabriella described. In a brief second meeting with her almost a week later, Gabriella reviewed the photographs and reacted with visible fear and distress. Pointing to details in

[149] Human Rights Watch interview with Gabriella P., British Columbia, August 2012.

the photographs, she further explained that the officers had made her stand with her hands against the side of a building while she was being raped. Human Rights Watch is not publishing the photos or further details in order to protect her identity.

In addition, in the second meeting, Gabriella said that she had been raped by police again two days earlier in a different location outside of town and that the officers had taken her underwear after she was assaulted. Human Rights Watch was unable to ask for further details about this rape because Gabriella abruptly ended the conversation out of fear of being seen talking to the Human Rights Watch researcher.

A community worker in the town said that she keeps packages of underwear for women living on the streets because other women have reported to her that they have been sexually assaulted by police and had their underwear confiscated. These allegations are deeply disturbing and demand action. Respecting Gabriella's wishes that an individual complaint to authorities not be made on her behalf, Human Rights Watch coordinated with a community worker to ensure that Gabriella had housing through friends and family that would limit her risk of further abuse. However, the lack of faith that victims have in the safety and effectiveness of current complaint processes, coupled with the exclusion of rape and sexual assault from the mandate of the new BC Independent Investigations Office, leaves victims of egregious abuse without a place to turn. As it stands, it also limits the options that human rights groups have to take these matters to the authorities, including in situations that raise concerns about ongoing abuse. Due to victims' fears of retaliation, Human Rights Watch did not alert authorities to the details of these allegations. Human Right Watch strongly urges an independent civilian-led investigation of these allegations with the aim of achieving criminal accountability for the alleged crimes. Human Rights Watch would eagerly cooperate with such an investigation to the extent we are able to without compromising the safety and privacy of victims.

Another allegation of police rape and sexual assault involving multiple officers is in the public record. A civil suit filed in August 2012 alleges that in the city of Prince George in August 2010, members of the RCMP took a woman they had arrested to a basement where they physical and sexually abused her. The civil complaint alleges that in the basement of a private house, the woman was:

i) Forcibly confined in the basement against her will;
ii) Repeatedly struck, punched, and kicked while verbally denigrated and threatened with the death and disappearance from her family;
iii) Forcibly stripped to a state of nakedness, sexually assaulted and sodomised.[150]

After the officers allegedly drugged her and doused her with alcohol, the complaint states that the woman was taken to the Prince George RCMP detachment where she was "forcibly strip searched without purpose, legal justification and contrary to the procedural standards, if any, in force at the time of the search."[151] The civil suit follows an RCMP investigation and subsequent inquiry by the Vancouver Police which found the woman's report of abuse in the basement to be unfounded.[152] The search, however, was deemed to be in breach of RCMP protocol.

Human Rights Watch was also told of indigenous women and girls being sexually abused in city cells after passing out due to intoxication. In 2007, when Hannah J. was 25, police put her in city cells when she was intoxicated. She woke up to find herself naked from the waist down:

I remember [two male officers] putting me in the cells and I passed out. I woke up with my pants and panties off. I asked the lady guard if I could look at the cameras. She asked why. She didn't let me look at the tape…. My pants were in the cell beside me. My panties weren't there… I felt funny, wet down there [pointing to between her legs]. I just went home and cried... Why did this happen to me? Why didn't they just leave me on the street?[153]

Hannah said that she felt too ashamed do file a complaint or even seek medical attention.[154] Similar circumstances were described by secondary sources, involving victims whom Human Rights Watch was unable to interview. We present that information for context. We received a secondary report from a woman whose friend told her that she had

[154] Ibid.

awoken in police holding cells in 2012 to find herself being sexually assaulted by a police officer.[155]

A representative of an advocacy organization recounted a similar incident in another town reported by a young woman who had been between 13 and 15 years old when it happened to her between 2006 and 2008. The young woman said that it had happened when she had been brought to the cells while she was intoxicated. She described attempting to pull down her shirt to cover herself after regaining consciousness to find that she had nothing on her bottom half and was being watched by a male guard.[156]

Physical Abuse of Women

Human Rights Watch received 15 reports of police physically mistreating women in cells and on the street in the communities we visited in the north. The reports ranged from routine rough handling during arrest to an outright beating in cells. Abuse and mistreatment occurred at all stages of the women's interaction with the police, including when they were arrested, while they were in custody and upon their release. Eleven women told us directly about physical abuse and additional information was taken from eye witnesses and community service providers.

Abuse During Arrest

Women interviewed by Human Rights Watch reported varying levels of physical abuse when police took them into custody. Jan K., arrested in 2010, was thrown into the police wagon after she was handcuffed, smashing her legs against the bottom of the wagon, resulting in bruises all over her legs, wrists, and elbows.[157] Nancy M. showed us white scars on her wrist where handcuffs were fastened so tightly, they had broken the skin months earlier. She had asked the police to be careful because her collar bone was broken, but they pulled her arm back anyway and would not take her to obtain medical attention when she complained of pain.[158] Melinda B. was walking home from a bar in 2012 when two police officers called her over to their patrol car. She said she would be happy if they would offer her a ride home but they told her "the only ride you're getting is to the drunk

tank."[159] When she refused to go with them, the officers wrestled her to the ground with such force that they tore a ligament, causing her to lose three weeks of work and experience pain more than six months later.[160] Social service workers in one city praised the local police but said that women transferred from other detachments reported being punched, kicked, and having their hair pulled in custody by police.[161]

Service providers who hear the complaints of mistreatment are concerned about the issue of abuse during arrest, but sometimes need to turn to the police for assistance. "People come in often and share that they were pushed around in the drunk tank, or, 'that officer he hits me.' It happens often enough that it's become a normalized thing that women experience,"[162] said one homeless shelter staffer. Another staffer said that police officers kicked indigenous people found passed out on the streets in order to get them up. "There's nothing that gets done. It's an old boys club. [We] had a person picked up here and they were all nice and professional coming in, but then you see them being put in the car . . ."[163] In another town, a shelter worker had to call the police in mid-2012 because an intoxicated woman was threatening to beat her up. In the process of removing the petite woman, the police officer crushed her throat, injuring her. "I had to watch her being assaulted and the whole point [of calling the police] was to make everyone safe," the staffer told Human Rights Watch.[164]

Rough treatment during arrest at times results in injuries beyond bruises. In 2006, an ex-boyfriend of Dina A. called the police and on his own admission falsely accused her of being violent towards him. Officers arrived on the reserve, found Dina, took her into custody but did not tell her why. "A cop handcuffed one wrist and banged it against the bun wagon… [He] put me in handcuffs and put me in the back and took me to the station." They kept her at the station for 8 to 12 hours, a portion of which was spent with a woman who "was shouting and violent and enraged." They refused Dina's requests to be separated from the woman, as well as her request that they take her to the hospital for an x-ray. "I had to walk up there myself after I was released (about a kilometer walk). The x-ray

showed that the smaller bone was broken and the bigger bone was fractured. I had to have a cast for eight weeks."[165] When Dina complained, the police took eight months to investigate and concluded that the other woman in the cell had broken her wrist, even though Dina told them the woman had not touched her.

Abuse While in Custody

Women also reported aggressive treatment after the arrest, during the process of being searched and physically placed into holding cells. Joy I. described how her experience in 2011 went beyond a routine search:

> I was in a fight and getting beat up. [The police] picked me up. They tore my sweater off and jeans off in the holding cell. There were three or four of them – men – a female guard was watching. I tried to sit up and they pepper sprayed me twice. They kept pushing me down and tearing my clothes off. I was all dressed up before I went in there. They ripped off my jeans and put them in a bag.

She was left without her jeans, but with her underwear, that night. They released her the next morning without charges, and did not allow her to put her jeans back on. "The next day I had to walk back to my brother's like that – no pants; clothes in bag." [166]

In Anna T.'s case, the police told her that they were going to beat her before putting her in cells in early 2012. Anna had called the police because a friend was being beaten by her boyfriend. Intoxicated and angry because the police had failed to come out on another occasion, Anna spit on one of the officers when the police arrived. They took her into custody and brought her to the police holding cells. Anna explained to Human Rights Watch what happened:

> "Here's your choice, [Anna], you either get charged with assaulting an officer or you take the beating," [said one of the officers.] Stupid me I said, "I'll take the beating." She grabbed me, slammed me up on the wall and I hit my head. Then she slammed me on the ground. A male cop drove his

knee into my back while she stripped earrings out of my ears and elastics out of my hair. “Have you had enough?” “Yes, I’ve had enough. I’m sorry.”[167]

[167] Human Rights Watch interview with Anna T., British Columbia, July 2012.

III. Police Failures to Protect Indigenous Women and Girls

Women and Girls' Lack of Confidence in Police Protection

> What would they do to me if I need to call the cops? Police officers – you're supposed to look up to them. I needed help and they didn't help me. We've been having gang people come to our house. Who do we call? It's just pretty sad. We've got nobody to go to for help.
>
> —Sophie B., who was assaulted by a police officer when he responded to a distress call

Police abuse undermines women and girls' safety far beyond the direct physical consequences of any physical mistreatment. The impact is felt in the reticence of indigenous women and girls to call the police for help when they fear or have experienced violence. The problem is not limited to those who have experienced police abuse directly. According to a youth service provider, addressing the exploitation of girls by other youth in co-ed programs run by some organizations has been challenging because the girls do not trust the RCMP enough to report.[168] The possibility of abuse in cells also inhibits some community members from turning to the police when they see youth in a compromised position. One woman whose sister was raped by a police officer decades ago and who since has received periodic reports of police rape from others told Human Rights Watch:

> Every time we see drunk kids stumbling around the streets it's hard to know whether to let them stay on the street vulnerable to what can happen on the street or to call the RCMP, given my brother's and my sister's experiences. I remember all the things that have happened. What do you do? Leave them vulnerable to perverts on the street or call the RCMP and risk that they could be abused sexually or physically?[169]

[168] Human Rights Watch interview with community service provider (#13), British Columbia, July 2012.

[169] Human Rights Watch interview with Penelope N., British Columbia, July 2012.

Police Response to Disappearances and Murders

The E-PANA task force on the unsolved Highway of Tears cases is an important step forward. However, it does not on its own ensure that all cases of missing and murdered women in the north are handled with due diligence. As noted, some estimates put the number of cases of missing and murdered women along Highway 16 at more than 40, more than double the number taken up by E-PANA.[170] In addition, the task force does not reach cases that are mishandled at the point they are reported. A leader in the indigenous community with a law enforcement background told Human Rights Watch that he reported a 14-year-old girl missing from a group home in late 2011.[171] He said the officer taking the report initially reacted by asking: "Why are you calling us about this? What do you expect us to do?" The officer apologized after learning about his position in the community, and took steps to look for the girl, who was ultimately found safe. However, the leader was left concerned about how others without his standing in the community were treated.

This concern was echoed by others. According to a community provider of services to domestic violence survivors, the reaction of the police to missing person reports depends on the officer and whether the missing person is a repeat criminal offender or known to the criminal justice system.[172] The community service provider told Human Rights Watch about reporting a woman missing in 2011 who had previous contact with the criminal justice system:

> We reported a young aboriginal woman missing this past fall and it took three weeks before they even started to look for her. The police officer called and asked questions about her after three weeks. There was no explanation of why he'd taken that long. But all of a sudden he needed this and this. I thought: "Why am I doing your job for you?"[173]

[170] Linda Locke, QC, Missing Women Commission of Inquiry, "Standing Together and Moving Forward: Report on the Pre-Hearing Conference in Prince George and the Northern Community Forums," p. 8.

[171] Human Rights Watch interview with community leader, British Columbia, July 2012.

[172] Human Rights Watch interview with community service provider (#16), British Columbia, July 2012.

[173] Ibid.

RCMP policy states that people reporting a missing person should never be told they must wait a certain amount of time.[174] However, Rose L. told Human Rights Watch that in 2010 her sister's 16-year-old granddaughter (whom she considered and referred to as her granddaughter) went missing.[175] "She had a drug problem and was on probation. I called [the police] to find out where she was after she was missing for 14 hours and the police wouldn't do anything because it was too early." She later found out that her granddaughter had been in jail, having been arrested for allegedly beating up a man who witnesses said had attempted to sexually assault her.

For families whose loved ones have gone missing or been murdered, detailed information about the investigation's developments is critical. For the police, updating the families is important for maintaining their trust and cooperation. At the same time, releasing certain details could jeopardize the investigation. Human Rights Watch's interviews suggest that the RCMP still needs to find the right balance.[176] "One of the things they need to do is to explain what the investigative process is rather than just saying 'We're investigating,'" said one family member. "We need to be told point by point. Otherwise we don't understand and just feel like nothing is happening."[177]

Police Response to Domestic Violence and Sexual Assault

Domestic violence survivors and community organizations in northern British Columbia reported to Human Rights Watch that calls to the police by indigenous women and girls seeking help with violence are frequently met with skepticism and victim-blaming questions and comments, and that police often arrest victims of abuse for actions taken in self-defense. While these problems occur in many communities, service providers emphasized that indigenous women and girls are especially likely to be treated as blame-

[174] RCMP "E" Division Operational Manual, Chapter 37.3. Missing Persons, sec. 1.4: "Under no circumstances will a complainant be advised that he or she must wait a specific period of time before a report of a missing person can be made" (no emphasis added); the manual further reiterates that a missing person investigation must involve "a diligent early response" (sec. 37.3.1.2.1.), "the early and efficient gathering of witness accounts/leads/information/facts" (sec. 37.3.1.2.2."), and "no delays in collecting required information/facts" (sec. 37.3.1.2.3.). Missing children are considered high risk (sec. 37.3.1.3.1.) and high risk missing persons cases should "especially" be given prompt and thorough attention (sec. 37.3.1.3.).

[175] Human Rights Watch interview with Rose L., British Columbia, July 2012.

[176] Human Rights Watch interviews with Peter M., British Columbia, July 2012, and Patrice L., British Columbia, July 2012.

[177] Human Rights Watch interview with Patrice L., British Columbia, July 2012.

worthy by police.[178] This treatment was evident in the response of the police to Lena G.'s call regarding the dispute between her 15-year-old daughter and her abusive adult boyfriend, discussed above, which resulted in the police handcuffing and breaking her daughter's arm.[179]

The RCMP Operations Manual instructs officers responding to Violence in Relationships (VIR) calls to identify the primary aggressor and states that dual arrests should be rare.[180] In determining who the primary aggressor was, officers are supposed to consider the history of the relationship, among other factors, and to keep in mind that "An allegation of mutual aggression is often raised by the Primary Aggressor as a defense with respect to an assault against a partner."[181] Human Rights Watch learned of several incidents indicating that police fail to implement this instruction consistently. One service provider told Human Rights Watch that she had seen a number of indigenous women charged as first-time offenders because they defended themselves in the context of domestic abuse, including a woman who had recently been arrested after police found bite marks on her abuser's arm that she had left in attempt to free herself from a chokehold.[182] Service providers in different communities in the north said that police in general tend to side with the person who calls the police, and that abusers will manipulate that to their advantage.[183] "The man's the first one to the phone and she's arrested even when there is physical evidence of abuse," said one provider.

Several service providers told Human Rights Watch that RCMP officers responded dismissively to calls from indigenous women out of apparent frustration with seeing women remain in violent relationships.[184] They complained that the abuse was taken less seriously when the police had responded repeatedly to a particular household, and that officers lacked an appreciation for the financial and other barriers that make it difficult for women to leave abusive men.

When women reporting violence have been using alcohol or drugs, getting the police to take their complaints seriously can be even more difficult. "Police still have the attitude: 'All he did was punch her,' and with Aboriginal women: 'Were you drinking? Using?'" said one community service provider.[185] Amy N. told Human Rights Watch that she had called the police for help with an abusive partner on two separate occasions in different towns during the years that she was in active addiction. She said both times the police were more interested in the drugs than the abuse.[186] On the second occasion in 2006, a police officer told her, "You're pretty much asking for it when you're high on that stuff." Amy N. concluded that "They're always going to ask if you're under the influence and once that information was available, I was treated much differently."[187] Dina A., from another town, was injured in an automobile accident deliberately caused by her cousin's boyfriend. When she went to the police to complain about her cousin's boyfriend's actions, the police dismissed her on the basis that she had been drinking prior to the incident:

> [My sister and I] got into my cousin's vehicle [which she was driving] – she was begging me to go for a ride. My cousin's boyfriend was there and he said to her, "Hey, you know how we were talking about suicide? Why don't we do it now with these two bitches in the car?" I buckled my sister's seatbelt in fast... He reached over and grabbed the wheel and turned us into the ditch… [After the crash,] my sister dragged me out of the vehicle. We went to the house of people we know and called a cab and went to the hospital. I was in and out of consciousness for 4 to 5 hours. I had a head injury – 24 stitches on the side of the head. I lost so much blood. They had to give me two and a half pints of blood...
>
> The next day I went to the police to report in the morning. There were three cops standing there. I said I'm here to give my report about the accident I was in last night because when [the police] came to the hospital they only asked about who was driving and whose vehicle it was. The police officer was just like, "You guys were intoxicated." They didn't even want to listen to me.[188]

Indigenous women and girls who survive sexual assault may face similar challenges to accessing effective protection from sexual violence. An elected official in the north said that in his location there is a general sense that cases of sexual abuse are a low priority for the RCMP detachment and that he has heard from community members on a nearby reservation that there is not a seriousness or timeliness to investigations into sexual abuse. He said that it may be a workload issue, and that cases could be de-prioritized because they take a lot of time to investigate and then may be dropped if the victim decides not to pursue it further.[189] According to victim advocates, the low priority placed on these cases acts as a disincentive to reporting for women, who believe their cases will not be taken seriously.[190]

When investigations do occur, victim-blaming by police officers is a problem. One service provider told Human Rights Watch:

> I had a woman about two years ago who decided to report to the RCMP – very rare. I have worked with many women sexually assaulted and only a handful go forward with charges. She was made to feel that she was to blame. "Why had you been drinking with him?" I had to work triple time to work through her natural feelings of guilt… You have a system of authority that puts the blame on the victim.[191]

Cara D., a 17-year-old victim of attempted rape in 2012, reported the crime to the police and became the subject of scrutiny. After an initial visit by a female officer who took pictures of bruises on her leg and arm, Cara received a succession of visits from male officers questioning her story:

> The cops came to the house to talk about it at all hours… earlier than 6 a.m.... Different cops, same questions. They were all male and you could tell they didn't believe me. They acted like they wanted to leave. "Are you lying to us?" They basically said I might have to do a lie detector test, but it didn't happen. They took [the perpetrator] in for questioning and he refused

[189] Human Rights Watch telephone interview with Bob Simpson, Independent Member of the Legislative Assembly of British Columbia (MLA) for Cariboo North, July 2012.

[191] Human Rights Watch interview with community service provider (#4), British Columbia, July 2012.

> to make a statement. They let him go. There was a two-month investigation and they dropped all the charges. The guy had charges of sexual assault before but it was still not enough for them to not drop the charges… What was I supposed to do – let him rape me so you would have evidence?[192]

The man who attacked Cara was originally charged with attempted rape but the charges were later dropped and temporary restrictions which had been imposed on his movements were lifted. However no one told Cara. "I found out that he got off because I saw him out," she said.

Anna T. was a prominent member of her community before the abuse by her white ex-husband climaxed in a rage one night in 2009. She told Human Rights Watch about her near escape and the police failure to gather key evidence:

We were walking home from the bar and we walked past my street. I got this bad feeling. I said to my friend, "Something's wrong. I need to go to my house." I got to the door and opened the lock. My ex was high on crack. "What are you doing? Where are the kids?" I asked. I had found him and a friend in the smoke room. Crack was on the table. I kicked out the friend. Me and my husband went upstairs and got into an argument about why he had disappeared for a week. He grabbed me by the neck and threw me up against a wall. He said: "The only reason I was gone for a week is because I wanted to kill you and the kids." He was choking me and I was slapping him. He dragged me by my hair toward the bedroom. We were weapons collectors. We had bows and swords all around the house. He grabbed a weapon and said, "You're not going to get out of this room. You're going to die tonight." He stumbled and I was able to get away. I was running down the street and he was chasing me all the way to my neighbor's house. There we called police. They said to stay inside. I said I was worried about the kids. "I'm afraid he's going to kill the kids because he's going back to the house," I said. Six cop cars came because of his criminal record. When cops got into the house they found that the kids were okay. Cops took him away and tried to charge him with assault…

Six to eight months later the charges against Anna's ex-husband had to be reduced because there was insufficient evidence of the attempt on her life. Anna faults the police for the reduced charge because they never interviewed the neighbor who helped her escape that night. With the reduced charge, her ex-husband's only punishment was a year probation. The limited accountability he faced for the attempt on her life has had ongoing implications. In coping with the trauma of the assault and seeing him set free, Anna turned to drugs and alcohol. Her substance use was a factor in her ex-husband getting primary custody of their daughter. He continues to behave violently, including choking a 14-year-old daughter from another marriage.

[192] Human Rights Watch interview with Cara D. and Lisa E., British Columbia, July 2012.

IV. Inadequate Complaint and Oversight Procedures

As noted in the background section of this report, most complaints of police misconduct are investigated by police themselves. RCMP policy calls for complaints of misconduct to be investigated by an independent provincial body or, failing that, an external non-RCMP police department. If neither of those is available, another RCMP detachment will investigate, or as a last resort, the detachment at issue will conduct an internal investigation.

Although a civilian complaints commission monitors the processing of public complaints against the RCMP and external police teams investigate the more serious allegations, the practice only provides an independent civilian accountability mechanism for a small portion of the complaints of police misconduct. Some hope that British Columbia's new civilian Independent Investigations Office will end impunity for police abuses in the province. But, as discussed, the limitations of the office's mandate mean that it holds little promise of justice for victims of sexual assault. Recourse for many complaints will be limited to the existing complaint mechanisms.

Five women and girls we interviewed filed complaints about RCMP officer misconduct, including physical assault and sexual harassment. Two of the complaints were being investigated by external, non-RCMP police forces at the time of the interview. Responses to the other complaints raise concerns about all the different types of investigative mechanisms. Dina A., whose wrist was broken by an officer during her arrest in 2006, made a complaint that was investigated by the local detachment. The investigation took more than eight months and the detachment did not question any witnesses at the scene of the arrest, instead blaming another woman held in city cells that night.[193]

Investigation by an outside RCMP detachment does not guarantee independence. Two RCMP officers who had experience investigating complaints against members in other detachments said that the process was hardly impartial. One remembered being told to go up to a particular northern town and "investigate this Tasering that didn't happen."[194] The

[193]Human Rights Watch interview with Dina A., British Columbia, July 2012.

[194] Human Rights Watch group interview with five RCMP officers, British Columbia, August 2012.

other said that he wrote up reports of investigations that were returned for revision when they did not reflect the outcome desired by his supervisors.[195]

As noted above, in Sophie B.'s case, an officer was eventually put on trial for assault following an investigation by an external police department. However, before that happened the detachment to which the officer belonged launched its own investigation and laid assault charges against the girl who had filed the complaint.[196] The charges were later dropped.

Many of those we interviewed did not file a complaint. Fear of retaliation obstructs access to complaint mechanisms, particularly for women and girls who live in small communities, are homeless, or have had multiple contacts with the criminal justice system. "I never filed a complaint," said Anna T. who was beaten by two officers in city cells, "because I'm well known and if you go back in its probably going to be worse."[197] Another woman who reported a serious sexual assault by police officers said the officers threatened to kill her if she told anyone.[198] She has chosen not to make any complaints against them.

Individuals interviewed by Human Rights Watch expressed skepticism about the independence and effectiveness of complaint processes through the RCMP itself and of the Commission for Public Complaints against the RCMP. An indigenous community leader anxious to see the Independent Investigations Office get up and running remarked of the RCMP complaint process, "How far is that going to get?"[199] The mother of a girl assaulted by a police officer told another officer standing by at the incident that she planned to complain and received the response: "You're Aboriginal, what is anyone going to do?"[200] Another woman said she told her friends about her experience waking up in a jail cell without her underwear in order to warn them. But she did not complain to the police because "they'll just lie for each other."[201] Service providers told us they informed their

[201] Human Rights Watch interview with Hannah J., British Columbia, July 2012.

clients about the complaint mechanisms but rarely, if ever, saw their clients use the mechanisms. One told Human Rights Watch:

> I have not seen the complaint process go forward. We have suggested that to people before. People don't trust that. Where's that going to go? There's great mistrust in that. No feeling of safety in doing that. When you don't have that sense of safety, I wouldn't want to come forward and complain. Who do you go to then?[202]

Elaine H. told Human Rights Watch that her local police told her to take her complaint about the officer who was stalking her to the Commission for Public Complaints against the RCMP:

> Well, there really aren't any systems in place because I phoned the police department, who then said, sorry this is happening to you, you need to call the police complaints center, so I called them and wrote several letters… On the phone the woman asked for a description. "Well I'm five feet eight inches, 130 pounds, I've got dark hair. I'm told I'm pretty attractive." The response was: "No wonder why this is happening."[203]

A year and a half later the officer was transferred, but it was not clear whether her complaint had triggered the transfer. Shortly after that, a second police officer began harassing her but she did not bother to make a complaint because after the response to the earlier situation "it seemed pointless to make a complaint."[204]

Human Rights Watch asked the RCMP how many complaints of police misconduct relating to interaction with indigenous women and girls had been lodged over the past five years. The RCMP responded that it "does not collect race data for purposes outside the legitimate police mandate" and that "Asking a victim or accused person to self identify may give rise to human rights and privacy concerns."[205] Although a requirement that complainants

provide information on their ethnicity would certainly be problematic, giving them the option of doing so would open up the possibility of tracking whether police interaction with certain groups has generated a disproportionate number of complaints. Notably, the Canadian government failed to provide complete information in response to a request from the Committee on the Rights of the Child (CRC) for the number of reported cases of abuse and maltreatment of children occurring during their arrest and detention.[206]

Video cameras comprise another component of RCMP oversight of police officer activity in detachment cells. Closed circuit video equipment monitoring (CCVE) is a part of British Columbia Provincial Policing Standards and the RCMP has stated its commitment to ensuring that all facilities achieve compliance by the effective date of January 30, 2015.[207] CCVE monitoring has been important for corroborating victims' accounts of abuse in some cases. However, it is not a complete solution. As RCMP officers who spoke with Human Rights Watch noted, there are always blind spots known to officers and there can be events like power outages that result in the loss of recordings.[208]

[208] Human Rights Watch group interview with five RCMP officers, British Columbia, August 2012.

V. Canada's Obligations under International Law

Canada's international treaty obligations require that the government take measures to prevent and address with due diligence violence against indigenous women and girls. They must also ensure that police do not treat individuals in violation of the prohibition on inhuman and degrading treatment, but treat them with respect and dignity in a non-discriminatory manner. United Nations human rights treaty monitoring bodies – including those committees addressing children's rights violations, torture, discrimination against women, and civil and political rights violations – have criticized Canada for the inadequate government response to violence against indigenous women and girls.[209] The United Nations Committee on the Elimination of Discrimination against Women (CEDAW) has gone even further and taken the exceptional step of announcing an inquiry with respect to disappearances and murders of indigenous women and girls.[210]

The Responsibility to Address Violence against Women and Girls

Among their most basic human rights, women and girls have the right to bodily integrity, to security of person, and to freedom from torture and cruel, inhuman, or degrading treatment. These rights are enshrined in the Universal Declaration of Human Rights (UDHR), the International Covenant on Civil and Political Rights (ICCPR), acceded to by Canada in 1976,

and the Convention against Torture, ratified by Canada in 1987.[211] In addition, violence against women constitutes a form of discrimination, triggering government responsibilities under the Convention on the Elimination of All Forms of Discrimination against Women, ratified by Canada in 1981.[212] By agreeing to these international treaties, Canada assumed a positive obligation to address violence against women. Whether the violence is perpetrated by the government authorities or by others, international law requires that Canada exercise due diligence to prevent, investigate, prosecute, and punish acts of violence against women.[213] Canada has also assumed the obligation to take appropriate measures to protect children from physical or mental violence while in the care of their parents, guardians, or any other person.[214]

Determining whether Canada has exercised due diligence in this context requires assessing the government's performance of a number of duties. Chief among these is the duty to investigate cases of violence against women and girls. An effective investigation, according to international human rights tribunal case law, is one capable of leading to the identification and punishment of those responsible.[215] Police omission of basic steps like interviewing key witnesses or following up on tips limits the effectiveness of an investigation. International standards also apply to how authorities should treat victims and their families in the course of investigations. The Inter-American Commission on Human Rights (IACHR) has commented on the need for those involved to have access to information about the progress of an investigation[216] and to be treated with respect by authorities. [217] Young victims and witnesses are due particular attention and support appropriate to their age to avoid further trauma.[218] Victim-blaming in particular can alienate people from the justice system and deprive them of redress for violence. [219] The UN special rapporteur on violence against women recommends training of law enforcement personnel to sensitize them to the needs of women as one component of due diligence.[220]

Holding police officers to account for demonstrating that sensitivity and following through with effective investigations constitutes another complementary piece.[221]

Effective and conscientiously conducted investigations serve a broader preventative function as well. They may not only prevent future crimes by the specific perpetrator, they signal to the community that violence against women and girls will not be tolerated. In contrast, police apathy in cases involving violence against women and girls – or violence against certain groups of women and girls – sends a message that such behavior is accepted and will carry no consequence for perpetrators.[222] It may, in effect, encourage the targeting of certain groups for violence. For this reason, in evaluation after evaluation of Canada's human rights record, expert bodies have called on Canada to fully investigate the murders and disappearances of indigenous women and girls, and to examine the reasons that full, transparent, and accountable investigations did not proceed from the outset.[223] Project E-Pana, an investigation into the Highway of Tears cases, and the Missing Women's Commission of Inquiry in British Columbia represent important efforts to heed those calls. However, there remains a clear need for a broader examination of police handling of

violence against indigenous women and girls that provides for the meaningful participation of indigenous communities in identifying past failures and searching for solutions.

For these and all efforts aimed at addressing violence against women and girls, accurate data on the scope of the problem is essential. [224] Collecting comprehensive data on violence against women and girls is a key part of the government's due diligence obligation. [225] The Committee on the Elimination of Discrimination against Women commended Canada for funding the NWAC Sisters in Spirit data Initiative, which tracked cases of missing and murdered indigenous women across Canada. However, as detailed in the background section of this report, funding for that data initiative has since ended and it is not clear that data collection by the police will adequately track the specific number of murders and disappearances of indigenous women. The absence of race-disaggregated data will obscure the racial dimensions of the violence and inhibit efforts to identify discrimination in efforts to prevent and respond to violence.

Broader prevention efforts are also required that address domestic and sexual violence. The Declaration on the Elimination of Violence Against Women calls on governments to "[d]evelop, in a comprehensive way, preventative approaches and all those measures of a legal, political, administrative and cultural nature that promote the protection of women against any form of violence, and ensure that the re-victimization of women does not occur because of laws insensitive to gender considerations, enforcement practices or other interventions."[226] The Canadian government has made some efforts in this regard but has yet to develop a national action plan to address the high levels of violence against indigenous women and girls.

The Responsibility to Protect the Rights of Persons in Custody

Women and girls taken into custody by the RCMP do not lose their fundamental rights. The International Covenant on Civil and Political Rights (ICCPR) provides that "all persons deprived of their liberty shall be treated with humanity and with respect for the inherent dignity of the human person."[227] The Human Rights Committee, which oversees the implementation of the ICCPR, has explained that governments have a positive obligation to see that individuals in custody suffer no "hardship or constraint other than that resulting from the deprivation of liberty; respect for the dignity of such persons must be guaranteed under the same conditions as for that of free persons. Persons deprived of their liberty enjoy all of the rights set forth in the Covenant, subject to the restrictions that are unavoidable in a closed environment."[228] Police brutality and risk of custodial sexual abuse, in addition to constituting criminal acts under Canadian law, violate those rights and in some cases may constitute torture or cruel, inhuman, or degrading treatment prohibited under the Convention against Torture.[229]

In addition to addressing the absolute prohibition on rape and sexual assault of persons in detention, international human rights bodies have specifically addressed the subject of body searches in custody. The Human Rights Committee has determined that preserving prisoners' rights to privacy necessitates that body searches by government authorities or medical personnel should only be conducted by persons of the same sex.[230] Under the UN

Standard Minimum Rules for the Treatment of Prisoners, women prisoners are to "be attended and supervised only by women officers."[231] The Committee on the Elimination of Discrimination against Women has called on Canada to "discontinue the practice of employing male guards as front-line staff in women's institutions" and to "ensure that girls are not held in mixed-sex youth prisons or detention centres."[232] Although this report concerns searches in holding cells and on the streets, rather than long-term imprisonment, the privacy concerns in these contexts are similar.

Specific protections apply to children in custody. As a preliminary matter, children should be deprived of their liberty only as a last resort.[233] According to the Committee on the Rights of the Child, "respect for the dignity of the child requires that all forms of violence in the treatment of children in conflict with the law must be prohibited and prevented"[234] and protection from violence must "extend to their contacts with police officers, as well as to custodial institutions and any other place of detention…"[235] The committee recently expressed concern that law enforcement in Canada lacked understanding and training on the Convention on the Rights of the Child.[236] When girls are taken into custody, international standards require that authorities provide for their specific protection needs, including protection from physical, sexual, and emotional abuse and exploitation.[237]

Women and girls who feel that their rights have been violated while in government custody should have recourse to an effective complaint mechanism. The Convention against Torture provides that an individual alleging torture must have the "right to complain to, and to have his case promptly and impartially examined by, its competent authorities" and be protected against retaliation.[238] Under the ICCPR, individuals whose civil and political rights have been violated have a right to an effective remedy "notwithstanding that the violation has been committed by persons acting in an official capacity."[239] Further, principles developed by the United Nations regarding use of force, state that "Persons affected by the use of force and firearms or their legal representatives shall have access to an independent process, including a judicial process."[240]

The Responsibility to Address Discrimination

The disproportionate rates of violence against indigenous women and girls, as well as the socio-economic indicators and historical context that predispose those same women and girls to be at an increased risk for police abuse, call for an examination of the government's fulfillment of its duties to address discrimination.

Canada is party to a number of treaties that prohibit discrimination on the basis of race and sex, among other protected categories. The International Convention on the Elimination of Racial Discrimination, ratified by Canada in 1970, requires states to prohibit and eliminate racial discrimination and to guarantee equality before the law, particularly with regard to the "right to security of person and protection by the State against violence or bodily harm, whether inflicted by government officials or by any individual group or institution."[241] Like many of the community service providers who spoke with Human Rights Watch, the Committee on the Elimination of Racial Discrimination has recommended that

[241] International Convention on the Elimination of All Forms of Racial Discrimination (ICERD), adopted December 21, 1965, G.A. Res. 2106 (XX), annex, 20 U.N. GAOR Supp. (No. 14) at 47, U.N. Doc A/6014 (1966), 660 U.N.T.S. 195, entered into force January 4, 1969, http://www2.ohchr.org/english/law/cerd.htm(accessed January 30, 2013), art. 5(b).

Canada "take effective measures to provide culturally-sensitive training for all law enforcement officers, taking into consideration the specific vulnerability of aboriginal women and women belonging to racial/ethnic minority groups to gender-based violence."[242] Also instructive is the UN Declaration on the Rights of Indigenous Peoples (UNDRIP)[243]. The UNDRIP states that governments "shall take measures, in conjunction with indigenous peoples, to ensure that indigenous women and children enjoy the full protection and guarantees against all forms of violence and discrimination."[244] The need for joint action between government and indigenous organizations in Canada has been emphasized by indigenous groups, women's groups, and human rights organizations, which fault the government for failing to develop a comprehensive national action plan to respond to the violence.

The government has a responsibility to address any differential treatment of indigenous women and girls by law enforcement and the criminal justice system, especially when the over-policing of indigenous women and girls is linked to incidents of police abuse. In 2012, the Committee on the Elimination of Racial Discrimination expressed concern "at the disproportionately high rates of incarceration of Aboriginal people including Aboriginal women, in federal and provincial prisons across Canada" and recommended that the government "reinforce measures to prevent excessive use of incarceration of indigenous peoples."[245]

The violence against indigenous women and girls is integrally linked to the social and economic disadvantages that are the product of years of structural discrimination. The

responsibility for addressing these social and economic disadvantages falls squarely within the state's international legal commitments to address discrimination and to fulfill the rights to work and education, social security, and an adequate standard of living, which are set out in the International Covenant on Economic, Social and Cultural Rights, ratified by Canada in 1976.[246] The House of Commons Standing Committee on the Status of Women observed that "addressing the violence against Aboriginal women will require interventions on a number of fronts in a strategic, coordinated effort" and cited to article 21(1) of the UN Declaration on the Rights of Indigenous Peoples: "Indigenous peoples have the right, without discrimination, to the improvement of their economic and social conditions, including, inter alia, in the areas of education, employment, vocational training and retraining housing sanitation, health and social security."[247] The Committee on the Elimination of Discrimination against Women in its 2008 Concluding Observations has urged Canada to "develop a specific and integrated plan for addressing the particular conditions affecting aboriginal women, both on and off reserves….including poverty, poor health, inadequate housing, low school completion rate, low employment rates, low income and high rates of violence…"[248] Similar recommendations have been made by the Committee on Economic, Social and Cultural Rights, and the Committee on the Elimination of Racial Discrimination.[249] In 2009, during its first Universal Periodic Review by the United Nations Human Rights Council, recommendations were made to Canada to "study and address the root causes of domestic violence against women, in particular Aboriginal women" and to "take measures to combat socioeconomic discrimination, which is a cause

Acknowledgments

Human Rights Watch would like to express our deep appreciation to the women and girls who came forward to speak with us for this report. We are also grateful to the family members, community service providers, police officers, and others who spoke with us. We would like to thank the indigenous communities of the north for their support and cooperation in our research and would particularly like to express our gratitude for the Carrier Sekani Tribal Council's resolution welcoming us onto the territory to conduct this research. We thank the RCMP for its response to our inquiry about the policies and practices that relate to its policing and protection of women and girls and for the ongoing dialogue about the issues raised in this report.

We would like to recognize the great contributions to the research made by Mavis Erickson, representative of the Carrier Sekani Tribal Council; Annabel Webb and Asia Czapska of Justice for Girls; Sharon McIvor and Shelagh Day of the Canadian Feminist Alliance for International Action; and David Eby of the British Columbia Civil Liberties Association. In addition, we thank JFG, FAFIA, BCCLA, and the Native Women's Association of Canada for providing feedback on drafts of this report.

Human Rights Watch gratefully acknowledges the generous financial support of Donna and Gary Slaight, Kathryn Cottingham, Carol Gray, Nancy Hamm, The Joan and Clifford Hatch Foundation, Linda Haynes, Michelle Koerner, Nancy Lang, Trish McCain, and Sarah Milroy.

This report was written by Meghan Rhoad, women's rights researcher. It is based on research conducted by the author and Samer Muscati, women's rights researcher. Samer Muscati took the photographs in this report's photo essay. Lara Yeo, intern with the Women's Rights Division, provided extensive research and editing support. At Human Rights Watch, the report was reviewed by Liesl Gerntholtz, director of the Women's Rights Division; Samer Muscati; Elizabeth Calvin, senior advocate with the Children's Rights Division; Aisling Reidy, senior legal advisor; and Tom Porteous, Program director. Matthew Rullo, coordinator with the Women's Rights Division, and Camille Pendley, associate with the Women's Rights Division, assisted with final proofreading and formatting. Ivy Shen provided assistance with the photo essay. Layout and production were coordinated by Grace Choi, publications director; Fitzroy Hepkins, administrative manager; and Matthew

Rullo. Jasmine Herlt, Canada director, and Kathryn Semogas, consultant, coordinated communications and advocacy outreach and strategy.

THOSE WHO TAKE US AWAY

Abusive Policing and Failures in Protection of Indigenous Women and Girls in Northern British Columbia, Canada

More than 582 indigenous women and girls have gone missing or been murdered across Canada over the last five decades. Indigenous women are almost seven times more likely to be murdered than non-indigenous Canadian women. *Those Who Take Us Away* documents the double failure of policing by the Royal Canadian Mounted Police (RCMP) in the western province of British Columbia: the failure to protect indigenous women and girls from violence and the responsibility of the police for abusive practices and behavior, including excessive use of force, and physical and sexual assault.

The report also documents the weakness of police oversight mechanisms. Complaints lodged with the Commission for Public Complaints against the RCMP are likely to be investigated by the RCMP itself or an external police force. A recently established provincial mechanism for civilian investigation of police misconduct offers some promise, but the office's mandate excludes investigations of rape and sexual abuse. Fear of retaliation from police runs high, and the apparent lack of genuine accountability for police abuse adds to long-standing tensions between the police and indigenous communities.

To address the high levels of violence against indigenous women and girls, Canada should establish an inclusive national public commission of inquiry into the murders and disappearances of indigenous women and girls. British Columbia should expand the mandate of the civilian Independent Investigations Office to include authority to investigate allegations of sexual assault by police. Among other steps, the RCMP, in cooperation with indigenous communities, should expand training for police officers to counter racism and sexism in the treatment of indigenous women and girls.

Highway 16, sometimes referred to as "the Highway of Tears" in recognition of the women and girls who have gone missing or been murdered in its vicinity, in northern British Columbia. July 2012.

Gendered Racial Violence and Spatialized Justice

The Murder of Pamela George

Sherene H. Razack

[GLENBOW ARCHIVES NA-2399-76]

To unmap literally is to denaturalise geography, hence to undermine world views that rest upon it.

—Richard Phillips, *Mapping Men and Empire*

On Easter weekend, April 17, 1995, Pamela George, a woman of the Saulteaux (Ojibway) nation and a mother of two young children, was brutally murdered in Regina, Saskatchewan. Beyond the fact that Pamela George came from the Sakimay reserve on the outskirts of the city, and that she occasionally worked as a prostitute,

something she was doing that weekend, few details of her life or the life of her community are revealed in the court records of the trial of the two white men accused of her murder or in the media coverage of the event. More is known about her two murderers—young middle-class white men. Easter marked the first weekend since the end of their university exams. There was a week or so of freedom before summer jobs began, and nineteen-year-old university athletes Steven Kummerfield and Alex Ternowetsky set out to celebrate the end of term. They went out drinking in isolated areas under bridges and behind hockey arenas, and then cruised "the Stroll," the city's streets of prostitution. Eventually, after failing to persuade one Aboriginal woman working as a prostitute to join the two of them in the car, one man hid in the trunk. Approaching her twice and being refused twice, they finally succeeded in persuading another Aboriginal woman, Pamela George, to enter the car.

The two men drove George to an isolated area outside the city, a place littered with bullet casings and condoms. Following oral sex, they took turns brutally beating her and left her lying with her face in the mud. They then drove to a fast-food restaurant and later to a cabin on Saskatchewan Beach, which belonged to one of their grandfathers. The next morning, upon returning to town, they heard a radio report describing a body found outside the city. After both first confided their involvement in the murder to a number of friends and to one of their parents, one man left town to take up his summer job planting trees in the northern forests of British Columbia. The other man flew to the mountain resort of Banff, Alberta, where he joined other white male university athletes celebrating the end of term. In early May, nearly one month later, after following a tip and having exhausted the list of suspects who were mostly Aboriginal or of the "streets" of the Stroll, the Royal Canadian Mounted Police (RCMP) arrested both men for the murder of Pamela George. The arrest of two young middle-class white men for the murder of an Aboriginal woman working as a prostitute sent shock waves through the white population of this small prairie city. Pamela George's own family endured the pain of losing a loved one violently.

At the trial two years later, the defence at first tried to argue that Pamela George managed to walk away from the isolated field and was killed by someone else, an Aboriginal man. They also argued that since both men were highly intoxicated, they bore diminished responsibility for the beating. The boys did "pretty darn stupid things," but they did not commit murder. Both the Crown and the defence maintained that the fact that Pamela George was a prostitute was something to be considered in the case.[1] The judge sparked a public furor when he instructed the jury to bear this in mind in their deliberations. The men were convicted of manslaughter and sentenced to six-and-a-half years in prison, having already spent twenty months in prison. The objections of the Native community and some members of the white community stemmed from their belief that the crime was, at the very least, one of second-degree murder and that the judge acted improperly in directing the jury to a finding of manslaughter.[2] Alex Ternowetsky was paroled in 2000 after having served only two-thirds of his sentence. In August 2001, he faced new charges of assault, robbery, mischief, impaired driving, and refusing to take a Breathalyzer test.[3]

Why write about this trial as spatialized justice and this murder as gendered racial or colonial violence? Some readers of early versions of this essay have commented that the prison sentences for manslaughter meted out to the two accused were not highly unusual and therefore not indicative of the court's leniency. Others noted that a finding of murder would have required more evidence than was available. In agreement with this latter view, in 1998, the Saskatchewan Court of Appeal rejected an appeal by the Crown that the trial judge had failed to fairly present the Crown's position that the two men had murdered Pamela George. The Appeal Court concluded that Mr. Justice Malone had made it clear to the jury that a finding of murder, whether first or second degree, would require evidence that the accused intended to commit murder or knew that their actions would result in Pamela George's death. There is some indication, according to the Appeal Court, that the jury did indeed carefully consider whether there was enough evidence to convict on a charge of murder rather than manslaughter. Further, the Appeal Court continued, the trial judge's direction to the jury to consider that Pamela George was working as a prostitute the night of the murder did not degrade her in any way and thus cannot be considered to have led the jury to its conclusion that the men committed manslaughter and not murder.[4]

I propose to show that a number of factors contributed to masking the violence of the two accused and thus diminishing their culpability and legal responsibility for the death of Pamela George. Primarily, I claim that because Pamela George was considered to belong to a space of prostitution and Aboriginality, in which violence routinely occurs, while her killers were presumed to be far removed from this zone, the enormity of what was

done to her and her family remained largely unacknowledged. My argument is, in the first instance, an argument about race, space, and the law. I deliberately write against those who would agree that this case is about an injustice but who would de-race the violence and the law's response to it, labelling it as generic patriarchal violence against women, violence that the law routinely minimizes. While it is certainly patriarchy that produces men whose sense of identity is achieved through brutalizing a woman, the men's and the court's capacity to dehumanize Pamela George came from their understanding of her as the (gendered) racial Other whose degradation confirmed their own identities as white—that is, as men entitled to the land and the full benefits of citizenship.

In the same vein, I race the argument made by some feminist scholars that women working as prostitutes are considered in law to have consented to whatever violence is visited upon them.[5] While I wholeheartedly agree, I underline how prostitution itself (through enabling men to mark the boundary between themselves and degenerate[6] Others) and the law's treatment of it as a contract sustain a colonial social order. Finally, I reject the view that the spatialized justice I describe, the values that deem certain bodies and subjects in specific spaces as undeserving of full personhood, has more to do with class than it does with race. In this view, it is her poverty and her location in the inner city that most influenced how Pamela George was treated in life and in law.[7] A white woman in a similar circumstance and place would be treated the same way, or perhaps only slightly better. Again, while I would not disagree (indeed I would argue that a white woman working as a prostitute on the Stroll would be racialized), I emphasize here that race overdetermined what brought Pamela George *and her murderers* to this brutal encounter. Equally, race overdetermined the court's verdict that the men bore diminished culpability for their actions.

The racial or colonial aspects of this encounter are more prominently brought into view by tracing two inextricably linked collective histories: the histories of the murderers, two middle-class white men, and of Pamela George, a Saulteaux woman. Significantly, history is precisely what was absent in the trial. Pamela George stood abstracted from her history and remained for the court only an Aboriginal woman working as a prostitute in a rough part of town. The two men, Alex Ternowetsky and Steven Kummerfield, were also abstracted from their histories. They were simply university athletes out on a spree one Easter weekend. As abstractions, neither side could be seen in the colonial project in which each was embedded. The history of dispossession, and its accompanying violence, that brought both Pamela George and her murderers to the Stroll; white people's historic participation in and benefit from that dispossession and violence; and the law's complicity in settler violence, particularly through an insistence on racelessness and on contract, all remained invisible. At the end of the day, the record showed only that two white "boys" lost control and an Aboriginal woman got a little more than she bargained for. That an Aboriginal woman was brutally murdered sometimes seemed lost during the trial.

The collective histories I trace are also geographies. In examining the transcripts of the case, one can hardly miss the spatiality of the violence and its relationship to identity as well as to justice. The men leave the university and their families' and girlfriends' middle-class homes in the suburbs to spend time with each other, in places that are "outside" civilized society. From drinking under bridges, beside airports, and behind hockey arenas, they proceed to the Stroll, the streets of prostitution occupied by racial Others, and ultimately to the murder scene. In the elite spaces of middle-class life (the university, suburban homes, chalets, and cottages), they learn who they are, and, more important, who they are not. Moving from respectable space to degenerate space and back again is an adventure that confirms that they are indeed white men in control who can survive a dangerous encounter with the racial Other and who have an unquestioned right to go anywhere and do anything.

These journeys of transgression are deeply historical ones. White settlers displaced Pamela George's ancestors, confining her Saulteaux nation and others to reserves. Pamela George's own geographies begin here. Colonization has continued apace. Forced to migrate in search of work and housing, urban Aboriginal peoples in cities like Regina quickly find themselves limited to places like the Stroll. Over-policed and incarcerated at one of the highest rates in the world, their encounters with white settlers have principally remained encounters in prostitution, policing, and the criminal justice system. Given the intensity of this ongoing colonization, white men such as Kummerfield and Ternowetsky had only a very small chance of seeing Pamela George as a human being. When the court itself undertook the same journey from respectable to degenerate space during the trial, as it reviewed the events surrounding the murder, her personhood again remained invisible. White complicity in producing the harsh realities of her life never surfaced, and the men's own activities were subjected to very little critical scrutiny. The "naturalness" of white

innocence and of Aboriginal degeneracy remained firmly in place as the conceptual framework through which this incident of gendered racial violence could be understood.

I propose to unmap these journeys. That is to say, I want to denaturalize the spaces and bodies described in the trial in an effort to uncover the hierarchies that are protected and the violence that is hidden when we believe such spatial relations and subjects to be naturally occurring. To unmap means to historicize, a process that begins by asking about the relationship between identity and space.[8] What is being imagined or projected on to specific spaces, and I would add, on to bodies? Further, what is being enacted in those spaces and on those bodies? In the first section of this chapter, I discuss the factors that brought Pamela George to the Stroll and those that brought two white men to it. I suggest that the encounter between the white men and Pamela George was fully colonial—a making of the white, masculine self as dominant through practices of violence directed at a colonized woman. In the second section, I explore how various legal and social constructs naturalized these spatial relations of domination, highlighting in the process white respectability and entitlement and Aboriginal criminality. In the conclusion, I explore how we might contest these practices of domination through a resurrection of historical memory of colonization and its continuing effects. In essence, I suggest that we insist that in law, as in life, we inhabit histories of domination and subordination for which we are accountable.

Space, Gendered Racial Violence, and the Making of White Settler Societies

> Why was she prostituting herself when the Queen promised her a prosperous life on the reserve? . . . Why would she prostitute herself if the treaties had been fulfilled? . . . Many times I wonder at nights whether she screamed "Canada, Canada" like that Somalia kid that was killed by the Airborne Regiment.
>
> —Morning Child, commenting on the death of his daughter, Calinda Waterhen[9]

Two white men who buy the services of an Aboriginal woman in prostitution, and who then beat her to death, are enacting a quite specific violence

perpetrated on Aboriginal bodies throughout Canada's history, a colonial violence that has not only enabled white settlers to secure the land *but to come to know themselves as entitled to it*. In the men's encounter with Pamela George, these material (theft of the land) and symbolic (who is entitled to it) processes shaped both what brought Pamela George to the Stroll and what white men from middle-class homes thought they were doing in a downtown area of prostitution on the night of the murder. These processes also shaped what sense the court made of their activities.

In *Racist Culture*, David Goldberg writes about the spatial configurations of colonial societies, arguing persuasively that racial categories have been spatialized. Colonizers at first claim the land of the colonized as their own through a process of violent eviction, justified by notions that the land was empty or populated by peoples who had to be saved and civilized. In the colonial era, such overt racist ideologies and their accompanying spatial practices (confinement to reserves, for example) facilitate the nearly absolute geographical separation of the colonizer and the colonized. At the end of the colonial era, and particularly with urbanization in the 1950s and 1960s, the segregation of urban space replaces these earlier spatial practices: slum administration replaces colonial administration. The city belongs to the settlers and the sullying of civilized society through the presence of the racial Other in white space gives rise to a careful management of boundaries within urban space. Planning authorities require larger plots in the suburbs, thereby ensuring that larger homes and wealthier families live there. Projects and Chinatowns are created, cordoning off the racial poor. Such spatial practices, often achieved through law (nuisance laws, zoning laws, and so on), mark off the spaces of the settler and the native both conceptually and materially. The inner city is racialized space, the zone in which all that is not respectable is contained.[10] Canada's colonial geographies exhibit this same pattern of violent expulsions and the spatial containment of Aboriginal peoples to marginalized areas of the city, processes consolidated over three hundred years of colonization. Here, however, both colonial and slum administration persist. Reserves remain lands administered by the *Indian Act*, while city slums are regulated through a variety of municipal laws.

Regina, a city of almost two hundred thousand people in which Aboriginal peoples make up approximately 8 per cent of the population,[11] is estimated to have a higher urban Aboriginal population per capita than all other major Canadian cities. The Aboriginal population is also the

youngest one in Canada—43 per cent of Aboriginals are fifteen years old or younger.[12] However, the presence of a significant Aboriginal population in an urban centre is a relatively recent historical development. Canada's colonizing endeavours confined the majority of Aboriginal peoples to reserves by the second half of the nineteenth century, establishing in the process the geographical configuration of Regina today as a primarily white city in the midst of the reserves of the Qu'appelle Valley. This nineteenth-century spatial containment of a subject population was never secure and often required brutal policing and settler violence. In 1885, for example, white settlers of Regina who were fearful of Native rebellions organized a Home Guard and pressed vigorously for the North West Mounted Police (NWMP) to police Natives and to hang Native leaders arrested after the Riel Rebellion.[13]

Sexual violence towards Aboriginal women was an integral part of nineteenth-century settler strategies of domination. In her research on the appearance during this time of captivity narratives (stories about the abduction of white women and children by Aboriginal peoples), Sarah Carter documents the important role that stereotypical representations of Aboriginal women played in maintaining the spatial and symbolic boundaries between settlers and Natives. Prior to 1885 there had been relative co-existence between fur traders and Aboriginal peoples, but the Métis rebellion and general Aboriginal resistance to their spatial confinement, as well as the increasing presence of white women on the Prairies, led to powerful negative images of Aboriginal women that portrayed them as licentious and bloodthirsty. These images helped to justify the increasing legal regulation of Aboriginal women's movements and their confinement to reserves. As Carter demonstrates, "the squalid and immoral 'squaw'" helped to deflect criticism away from the brutal behaviour of government officials and the NWMP, and it enabled government officials to claim that the dissolute character of Aboriginal women and the laziness of the men explained why reserve land was not used to capacity and were pockets of poverty.

After 1885, the pass system was introduced and required Aboriginal peoples to obtain a pass from a government employee before leaving the reserve. One rationale was that the system would limit the numbers of Aboriginal women "of abandoned character" entering the towns. Relying on diaries of policemen, newspapers, and court records, Carter discusses a variety of oppressive practices towards Aboriginal women. For example,

government agents sometimes withheld rations to reserve communities unless Aboriginal women were made available to them. The NWMP often turned a blind eye to such practices, engaging in their own coercive relations with Aboriginal women. White men in positions of authority often beat Aboriginal women, sometimes fatally. Oral narratives of late-nineteenth-century Lakota women suggest that the NWMP had easy sexual access to Aboriginal women whose families were starving.[14]

Newspaper records of the nineteenth century indicate that there was a conflation of Aboriginal woman and prostitute and an accompanying belief that when they encountered violence, Aboriginal women simply got what they deserved. Police seldom intervened, even when the victim's cries could be clearly heard.[15] In one case explored by Sarah Carter, which bears an uncanny parallel to the trial of Ternowetsky and Kummerfield for the murder of Pamela George, a Cree woman, referred to in the newspapers as a squaw named Rosalie who was working as a prostitute, was murdered by William Fisk, a white man of a well-established family. Even when Fisk confessed to the murder, the Crown expressed his sympathy for Fisk as a man whose activities in capturing rebellious Natives clearly marked him as a patriot and an upstanding citizen. When a jury declared Fisk innocent, a judge ordered a retrial and, unusual for the period, urged the new jurors to forget the victim's race and consider the evidence at hand. Ultimately convicted of manslaughter, Fisk was initially given a life sentence, but this reduced to fourteen years of hard labour when testimonials of support for him poured in. Rosalie, as one newspaper boasted, had a "respectable burial" even though she was not white, an honour swiftly diluted when the church refused her burial in the mission's graveyard because she had died in "sin" while engaging in prostitution. The lesson of the case, one Calgary newspaper opined, was that it was important to "keep the Indians out of town."[16]

The nineteenth-century spatial containment of Aboriginal peoples to reserves remained in place until the 1950s. As professor Jim Harding of the University of Regina noted in his presentation to the Royal Commission on Aboriginal Peoples (RCAP), a white boy growing up in Regina in the 1950s would know Regina as almost exclusively white and as bordered by the reserves of the Qu'Appelle Valley: "two different worlds."[17] By the 1960s, however, a steady stream of Aboriginal peoples flowed from the reserves to the city. With a high birth rate, Aboriginal peoples left reserves in increasing numbers, impoverished among other things, by a series of

federal government cutbacks for housing. In 1971, the census indicated only 2,860 Aboriginal peoples living in Regina, but unofficial estimates placed the number closer to thirty thousand by mid-decade.[18]

This pattern of migration from reserves to cities is well documented for other Canadian cities. For example, Russell Lawrence Barsh studied the high rates of relocation from reserves to Lethbridge, Alberta, a city also bordered by reserves, in the 1990s and concluded that migration was primarily linked to housing rather than to the lure of economic activities in the city. Barsh suggests that housing shortages were created by cutbacks in federal grants to reserves during the 1980s.[19] These patterns are confirmed in the Ontario context by Allison Williams, who has reviewed a number of Canadian studies of migration of Aboriginal peoples to cities.[20] Between 1986 and 1991, the urban Aboriginal population in Canada increased by 55 per cent in contrast to the non-Aboriginal urban population increase of 11 per cent.[21]

Pamela George's homeland, the Sakimay reserve, is typical of the spatial configurations that emerged in Canadian colonialism and produced the migration from reserves to the city. The link between the material privilege of white settlers in the cities and Aboriginal marginalization is a direct one, as the Indian Claims Commission (an independent body set up by the federal government to aid in the settlement of land claims) established with respect to the Sakimay and other reserves in the area. The Commission found that, in the 1940s, the federal government failed to consult the six First Nations involved before passing the *Prairie Farm Rehabilitation Act*, which authorized the construction of dams and the flooding of reserve lands along the Qu'Appelle River. The government also failed to expropriate or obtain surrenders of affected reserve lands. These practices left the Sakimay reserve tremendously impoverished, while white farmers profited from the enhanced irrigation.[22]

The three Prairie cities of Winnipeg, Regina, and Saskatoon have a higher in-migration from reserves than other Canadian cities. Women form the majority of these migrants (58 per cent), relocating to the city for a variety of reasons, including loss of tribal status, violence, and lack of housing and employment. Once in the city, however, the majority of urban Aboriginal peoples are left in a "jurisdictional limbo" between the city and the reserve.[23] As the authors of a case study of the First Nations economy in Regina conclude, the urban Aboriginal population remains more marginal than their reserve counterparts, without access to social services and networks. Aboriginal people also remain outside the city's economy—only 2.8 per cent of the workforce is Native, while Aboriginal people constitute 8 per cent or more of the population. In Winnipeg, Regina, and Saskatoon, according to the 1991 census, 60 per cent of urban Aboriginal households live below the poverty line and, for single-parent households headed by women, the figure is 80 to 90 per cent.[24] In Regina itself, this picture is even worse: 81 per cent of Aboriginal households live in poverty and the high-school drop-out rate for Aboriginal children is 90 per cent—higher than in any other city.[25]

Despite three decades of significant urbanization, the spatial configuration of the nineteenth century and the social hierarchies it both engenders and sustains remain firmly embedded in the white Canadian psyche and in social and economic institutions. The Native Council of Canada put it directly to the Royal Commission on Aboriginal Peoples: "There is a strong, sometimes racist perception that being Aboriginal and being urban are mutually exclusive."[26] In their own testimonies to the Royal Commission and other bodies, Aboriginal peoples report on the considerable racism in their lives in the cities. Robin Bellamy, a front-line worker in inner-city Saskatoon, told commissioners of the fear Aboriginal people had described to him in entering white areas of the city. Bellamy also described in considerable detail the almost complete exclusion of Aboriginal people from Saskatoon's institutions—in banks, for example, Aboriginal people regularly encounter difficulties cashing cheques.[27]

There are perhaps no better indicators of continuing colonization and its accompanying spatial strategies of containment than the policing and incarceration of urban Aboriginal peoples, a direct continuation of the policing relationship of the nineteenth century. Between the late 1960s and the early 1970s, the number of Aboriginal peoples in Regina's jails increased by 10 per cent. In 1971 the city stepped up downtown patrols, and in 1975 created a special task force for the purpose of policing Aboriginal peoples. By 1994, the province of Saskatchewan (of which Regina is the capital) had the highest level of incarceration of Aboriginal peoples in Canada: 72 per cent of the population in the province's jails were Aboriginal.[28] According to a "One-Day Snapshot" survey taken in October of 1996, 76 per cent of Saskatchewan's inmates on register in adult correctional facilities were Aboriginal.[29] In 1999, Patricia Monture-Angus tells us that Aboriginal men made up approximately 80 per cent of the population at Saskatchewan Penitentiary.

The rates of incarceration are even more dramatic for Aboriginal women. Ten years ago it was estimated that in Saskatchewan a treaty Indian woman was 131 times more likely to be incarcerated than a non-Aboriginal woman, while Métis women were twenty-eight times more likely to be incarcerated. According to Jim Harding's 1993 testimony to the Royal Commission, Aboriginal women then made up 80 to 90 per cent of the prison population at Pinegrove, a correctional facility in Regina. Thus, while the number of admissions to correctional centres increased in Saskatchewan by 46 per cent between 1976 and 1992, the rate of increase for Aboriginal women was 111 per cent for the same period.[30] Looking to a national scale, and to more recent statistics, First Nations women (registered or "Status" Indians) made up only 1 to 2 per cent of the Canadian population in 1997, but represented 19 per cent of federally sentenced women.[31] Harding connected Saskatchewan's provincial carceral scene, in particular, to the history of colonization, reminding RCAP commissioners that it was in Saskatchewan that Louis Riel was hanged and eight Indian leaders were executed in 1885. Perhaps, he speculated, the lessons of 1885 remain "deeper in our psyche [and] in our social structure than we would like to realise."[32]

Not surprisingly, the encounter in policing between white people and Aboriginal people maintain all of the characteristics of the nineteenth-century colonial encounter. Commenting on the use of police dogs to terrorize Native youth, Professor Harding recalled witnessing the police unleashing a dog in the house of a Native woman engaging in prostitution. Describing to the commissioners the scene of terror that ensued, Harding underlined the fact that the typical offender is also the typical victim: a young Native woman. Indeed, Native women can seldom count on the police when assaulted. Harding estimated that in the decade preceding the RCAP hearings, at least ten Aboriginal prostitutes had been murdered in Regina. René Dussault, co-chair of the Royal Commission, aptly concluded that Harding's presentation described "the dark side of the city," a zone where Aboriginal women are particularly at risk.[33]

The evidence that Aboriginal peoples live in a state of colonization as direct and coercive as prevailed two centuries ago is nowhere better demonstrated than in the high rate of suicide among Aboriginal peoples in Canada. As a government report concludes, the suicide rate, one of the highest in the world and four times higher than that of the non-Aboriginal population, is an expression of the "collective anguish" of three hundred

years of colonial history. Illustrating the sources of this anguish and the depth of despair, one young Aboriginal woman told the report's authors of her own former life on the street, a past which included prostitution. Exemplifying what the report calls "a mixture of sexual and racial exploitation," "Missy" described how men from high-class communities go downtown to look for Native kids to rape and assault, knowing that the Native kids who survived would not talk. She commented on how she was generally perceived by such men: "One thing that really used to bother me was that men looked at me differently [from the other girls]. I always felt really dirty all the time. Men used to look at me and undress me with their eyes just anywhere, or try and pick me up thinking I was just easy. That used to really bother me." As Missy concluded: "So I felt really dirty being an Indian."[34]

Although there is no systematic study of the sexual violence Aboriginal women endure today on the streets at the hands of white men,[35] the cases that do surface suggest that the nineteenth-century perception of the Aboriginal woman as a licentious and dehumanized squaw (a perception described by Missy near the end of the twentieth century) continues to prevail. The Aboriginal Justice Inquiry's discussion of the 1971 murder of Helen Betty Osborne in The Pas, Manitoba, elaborates on its prevalence. Brutally murdered by two white men, Osborne, an Aboriginal student who was walking along a downtown street, was picked up in town and driven to a more secluded spot where she was assaulted and killed. As the Commissioners of the Aboriginal Justice Inquiry concluded, Osborne's attackers "seemed to be operating on the assumption that Aboriginal women were promiscuous and open to enticement through alcohol or violence. It is evident that the men who abducted Osborne believed that young Aboriginal women were objects with no human value beyond [their own] sexual gratification."[36]

Such assumptions often appear to be operating when the police fail to respond to the disappearance of Aboriginal women, citing their involvement in prostitution and their practices of moving from place to place. In the early 1990s, John Crawford, a white man, was convicted of murdering three Aboriginal women—Calinda Waterhen, Shelley Napope, and Eva Taysup. In each case, Crawford and another white friend began by drinking and having sex with the woman in question who was possibly working as a prostitute. The women's disappearance attracted little attention. When their families reported them missing, police appeared to assume that such women were simply transients on the move. As police sergeant Dave

Kovach told a reporter, the police don't look for transient adults because such individuals often go missing and often don't want to be found.[37] Crawford's victims were indeed, as Denise McConney has written, "caught up in the ongoing displacement, relocation, and search for a safe place that is a consistent theme in the lives of most native women."[38] Ironically, it is their very dispossession that is held against them when Aboriginal women encounter violence on the streets.

The Making of White Men: The Two Accused

Alex Ternowetsky and Steven Kummerfield's histories begin in the colonial practices described above. In their everyday life, they would have had almost no chance of encountering an Aboriginal person. Absent from the university, the ordered suburbs of their families, the chalets and cottages, Aboriginal bodies had to be sought out in the marginal spaces of the city. Why would white men seek out these bodies? Why would they leave their own spaces of privilege? How do young white men such as Alex Ternowetsky and Steven Kummerfield come to know themselves as beings for whom the definition of a good time is to travel to the parts of the city inhabited by poor and mostly Aboriginal peoples and there to purchase sexual services from an Aboriginal woman? I argue that the subject who must cross the line between respectability and degeneracy and, significantly, return unscathed, is first and foremost a colonial subject seeking to establish that he is indeed in control and lives in a world where a solid line marks the boundary between himself and racial/gendered Others. For this subject, violence establishes the boundary between who he is and who he is not. It is the surest indicator that he is a subject in control.

I have argued elsewhere[39] that the spatial boundaries and transgressions that enable the middle-class white male to gain mastery and self-possession are generally evident in his use of a woman in prostitution. When they purchase the right of access to the body of a prostitute, men, whether white and middle-class or not, have an opportunity to assert mastery and control, achieving in the process a subjectivity that is intrinsically colonial as well as patriarchal. Naturalized as necessary for men with excess sexual energy, prostitution is seldom considered to be a practice of domination that enables men to experience themselves as colonizers and patriarchs, that is, as men with the unquestioned right to go anywhere and do anything to the bodies of women and subject populations they have conquered (or purchased). Instead, the liberal idea that we are autonomous individuals who contract with each other is used to annul the idea that prostitution is non-reciprocal sex and thus a violation of the personhood of the prostitute. The contract cancels the violence, although we readily recognize the violence of other financial transactions (such as Third World youth who sell their corneas to First World buyers). The space of prostitution, which Malek Alloula describes as "*the very space of orgy*: the one that the soldier and the coloniser obsessively dream of establishing on the territory of the colony,"[40] is the space of license to do as one pleases, regardless of how it affects the personhood of others.

How did the two men enact their colonial histories? Race is not, at first glance, as evident as gender although neither exists independently. The men's behaviour bears some resemblance to the young hockey athletes researched by Laura Rohinson in her *book Crossing the Line: Violence and Sexual Assault in Canada's National Sport*. Robinson describes the masculinity that is actively fostered in the world of young athletes as one where violence and sexual aggression, and a hatred of the softness that is female, are positive signs of masculinity. The normalizing of abusive relationships and male-bonding rituals designed to foster team relationships help to produce men for whom relationships with other men become the primary source of intimacy. Drawing on the work of scholars researching sports and masculinity, notably Peggy Reeves Sanday, Robinson suggests that sexual violence collectively enacted enables the men to get as close to each other as they can without endangering their sense of themselves as heterosexuals. To debase and degrade a woman in the presence of other men secures the masculinity that must be aggressive and that must disavow sexual feelings for other men.[41]

Scholars pursuing these themes in the context of university-educated men on sports teams share Robinson's emphasis on the relational features of this masculinity. S.P. Schacht, for instance, concludes of male rughy players that a kind of "order-by-violence" often prevails in which the definition of a real man is someone who sexually harms women. The players resorted to a variety of violent practices to "distance themselves from the feminine," continually reminding one another what masculinity is.[42] Peter Donnelly and Kevin Young also note "the fragility of reputations" in sports subcultures, that is, the need to make and remake masculine identity and the constitutive role that violence plays in this cycle.[43] Laurence Wenner describes the male adolescent for whom excessive public drinking (as well as buying the services of a prostitute) is a rite of passage into manhood, an exposure of

oneself to a dangerous situation from which one emerges triumphant. Sport, Wenner suggests, works in a similar way, enabling men to establish their reputations with other men and to mark off the distinction between themselves and women.[44] As I show below, such practices also enable men to mark themselves as different from and superior to racial Others.

Kummerfield and Ternowetsky inhabited a world in which the homosocial bonding, drinking, and aggression were important features. Their counsel presented a unified picture of boys who started drinking at fourteen and who steadily progressed into a regular pattern of weekend and summer drinking. Both of the accused noted that as the youngest members of their university sports teams, they were initiated into more serious drinking by older teammates. Described as an "up and coming basketball star" of the University of Regina, Steven Kummerfield was cautioned about his excessive drinking by his basketball coach and saw an addictions counsellor while in his first year of university.[45] Kummerfield's drinking led on one occasion to his becoming a young offender, when in 1994 he damaged some unoccupied farm buildings.[46]

For his part, Alex Ternowetsky described socializing and drinking with his hockey teammates at the University of Northern British Columbia. Returning to Regina for a visit a few months after beginning his first year, Ternowetsky drank to excess with his friends (Tyler Stuart and Ryan Leier) and ended up at a convenience store in the early morning. While there, he tried to hug a girl emerging from a nearby vehicle and when confronted by her boyfriend proceeded to smash the latter's car with a golf club handed to him by his friends. He received a conditional discharge and his father paid the damages of $3,000. The assault charge was dropped. Shortly after, he sought some addictions counselling, although it is not clear if this was as a consequence of the court case.[47]

On the weekend of the murder, both men indulged in extensive drinking with their friends. Ternowetsky's account of his activities over the Easter weekend prior to the murder provides some idea of his social world. Arriving via Edmonton, he contacted a friend, Rod MacLeod, with whom he went drinking at one of their old haunts behind the Balfour hockey arena. Later, at a bar, his friend Eric Willrich got into a fight with a man he assumed was harassing Ternowetsky. Eric broke his leg during the fight. The following day, Ternowetsky continued drinking with MacLeod on the roof of the Optimist's arena.[48] Nostalgically sharing a bottle of rye in memory of a good time the summer before, the two also went drinking behind

Massey Pool. Finally, when neither Willrich nor MacLeod was available to continue partying, Ternowetsky arranged to meet Kummerfield at Rainbow Bridge and took a cab there, stopping at a bank machine en route to withdraw money for the night's activities.

Of the dozen or so male friends of the accused who testified, all were white male athletes attending university. In this remarkably homogeneous shared world of young, white, athletic, middle-class men (some of whom even had the same first Christian names), drinking and socializing occurred in isolated spaces outside their respectable homes. Parental surveillance and the financial costs of drinking in a bar were undoubtedly factors contributing to this pattern; during the Easter weekend, Ternowetsky was not allowed into the home of a friend and Kummerfield's parents refused to lend him the car to go out drinking. The men relied on their allowances to obtain drinking money. Their places of drinking and socializing were invested with special meaning, a testimony to the importance of their friendships. The accused testified that the places were secluded and a tradition, a place where they shared good times. A strip of gravel beside the airport runways was Alex Ternowetsky's favourite place and his friends named it the "Alport" in his honour. Steven Kummerfield's favourite place to drink was underneath Rainbow Bridge, a cement bridge over the Waskana Creek, which he described to a correctional officer as "a special place" for himself and Alex.[49] It was in this spot that "Allie" and "Stevie," as the accused called each other, began drinking on the night of the murder.

The sense of identity that both accused gained from their activities with other men was premised on a shared whiteness. Their sports activities cement white settler identity in ways I do not explore here,[50] but evidence of their shared whiteness is most apparent in their own and their friends' and families' responses to Pamela George and to the Stroll. The men told several of their friends about the events the night of the murder and received considerable support and advice. Alex Ternowetsky told at least four of his friends. One of these, Rodney McLeod, with whom he had been drinking at Massey Pool and whose fleece jacket he was wearing the night of the murder, reassured him that no one would find out. To another, Tyler Harlton, he confided that he had killed "an Indian hooker." Ryan Leier, with whom Ternowetsky had been in trouble before and to whom he confided the full details of the night while both were in a hot tub at a chalet in Banff, reassured his friend with the advice "you shouldn't assume you killed her." Finally, Ternowetsky told his fried Eric Willrich, whose jeans he

was wearing the night of the murder and at whose house he is alleged to have washed the blood stains off.[51]

Steven Kummerfield confided to his best friend Tyler Stuart, with whom he had once gone to the area of prostitution, that "we beat the shit" out of "an Indian hooker." In Tyler Stuart's account, Kummerfield also elaborated that he said to Pamela George, "If you don't give us head, we're going to kill you." Stuart, apparently mostly concerned about the transmission of disease to Kummerfield's white girlfriend, advised his friend to break up with her if he hadn't worn a condom the night of the murder.[52] In none of these conversations was there any indication that the men acknowledged that a woman had been brutally murdered; her death seemed almost incidental and simply inconvenient. The men seemed to possess a collective understanding of Pamela George as a thing, an objectification that their exclusively white worlds would have given them little opportunity to disrupt.

In contrast to these spaces of intense white male bonding, the men's relationships with white women and parents appeared to be less intense although no less supportive of their practices of white masculinity. Kummerfield had dinner with his girlfriend Shannon Johnstone before the murder and then went out drinking with Ternowetsky. Although each said they were in love, he never told her about the murder. Suspecting that he had been with another woman, she apparently interpreted his withdrawn manner in the days following the murder as irritation at her questioning about where he had slept on the night of the murder. Kummerfield did confide in his mother about his involvement in the murder, the morning after. Far from counselling her son to go to the police, she suggested that she could call Crimestoppers and provide the police with a false tip. His mother also washed his jeans and cleaned his shoes. Other parents were equally protective of their sons once they became aware of the gravity of the charges. For example, Tyler Harlton's father mailed newspaper clippings of the trial to his son but took care to return unopened a letter from Alex Ternowetsky.[53] Here, too, there appeared to be little anguish over the fate of Pamela George.

In addition to their own isolated spaces, the men also inhabited those of middle-class respectability—white spaces of the university and sports arenas. The suburban households out of which they came enabled them to wear expensive clothing, including the labels of Club Monaco, Nike, and Timberland; Kummerfield used his father's credit cards to withdraw money for prostitutes, and Ternowetsky used his own account to buy a plane ticket

to Banff.[54] There were cabins and chalets, the former owned by a grandfather who was formerly a member of the provincial legislature, the latter rented by hockey-playing friends. These privileged spaces provided the men with another male space for drinking. Alex Ternowetsky, who flew to Banff the day after the murder, was able to book himself into a hotel room in the resort town and to continue partying, activities that required cabs and money for the room, food, and alcohol.

The testimonies of the men staying at the chalet in Banff suggest that, at least in the all-male spaces, sexual aggression was normalized. Ternowetsky's drunken talk at the chalet did not strike his listeners as unusual. (He is reported as saying eight times in a half-hour period that "I want to go find a hooker and beat and rape her," and replying to a question about whether he had ever done this with "Yeah . . . it was fun and it was a rush.") They objected to his loudness but, as Curtis Doell testified, nothing struck him as unusual. The normal pattern was to ski and follow this up by eight hours or more of drinking. It was also typical to bring white women picked up in bars to the chalet.[55] Presumably, this talk about women and "Indians" was entirely normal.

In this all-white masculine world of privilege, the Stroll, the area of prostitution described in the trial as encompassing St. John and Ottawa Streets and involving a specific set of streets and hotels in between, represented the dangerous world of racial Others, a frontier on the edge of civilization. Police described the Stroll as a world of drugs and prostitution, and most of all, as a space of Aboriginality. Steven Kummerfield and his friends visited the Stroll "out of curiosity." Alex Ternowetsky and his friends took their girlfriends on an adventure to the Stroll, "sort of seeing who was there," as his lawyer put it.[56] The young women hid under blankets while the young men negotiated for the services of an Aboriginal prostitute: a thrilling excursion to the slums that would have helped these young white people to know their own place in the world.

On the night of the murder, after leaving Rainbow Bridge, Kummerfield and Ternowetsky drove to a place where they could buy liquor and then headed to the streets of the Stroll. They encountered Charlene Rosebluff, an Aboriginal woman working as a prostitute. In her account, they offered her $60, which neither of them had. Rosebluff refused to get in the car because there were two men and both were drunk. When she refused, the two men yelled at her using a string of racial slurs. At the trial, they acknowledged that this was possible and that they were likely to have used

racial epithets.[57] One man then got into the trunk of the car while the other drove around and tried to persuade Rosebluff twice again. (At the trial, it is unclear whether they recognize her to be the same woman.) She again refused. The men switched positions and tried once more. This time, when Pamela George agreed to get into the car, they drove her to a country field two miles outside the city.

When young white men enter racialized urban spaces their skin clearly marks them as out of place. They are immediately read as johns, as rich white men who have come "slumming." This visibility no doubt contributes to white (particularly more affluent) city dwellers' tendency to perceive themselves as likely targets of robbery or violence in racialized urban space.[58] Steven Kummerfield once paid for the services of a prostitute and alleged that she disappeared with the money without providing her service. Such perceptions of white vulnerability frequently exist in a manner disproportionate to actual documented incidence of crimes, violent crimes in particular.[59] It is perhaps the men's perception that they were marked and at risk on the Stroll that prompted them to drive Pamela George outside the city to a borderland between the country and the city, a no-man's-land that offers greater anonymity.[60] In this no-man's-land, violent acts can be committed without meaningful consequence. Although the accused both maintained that they did not know the area, the RCMP and the neighbouring farmers testified that it was isolated and that it was routine for prostitution to occur there.[61]

What normally happened in this space was mostly undisputed during the trial. The Crown referred to activities in the space as "romantic" activities, while a farmer stated that couples and prostitutes often used the area and that there was "necking or petting in vehicles." The defence lawyer Kovach asked an RCMP officer (who testified that he often stopped vehicles in this area) if "we're talking males, females, homosexuals, whatever, we don't know the kind of people—or you don't know the kind of people that frequent that road." The accused had no response when they were asked by the Crown why they would drive George to this area if all they wanted to do was have sex with her, a question the judge later directed the jury to ignore. Presumably, since Pamela George and the men were engaged in a contract of prostitution, something that occurred routinely in this space, the jury was directed to draw no special conclusion from their having taken George there.[62]

It is difficult to avoid both the historical and contemporary racial and spatial parallels between the murders of Helen Betty Osborne and Pamela George. Equally, newspaper reports in 1999 calling attention to cases of Aboriginal men found frozen to death after Saskatoon police apparently dropped them outside the city limits in the dead of winter, outline the tremendous violence of the eviction of Aboriginal peoples from urban space.[63] In each instance, white men forcibly and fatally removed Aboriginal bodies from the city space, a literal cleansing of the white zone. The violence is itself cleansing, enabling white men to triumph over their own internal fears that they may not be men in control. The evictions are to areas where white men are able to evade responsibility for their violent acts, areas where there are few witnesses and where, significantly, the norms of civility are suspended and violence by contract is known to occur.

Although there are several instances which neither of the accused can recall, they generally agreed that once at the country field, Pamela George was frightened and tried to defend herself. They talked to her and gave her false names. She ultimately agreed to perform oral sex and all three remained in the front seat of the car while this was in progress. While George was performing oral sex on Ternowetsky (having finished with Kummerfield), Kummerfield announced that they should leave. Ternowetsky asked that George be allowed to finish but a short time later, Kummerfield dragged her from the car and hit her. Ternowetsky, at first surprised, joined in. Neither recalled the extent of the violence but each remembered her face in the mud and the fact that she tried to defend herself. They later claimed that when they drove off (after having bent the license plate to conceal the numbers), Pamela George was still standing.[64]

During the trial, the murder scene and the Stroll were described as spaces somehow innately given to illicit and sexual activity. The bodies of Charlene Rosebluff, Pamela George, and a number of Aboriginal men were represented variously as bodies that naturally belonged to these spaces of prostitution, crime, sex, and violence. This degenerate space, into which Kummerfield and Ternowetsky ventured temporarily, was juxtaposed to the spaces of respectability. Each space required a different legal response. In racialized space, violence may occur with impunity. Bodies from respectable spaces may also violate with impunity, particularly if the violence takes place in the racialized space of prostitution.

Unmapping Law: Gendered Racial Violence in Anomalous Zones

When I identify Ternowetsky and Kummerfield's transgression into racial space as an identity-making process (the men entered the zone, came into close contact with its degenerate occupants, and survived to tell the tale), it is worth reiterating the important connection between prostitution, race, space, and justice. Prostitution emerged in its modern form as distinct and confined to sharply demarcated areas of the city at the historical moment when liberal nation-states emerged. Bourgeois subjects, the new citizens of the nation-state, knew themselves as respectable and civilized largely through a spatial separation from those deemed to be degenerate and uncivilized. Degenerate spaces (slums, colonies) and the bodies of prostitutes were known as zones of disorder, filth, and immorality. The inhabitants of such zones were invariably racialized,[65] evacuated from the category human, and denied the equality so fundamental to liberal states.

During the trial, Pamela George came to be seen as a rightful target of the gendered violence inflicted by Kummerfield and Ternowetsky. Put another way, her murder was characterized as a natural by-product of the space and thus of the social context in which it occurred, an event that is routine when the bodies in question are Aboriginal. This naturalizing of violence is sustained by the legal idea of contract, an agreement between consenting and autonomous individuals. Because she consented to provide sexual services, the violence became more permissible. The moment of violence is contained within the moment of the contract and there can be no history or context, for example the constraints on her choice and the historical conditions under which the bargain was made. Trapped in the moment in time of the contract, Pamela George remained simply "the prostitute" or the "Indian."

In the absence of details about George's life and critical scrutiny of the details of the lives of the accused, a number of subject positions remained uninterrogated. Thus, not only did George remain the "hooker" but Ternowetsky and Kummerfield remained boys who "did pretty darn stupid things"; their respective spaces, the places of white respectability and the Stroll simply stood in opposition to each other, dehistoricized and decontextualized. If Pamela George was a victim of violence, it was simply because she was of the Stroll/reserve, Aboriginal, and engaging in prostitution. No one could then be really held accountable for her death, at least not to the extent that there would have been accountability had she been of spaces within the domain of justice.

The Stroll and the Street

The perception that the Stroll and Aboriginal bodies are spaces of violence, while the university and white suburbs are spaces of civility, is first demonstrated by the candid responses of the police when questioned as to whom they initially pursued and why. The boundary between the streets and the university and suburbs was so firmly entrenched in the minds of the police that they spent the first three weeks after the murder "rounding up the usual suspects." The testimony of Corporal Torgunrud in reply to the Crown attorney's question as to who is a murder suspect is revealing in this respect:

Q Who do you usually suspect when you get a murder?
A Well – . . .
Q Let me give you a better example. If it's a woman who's killed and there is [sic] boyfriends, husbands, are those people often the suspects?
A Yes.
Q And that's simply because of the reality of life because oftentimes there is violence in relationships?
A That's right.
Q And do you often suspect associates?
A Yes.
Q And if a person happens to live a life on the street, involved in that type of world, you might suspect other associates in that area?
A That's right.
Q Did you suspect anybody who was attending the University of Regina when you first got the case?
A No.
Q And why not?
A Nobody had ever come forward or there was never anything to point to anybody there.
Q And why would you suspect somebody *far removed from Pamela George's life,* I take it?

A Right.

Q And did you get much, make much headway in this case pursuing the leads where the suspects were street people, people involved in sort of a lifestyle different, maybe, than most of us have?[66]

It is, of course, only possible to consider the world of the university as entirely apart from the world of the streets if one discounts that there are two parties in prostitution: the prostitute *and* the client. Pursuing suspects on the street, the RCMP interviewed a number of Aboriginal men, and the white man described as George's common-law husband. The suspects all speculated that George was murdered by a "bad Trick,"[67] but this made little impression on the police and they continued looking for Aboriginal men or men from the "streets." The police had to overcome a number of obstacles in order to keep their focus on suspects from the streets, obstacles that ultimately defeated them. For one thing, the shoe marks at the murder scene indicated that the murderer likely wore Caldera Nike hiking boots, expensive shoes that no suspect from the streets possessed. It was only when they followed up on Charlene Rosebluff's tip that the police considered the men who were most likely to possess such shoes: white middle-class athletes.

The first suspect the police pursued, George's common-law husband, Lenny Hall, was a white man who was consistently described by the defence as "an elusive character" whose "whereabouts are pretty scarce," a man with long greasy hair all the way to his mid-back. The police described Hall as extremely distraught when they told him of Pamela George's death. He later took a polygraph test and was cleared. In spite of being white, Hall was so thoroughly racially marked and identified as "of the street" that when the defence hired a private investigator to find him (on the strength that he was still a suspect), she looked in the downtown hotels, the salvation Army Hostel, the Souls Harbour Mission, the food bank, and the correctional centres. She asked "certain street people . . . that generally sort of keep tabs on each other" but did not think to ask George's family if they knew where Hall was.[68] At the trial, both she and the police concluded that Hall was unlocatable, a conclusion the Crown attorney quickly attempted to qualify with his own spatial assessment:

> . . . you can appreciate to some extent who we're dealing with here, this is someone who, from his background, has moved around a fair bit, he is an Ontario native to begin with. . . . Saskatchewan isn't home, he's not born and raised here . . . for example, Charlene Rosebluff's evidence, why people don't want to get involved in this, especially street people . . . the last thing Mr. Hall, quite frankly, wants to be doing is getting involved in this thing.[69]

In his awkward naming of Hall as an "Ontario native to begin with," the Crown attorney very nearly made an explicit and subtextual conflation of Hall and "Natives," a predictable slip given the extent to which Hall was invested with racial characteristics and regarded as degenerate and therefore not white enough.[70] One should not read anything sinister, the Crown attorney suggested, in Hall being difficult for the police and the private investigator to find: such people are hard to find and are reluctant to become involved with the police. Again, Hall's elusiveness was naturalized as an innate feature of someone of this background, almost a cultural characteristic (or an acquired racial one), and not in any way an effect of ongoing police violence towards individuals racialized and policed in urban Aboriginal spaces.

In contrast to Hall, the Aboriginal suspect, Lloyd Issac, was easy to find since in the weeks following the murder he was arrested and jailed for robbery. As with other Aboriginal suspects, Issac had no Caldera boots and his own running shoes were free of mud and blood. Nonetheless, the defence maintained throughout the trial that he was possibly the killer. With a history of encounters with the police, Issac was reported to be very agitated when asked if he would take a polygraph test. (He was earlier falsely accused on the basis of one.) Issac had several theories about the murder and had heard from other Aboriginal men in prison, including George's cousin, about some of the details of the investigation. In the retelling of the police's interview with Issac, the court heard details of how prisons, conflated with Aboriginal spaces, operate. They learned of prison networks of information, for example.[71]

The street thus remained, in the space of the courtroom, an aggregate of individuals who form a mass and who function according to their own rules. From this perspective, criminality sticks to the Aboriginal bodies, entrenching a view that such bodies can be associated with little else. In the court transcripts, we do not learn, as newspaper reports revealed, that Issac had been struggling to overcome a drug habit, that he had been subjected to several beatings by police, and had feared being

framed for the murder of Pamela George. He had been interrogated by the police four times in relation to the case and was unable to find legal assistance, circumstances that possibly contributed to the taking of his own life in March 1996.[72] Since the over-policing, incarceration, and high suicide rates of Aboriginal peoples were not brought to bear on the details, the stain that is Aboriginality could not be seen as socially constructed.

Aboriginal women did not fare any better than the men in failing to materialize as subjects during the trial. They too remained "of the streets" and therefore of the violence. Charlene Rosebluff, who was originally of the Sakimay reserve, as was Pamela George, and who the men first approached on the night of the murder, remained in the judge's mind as "the prostitute." When she was late for her second court appearance, the Crown attorney explained that she was upset by the way in which "her world" was being described. The judge instructed the jury to read nothing sinister into her failure to show. Kummerfield described her to his friend Tyler Stuart as a hooker and not very good-looking. As an expert on substance abuse revealingly suggested to the court, it was likely that the men were unable to positively identify Rosebluff as the person they approached three times, not because of their state of inebriation, but because they couldn't tell one Indian from another and viewed all Indians as being the same. Later pressed by the defence to explain once again what the men's failure to recognize Charlene Rosebluff might mean, the expert witness, Dr. Aubrey Levin, again suggested that while such behaviour might be explained by memory loss due to the effects of alcohol, the use of insulting language towards Rosebluff would more strongly suggest that the men were unable to recognise her because of "a certain attitude towards that kind of person," a person who is a prostitute.[73] His expertise, and thus his opinion of the source of the men's confusion, was later discredited by the judge in his address to the jury.

Apart from a few moments, such as when Charlene Rosebluff remembered her as a nice person and a mother with two children, and when her mother and sister recalled that she liked doing crafts, could cook anything and was a good mother to her ten- and five-year-old, Pamela George never left the racially bounded space of prostitution and degeneracy during the trial, a space that marked her as a body to be violated. We never learn of the Sakimay reserve and the extensive familial networks of her life there, nor do we learn anything about why she resorted to prostitution a few times a month, and why she left the reserve in the first place. It is

only in newspaper articles that we learn that she helped her father through his crisis with alcohol abuse, supporting him in his journey to become an addictions counsellor. When details of her life emerged, such as the fact that Pamela George had a cousin in prison, and her father had himself been falsely accused of a crime,[74] they only confirmed the equation of Aboriginality with violence, a state of affairs that remained unconnected to the violence of the colonizers. In place of details that might have given her personhood, there were a myriad of other details that instead reassured the court of her belonging to spaces of violence. The needle marks on her arm, the tattoos on her body with the words "Ed" and "I love Mom," the stories of her ripping off clients (stories the police report they heard from Lenny Hall), the mention of her sister who was also a prostitute, and the detailed descriptions of how prostitutes conducted their business (but not how clients participate) leave a powerful image of degeneracy. This degeneracy was clearly racial. She was described as a member of the Mongoloid or Mongolian race when a strand of her hair was classified in evidence. Stephen Kummerfield described her as "shuffling" away from him in fear when she saw Alex Ternowetsky jump out of the trunk.[75]

Perhaps most telling of all were the accused's sense of the crime they committed. Ternowetsky told his friend Tyler Harlton that they picked up an Indian hooker, got kind of mad at her, started to hit her and did it too much and so probably killed her. Tyler was asked on the witness stand how Ternowetsky regarded the murder, to which he replied: "He kind of glanced over it, looked at it sexually." When asked to clarify, he explained that his friend did not describe the sexual act but instead made a noise like grunting. Ternowetsky did not apologize to the George family until relatively late in the trial. Questioned by the Crown attorney as to why he felt he had to leave town quickly if all he thought he had done was hit someone a few times, Steven Kummerfield replied:

> I was basically disgusted with what took place that evening, and I really didn't want to be arrested or anything like that just because there are so many opportunities I had, you know, to be successful and stuff and, you know, I just felt so ashamed and things like that.[76]

Lost opportunities weighed more heavily on Kummerfield's mind than the thought that he might have severely injured if not killed a woman. Kummerfield's response to the violence parallels those of hockey players

like Jarret Reid, who described in his statements to the court the tragedy of the loss of his hard-won hockey career and his reputation as an adored and respected athlete.[77]

Ultimately, it was Pamela George's status as a prostitute, hence not as a human being, and her belonging to spaces beyond universal justice, that limited the extent to which the violence done to her body could be recognized and the accused made accountable for it. Although it was central to the defence to spatialize accountability in this way, neither the Crown attorney nor the judge contested these relations between space and justice. The defence naturalized the violence by framing it as merely something that happens in prostitution and in those spaces. Describing the murder scene as a "quiet" rather than isolated location in which to have sex,[78] defence attorney Kovach suggested at sentencing: "They were out in the country doing what happens apparently on that road on a regular basis. . . . This is a fairly common area for that type of activity to be taking place. . . . She wasn't stabbed forty times. There wasn't a hammer used."[79] In perhaps the most convoluted but revealing of arguments that prostitution lies beyond the space of universal justice, the defence lawyer for Alex Ternowetsky suggested that if the court was going to ignore that Pamela George was working as a prostitute (and thus consider the beating and murder as one would any other), then the same consideration must be extended to his client:

> But I think the same consideration has to apply when you look at the evidence as it applies to Alex Ternowetsky. Alex admits that he drank excessively, that he picked up a prostitute, that he hit her and he left her out in the country to walk back to the city on her own, and no one can blame you if you look at that and say that's disgusting behaviour. But the issue that you have to consider is whether or not he's guilty of murder. . . .[80]

Although it is difficult to follow his logic, defence lawyer Aaron Fox appeared here to be suggesting that if the court ignored that the violence occurred within the context of prostitution (and is thus a lesser violence), then it must also ignore that his client drove George to a place of prostitution and inflicted the violence that caused her death. The social meaning of places and bodies must all be studiously ignored even as the law depends on these meanings to evaluate the violence. Presumably, his client would then be guilty of disgusting behaviour but not of murder. A parallel was being made between George engaging in prostitution and his client's drinking, both being examples of risky and ill-advised behaviour. Prostitution in particular "may not be pleasant but that's the reality." Further, Pamela's alleged drug addiction can be equated to their client's drunkenness. It was indeed central to the defence's arguments that the accused were simply young men who went out drinking. As Fox sums up: "You come to realize how easy it is for two otherwise rather average young boys with a booze problem to find themselves in a whole pile of extremely serious criminal difficulty, difficulty that could indeed effectively wreck their lives for years to come." For the defence, if there was a problem to be named in this trial, it is "substance abuse,"[81] and not racial or sexual violence that ended in murder.

The defence had to go to considerable lengths to make the argument that their clients were drunk and incapable of formulating an intent to injure or kill. The accused performed a number of deliberate actions (hiding in the trunk, hiding the license plate, having oral sex, and so on). While one expert witness saw such actions as indicating consciousness of what they were doing, the defence's own expert on substance abuse declared the men "alcohol tolerant" to the point that they could perform intricate tasks while very drunk.[82] Drunkenness as a defence for what was being viewed as a temporary loss of control on the part of the men may have made sense to the court not only because of the men's firm belonging to their own social space but also because of the victim's position outside of it. In other words, given her status in the trial as an Aboriginal woman prostitute and thus of the space of violence, was Pamela George seen as having simply gotten what she deserved?[83]

In his summation, after noting that Pamela George worked as a prostitute, the Crown attorney reminded the court that everyone was entitled to the protection of the law.[84] He nevertheless concluded in his summary remarks, after sympathizing with the families of the accused, that "Pamela George obviously lived a lifestyle far removed, probably from yours and mine. . . . The fact that she was a prostitute obviously is a fact, and you have to consider that as part of the case."[85] In his address to the jury, the judge directed the jury as follows:

> Now, if you should find that Pamela George consented to the sexual activity of the two accused, notwithstanding Kummerfield's remark

> about killing her if she did not give them head, or if you should have a reasonable doubt as to whether the accused consented or not, bearing in mind that the evidence indicates that she indeed was a prostitute, then the Crown has not made out its case with respect to first-degree murder occurring during a sexual assault, and you must find the accused not guilty of first-degree murder but guilty of second-degree murder.[86]

He then clarified that forcible confinement was a separate and distinct issue from confinement for sexual assault. For there to be forcible confinement, Pamela George would have to be shown to have been dragged to the car and held against her wishes; she cannot simply have been forced to have sex. He directed the jury to remember that George consented to perform sexual acts and that the accused were within their rights to hire her. Even Kummerfield's remark that he would kill her if she did not perform the sexual acts had to be considered in light of the fact that he had in fact hired her to perform these acts. While George was to be judged for engaging in prostitution, the men were not to be judged for having purchased her services. Put more plainly, her activity was a crime which carried the risks of violence, while theirs was a contract. Taking her out to the country should then have no bearing on how the intentions of the accused were understood.[87] Presumably, this was all within the purview of the contract Pamela George made to sell her sexual service and within the limits of her lifestyle.

I suggest that it was difficult for the Crown to disturb the argument of drunkenness and disorderly conduct (as opposed to murder), primarily because of an implicit spatial underpinning which was never challenged and was indeed shared by the Crown. While Pamela George remained stuck in the racial space of prostitution where violence is innate, the men were considered to be far removed from the spaces of violence. She was of the space where murders happen; they were not. The men received support from several white people and were praised for their accomplishments. The RCMP reported that they got along well with the accused and a correctional officer conveyed that he related to Alex Ternowetsky like a father. Counsel received an anonymous note claiming that a juror flirted with the boys.[88] Steven Kummerfield's lawyer reminded the court at sentencing that Kummerfield had often been the most valuable player of the week and that his sports record "is some indication of who he is and more important who he is now and hopefully who he'll be able to become after he pays his debt."[89] At the trial's end, the judge defended his remarks to the jury by noting that the media did not report evidence that was favourable to the accused.[90] As Robinson shows in her review of cases involving hockey players accused of sexual assault, such evidence need hardly be mentioned since white male judges and lawyers alike often share the view that the loss of the young men's hockey career is a greater tragedy than the young woman's loss of her life.[91]

Race rarely surfaced explicitly in the trial but when it did, it was quickly disconnected from whiteness. For example, during a discussion of hair found in the car of the accused, the defence (using a nineteenth-century language of race) discussed negroid, caucasian, and Mongolian hair. The defence lawyer Kovach asked the expert witness on hair whether Kovach, as a Hungarian, would be Caucasian or Mongolian.[92] In this discussion, the word "white" was never mentioned. It was as though white people did not exist, only Caucasians and Hungarians, labels that have less association with racism than the term "white" does. When race threatened to disturb the raceless equivalences that were maintained (George's prostitution and the white men's drunkenness, her addiction and theirs), the attorneys drew attention to their own ethnicity in a bid to represent everyone as equally raced. Following a long exchange in which the expert witness Dr. Aubrey Levin maintained that the language used by the men (language that includes racist slurs but is seldom named as such) indicated their social attitudes rather than their state of inebriation, the defence then asked him whether one's true personality emerged when one was drunk. When Dr. Levin replied that what emerged when drunk was a facet of a person's personality, Kovach once again introduced his own ethnicity and asked:

> So that if one, inappropriately perhaps—and let me use the—we—the word Hungarian, because I am Hungarian and proud of it, but if one sees six drunk Hungarians, including myself, on the street corner and we're being rude to you and drunk to you and aggressive towards you, which we might not otherwise be, and if you walked by and described us as being six or seven rude, vulgar, drunken whatever, Hungarians in this case, you are saying that that is a true description of them, as opposed to how they might otherwise be; is that correct doctor?[93]

Hungarians once again replaced white in this exchange where the defence argued that it was unreasonable to consider "rude" conduct while drunk as having anything to do with underlying social attitudes. If the accused uttered racial slurs to Charlene Rosebluff, this could not then be taken as evidence of their racism since racial slurs uttered under the influence of alcohol were not evidence of racism. Instead, as Kummerfield's lawyer Kovach maintained, they were remarks made "out of character."[94] Interestingly, while it was argued that being drunk is out of character for white men, being drunk is more often than not seen as in character for Aboriginal peoples.[95] Alcohol abuse and its accompanying racial and sexual violence were described as temporary aberrant behaviour while Pamela George's "lifestyle" remained a permanent personal characteristic.

It is no small irony that racism, so rarely named during the trial, only emerged explicitly during sentencing. The defence reported that Alex Ternowetsky had taken a course on Native literature while in prison and had written a paper on Aboriginal–white relations that proved that he had "no clear motive of hatred towards someone of a particular racial origin."[96] Racelessness was pursued to the bitter end, however. When there were complaints made against him after the trial, Mr. Justice Malone confirmed (in a letter to Chief Justice Allan McEachern) that race overdetermined the trial, but noted that only a strategy of racelessness (ignoring everyone's race) countered it:

> I suspect the real basis for most of the complaints, including the two that I have dealt with, is the underlying feeling that because the two accused were white and the victim was a First Nations person they received special treatment and the jury's verdict [of manslaughter and not murder] was based on racism. This was certainly the reaction of several First Nations spokesmen and extensive media coverage was given to their remarks in this regard. Furthermore, both accused came from financially secure homes and enjoyed the material benefits associated therewith. Their position in life was in striking contrast to the position of the victim. Every effort was made during the trial by counsel and myself to deal with the case strictly on the basis of relevant evidence and not on the financial and social positions of the accused and their victim or their race.[97]

Here, colour-blindness as a legal approach, the belief that justice can only be achieved by treating all individuals as though they were the same, held full sway.

Race, social position, and, I would add, gender were indeed made to disappear during the trial and in sentencing. The social meaning of spaces and bodies was deliberately excluded as evidence that would contaminate the otherwise pure processes of law, evidence that was not relevant. It was not then possible to interrogate what white men thought they were doing in journeying to the Stroll to buy the services of an Aboriginal prostitute. It was also not possible to interrogate the meaning of consent and violence in the space of prostitution and between white and Aboriginal bodies. Since bodies had no race, class, or gender, the constructs that ruled the day, heavily inflected with these social relations, coded rather than reveal them explicitly. Thus "prostitute" and people of "the street" came to signify the racial Other and the spaces of violence. In contrast, the university, the chalet, the cottage, the suburban home, the isolated spaces in which the men socialized were unmarked. When Pamela George's mother Ina and her sister Denise respectively commented in their victim impact statements, "so what if she was a prostitute" and "it felt she was on trial because she was a prostitute," they were identifying two domains of law—the domain of justice and the domain beyond it.[98] This spatial configuration was explicitly geographical and quite deliberately mapped. It was also explicitly raced, classed, and gendered. Bodies that engage in prostitution and the spaces of prostitution are racialized, as I have argued elsewhere, regardless of the actual race of the prostitute. In this sense, it is possible, as Ternowetsky's lawyer suggested at sentencing, that Pamela George's race made no difference, but only in the sense that any woman engaging in prostitution loses her status as white. What a spatial analysis reveals is that bodies in degenerate spaces lose their entitlement to personhood through a complex process in which the violence that is enacted is naturalized. Even when the trial judge at sentencing acknowledged that Pamela George was the victim of mindless violence and that her murderers "cast her aside as if she were something less than human," these observations did not alter his ultimate position that the accused deserved a punishment of six and a half years, given the time of twenty months already served.[99]

Uncovering this spatialized view of justice helps us to see how race shapes the law by informing notions of what is just and who is entitled to justice. It

enables us to see how whiteness is protected and reproduced through such ideas as a contract between autonomous individuals standing outside of history. What would it mean to deliberately introduce history and social context into this trial? In the first instance, we would have to ask questions about the activities of the accused. How did they routinely conduct themselves? What is the role of violence against women in their activities? Who were the women who were seen as targets of the violence? These questions would have to be raised within the historical and social context of Aboriginal–white relations in Regina. Secondly, to appreciate that a person has been brutally murdered, details about Pamela George's life, once again historically contextualized, would have to be on the record to counter the historically produced response to her as a woman whose life was worth very little. Efforts to introduce these two lines of evidence would be thwarted by the notion that prostitution is a contract and not violence, and the notion that individuals must be judged as though they were not embedded in historical and contemporary relations of domination. These approaches would also be resisted by the deeply entrenched notion that colonization simply happened a long time ago, if at all, and that it has ended, without colonizers enacting it and benefiting from it and, most of all, without their continuing to do so. If this exploration of Pamela George's murder trial does anything at all, my hope is that it raises consciousness about how little she mattered to her murderers, their friends and families, and how small a chance she had of entering the court's and Canadian society's consciousness as a person.

5 See, for example, B. Balos and M.L. Fellows, "A Matter of Prostitution: Becoming Respectable," *New York University Law Review* 74 (1999). The authors write: "The unstated assumption is that if a woman enjoyed a benefit, she 'assumed the risk' and therefore bears responsibility for the violence, leaving the alleged perpetrator less accountable for his behavior" (p.1231).

6 I use the term "degeneracy" in this article to denote those groups Foucault describes as the "internal enemies" of the bourgeois state—women, racial Others, the working class, people with disabilities—in short, all those who would weaken the vigorous bourgeois body and state. For a discussion of the concepts of respectability and degeneracy, see Sherene Razack, "Race, Space and Prostitution: The Making of the Bourgeois Subject," *Canadian Journal of Women and the Law* 10,2 (1998), pp.335–52.

7 For a general argument of this kind, made with respect to Aboriginal people in the inner city, see C. La Prairie, *Seen But Not Heard: Native People in the Inner City* (Ottawa: Minister of Justice and Attorney General of Canada, 1994). La Prairie writes: "Overall, the research suggests that social stratification and the experience people have in their families dictate the role they play in cities. It is the ill-equipped who are mostly seen on the streets of the inner city" (p.19). Similar to the deficit model in educational theory, this view places the problems Aboriginal peoples have in cities squarely on their own shoulders, leaving little room for the ongoing effects of colonial practices emphasized in this article.

35 Of course Aboriginal women also endure considerable violence from the men of their own communities. I would argue that such violence is of a different order than the violence discussed here, although the obvious link is that both emerge out of conditions of colonization. As Emma LaRocque so insightfully commented in her testimony to the Aboriginal Justice Inquiry of Manitoba, the squaw stereotype regulates relations between Aboriginal men and women as it does between Aboriginal women and white society. Emma LaRocque, "Written Presentation to Aboriginal Justice Inquiry Hearings, 5 February 1990," cited in Manitoba, *Report of the Aboriginal Justice Inquiry*, p.479. 50 Although few scholars of sports masculinity discuss the role that race plays in the making of the white male athlete in the contemporary context, several scholars have noted the connections between sport masculinities and empire. See, for example, R. Morrell, "Forging a Ruling Race: Rugby and Masculinity in Colonial Natal, c.1870–1910," in J. Navright and T.J.L. Chandler, eds., *Making Men: Rugby and Masculine Identity* (London: Frank Cass, 1996), p.91; J. Rutherford, *Forever England: Reflections on Masculinity and Empire* (London: Lawrence and Wishart, 1997). Related Canadian work on sport and national identity has not been explicitly about race and the forging of identities in a white settler society. See, for example, R.B. Wamsley, "The Public Importance of Men and the Importance of Public Men," and A. Bélanger, "The Last Game? Hockey and the Experience of Masculinity in Quebec," in P. White and K. Young, eds., *Sport and Gender in Canada* (Don Mills, ON: Oxford University Press, 1999).

#MMIW: A critique of Sherene Razack's piece exploring the trial of Pamela George's murder

Naomi Sayers, *Kwe Today.*

https://kwetoday.com/2014/12/26/mmiw-a-critique-of-sherene-razacks-exploration-of-the-trial-of-the-murder-of-pamela-george/

This post is a critique of Razack's piece, "Gendered Racial Violence and Spatialized Justice: The Murder of Pamela George", who was an Indigenous woman and worked on the streets as a prostitute (this is the term employed by Razack in her article). I will outline Razack's assumptions and how they do not set out Razack's intentions: exploring the trial of a murder of an Indigenous woman who worked on the streets as a prostitute to introduce the idea of colonial violence within spatialized justice. Spatialized justice is defined as "violence against marginalized people in places like the Downtown Eastside are treated differently than those who live elsewhere and who are engaged in different work."[1] While her work provides a useful framework for discussing violence, the issue with this piece is the very thing that is has become useful for: discussion of violence against Indigenous women in colonized spaces.

Razack begins, "why write about this trial as spatialized justice and gendered racial or colonial violence?" (p. 125). Her answer to this question is to call attention to "a number of factors contributed to masking the violence of the two accused and thus, diminishing their legal culpability and responsibility for the death of Pamela George" (p. 125). Briefly, some of these factors include the erasure of colonial violence and treating prostitution as a contract which is both violence and negates violence. She asserts that Pamela George existed in spaces of prostitution and Aboriginality where "violence routinely occurs" (p. 125) (as if this violence is natural to prostitution and Aboriginality). She also maintains that this not an argument about generic patriarchal violence against women (as if patriarchal violence has ever been generic); rather, her piece is an argument about race, space and the law (p. 126). Overall, Razack plans to contests the reasoning that "women working as prostitutes are considered by law to have consented to whatever violence is visited upon them" (p. 126).[2]

Razack acknowledge the histories, where white men were/are historically the perpetrators of violence against Indigenous women within the context of domination and control, as what brings the encounters between Pamela and her two attackers together (p. 126). Razack submits that it is also history what is missing from the trial (p. 126). While it is very true that it is history, including Pamela's history that is missing from this trial, I would argue that it is George's indigeneity that is missing from the trial. I find this more of an issue with case law as a whole, regardless of whether the case is criminal or another area of law or whether the victim is Indigenous or the offender is Indigenous. This can be seen in the case of *R v Briscoe*, where the victim was a young Indigenous girl, and *Winnipeg Child and Family Services v. G(DF)* where G is an Indigenous mother. In the former, the Supreme Court of Canada (SCC) does not mention the victim's indigeneity and in the latter, G's indigeneity was acknowledged but the history of colonialism was not. Though the issue is that history is missing, this is part of a much larger problem as the issue exists within how law is formed and shaped. When case law carefully extracts certain facts as more relevant than others, it determines some facts as unimportant and these irrelevant facts tend to point to colonialism and indigeneity. So I will agree that this history is erased. But it is also important to acknowledge that this is a larger problem of the legal system as how law is both shaped and formed through case law.

Razack also recognizes the over-policing and over-incarceration in the lives of Indigenous peoples which play out through prostitution, policing and the criminal justice system (p. 127). Indigenous women who both live and work on the street report higher incidents of police violence and harassment.[3] If she accepts that Indigenous peoples are over-policed and over-incarceration, then she must acknowledge that it is the criminalization of prostitution that creates the space for over-policing and over-incarceration of Indigenous women, especially Indigenous women who work outdoors, like Pamela George. Through this

criminalization, these same women are then forced to work in isolated areas such as the field where Pamela was murdered, away from protection and safety. She agrees and affirms this reality that Pamela was forced to an isolated field where she was later murdered and that other Indigenous women were also driven to secluded areas for the purpose of murder (p. 142; 134; 135). But she does not recognize that it is this forced isolation and displacement that contributes to the violence *anywhere* in her piece. In fact, Razack ignores the reality that it is being displaced to isolated places like the field where Pamela was murdered that creates the environment for violence to occur. In her efforts to historicize Pamela's circumstances and tragic outcome, Razack fails on all counts. She focuses solely on the acts that occurred in the field and not the space that it occurred in (p. 142-144). She also fails to identify the isolated fields where she was murdered as an outcome of the criminalization of prostitution, though she acknowledges prostitution as a site of over-policing but not under-protection.

The "innate" violence in prostitution that Razack attempts to position as the *real* violence in prostitution also negates the personhood of women like Pamela. Razack refers to these women as simply passive bodies waiting to be penetrated, dominated and violated (p. 136-137). In other words, they are merely objects. In critiquing the objectification done by the Indian Agents and the NWMP (RCMP's predecessor), she disparages Pamela by reducing her to a body existing in space. For Razack, women in prostitution exist in spaces of prostitution as nothing more than bodies (p. 136). She continues with the reasoning that we, the reader, exist within histories of domination and subordination for which we are accountable (p. 128). But how is Razack being held accountable for her continued subordination of Indigenous women as passive bodies, or more appropriately, objects occupying colonial spaces? In an attempt to position Pamela as existing within a space of prostitution and Aboriginality, which we must remember Razack asserts as a space of routine violence, she positions Pamela as a body existing within these spaces. When she argues that the space of prostitution is where men use women in these spaces or purchase access to their bodies (p. 136), she argues that this is a violation of their personhood. Yet, she re-affirms this violation by reducing *all* women in prostitution to passive bodies.

It is hard to follow Razack's logic when she focuses on prostitution as innately violent and concedes that Indigenous peoples interactions with white settlers is situated within prostitution, policing, and the criminal justice system. She also admits that this over-incarceration and policing strategies is an indicator of the ongoing colonialization of Indigenous populations (p. 133). If this is what she submits, then she must also admit, as noted earlier, that the criminalization of prostitution as a result of the criminal justice system and policing initiatives and responses to prostitution ultimately contributes to the violence that she suggests is "innate" to prostitution. She contradicts herself by admitting that violence exists between Indigenous peoples and white settlers in the context of prostitution but ignores the on-going criminalization of prostitution through the criminal justice system, its legal regimes and policing agencies.

Further, in her discussion of spatial configurations of colonial societies through boundaries and through laws, she explicitly lists nuisance laws as a mark of spaces of settler and the native. She ignores the fact that, at the time, Canada's anti-prostitution laws policing outdoor workers were largely enacted to prevent nuisance (p. 129). At the moment, this has recently changed. Regrettably, the Canadian government enacted similar anti-prostitution laws, including a specific law that will police outdoor workers in the same manner that forced them to work in isolated places, like Pamela George, as the previously struck down laws. Additionally, this "new" communication law is enacted with the intention to help stop the impediment of traffic, as opposed to preventing nuisance. I guess the movement of traffic is more important than the lives of sex workers.[4]

Throughout the entire article, her discussion of violence is most troubling. She ignores the police violence when talking about Indigenous women in prostitution. She admits repeatedly that the violence in prostitution is natural ignoring the fact that it is through the criminalization of prostitution that this violence manifests itself. When she describes the incident of policing using dogs to force an Indigenous woman accused of prostitution out of her house, she does not name this as violence (p. 134). More explicitly, police using dogs to remove Indigenous women from their homes is *just* "natural." She does not even acknowledge that being forced to work in isolated places away from protection creates the environment for violence to take place. In fact, she erases this reality of under-protection, displacement to isolated places

and police violence altogether. Why does she not name this violence as police violence or more appropriately, colonial violence? She commits the offence she intends to call attention to by erasing this history and colonial violence; she talks about this violence as cleansing but her erasure of colonialism and history of police violence is cleansing of colonialism (p.143).

Another fallacy presents itself when she does not in fact contest the idea that women in prostitution call the violence into their lives. This is evident when she recognizes the fact that the field Pamela is murdered is isolated but ignores the fact that the criminalization of prostitution forces these women to work in isolated places. Even in her critique of prostitution where the law that treats prostitution as a contract, she reduces the violence that these women experience as existing only between individuals and not as a result of larger structures that govern and regulate their lives. She ignores how the criminal regulation of prostitution creates these spatial configurations in colonial societies. In an attempt to espouse the liberal idea of free, autonomous individuals she also reduces this violence as existing between individuals which erases colonial violence. (p.143). In her discussion of the trial, she states that the court viewed Pamela as a "rightful target" or a "by product" by arguing that this violence is naturalized when prostitution is reduced to a contract where the contract negates the violence that women in prostitution experience (p. 144). In the same breathe, however, she argues that when the law treats prostitution as a contract, this *is* violence itself (p. 144). How can something simultaneously be violence and negate violence?

Further, she does not distinguish between the treatment of prostitution as contract which is violence and prostitution as violence itself. Razack attempts to argue when the law treats prostitution as a contract it assumes the violence as something that happens in prostitution (p. 159). Something she also concedes in her argument that prostitution is innately violent (p. 152). If Razack admits that treating prostitution as a contract both is violence and negates violence, then calling prostitution innately violent works in a similar fashion. In other words, calling prostitution as innately violent is both violence and negates violence. This is demonstrated in Razack's negation of police violence or more suitably, colonial violence. On top of this, she argues that this treatment of prostitution as a contract erases Pamela's personhood (p. 127).

Razack intends that " a spatial analysis reveals is that bodies in degenerate space lose their entitlement to personhood through a complex process in which that is enacted is naturalized" (p. 155). This the very same loss of personhood that Razack maintains when women engaging in prostitution are merely bodies existing in space waiting to be violated as if they cannot say yes or no and if one says yes, they never *actually* said yes. She attempts to argue that accepting prostitution as a contract naturalizes the violence in prostitution but she also commits this same offence by postulating that prostitution is innately violent. Razack's ultimate goal, if not anything, was to introduce Pamela's murder and the unlikelihood of the court and Canadian's society treating her as a person (p. 156). Why then does Razack reduce women like Pamela to passive bodies, objects, waiting to penetrated and violated? Relegating Indigenous women, like Pamela George, to bodies waiting to be violated is colonial violence in itself.

Through this re-reading of Razack's article, I want to call attention to her failure to contest the idea that women in prostitution deserve the violence that they experience. She does very little to address this notion. Arguably, she re-affirms these notions that women deserve the violence that they experienced by calling the violence in prostitution innate. It is often these same statements that prostitution is innately violent which inform societal and legal reactions to prostitution and prostitutes. This can be seen with the most recent enactment of *Protection of Communities and Exploited Persons Act*, where supporters of the law called prostitution innately violent and the government accepted this understanding of prostitution as normal, proceeding to enact the same violent laws that contributed to the isolation and alienation of the most marginalized women in prostitution—women like Pamela George. We also seen from this recent passing of this new law that the government's goal was not to protect prostitutes[5] and throughout the entire *Bedford* constitutional challenge of Canada's anti-prostitution laws, where the AG argued that prostitution is innately violent and because of this innate violence, women who engage in prostitution assume the associated risks.[6] More fitting, the women deserve the violence that they experience because who in their right mind would consent to a violent activity.

Razack then presents the following question: did Pamela George get what she deserved as an Aboriginal woman prostitute? (p. 151) From Razack's assumptions about prostitution and Aboriginality, that they are spaces of routine violence, and her failure to contest the notion that women working as prostitutes are considered by law to have consented to whatever violence is visited upon them, Pamela George, and other women like George, accepted the violence that they experienced by engaging in prostitution. It is these same ideas that prostitution is innately violent that inform the very same legal response to prostitution: that women consented to the violence that they experienced. Razack argues that treating prostitution as a contract removes individuals from relations of domination, when colonialism is also a system of domination (p. 143). She is guilty of removing individuals from relations or systems of domination by reducing this violence as existing between individuals, not questioning how larger structures that govern and regulate prostitution as a criminal behavior. This is demonstrated when she admits that Indigenous women are 131 times more likely to be incarcerated than non-Indigenous women (p. 134). Yet she fails to question the criminalization of prostitution as creating a relation of domination within the larger system of domination, colonialism.

Razack presents a concluding question: what would it mean to deliberately introduce history and social context into trial? (p. 156) I propose to ask more correctly: what would it mean to introduce the history that Razack blatantly and explicitly left out, like the fact that the first bawdyhouse law and subsequent anti-prostitution laws were enacted under the *Indian Act*?[7] How are Razack's assumptions about prostitution contributing to colonial violence against Indigenous women? In talking about a historical contextualization, we have to be honest in how academics like Razack are touted as compelling and persuasive and how their assertions remain unquestioned and removed from critique and critical evaluation.

When we return to her original question: "why write about this trial as spatialized justice and gendered racial or colonial violence?" (p. 125) If Razack actually addressed colonial violence and the history of colonialism, like the history of Canada's anti-prostitution laws and the policing of Indigenous persons, as creating the environments for violence that she assumes is routine to the space of Aboriginality and prostitution, then a more appropriate framework for discussing violence against Indigenous women may have been produced. Instead what is (re)produced is colonial assumptions about Indigenous women as passive bodies waiting to be violated. In closing, I propose that people question how this piece and others like it, which call prostitution as innately violent, is colonial violence in itself and begin to question how the criminal regulation of Indigenous women's sexualities and bodies perpetuates the ongoing colonial violence in their lives. It is about time that this piece stops being recycled as a persuasive and compelling for discussing violence in the lives of Indigenous women and girls, especially those who engage in prostitution, when reducing Indigenous women to passive bodies, or objects, waiting to be violated is violence in itself.

[1] http://www.pivotlegal.org/pivot-points/blog/calling-out-spatialized-justice While this source refers to a specific area like the DTES, spatialized justice can also be applied to other areas like the slum in Regina, where Pamela's attackers found her and where they often were after they drank alcohol (as noted in Razack's article).

[2] This is also the same argument that informed the AG's arguments in Bedford (that women in prostitution accept the risk of violence because prostitution is inherently violent) which is also the same line of reasoning that informs the response to Bedford, *The Protection of Community and Exploited Persons Act.*

[7] https://kwetoday.com/2013/12/28/canadas-anti-prostitution-laws-a-method-for-social-control/ To her defence, she does mention the criminal regulation of Indigenous women's sexualities and bodies although only in a footnoot at the end of her chapter. But not much is mentioned in the substance of her argument

The State is a Man: Theresa Spence, Loretta Saunders and the Gender of Settler Sovereignty

Theory & Event 19 (4): in press.

Audra Simpson

ABSTRACT

This article examines the relationship between settler colonialism and Indigenous women's life and death. In it I examine the incredulity and outrage that obtained to a hunger strike of (Chief) Theresa Spence and the murder of Loretta Saunders. Both affective modes were torn from the same book of exhonerating culpability from a public that denied an historic and political relationship between Indigenous women's death and settler governance. The paper argues that in spite of this denial, these deaths worked effectively to highlight the gendered, biopolitical life of settler sovereignty.

This article makes two very simple arguments: one about settler statecraft, and the other about settler imperative. First: Canada requires the death and so called "disappearance" of Indigenous women in order to secure its sovereignty.[1] Two: that this sovereign death drive then requires that we think about the ways in which we imagine not only nations and states but what counts as governance itself. Underpinning these arguments is a crucial premise: in spite of the innocence of the story that Canada likes to tell about itself, that it is a place of immigrant and settler founding, that in this, it is a place that somehow escapes the ugliness of history, that it is a place that is not like the place below it, across that border. Canada is not like that place for many reasons[2] but it is especially exceptional now, because it apologized, it stood in the face of its history, it "reconciles" the violence of the past with its present and so, presumably, with this acknowledgment of wrongdoing, may move on. These emotional gestures, registered at an

institutionalized, state level are undermined by an extractive and simultaneously murderous state of affairs. And, in spite of those present-day discourses from Canadian political scientists and policy makers that imagine a process of equality through the space afforded to Indigenous political orders as the "third order of government", the evidence suggests that Canada is quite simply, a settler society whose multicultural, liberal and democratic structure and performance of governance seeks an ongoing "settling" of this land. The process of settlement is definitely *contra* equality. I will speak more of this evidence shortly. This settling thus is not innocent – it is dispossession, the taking of Indigenous lands and it is not over, it is ongoing. It is killing Native women[3] in order to do so and has historically done this to do so. It is this killing that allows me to also qualify the governance project as gendered and murderous.

Relatedly, Jodi Byrd's *Transit of Empire*[4] structures its intervention among two methodological axes: one of "cacophony" the other of "transit." It is through these axes that history is known, possibility is made and difference is rendered. With "cacophony" you have the possibility of multiple, sometimes competing and contestory narratives of truth and with this, possibility as well. But with that multiplicity, also the riot of noise that requires an ear, and a decipherment, an audibility but perhaps a willingness to listen. With these two axis/methodological modalities introduced to us we see her analytic commitments unfold, Indigeneity she argues operates as a transit, an emptying nodal point, or circuit, that allows for empire to move, geographically, politically, hermeneutically. With this, Indigeneity is moved well beyond the body and into a global heuristic. "Cacophony" more than acknowledges, in a thin way, the ways in which force structures the multiplicity of voices and truths that emerge out of the transit of this force, it

privileges the lives of multiple narratives and invites us to listen closely for those that may matter to us and remain unacknowledged.

In all of the acoustic mess of settlement, there is a clarity of one trumpeting discourse and that is of 'the state' and here I want to ground Byrd's transit in flesh, as the force that she describes and analyzes through texts, I will demonstrate, moves through bodies, through flesh. The state that I seek to name has a character, it has a male character, it is more than likely white, or aspiring to an unmarked center of whiteness, and definitely heteropatriarchal. I say heteropatriarchal because it serves the interests of what is understood now as "straightness" or heterosexuality and patriarchy, the rule by men.[5] As well, it seeks to destroy what is not. The state does so with a death drive to eliminate, contain, hide and in other ways "disappear" what fundamentally challenges is legitimacy: Indigenous political orders. And here is the rub, Indigenous political orders are quite simply, first, are prior to the project of founding, of settling, and as such continue to point, in their persistence and vigor, to the failure of the settler project to eliminate them,[6] and yet are subjects of dispossession, of removal, but their polities serve as alternative forms of legitimacy and sovereignties to that of the settler state.

Settler states do not narrate themselves in the following manner: "as settler states we are: founded upon Native dispossession, outright and unambiguous enslavement, we are tethered to capitalist modes of production that allow for the deep social and economic differences that takes the shape in the contemporary of "unequal" social relations. We now seek to repair these unequal social relations through invigorated forms of economic liberalism that further dispossess and some would say consensually enslave those who do not own their means of production or opt out

or fall out of this form of economic life." More often than not, and here I am thinking of the US (in its cagey political project), Australia and Canada fancy themselves as "multicultural, democratic, economically liberal," and committed to free trade among nations and sometimes, social policies that allow for forms of historical redress that correct or attempt to repair the fundamental and un-narratable violences that bring them into being. Their histories do not live fully within the present, do not enter into a cacophony of discourses, but instead take the form of supposedly good policy and good intentions, liberal, settler governance. Those good policies and intentions perform a kind of historical reckoning, but through Truth and Reconciliation commissions, discourses of "healing", Apologies – in general, the performance of empathetic, remorseful, and *fleetingly* sorrowful states. But states that are built upon violence and still act violently, either at a bureaucratic level, at an economic level (as we see saw with the former Prime Minister Stephen Harper's relentless drive to extract from land),[7] or through a violent indifference – which we saw as well with that governments unwillingness to launch an inquiry into the Murdered and Missing Indigenous Women (MMIW). This was an unwillingness that is absolutely of a piece with Harper's August 19, 2014 statement that the problem of murdered and missing Native women should be understood as a "crime" (rather than sociology).[8] As a crime it appears to have no context no structure animating it, no materiality besides a legal transgression – thus the appearance of death after a murderous act, with a perpetrator, a victim and a clear and punishable transgression of a moral and legal code. This is an individuated, judiciable act – justice can be served. But Harper uttered that as the bodies aggregated, and became something sturdy, something apparent, something hard to ignore, a cacophony of death, of grief and of outrage. Harper said this even though this density of native women's bodies, this aggregate of grief has been called a "phenomenon" of such statistical significance that it warrants reports,

warrants explanation. And yet in response to this phenomenon, sociological fact or crime, Stephen Harper replied to Peter Mansbridge's query on need for a national inquiry in December, 2014, with "… it isn't really high on our radar, to be honest."[9] This specificity of the Murdered and Missing Indigenous Women and Girls (MMIWG) is of a piece with the diffuse forms of violence that constitute a state: the intentions, the feelings, the capacities of its citizens, who can also, as we saw in the case of Loretta Saunders, and so many more, kill. States do not always have to kill, its citizens can do that for it.

How do the subjects of such states reach for life in the face of this death? How do they not lose themselves in the cacophony? What does this speak of for the future? I will consider two cases that stretch beyond a simple, monologic story of governmental sorrow, abandonment and ineptitude and into an opening into the ways we think about citizenships or publics, particularly the way they may be in active antagonism with the subjected, with those that are being made vulnerable. The arc of this article will be the following: bodies, sovereignty and what I see as the necessity of pedagogical practices of thoughtful antagonism and "contention" not "reconciliation."

Bodies

In December 2012 Theresa Spence announced that she would stop eating until the Prime Minister of Canada and the Governor General of Canada - the official representative of the Crown, met with her to discuss treaties, to discuss the deplorable conditions of life in her community as well as the broader and also deplorable conditions of life in the North. Each of

these men, as the embodiments of states, she said, had a hand in suffering, in the failure to meet their historic obligations to the land and the people upon the land who were living in contaminated conditions, were without clean water and proper housing, in legendarily cold and bitter winters. She described this Conservative political party in power as particularly "aggressive" and the Prime Minister Stephen Harper as exceptional in his willingness to withdraw the care and compassion that is supposed to mark a 21st century liberal, democratic state.

As with all spectacularized political cases, things were not what they seemed. The Hunger Strike was not a hunger strike in a strict sense of the term, and to be fair, which many were not at the time, a hunger strike under conditions of ongoing death deserve more interpretive flexibility than Theresa Spence or any indigenous or racialized woman in Canada would or could be afforded in those moments. But to continue with my other point, this was not a hunger strike in a "classic" sense – it was rendered a "soft" hunger strike. And as such we read in endless newspaper articles, blog posts, vicious comments sections, in twitter flame wars and heard on TV.[10] We heard in comparative terms that her campaign did not compare to the strike of Bobby Sands, or other, "successful" strikes – for example, the strikers at Guantanamo, who have had to be force fed, hers did not compare to these other declarations of a willingness to die because these other strikes nearly ended in death, or in fact, ended in death. She was drinking fish broth twice a day, and so, was "fudging" things (so to speak). And in fact, you would think she was actually eating fudge, as irate Canadians "weighed in" continuously on her insincerity, her avarice, her body, and in particular, her fat. Yet as the hours turned into days and the days turned into weeks, people caravanned to her camp across from Parliament to assemble around her, to offer strength

to her, to visit, – to pray with her. They did not care if she drank fish broth twice a day. In fact, they prayed for her continued life, and they celebrated her fortitude. Of this the Anishnaabe scholar Leanne Simpson argued in her crucial piece "Fish Broth and Fasting":

> We protect the faster. We do these things because we know that through her physical sacrifice she is closer to the Spiritual world than we are. We do these things because she is sacrificing for us and because it is the kind, compassionate thing to do. We do these things because it is our job to respect her self-determination as an Anishinaabekwe – this is the most basic building block of Anishinaabeg sovereignty and governance. We respect her sovereignty over her body and her mind. We do not act like we know better than her.[11]

Out of respect for her action and for her sovereignty, other Indigenous people stopped eating in solidarity, all repeating her "demand" to meet with the PM, to have the Treaties upheld, to make something happen in a governmental storm of complete and total indifference to the life of land and people in Canada. This indifference has a life of its own, of course, and its clearest embodiment and manifestation, Stephen Harper, sowed his own roots as a chief policy analyst for the Reform party in 1987 – a party that was resolutely opposed to any form of indigenous rights that was not based on the rights of the individual to acquire and accumulate property. This way of thinking about rights converted historic agreements signed between their country – Canada - and First Nations, what are in fact, *treaties*, to be in fact, "race-based" forms of recognition that were not tenable with the idea of equality-as-sameness that his particular political party advocated for. Hence, Harper's immediate shelving of the Kelowna Accord upon

coming into office. This is a gloss on a deeper history of reform/alliance party politics that take the form of conservative skepticism (and here I am being generous) towards Indigenous peoples in Canada, but it is enough to say for now that the intellectual and political project of neoliberal capital accumulation that marked Harper's ascent to the position of PM is what Theresa Spence walked in to. And in this time of aggressive moves into soil and subsurface soil, of governmental indifference if not abandonment, she stopped eating.

Here I want to gender this argument and move to her body. Theresa Spence's appearance, her fleshy appearance, was itself a site of ire by commentators on-line, in twitter flame wars, and in print journalism. She was too fat! We heard in different ways, over and over again, to be sincere, to be what she was supposed to be, which was a person in starvation. Yet her "excess" flesh, flesh that exceeds the western, normative Body Mass Index (BMI) of under 25, itself defies a logic of genocide and in this, settler domination. Why this link between fat, her fat in particular, and a resistance or refusal of domination? Because what she is required to do, with or without the starvation, is die. In fact, her very life, like the lives of all Indian women in Canada is an anomaly because since the 1870s they have been legally mandated to disappear, in various forms – either through the *Indian Act's* previous instantiation of Victorian marriage rules whereby an Indian woman who married a non-Indian man lost her Indian status (her legal rights based identity) and as such her right to reside on her reserve. With this legal casting out was the casting out as well of the possibility of transmitting that status to her children, a loss as well of governmental power with Indigenous governance itself, the political form that her body and mind signified.

Here I want to use an example to demonstrate this argument about symbolization, Indigenous political orders and settler governance. In the case of Iroquois or Haudenosaunee peoples (the peoples who signal North America's first "new world" democracy) this move to make Indian women white, to remove their status as Indians was a blow to the knees, if not a strangulation of Indigenous governance and political order, as Iroquois women appointed Chiefs, held property, counseled chiefs and de-horned them if necessary (removed them from their position of Chief). They divorced their men by placing their belongings outside of the Longhouse. They were the inverse of the settler colonial woman, they had legally mandated authority and power, and so, they represented an alternative political order to that which was in play or was starting to be in play in the late 19th Century. They embodied and signaled something radically different to Euro Canadian governance and this meant that part of dispossession, and settler possession meant that coercive and modifying sometimes killing power had to target their bodies. Because as with all bodies, these bodies were more than just "flesh" – these were and are sign systems and symbols that could effect and affect political life. So they had to be killed, or, at the very least subjected because what they were signaling or symbolizing was a direct threat to settlement.

Now I want to emphasize that the technique of elimination that I am emphasizing here is legal and the time that I am thinking of is the mid and late 19th Century, when the legal work of the Indian Act went into play and marriage rendered Indian women the property of their husbands. As such if Indian women "married out" they were disappeared into a white, settler body politic through a limited enfranchisement (here I say "limited" because as new white women and they would not vote in Manitoba until 1918 and Quebec by 1940). Nonetheless, when their Indigenous political order was overlaid by the Indian Act and specifically its gendered rules

recognizing only some forms of marriage, defining then, a notion of out-marriage and the simultaneous imposition of patrilineal descent. At that moment we see a white, heteropatriarchal and white setter sovereignty ascend and show us its face. It does so through the work that it does with this legal move to dispossess people of land, of territory, to kill traditional governance forms and in the Haudenosaunee (and other Indigenous) cases, supplant traditional Indigenous governance, sovereignty and political life. This was achieved through the imposition of Federal and state law in particular legislative moments[12] but also through slow processes of forced geographic removals, assimilation projects and citizenship itself. The move to patrilineal/patriarchal governance in Indian territories was a legal femicide of a sort – but not of fleshy bodies, of political form, as women are the political form of the Iroquois Confederacy.

Yet, it is this very instrument of Indian women's legal death or redefinition as subjects of white sovereignty, that makes Theresa Spence a "Chief." An elected, Indian Act "Chief," 136 years after the Act is imposed on Indians in Canada and 82 years after her Cree trapping community of Attawapiskat in Northern Ontario, enters into Treaty with Canada – Treaty 9 – this is 1930**.** They are among to the last to sign on, or be added to this Treaty. At that point this small "hunting band", one that lays at the mouth of James Bay, an important stopping point for travelers, fishermen and hunters, was brought into the legal life of an emergent state. Within 82 years the broader political order of "Cree" in James Bay (who are in both what is now Northern Ontario and Northern Quebec) have suffered at least one serious famine at the turn of the century due to beaver pelt over hunting, have resisted and then endured the construction of a hydro-electric dam in 1971 (for Quebec) have then Treated again in 1975 (JBNQA).[13] It was at that time that Mathew Coon-Come argued, "Under this Agreement… [we were] promised compensation,

schools, social services, health care, sanitation, housing, employment and training. We were also assured that our hunters and trappers would be able to continue their traditional way of life. As with other Indian treaties, many important commitments have not been honoured."[14] What appeared to be an exorbitant payment for their water at that time was actually paltry – as they cannot fish because of methylmercury poisoning, suffer obesity because of the sedentarization required of their forced relocation and reservationization, and then had to contest with every bit of energy imaginable, with a Public Relations firm in tow, a second hydroelectric project "Great Whale" (in 1992), which was to provide energy to sell to the United States.

Theresa Spence's people and community are literally, cousins to all this,[15] and seem to suffer even more, outside of recent Treaty and Provincial payments, it is as if they are outside of time, they suffered the same famines as their kin in Quebec, and live in what all accounts, sounds like a surreal, federally recognized zone of simultaneous emergency and abandonment. Spence has been on Council since 2010, there have been *three* states of emergency declared since 2009 because of flooding, because the houses are in such disrepair they are uninhabitable, because of sewage back up, because these conditions are not survivable anywhere but especially so in subzero temperatures. Here from Indian Affairs: ""only 46 of Attawapiskat's 316 housing units are considered adequate, while another 146 need major work and 122 are placement.[16] Further to this, Aboriginal and Northern Affairs representative revealed that of the 316 homes, 85 percent are "unfit for human habitation"[17] The Canadian Press – where they have alighted upon Attawapiskat – have zoned in on federal transfers to the community, totaling in every year, 31 million dollars, and requiring forensic auditing on where the money has gone – transfers in the shadow of a De Beers Victor diamond mine that starting extracting from the land next to

Attawapiskat in 2009 – something they have since protested vigorously, pointing to problems with a community consultation process and the signing a 2005 Impact Benefit Agreement (IBA), negotiated in secrecy, that did not result in housing, better health care services, jobs and improved recreation facilities for the youth.[18] Shiri Pasternak has argued in her meticulous analysis of the fiscal warfare against First Nations people and the case of Attawapiskat that these Impact Benefit Agreements are another strategy to gain access to Indigenous lands because they "sanitize a regime of accumulation" in new "frontiers like Attawapiskat (2015: 14). She elaborates, "[w]hile IBAs technically constitute a consultation process, since they imply consent from First Nations, these agreements contain confidential and non-compliance clauses that scholars refer to as a hostage situation of "indentured servants, who promise to work a certain number of years in exchange for their freedom, no matter how bad the working conditions" (Pasternak 2015: 21). [19]According to a 2013 APTN article, this problematic Impact Benefit Agreement provides Attawapiskat with roughly $2 million a year (1.5 percent) of their annual revenue and De Beers has transferred $10.5 million into a trust fund for Attawapiskat as of January 2011. The mine also generated $448.8 million in gross revenues by the same date.[20]

It is in this context as well that Theresa Spence, out of what some may say is desperation or deep strategy, stopped declaring states of emergency from the North and, while down south in their nation's capital – Ottawa, for an Assembly of First Nations General Meeting, decided to declare her own body an exception. In this, she declared her own body a space for the pronouncement of need, of sovereignty, the site of the decision *not* to eat. And to *not* eat solid food until the Prime Minister, Stephen Harper would meet with her to talk about the indifference his Conservative government had shown to Attawapiskat, but also to all communities in the North, to the land, to

the people on the land. She then started her fast in a traditional dwelling constructed parallel to Parliament and her body, her action became a piece with the "Idle No More" movement – what may be largest, broad based, grass roots social and political movement to unfold in Canadian history.[21] Its goals are literally and directly to (and I quote) "stop the [Stephen] Harper government from passing more laws and legislation that will further erode treaty and indigenous rights and the rights of all Canadians."[22] Further it stated "Idle No More calls on all people to join in a revolution which honors and fulfills Indigenous sovereignty which protects the land and water."[23]

With those objectives the movement has taken the form of "actions": flash mobs and round dances in public spaces that were peopled by at times, hundreds and thousands of participants who drummed and danced peaceably, as well peaceful road blockages. Although Spence's action was separate from the four women in Saskatchewan who first brought the serious implications of the government's Omnibus Bill C-45 to public attention[24] their actions drew strength from each other and shared similar concerns. The Omnibus Bill was a budget bill that would do many things but of most interest to native people and the environment, would amend the Indian Act so that reserve lands could be leased without a majority consent of the voting membership, amend the Navigational Protection Act so that major pipeline and power line projects did not have to prove their project won't damage or destroy a navigable waterway it crosses, unless the waterway is on a list prepared by the transportation minister and the Environmental Assessment Act, which in this Omnibus bill reduces further the number of projects that would require impact assessment under the old provisions. "Idle No More" describes itself as an ongoing movement that took and probably still takes exception to the lack of consultation that marked the passage of these acts, as

well as the way in which they over-rode existing treaty agreements and the Indian Act itself, not to mention fundamental issues of consent, as well as the abusive indifference of the Federal government to the lives and lands of Indigenous peoples. According to estimates by Idle No More, those amendments removed environmental protection for 72 to 99.9 percent of lakes and rivers in Canada.[25] It is because of this removal of legal protections (and probably other very good reasons) that the movement joined forces with those who want to simply end the prospect of tar sands extraction in Northern Alberta in order to transport and sell oil elsewhere – treating the land like a dead body to be extracted from. It is of no irony that, in that political moment and in the historical context that structures Canada, Theresa Spence's body would be treated with the callous indifference if not the ire that it was.

Flesh and Sovereignty

I want to explain why and to do so with recourse to her body and its relationship not so much with this movement but with death and its failure to die. Spence fasted for six weeks, drinking one cup of fish broth in the morning, one at night. During that time The Sarah Palin of electoral politics in Canada, then Conservative (Algonquin) Senator Patrick Brazeau declared at a fundraising dinner that he had the flu and lost more weight in one week than she did in six weeks. This prompted a heckler to chime in, (and be reported in the Press repeatedly), "I think she gained weight!"[26] Spence's fleshy body was not seen as a sign of resurgent Indigenous life to white Canada, it was not seen as a stubborn, resolute, and sovereign refusal to die, staying alive to *have that conversation* about Crown obligations, about housing and about historical obligations -- it was read as a failure to do what it was supposed to do – perish. Not only do

Conservative, neoliberal governments require extractive relationships to territory at all times, focusing upon surplus rather than social welfare or care of its supposed citizens (even if they are differently citizened, as Indigenous peoples are),[27] those that are Conservative settler regimes require a double move, to extract from land and kill land if necessary – it is metaphorically a resource that gives itself to you for this purpose. Harper's regime is most open about this way of viewing territory. Now all settler colonial regimes, some would argue (here I am thinking of Patrick Wolfe's work and those on his tail or trail) have territory as its irreducible element, a desire for territory, not labor, or exclusively labor for example. But Theresa Spence's two bodies, her Chiefly one and her Womanly one were especially untenable because they were both Indian bodies. An Indian woman's body in settler regimes such as the US, in Canada is loaded with meaning – signifying other political orders, land itself, of the dangerous possibility of reproducing Indian life and most dangerously, other political orders. *Other* life forms, other sovereignties, other forms of political will. Indian women in the aforementioned example of the Haudenosaunee Confederacy transmit the clan, and with that: family, responsibility, relatedness to territory. Feminist scholars have argued that Native women's bodies were to the settler eye, like land, and as such in the settler mind, the Native woman is rendered "unrapeable" (or, highly rapeable")[28] because she was like land, matter to be extracted from, used, sullied, taken from, over and over again, something that is already violated and violatable in a great march to accumulate surplus, to so called "production."

This helps us to understand the so-called "phenomenon" of the disappeared women, the murdered and missing Native women and girls in Canada. When we account for this way of looking at Indian women it is not a mystery, is not without explanation, their so called "disappearances" are consistent with this ongoing project of dispossession. And we can see that

this *is* sociology and this *is* criminal. Sherene Razack (2002), Andrea Smith (2005), Beverly Jacobs and Amnesty International (2004, 2009), the film-makers Christine Welsh (2006) and Sharmeen Chinoy (2006),[29] as well as countless activists and heartbroken, devastated family members who have marched and petitioned who have stayed on the police have all documented, theorized, and written about these deaths, these disappearances, which are explained not only by police ineptitude, by police racism, by gendered indifference, but by Canada's dispossession of Indian people from land. This dispossession is raced and gendered, and its violence is still born by the living, the dead, and the disappeared corporealities of Native women. The disappearance of Indian women now takes on a sturdy sociological appearance: "missing" in the past decade, gone from their homes, murdered on the now-legendary "Highway of Tears"[30]in Northern British Columbia, off streets or reservations. Indian women "disappear" because they have been deemed killable, rapeable, expendable. Their bodies have *historically* been rendered less valuable because of what they are taken to represent: land, reproduction, Indigenous kinship and governance, an alternative to heteropatriarchal and Victorian rules of descent. As such, they suffer disproportionately to other women. Their lives are shorter, they are poorer, less educated, sicker, raped more frequently, and they "disappear." Their disappearance thus is not an unexplainable phenomenon; like the so called "Oka Crisis" of 1990 in Mohawk territory, these not-so-mysterious disappearances are symptomatic of what administrators have called in Canada (and sometimes in the United States) "the Indian Problem." And the Indian's problem": dispossession and settler governance are not up for examination and scrutiny, as they were with INM and the pushbacks such as Oka, Ipperwash, Elsipogtog. Theresa Spence's fleshy life, disciplined in a spectacular declaration to not eat in order to effect a political end was a sovereign exception to the exception that Indian people find themselves in settler states of

occupation, Indigenous dispossession and right now, what may be qualified as neoliberal indifference and aggression to corporeal life. The Chief's two bodies signaled too much for a settler eye and imagination to hear let alone act upon, and were she to have died, her body would have been in fact, the eliminatory logic of the state laid bare, and made all too real. And in these times when the drive to death is apparent, when we are sent the memo repeatedly on the relationship between ideological degradation, gender, dispossession and governance, rendered in the bodies of the murdered and missing women, when Indigenous people are rising up all over, holding hands with settlers in absolute concern, grief and outrage, the language normatively should not be "reconciliation" since the historical violence of colonialism is not over, it is ongoing (Coulthard 2014).

Grief

I now want to turn now to a recent death, which was a grief filled, nerve ending in this. Loretta Saunders was a young Inuk woman who was killed in February 2014. I will unpack some of the details of her passing shortly but will say for now that this violent murder, which is actually unexceptional when considered against the larger corpus that I have been talking about: the sociological fact, the crime of "Murdered and Missing Indigenous Women in Canada" is one that was exceptional in that it that actually seemed to matter, it seemed to shock Canada. It was saturated with grievability and managed to rouse the murdered and missing women to settler (and Indigenous) consciousness in ways perhaps that it had not before.[31] But before talking of the specifics of her passing so I want to think first with the writing Darryl Leroux, her thesis

advisor, who attempted upon her death, to puncture common understandings of the murders and deaths of Indigenous women in order to offer historical and political context to these deaths.

After Saunders' death was confirmed and it was in fact, a "fact" that she was gone, Daryl Leroux made a careful, and simultaneously impassioned plea in the Huffington Post for white Canadians to think about the history that they inhabit, the benefits that they incur from Indigenous dispossession – as Indigenous dispossession is as I have just argued, foundational for Canada (and of course, the United States). And Indigenous women's vulnerability to harm, to violence is symptomatic of this dispossession. Before I get further into the crux of his argument I will just rehearse a few points. When we speak of dispossession we are speaking of the materiality of land. The land that Indigenous peoples own, care for, are related to and are moved from, by force or by fiat for settlement. Thus when we think about dispossession we have to think about it as an ongoing activity that the US and Canada are very involved in as these governmental projects also move Indigeneity – as a living thing, a corporeal thing and also a system of ideas and practices out of the way. These states have to be involved in this ongoing "moving away" because they fundamentally need this land and its resources to fuel themselves and keep producing themselves of course, as a political order but as systems that are attached to people who are not but who can invoke Indigeneity in different ways to suppose themselves, to construct themselves, as civil, as lawful, as the "not-that" (savage and prior other). This may seem a crude construction from various literatures but I want to ground my analysis though in the need for not only land, but also selfhood and statecraft to legitimate claims to governance. When we talk about dispossession, when we talk about settler colonialism or imperial colonialism we are not talking about prior events, or even just events, we are talking about ongoing processes,

and what the comparative historian Patrick Wolfe has called a sturdy, enduring "structure" and in this, not only an event.[32] Alyosha Goldstein has recently called for a nuancing of this further, as assemblage,[33] but the feature of a discernable will to eliminate over time and is born out in the Canadian case and especially so in relation to gender. Structures move through time and place and if you pay close attention, you can actually *see* structural activity.

The evidence for this, some of which was in Leroux's articles on the Saunders's murder, is a "termination plan" put forth by Harper's regime in September of 2013,[34] the ongoing tar sands[35] project in Northern Alberta, which strips the top soil of Northern Cree and Ojibway communities in order to extract oil from the stripped earth to pipeline through the United States and ship through, literally through, other Indigenous communities, and white communities through the trick of "eminent domain" – a legal manoeuver that Indians in the states are very familiar with because it was one of ways in which land was expropriated from them through an argument that targeted it as necessary "for the public good." The four phase Keystone Pipeline[36] in particular is a compact between big oil, (TransCanada Corporation based in Calgary) and local and federal Canadian and US governments, as state permits were required to start construction. Starting in 2008 private industry worked with public law to expropriate private and Indian land to route crude oil from Hardisty Alberta to Regina, Saskatchewan across the border down to Nebraska and on to Illinois. Later phases extended the pipelines from Nebraska to Oklahoma Liberty County Texas and "Phases 3 and 3a" onto Houston, Texas. Phase 4, called Keystone XL was rejected by the Obama administration after years of review.[37] The 1700 mile pipeline was also to start in Hardistay Alberta and route itself through Nebraska, down to the Gulf of Mexico where the oil would be reworked for domestic consumption and/or sold to markets in China, solely for

the profit of big oil, not the "public good." Indian land in Northern Alberta is being harvested as well as privately held acreage by white Americans in the Plains. White Farmers that till the earth in perfect, Lockean fashion, are being subjected to the legal concept of "eminent domain" in North Dakota.[38] It duplicates in precisely what happened to indigenous peoples whose land they now claim and is being taken from them.

So let me return to this person, the late Loretta Saunders and what her passing means in all of this. For those of you that don't know who Loretta Saunders is, she was a 26-year old Inuk student from Labrador who was studying at St. Mary's University in Halifax, Nova Scotia. She was writing her honor's thesis on the so called "phenomenon" of murdered and missing Native women in Canada, and during the course of her thesis research and writing, in February, 2014 her lifeless body was found in a hockey bag along the Trans-Canada highway in New Brunswick.[39] She was pregnant on multiple levels, pregnant with this thesis that she was researching and writing, and quite literally, three months pregnant. According to all accounts, she was a great student, working hard, looking forward to starting these new chapters in her life, and then was killed shockingly, suddenly by a white couple subletting her apartment when she went to collect the overdue rent from them.[40]

Loretta Saunders' murder really, really upset everyone, registering grievability and forms of action[41] in ways not seen before for reasons that are both predictable and yet, not. One, she was, like all of these Native women, killed in part of what looks like a vaporous crime spree that belongs to not one serial murder, but an entire citizenship. As mentioned earlier 1,060[42] Native women have disappeared or been killed in the past decade – there have been two Amnesty

International reports, calls for a national public inquiry, reports into police ineptitude, a municipal inquiry followed by an apology by the Vancouver police chief Jim Chu for years of doddering inaction regarding the murdered and missing women in that city and the specificity and particular heinousness of Robert Pickton's perfectly commodifying site of gendered pain and gendered elimination, the "piggy farm." At the so called "piggy farm" 49 women (he confessed to 49 and was charged for six) were murdered and ground, like meat. Like Saunders' body, found in a hockey bag, a container for the sport that seems to condense meaning, and hope, while sublimating white male violence in a civil form, to stand for Canada itself, Pickton's violence does perfectly disgusting, and unambiguous work to tell us, to scream at us, "Native women will be killed by this country and its people."

Yet in spite of these signs that scream, settler governance in those moments could not or would not hear them. In March 2014, one month after the Saunders murder, the conservative-led cabinet refused the call for a national inquiry into these deaths that crash through austere, Canadian silence the in the form of tears, marches, outrage congealing into one discourse of outraged grief, why are these women being targeted, who is the perpetrator, what do we do?[43]

When history and sensibility is "the perp" a lot has to get done. And the Saunders case agitated all that in ways not seen before. So that is the one way in which this fairly recent murder scrapes at whatever iota of patience Indigenous people have with the state of affairs. But I suspect the other reason is that Loretta Saunders looked like a white girl. She had fair skin, blond hair, light eyes, she could have infiltrated a KKK meeting without notice. Perhaps, and we will find more than likely, perhaps not. It isn't white skin privilege that upset people, in that she is more

precious than the darker ones among us – it is that her death demonstrates that *no one* is safe. Her violent passing is teaching us that one cannot "pass" – this structure, this assemblage, those people that articulate themselves through and for it, will find you, and subject you, it can kill you. You too can be emptied of your familial relations, your relationship to land, your signifying possibility as the ongoing project of Empire transits in Byrd's parlance, or plows through you. One's, life, one's land, sovereignty, one's body, emptied out, in order for other things to pass through. This includes fleshy bodies, this includes Theresa Spence's stubborn and life sustaining fat. This is because if you are an indigenous woman your flesh is received differently, you have been subjected differently than others, your life choices have been circumscribed in certain ways, and the violence it seems, and will find you, and choke you, and beat you, and possibly kill you. And Darryl Leroux tried to explain this to Canadians in the *Huffington Post*, where you will find the startling comments of Canadians who argued in the comments section (in various ways) 'she was not subjected to this violence because she was Inuk, she was subjected to this violence because she is a woman, because these are killers and *they* are wholly responsible.' Somehow the killers were outside of the state, they were imagined as outside of the history that structures them as well.[44] My favorite comment to Leroux's post was and is "You also just helped explain why the numbers for missing/murdered native women are so high. You count any woman with any amount of native blood as native" – completely misapprehending his argument about history and territory, and with that that phenotype. His crucial point being that skin color is not a matter of Indigeneity, that Loretta Saunders was an Inuk that she belonged to her people, she belonged to her family, and that they belong to specific territory. Here he argued that Indigeneity is actually this kind of specificity of place and people, and that in particular this so called "white Inuk" belonged to those people and she was claimed and loved and grieved by them. In the numerous

YouTube videos on this case you can see her distraught family plead the public for information, you can see her sister Delilah Saunders with tear stained cheeks calmly ask for information from the public about her sister, and then wait and ask and then organize a search for her body. When the news comes to the Saunders family, we see them embrace each other with the relief of knowing simply that her body had been found – frozen, in the hockey bag. They were happy simply that she had been *found* because so many of these women have not. And couple their sentiments, which are literally, heartbreaking, her murder enraging, with the cacophony of comments from the Canadian public to Leroux's blog posts with statements of remorse, because this case is so awful it is inspiring even grief in the trolls.

Pedagogies of Contention

When I first wrote an earlier version of this article I presented it in Austin, Texas for a graduate student conference on 'Violence and Indigenous Identity."[45] This was in April of 2014. Like many other people, I was thinking a lot about Loretta Saunders, about the other women, and Leroux's piece made me think about my students,[46] about my job as Professor but specifically as a research Professor that takes teaching very seriously. And as a research Professor, I should not work so hard on my teaching. But nonetheless, I take it seriously and push things to the point of almost total bodily collapse every year when I get a long, painful and relentless bronchitis. I can barely walk to work, let alone lecture, and I work across the street from my apartment. I say this not to dramatize a point about exertion, we all work very hard, but to talk about what I teach and its crucial capacity to exhaust. What I teach: violence, dispossession, Indigenous political life in the face of death, is high stakes and I know it. *Where* I teach is high stakes and I know it – in the

US a site of complete atrophied disavowal of dispossession and ongoing colonialism, disavowal of indigeneity itself. And the courses push up and expose the structures of that dispossession and disavowal to students while providing an historical narrative with analytics to help them along. Repeatedly I hear, and read from them in different ways, "we didn't know this" and from my Indigenous students, of which there are more than I ever expected, "this helps to put it all together." From all, "let's do something!" I don't seek to make a claim of an extraordinary status for native studies alongside other crucial, non-canonical and subaltern histories, all with their own very serious and searing urgencies, but let me make the modest claim that the material serves as a "surprise" that topples things and so I would say, is crucial. But because of its generally non-curricular nature if I don't get it right, if I don't ensnare my students with this information, they may never get it, and they may never get it because they may never even *hear* it. This is because we live in a place, in multiple places, that simply require a disappearance of Indians in order to make the meta claims of the state make sense, "We are a nation of immigrants" – this is not true. And even though Obama then quickly offers the exceptional qualifier "Unless you are one of the Native Americans" he does not explain the violence of settler colonialism, the ongoing violence of this all and how it is still going on and itself explains the minoritized, post-genocidal and yes, exceptional space of indigeneity. So unless people have the data of dispossession, the conceptual and analytical toolkit to work with these statements, they may take it as a fact, they may be compelled by it as something that is true and also virtuous. When they have the material of native studies and Indigenous studies to think with these statements are perceived differently, their own histories are perceived differently, they will have to think more robustly and critically about what is before them. And why is this not a matter for everyone to care about, to teach, to think with, to act upon? Because this

disappearance keeps things in its place, the narratives, the politics, the distributions in power that allow for land to still be taken, for Indigenous identities as well to be violated and stolen because it is presumed that Indigenous peoples are not here to claim each other, to stand up for each other and themselves. I have written about this in my first book, *Mohawk Interruptus* (2014) but you will find other examples of this clarity of Indigenous political will in other works in literary history (Monture 2014) ethnography (Nesper 2002, McCarthy 2016), political analysis and critique (Alfred 1999, 2005, 2008, Coulthard 2014, Bruyneel 2007, Moreton-Robinson 2002, 2007, 2015).[47]

The people I have written about (and belong to), the Haudenosaunee for example, insist on the life of Indigenous nationhood and sovereignty through time and express this in actions that are about *not* being American*, not* being Canadian, and in this it is holding these nation-states in a position of doubt, sometimes interrogation and sometimes refusal. Their political posture is, in short, saying *I am not playing with you. You are not the only political or historical show in town, and I know it.* I think of Loretta Saunders, of her sister's completely devastating blog that documents her love for her sister, the sadness and rage that she wakes up with, her hopes for the safety of other women, of life after her sister's murder,[48] and I think of the death grip that threatens to seize all of us, the death grip that is very much a part of a settler show. A show of strength, of callous indifference, of an ire that obtains to Indigenous women's bodies and how this attaches even to those of us that might think we are safe. Simultaneously I think of her thesis advisor, who tried to translate the very things he was surely teaching Loretta Saunders, learning from Loretta Saunders, to Canadians in the Huffington Post. Is this the cacophony of discourses that vie for a kind of truth telling? Force qualified as violence moves through us,

trying to empty us out, transiting through moving to the flesh that is the subsurface of "identity" as peoples possessing bodies with living histories of relatedness to territory that is constantly being violated, harmed, ignored – allowing some of us to be devalued to the point where we are denied bodily integrity, denied philosophical integrity, flattened, sometimes killed. The force of this is ongoing, and multileveled. I think now, after writing my first book and thinking through the politics of Kahnawà:ke which are at times extremely difficult but so very alive and vibrant, which resist and refuse this kind of process at every turn, the desire for reconciliation by the Canadian government is a curious one. I am not sure that this is possible or fair to attempt to "reconcile" with something that is so violent, so relentless, unless all people stand fully before the sorts of stories I have just assembled, the stories that circulate in our communities, the loss, the gains, the names, and think then about what peace means. The settler state is asking to forgive and to forget, with no land back, no justice and no peace. I find this request for forgiveness by a killing state with what we now know and continue to know to veer towards the absurd if not insult, in spite of its conciliatory intent. This is because historical, bodily and heuristic violence along with theft are among those things that are really impossible to forgive let alone forget.

Acknowledgements

This article is dedicated to the late Loretta Saunders and the MMIWG who have been stolen from their territories and their loved ones. First written for "Violence and Indigenous Identity" at University of Texas at Austin (2014), I thank Lakota Pochedley for the invitation to Austin and the occasion to write new work for that specific event. Expanded and revised versions were

presented at the *Native and Indigenous Studies Association* meeting in 2014 as well as the University of Winnipeg, Ryerson University, Carleton University, McMaster University, Concordia University, Clark University and UCLA. I thank Isabelle St. Amand and Martin Loft for inviting me to keynote "Revisioning Americas" in Kahnawà:ke as well as Tracey Lindberg and Malinda Smith for inviting me to keynote *Critical Race and Anticolonial Studies Conference* in Edmonton, Alberta where an earlier version of this piece was presented in 2014. I am grateful to these audiences for their engagement. Any mistakes are my own.

Notes

[1] For the reach of global, imperial and comparative analysis of settler colonialism see Bruno Cornellier and Michael Griffith's volume of *Settler Colonial Studies* (2016) 6: 4. See also Alyosha Alex Lubins edited volume of *South Atlantic Quarterly* (2008): 107 (4).

[7] Trudeau cancelled the controversial Enbridge Northern Gateway project that would transport oil from the Alberta tar sands of the coast of British Columbia, He did so just 9 days after assuming office. He is, however supportive of the pipeline projects "Energy East" and "Trans Mountain" http://www.canadianbusiness.com/economy/how-the-trudeau-government-tore-up-the-rulebook-on-pipelines/ (last accessed 08/30/2016), because they are thought to offer a "cleaner" solution than pipelines that transport crude and are underway with more process and consultation with First Nations. The younger and presumably innovative and inclusive Trudeau was widely regarded at the point of his election as a departure from the Conservative party leader Stephen Harper's nine years in office.

[23] http://www.idlenomore.ca/vision (last accessed 09/20/2015).

[24] The Omnibus Bill was first brought to public attention by four women in Saskatchewan – Jessica Gordon, Sylvia McAdam, Sheelah McLean, Nina Wilson as well the woman that first started the hashtag

"Idle No More" (and thus intensive discussion and actions – Tanya Kappo). Theresa Spence was similarly acting in protest to what she called (and her people call) the "aggression" of the Conservative Government in Canada. In this, their callous indifference to the lives and lands of Native people in the North, in her community housing is abominable and water undrinkable. This is endemic to many reserves in the North. Please see Pasternak for a detailed legal history of Spence's action, placed within the larger context of Indigenous dispossession and Canadian lawmaking (2016) . For a multivocal, edited account of the "Idle No More Movement" please see The Kino-niimi Collective (eds.) *The Winter We Danced: Voices from the Past and the Future, and the Idle No More Movement* (2014).

[30] Highway 16 stretches across Northern British Columbia. Eighteen women have been murdered between Prince Rupert and Prince George, rendering that stretch "the Highway of Tears" (Chinoy 2006). On September 12, 2012 it was reported that Bobby Jack Fowler murdered one of these women in British Columbia and died in an Oregan jail in 2006.

[31] I will explain some of this shortly but let the attention paid to her death, shocking because of what Doenmez calls a "fatal symmetry" (2015), not override the sustained memorialization and activism of the families and other loved ones of the Indigenous women and girls or the grass roots community activism and documentation. Every February 14 is a day of remembrance for the women and girls which sees memorial marches all throughout Canada. Please consult as well http://www.itstartswithus-mmiw.com/ (last accessed 09/20/2015) for a "No More Silence" database that documents the missing women. This site works in partnership with "Sisters in Spirit" through the Native Women's Association of Canada. Defunded by the Conservative government, the Sister's in Spirit initiative documented the root causes of violence and harm in Native women's lives.

CAPTIVE GENDERS

TRANS EMBODIMENT AND THE PRISON INDUSTRIAL COMPLEX

EXPANDED SECOND EDITION

ERIC A. STANLEY & NAT SMITH, EDITORS

FOREWORD BY CECE MCDONALD

From a Native *Trans* Daughter:

Carceral Refusal, Settler Colonialism, Re-routing the Roots of an Indigenous Abolitionist Imaginary

Kalaniopua Young

I am a racially mixed Native *trans* daughter.[1] I was born to Marilyn Ilima Aken-Young and Clifton Kaukawilaohaupu Young in 1982. My parents are working class and are of Hawaiian, Chinese, German, and Irish heritage, however, when asked how they self-identify, each responds with a simple, "I am Hawaiian." This claiming of Hawaiian as a specific nationality, today, is not new, although such identity formation disturbs contemporary notions about ethnicity, what it means to be a U.S. citizen, and the political classification of the 50th "state." The struggle for Hawaiian self-determination or sovereignty in the face of an ongoing U.S. military occupation is continually evolving; in particular, the internal movements for independence in Hawai'i transform and are transformed by the way people talk about and embody emerging histories and politics as well as evolving ideas about

race, gender, and sexuality as well as affective notions of belonging and territoriality.[2] This essay seeks to articulate these tensions as an interface for healing and solidarity between critical resistances aimed at undermining the colonial logic embedded within the prison industrial complex (PIC).[3]

This essay is informed by both a political and personal commitment towards ending the PIC through an anti-racist framework and the contextual challenges of ongoing trans/gender queer phobia and settler colonial violence.[4] I explore what it means to embody and be embodied by a state of carceral refusal, by which I mean an evolving state of being and becoming in which we advocate for the abolition of the PIC and the interrelated logics of police brutality and militarism that continue to disappear poor people, trans/gender queer people, Native peoples, and people of color.

My lived experiences enable me to write this more-than-survivor critique of the PIC. In 1989, at the age of seven, I watched helplessly as white police officers arrested my mom, a woman of color, on an allegation of forgery. Despite my screams and desperate attempts to resist the arrest, my mom was violently torn from my arms and forced into a cop car while attempting to pay our rent. At the time of the arrest, my dad was serving overseas as an active member of the U.S. Army, and was unable to take us with him. Luckily, my brothers and I were taken in by our paternal grandparents, Jenny Leialoha Keamo-Young and Clifford Munwai Keka Young, into an overcrowded house on Puhano Street located behind the Tamuras Supermarket in the hot and humid coastal town of Waianae,[5] on the island of Oahu, where the majority of our *ohana* (extended family/kinship network) currently reside.

My cousin Jacob, a child of my dad's youngest sister, became my best friend and sibling. Being the same age and *mahu* (trans/gender queer), Jacob and I were inseparable. We could trust one another to hold even the most sacred aspects of our lives. Under the careful tutelage of a sophisticated yet down-to-earth cadre of grandparents, aunties, uncles, siblings, and cousins, whose gossip and occasional spanking served as a form of social control, Jacob and I came to understand the importance of *kuleana*[6] (collective responsibility) and *ohana*. In 1994, at the age of eleven, when I moved from Hawai'i to Washington state with my parents and brothers, Jacob and I made every effort to stay in touch.

Then, in 2000, wanting to escape Waianae's growing meth epidemic and a saturated tourist and service industry, Jacob moved to Washington for new opportunities. I was able to get him a job with me at a nursing home. Here, we worked as nursing assistants, providing for the emotional

and physical needs of elders in the home. We helped coworkers with unexpected blowouts and crisis situations and made sure that elders were well cared for. The job, however, proved particularly demanding and, at some point following the death of a beloved elder at work, Jacob quit—perhaps finding teenage adventures outside the stresses of caring for the dying and abandoned a more appropriate use of his time at the age of eighteen.

By 2001, Jacob began to neglect his *kuleana* (collective responsibility). When he failed to return home with my car, I set out to find him. He had borrowed my car the night before, promising to return it in the morning. When he did not show up, the lack of a ride led to the loss of my job and I grew more concerned for his safety and wellbeing. When I finally located him later that evening at his boyfriend's apartment—a place that I was familiar with—he was drunk, high, and annoyed by my lecture about trust and *kuleana*. Things quickly devolved. In the end, I chased him into the apartment, spanked his back and bottom, retrieved my car keys, and left. No one was hurt, nothing was broken, and Jacob was laughing the whole time. However, because of these events, police later arrived at my parents' house and arrested me.

Police officers trumped up the charges. The white leaseholder of the apartment, a mutual friend, was told by one of the police officers to file a restraining order against me. Unable to afford a private attorney, I took my public defender's advice and settled for the plea bargain. I did not fully understand the severity of the charges being brought against me. Moreover, my public defender did not act in my best interest. I was charged with burglary in the second degree, a felony. The official report was that I entered a dwelling without permission with the intent to steal or to commit an assault. Extenuating circumstances including the intimate and personal facts of the case were erased from the official police and legal record. In a word, I was *railroaded* through the criminal justice system without the strength or support to challenge the legal framing of my case.

I should state from the outset that the nuances of my conviction and subsequent incarceration do not deny responsibility for the events of that night or demonize any one person's actions. Rather, as someone who values responsibility, I trace the institutional structuring of my subject positions. I argue that my cultural upbringing and nationality as a Hawaiian, my race as an ethnically mixed brown person of color, my being of a working-class background and my gender/sexual identity as trans/gender queer—far from being outside the legal framing of justice—served precisely as categorical monikers for the forms of discipline and punishment I received.

In "Incarceration and the Imbalance of Power," Angela Davis points out that, "Class and racial bias, although often unintentional and unconscious, exist at every step of the [criminal justice] process."[7] Noting fundamental changes—significant increases in prosecutorial power, the minimization of public defense functions and a decrease in judicial discretion—Davis connects systemic failures to disproportionate rates of incarceration among the poor/working class, and communities of color. Additionally, she describes the current criminal system as "assembly-line justice" whereby one's freedom is placed in competition with prosecution ratings, underfunded public defense teams and restricted judicial powers. In other words, criminal convictions like mine are primarily based on a prosecutor's ability to secure convictions, a public defender's workload and pay rate, and a mandatory sentence requirement. In addition, because these charges unfairly impact historically disenfranchised communities in different ways, there is a pressing need to queer settler colonialism and gender racial violence within the contextual interstices of the PIC. According to Scott Lauria Morgensen, "Settler colonialism produced a colonial necropolitics that framed Native peoples as queer populations marked for death."[8]

After my arrest, I was taken to the Thurston County Jail in Olympia, Washington, where I was booked, fingerprinted, cavity searched, and forced to remove the breast enhancements from my bra, stripping naked in front of several white men. These police officers and correctional staff were incredibly rude, moving the in-take process from uncomfortable to unbearable. As a non-op trans woman new to the carceral system, I wanted sympathy. I imagined that after hearing me out, the officers, being of sound mind and judgment, would see the error of their ways and simply let me go. Instead, I was placed in community custody for twenty days. Community custody, according to one of the guards, was reserved for sex offenders, the mentally ill, and those with special needs.

In community custody, safety was precariously mitigated but never guaranteed. Facing daily, threats of physical and sexual abuse by both jail guards and cellblock recidivists, I befriended several inmates who protected me from physical violence in exchange for sexual favors. After a while, I began to notice something strange about the nature of incarceration; in particular, its imposition on the minds and bodies of the imprisoned, prompting a number of inmates to take personal responsibility for a system of failure beyond their control—a system built on hiding in plain sight the institutional, historical, and material limits of personal choice.

I remember my cellmate blaming himself for being poor and unable to find employment to support his family. Another inmate blamed himself for having severe depression. Taking on the failures of a system without critically examining the limits of personal choice often led a number of cellmates to conflate their sense of responsibility with issues beyond their control.

The criminal justice system's failure to incorporate more than penal options for offensive behavior continues to structure a settler colonial penal code that carries with it two harmful effects. First, it reduces people's needs for healing and justice to a carceral logic premised on domination, isolation, and criminalization. Second, it denies culturally appropriate healing practices that incorporate the *ohana* and the lived wisdom of elders. Despite the tumultuous nature of our relationship at any given time in the past, Jacob and I have learned much from each other. Certainly, as cousins, we have had many disagreements, fights, and problems. Nonetheless, we have always managed to resolve our grievances outside the legal system, particularly with the help of those who actually love and care about us.

As a convicted felon and Native trans woman of color, I am aware that multiple stigmas and intersecting oppressions attempt to circumscribe my will to empowerment. As a Hawaiian nationalist, I encounter this in the form of erasure. Erasure conditions the illegal occupation of my country by the United States.[9] It restricts my ability to claim a Hawaiian national citizenship. This means that I am inoculated into a U.S. Nation-State citizenry by force and not by choice. Likewise, a felony charge places restrictions on employment. At the university level, I have received several rejection letters that read: "Unfortunately, because of your criminal conviction, you are not eligible to apply for x position." Troubling as it may be, university employers are all too willing to take money for tuition and related expenses from working-class students with criminal backgrounds, but will be the first to deny these same students gainful employment.

Once convicted, it is difficult to escape the moral suspicion of a settler state legal system, a legal system premised on the oppression and elimination of underserved communities, Native peoples and peoples of color, particularly Native trans/gender queer people of color. Regarding my conviction, I recall an employer once telling me, "We all do things we regret," just before denying me a job to work with struggling LGBTQ youth.

Anthropologist Patrick Wolfe uses the term "settler colonialism" to define a network of consolidated power and the formation of a community

by settlers without regard for the Native inhabitants. Accordingly, settlers are complicit in the forced removal of indigenous populations from the land they claim. By eliminating and alienating indigenous peoples and their cultural practices, a settler colonial society can then claim ownership over territory without engaging in actual struggles that center indigenous peoples and their needs. The legal system has long been the site for legitimizing this process of land and cultural dispossession and ongoing indigenous alterity. According to this logic, at any point one can be silenced and forcibly pushed into camps and reserves and be labeled threatening to a liberal sensibility that sees itself as progressive, civil, modern, and multicultural.

As counter-neoliberal activists combat police brutality and the concomitant forces of administrative and racial gender violence,[10] critical and intellectual scholarship must articulate what it means to exist within and resist against multiple, intersecting sites of oppression and a transhorizontal push for solidarity among multiple lived fronts of oppression and exploitation. As Princess Harmony Rodriguez points out in *Whose Lives Matter?: Trans Women of Color and Police Violence*, "We must expand the conversation surrounding police brutality to include trans women who have been victimized or murdered by police."[11] Rodriguez highlights the case of Nizah Morris, a black trans woman from Philadelphia who died after being hit in the head with a gun by police officers. She continues, "Black and/or Latinx transgender people often find ourselves the target of increased police hostility, because of white supremacist, transphobic policing being distinctly opposed to our continued existence." In line with Rodriguez's critique of white supremacy and transphobia, more collective work must also historicize and archive the lived experiences of indigenous trans women of color in the PIC, particularly within the context of settler colonialism, which involves the elimination of Native bodies, cultures, and territories to make room for a settler state. As Judith Butler reminds us, "dispossession is precisely what happens when populations lose their land, their citizenship, their means of livelihood, and become subject to military and legal violence."[12] To add to Butler's observation, dispossession is also intimately tied to settler colonial violence and the de-personalization of this violence through cultural and lived experience.

The historical and political ideologies of settler colonialism naturalize the abusive forces of the police through families, communities, private and public organizations. For example, celebrated newspaper clippings and photos of my great grandmother, herself a *Hapa Haole* (half Hawaiian/half White)—the first woman to serve in the Honolulu Police Depart-

ment—reinforced the notion in my mind that the police were family and were there to ensure community and individual safety.

However, over time, particularly after observing and experiencing the destructive power of incarceration and police violence firsthand—most notably, the imprisonment of my mother and then later my own incarceration—I abandoned my liberal empathy for a police state. This is not to say that I have a deliberate disdain for all police officers. However, a major concern for me rests in the interests spawned by private enterprise, militarism, and settler police enforcement and brutality. We draw attention to settler colonialism and the historical linkages between surveillance, criminalization, incarceration, and Native dispossession to illustrate the underpinnings of ongoing U.S. Imperialism in Hawai'i.

Since the 1840s, white Christian missionaries from the U.S. have used surveillance to discipline gender, sexual, and family-making practices among indigenous peoples. Unfortunately such penal operations continue unabated today.[13] According to RaeDeen Keahiolalo-Karasuda, the public hanging of Chief Kamanawa II in 1848 introduced a "spectacle of morality" and the dismembering of Hawaiian political leadership. In this spectacle, eight hundred Hawaiians were held at gunpoint and forced to observe the hanging of a well-respected Hawaiian chief. Dubiously charged by missionaries for the murder of his wife, the chief was hung as an "object lesson for evil-doers." According to the author, the spectacle provided an important historical analytic from which to observe carcerality and the "selective definition and prosecution of Hawaiians as criminal."[14] The spectacle of the chief's death represented a dramatic shift in the order of things. Most notably, in the Hawaiian context, it further exalted White hetero-patriarchy and Christian domination for restoring public order in the islands and, by extension, alienated Hawaiians from central positions of political power, further codifying Hawaiian bodies as queer, criminal, sinful, and failed.

In recent findings, the Office of Hawaiian Affairs (OHA), in an executive summary entitled *The Disparate Treatment of Native Hawaiians in the Criminal Justice System*, observes that, while Hawaiians only make up 24 percent of the general population of Hawai'i, they comprise 39 percent of the incarcerated population.[15] A laudable achievement for a State-based institution like OHA, the summary documents stories of those who are inoculated into the abysmal state of Hawaiian incarceration. Though the study does an important job of raising awareness about Hawaiians and their experiences in the U.S. criminal justice system, its

occlusion of *mahu* (trans/gender queer) and *aikane* (gay queer) emphasizes the need for an indigenous analysis of gendered captivity narratives in order to challenge the entrenched ideologies of white hetero-patriarchy and settler sexual colonialism both within and without Native communities and communities of color.

Stories by and about *mahu* incarceration challenge romantic ideas about Hawaiian national solidarity. Because trans/gender queer individuals are criminalized, incarcerated, and imprisoned at a higher rate than our cisgender (non-trans) relatives, our stories provide a meaningful critique of prisons, camps, and reservations as temporal and spatial sites that reinforce a white heteronormative and cissexist hierarchy. It is within these spaces that the bodies of Native trans/gender queer peoples and people of color are brutalized and codified as disposable. Stories by, for, and about *mahu* also subvert the dominant narrative about *ka lahui* (the Hawaiian nation) as a puritanical project, pressing scholars to indigenize and decolonize our theorizations of gender captivity and indigenous self-determination; that is, the ways in which race, sexuality, and gender structure and subvert the colonial mapping of our relations to community, land, and ideas about the body, justice, and wellbeing.

Angela Davis reminds us that prisons "relieve us of the responsibility of thinking about the real issues afflicting those communities from which prisoners are drawn in such disproportionate numbers."[16] Centering Davis's observation within our analyses for prison abolition is key to emboldening social responsibility rather than hiding settler colonial processes, institutional racism, trans-queer phobia and poverty. By deflecting the responsibility of institutional failures onto poor, trans/gender queer and communities of color, possessive whiteness goes unchecked and the hegemonic forms of ignorance proliferate. Subsequently, the stories of Black, Latino, and Native young people who now have a greater chance of going to prison and war than getting a decent education remain under-theorized.[17] In addition to existing within the dangerous nexus of race, class, and gender, indigenous peoples and peoples of color are disproportionately inoculated into service for a white-dominated U.S. imperial project.

According to Linda Tuhiwai Smith, there are four key ways to conceptualize imperial domination: (1) imperialism as economic expansion, (2) imperialism as subjugation of others, (3) imperialism as an idea or spirit with many forms of realization, and (4) imperialism as a discursive field of knowledge.[18] Aiding imperialism within the U.S. context is the

Military Industrial Complex or MIC, which, like the PIC, refers to the complex policy relationships between governments, the armed forces, and the industrial sector in maintaining dominion and control over natural resources belonging to brown and black nations. What are important to critique here are narratives of imperial patriotism and nationalism that proclaim to make the world safer or better. Similarly, the PIC refers to the contractual relationships between the various businesses and organizations that promote correctional facilities and their related services. Similar in nature, both the MIC and the PIC require dispossession and exploitation of historically and economically disenfranchised populations to sustain capitalist goals. A dialogical tool for critiquing both the MIC and the PIC is to illustrate how these institutions actually make life less secure and more hostile despite purporting to do otherwise. One of the hidden realities of the PIC, in particular, is the fact that it is more concerned with creating jobs and filling up cells for profit than actually making communities safer. Hence, the war on drugs is a political and militaristic move to excite the economy, to create more jobs for junior partners while remaining remarkably unsuccessful in addressing underlying problems of historical trauma, institutional violence and poverty.

The war on drugs conditions the cultural and material underpinnings of settler colonial violence against indigenous and racialized trans/gender queer communities. Keahiolalo-Karasuda recounts the triangular connections between opium scandals, U.S. militarism in Hawai'i, and the overthrow of Hawai'i's last monarch, Queen Liliuokalani.[19] In the 1890s, the children of the missionaries in Hawaii participated in the opium economy much to the disapproval of Queen Liliuokalani, who, in response, considered legislation to license opium, understanding that decriminalizing the drug would allow the government to decrease its punitive practices. However, this move only threatened the interests of the American businessmen, who, by this time, opposed all forms of Hawaiian taxation and publicly caricatured the Queen as immoral, indolent, and unintelligent. They continued their assault by threatening to kill all of the Queen's supporters if she did not abdicate her throne. With no other choice, the queen yielded her authority hoping that the injustices against her and the people of Hawai'i would soon be resolved. As the first woman of color to head a modern nation-state, Queen Liliuokalani was a direct threat to ideas of white supremacy and heteropatriarchy. Spending nearly eighteen months in captivity, the queen maintained her rightful claim to the kingdom and its lands. In 1898, on the steps of the 'Iolani Palace, American

annexationists, however, had other plans. Pouring salt on an already festering wound of occupation, they lowered the Hawaiian flag, cut it into pieces and replaced it with the American flag. Shortly following this event, the Hawaiian language was banned in public schools. By 1920, under the Hawaiian Homelands Act, American paternal politics rose to define a blood quantum policy—further reducing Hawaiians from an indigenous people with national autonomy to an ethnic minority bound by a U.S. nation state framework of multiculturalism.[20]

By implicating the modern nation state, aka civil society, as enforcer of continued sexual violence against women of color, "Our strategies to combat violence within communities (sexual/domestic violence) must be informed by approaches that also combat violence directed against communities, including state violence—police brutality, prisons, militarism, racism, colonialism, and economic exploitation."[21] As a former rape crisis counselor, Andrea Smith observed the ways in which sexual abuse suffered by women of color was both gendered and racialized: "When a Native woman suffers abuse, this abuse is an attack on her identity as a woman and an attack on her identity as Native because she links the abuse to her cultural group. The issues of colonial, race and gender oppression cannot be separated."[22] In the same vein, she notes how patriarchal gender violence inscribed hierarchy and domination on the bodies of the colonized. She writes, "Ironically, while enslaving women's bodies, colonizers argued that they were actually somehow freeing Native women from the 'oppression' they supposedly faced in Native nations."[23] We can expand Smith's analysis of paternalism as co-constitutive of U.S. nation-state relations with native peoples by observing how hetero-patriarchy and the particular subjugation of Native and trans/gender queer people of color support a possessive investment in white supremacy and empire building.

Though it is difficult to envision a world without prisons, let alone racism and sexism, the deconstruction process of these systems begins with critical resistance. Frantz Fanon wrote, "In the colonial context, as we have already pointed out, the natives fight among themselves. They tend to use each other as a screen, and each hides from his neighbor the national enemy."[24] In other words, as oppressed people fight over day-to-day struggles, placing blame on one another, attention is detracted from the larger conceptual foundations that reproduce continuing symbolic, cognitive, and social oppressions. It is imperative in our struggles for liberation that we challenge possessive investments in whiteness,[25] heteropatriarchy, capitalism, and settler colonialism.

Under colonial rule, racialized and gendered bodies are assigned specific roles to maintain the modern state of capitalism and are alienated from indigenous ways of relating to each other and to the world. Consequently, the alienation of racialized and gendered bodies conditions governmental and private agents to surveil populations as if we are the internal threats to national security. Implicitly, we are marked by the prison system as jaded stockpiles of vengeance-seekers looking to exact revenge for past wrongs, people who are in need of control, discipline, and paternalism. In order to combat these reductive and over-deterministic images, it is important that we continue to share our stories, tell our truths, and make visible the interconnected articulations between our struggles while making room for acknowledging the incommensurability of our individuated circumstances, differences, histories, lived experiences, and cultural traditions.

In 2015, as a doctoral candidate in anthropology at the University of Washington Seattle, my incarceration in 2001 seems worlds away. Nonetheless, I still embody the spirit of that young Native trans woman, the girl who refused to deny her womanhood in the face of carceral violence, the young girl who scratched police officers for taking her mother away and then used those same fingernails to maintain her eyebrows while in the dimly lit cellblock bathroom of the Thurston County Jail. At the corner of NE 45th Street and 16th Avenue NE, near my academic department in Denny Hall, she appears in street art: "No More Prisons" and "Don't Let Your Dreams Die Here," reminding me that the work of abolition must intimate a deeper decolonial framework of solidarity and critical resistance that moves through and against institutional barriers and impositions. She reminds me that an articulation of shared liberation for all oppressed peoples—a desiring subjectivity in continual remaking—must also take to heart an indigenous abolitionist imaginary, one rooted and routed to evolving ideas about self-determination, anti-racism, trans/gender queer empowerment, de-militarism, and prison abolition.

NOTES

1 The title of this article pays homage to Hawaiian feminist scholar-activist Haunani-Kay Trask, and the coveted title of her polemical work *From A Native Daughter: Colonialism and Sovereignty in Hawaii* (Honolulu: University of Hawaii Press, 1999), a critical examination of feminist, Native, and ethnic tensions within and without the contextual frameworks of Hawaiian sovereignty and related movements for self-determination and autonomy.

2 For a more detailed read on the evolving notions of Hawaiian sovereignty, read *A Nation Rising: Hawaiian Movements for Life, Land and Sovereignty*, eds. Noelani Goodyear-Kaopua, Ikaika Hussey, and Erin Kahunaawaika'ala Wright (Durham: Duke University Press, 2014).

3 PIC, or the Prison Industrial Complex, refers to the contractual relationships between the various businesses and organizations that promote correctional facilities and their related services. For more about the PIC and the problems of a police state—particularly for trans/gender queer people and folks of color—see Dean Spade's *Normal Life: Administrative Violence, Critical Trans Politics and the Limits of Law* (Brooklyn: South End Press, 2011). Also, for further readings on the prison as an interface for conflicting ideologies, visions, and power dynamics, see Ruth Wilson Gilmore's *Golden Gulag: Prisons, Surplus, Crisis, and Opposition in Globalizing California* (Berkeley: University of California Press, 2007).

4 I'd like to thank Janet Mock and Maile Arvin who speak to the issue of anti-black racism in Hawai'i and raise the need for indigenous engagements with critical race, ethnic, and trans/gender queer studies. For further reading see Maile Arvin's piece "Possessions of Whiteness: Settler Colonialism and Anti-Blackness in the Pacific," which was published in the online journal *Decolonization: Indigeneity, Education & Society* on June 2, 2014 (https://decolonization.wordpress.com). Also, read Janet Mock's *New York Times* Bestseller, *Redefining Realness: My Path to Womanhood, Identity, Love & So Much More* (New York: Atria Books, 2014) for more on the lived experiences of anti-black racism and transgender subject formation in Hawai'i. While I agree that anti-black racism conditions everyday life in Hawai'i, it is imperative that mixed Hawaiian scholars continue to reclaim our indigenous epistemologies from the grips of possessive whiteness, erasure, and marginalization as a radical act of decolonial refusal and collective solidarity with all oppressed and exploited groups.

5 Waianae, Hawai'i is known for having the largest Hawaiian Kanaka Maoli, or indigenous Hawaiian population, anywhere in the world. It is also known for a population burdened with disproportionate rates of unemployment, disease, poverty, and low life expectancy due to a number of ecological, public health, and political factors. For more on Waianae, read *Potent Mana: Lessons in Power and Healing* (Albany: SUNY Press, 2012) by Wende Elizabeth Marshall, and Kali Fermantez's "Re-Placing Hawaiians in dis Place We Call Home," *Hūlili* 8 (2012): 97–131.

6 The term *Kuleana*, or collective responsibility, describes the labor practices invested into one's extended relational network. These obligations often involve generating cultural and material resources and reinvesting these resources into the wellbeing of relationships of self, family, community, nation, and more-than-human.

7 Davis's article can be found in *Invisible Punishment: The Collateral Consequences of Mass Imprisonment*, eds. Marc Mauer and Meda Chesney-Lind (New York: New Press, 2002), 62.

8 Scott Lauria Morgensen's "Settler Homonationalism: Theorizing Settler Colonialism Within Queer Modernities" was published in *GLQ: A Journal of Lesbian and Gay Studies* 16, no. 1–2 (2010): 105–131. The article explores both the limits of homonationalism as a specific project of queer modernity and seeks to queer the discursive limits of settler colonial theory.

9 The Apology Bill (1993), signed by former U.S. president, Bill Clinton, which acknowledges the illegal overthrow of the Hawaiian kingdom by the United States, for example, erases responsibility for settlement claims on behalf of Hawaiian national subjects, including claims to 1.8 million acres of land and self-governance on a non-blood quantum basis.

Indigenous Activism and Contemporary Solidarity and Struggle in North America

Black Lives Matter Stands In Solidarity with Water Protectors at Standing Rock

Members of the Black Lives Matter Network join resistance at Standing Rock

In the state of North Dakota, there is a movement for all of us. A movement for the recognition that water is life. A movement led by warriors, women, elders, and youth. A movement made possible by the actions taken by those who came before us, steeped in the wisdom of elders. A movement anchored by Indigenous women who put their bodies on the line for our liberation.

Over the past weekend, members of the Black Lives Matter Network traveled to North Dakota to stand in solidarity with Indigenous peoples who are putting their bodies and lives on the line to protect our right to clean water. The Dakota Access Pipeline could carry more than 400,000 barrels of crude oil a day from western North Dakota across South Dakota and Iowa to connect with an existing pipeline in Illinois. It is a 1,100-mile pipeline, estimated to cost $3.7 billion, and is about halfway complete. The water protectors who are protesting the Dakota Access Pipeline are engaged in a critical fight against big oil for our collective human right to access water. To be clear, this is not a fight that is specific only to Native peoples– this is a fight for all of us and we must stand with our family at Standing Rock.

Though the gathering of folks at Standing Rock began in April, it was approximately two weeks ago when the situation escalated as four women risked their bodies to physically stop construction on the pipeline. While construction was halted at that point, it continues on the pipeline right now, and hundreds of people have joined, donated to, and amplified the cause. Mainstream media is doing its part to ignore this resistance; it is not in the interests of large corporations or the federal government for the world to see Indigenous peoples in America working together to protect the land and water we all need to survive. The gathering at Standing Rock is a testimony against capitalism– we do not have to destroy the world and our resources for money to provide for one another. In fact, we must do the complete opposite. Scarcity is a myth and if we take care of the Earth, our family that comes after us will be taken care of by the Earth.

The Indigenous peoples leading this work have traveled from towns and reservations from all over the country, representing over seventy Nations and making this the largest gathering of Indigenous Nations since 1973. This is a critical moment in our history, where we must decide if we want to stand together for our collective well being or ignore what is happening– the further corruption of our water sources and the intentional disregard of the treaty rights and self determination of Indigenous folks in North Dakota.

Black Lives Matter stands with Standing Rock. As there are many diverse manifestations of Blackness, and Black people are also displaced Indigenous peoples, we are clear that there is no Black liberation without Indigenous sovereignty. Environmental racism is not limited to pipelines on Indigenous land, because we know that the chemicals used for fracking and the materials used to build pipelines are also used in water containment and sanitation plants in Black communities like Flint, Michigan. The same companies that build pipelines are the same companies that build factories that emit carcinogenic chemicals into Black communities, leading to some of the highest rates of cancer, hysterectomies, miscarriages, and asthma in the country. Our liberation is only realized when all people are free, free to access clean water, free from institutional racism, free to live whole and healthy lives not subjected to state-sanctioned violence. America has committed and is committing genocide against Native American peoples and Black people. We are in an ongoing struggle for our lives and this struggle is shaped by the shared history between Indigenous peoples and Black people in America, connecting that stolen land and stolen labor from Black and brown people built this country.

Black Lives Matter affirms that our lives do matter on Indigenous Land. We affirm our family's right to land and clean water, a right that does not change based on the whims of American companies who wish to make more money off poisoning the waters that we depend on to live. We affirm our right to live takes precedent over corporations' prerogative to make a profit.

Currently, water protectors are awaiting a decision from the courts. This decision is expected to be made by September 9th, and Black Lives Matter will continue to stand with Indigenous peoples throughout that time and beyond. Water is life, and we must all fight to

protect it.

#NODAPL #WaterIsLife

To support:

Red Warrior Camp, in partnership with the Camp of the Sacred Stones, has put out an official Call to Action for all allies to stand in solidarity. Please join the #NoDAPL Global Weeks of Solidarity Action which will run from September 3rd through September 17th. Please join this Indigenous led movement to stop the Dakota Access Pipeline by planning or joining an action near you! For more information about the weeks of action or to join an action, please visit www.NoDAPLSolidarity.org. (http://l.facebook.com/l.php?u=http%3A%2F%2Fwww.NoDAPLSolidarity.org%2F&h=IAQE_51FKAQHbZ45OfTAc6HMs_k7uslek1F6mDMwAa2BUpw&enc=AZPzn9YN_3au12SJnvcyJ2xGBv4GGvGJBuBVXX0o6Zs4-ihf2oCN6ThXJzhp0QI7OtjLDfbLjbtTrxqEqiQtOhgeww7vjvwEGtG3lpGeuBFBRY--6Q_H8aY2tJPNjU0s7N7obHcDe1P_sK1mKdei5OUoBo0Em671qMroG05TuvjDFpDdZOEYGTX-DJgwLCI3oU8&s=1)

Here is a list of some of the most recent needs for Red Warrior Camp:

- Gift Cards
- Visa Gas Cards

CAMPING SUPPLIES:

- Tents
- 1 person pup tents
- Camp stoves
- Propane tanks (lg & sm)
- Lighters/matches
- Flashlights
- Lanterns
- Sleeping bags
- Blankets
- Heat blankets
- Rain Coats/rain gear
- Wool Socks
- Winter gear
- Shades/canopies
- Chem lights
- Tarps
- Folding tables (Various Sizes)
- Lg Coolers
- Cell phone boosters
- Solar powered chargers/lights
- Walkie talkies
- Fire wood
- Parachute cord
- Jumper Cables
- Storage Bins
- CB Radios
- Police scanners

COOKING SUPPLIES:

- Industrial sized pots
- Pans
- Cooking sheets

BULK FOOD:

- Rice
- Flour
- Beans
- Meat
- Non-perishable food

ART SUPPLIES:

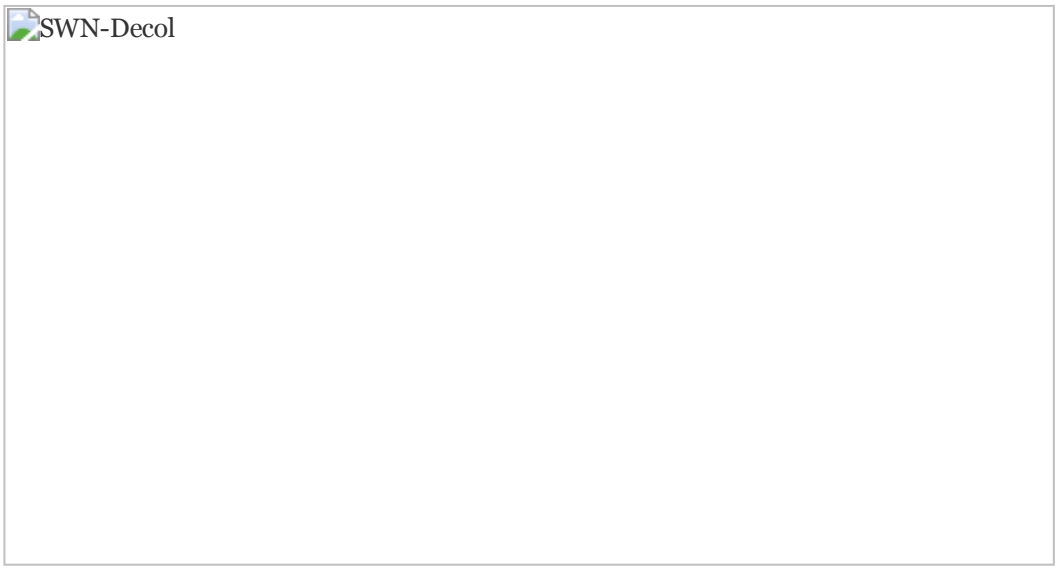
- Canvas
- Poster board
- Paint
- Paint rollers
- Spray paint
- White flat sheets
- Screen printing materials
- Drawing ink
- T-shirts
- Sweaters
- Large Tote/storage boxes

KITCHEN SHADE MATERIALS:

- Lumber
- Metal shelving units
- Nails
- Hammers
- Screws
- Battery powered drill

For Our Nations to Live, Capitalism Must Die

Posted on November 5, 2013 | 4 Comments



By Glen Coulthard, Voices Rising (Indigenous Nationhood Movement)

There is a significant and to my mind problematic limitation that is increasingly being placed on Indigenous efforts to defend our rights and our lands. This constraint involves the type of tactics that are being represented as morally legitimate in our efforts to defend our land and rights as Indigenous peoples on the one hand, and those which are viewed at as morally illegitimate because of their disruptive and extra-legal character on the other.

With respect to those approaches deemed "legitimate" in defending our rights, emphasis is often placed on formal "negotiations" – usually carried out between "official" Aboriginal leadership (usually men) and representatives of the Crown (also usually men) – and if need be coupled with largely symbolic acts of peaceful, non-disruptive protest that must abide by Canada's "rule of law."

Then there are those approaches increasingly deemed "illegitimate." These include but are not limited to forms of protest and direct action that seek to influence power through less mediated and sometimes more disruptive measures, like the slowing of traffic for the purpose of leafleting and solidarity-building, temporarily blocking access to Indigenous territories with the aim of impeding the exploitation of First Nations' land and resources, or in rarer cases still, the re-occupation of a portion of Indigenous land (rural or urban) through the establishment of reclamation sites that also serve to disrupt, if not entirely block, access to Indigenous territories by state and capital for prolonged periods of time.

Regardless of their diversity and specificity, however, most of these activities tend to get branded in the media in a wholly negative manner: as reactionary, threatening, and disruptive.

Blockades and beyond

What the recent actions of the Mi'kmaq land and water defenders at Elsipogtog c the form of Indigenous blockades are both a negation and an affirmation. They a as they seek to impede or block the flow of resources currently being transported lumber mills, mining operations, and hydro-electric facilities located on the disp nations to international markets. These forms of direct action, in other words, se economic infrastructure that is core to the colonial accumulation of capital in set Canada's. Blocking access to this critical infrastructure has historically been qui gains for Indigenous communities. Over the last couple of decades, however, sta become quite skilled at recuperating the losses incurred as a result of Indigenous leaders off the land and into negotiations where the terms are always set by and

What tends to get ignored by many self-styled pundits is that these actions are also an affirmative gesture of Indigenous resurgence insofar as they embody an enactment of Indigenous law and the obligations such laws place on Indigenous peoples to uphold the relations of reciprocity that shape our engagements with the human and non-human world – the land. The question I want to explore here, albeit very briefly, is this: how might we begin to scale-up these often localized, resurgent land-based direct actions to produce a transformation in the colonial economy more generally? Said slightly differently, how might we move beyond a resurgent Indigenous politics that seeks to inhibit the destructive effects of capital to one that strives to create Indigenous alternatives to it?

Rebuilding our nations

In her recent interview with Naomi Klein, Leanne Betasamosake Simpson hints at what such an alternative or alternatives might entail for Indigenous nations. "People within the Idle No More movement who are talking about Indigenous nationhood are talking about a massive transformation, a massive decolonization"; they are calling for a "resurgence of Indigenous political thought" that is "land-based and very much tied to that intimate and close relationship to the land, which to me means a revitalization of sustainable local Indigenous economies."

Without such a massive transformation in the political economy of contemporary settler-colonialism, any efforts to rebuild our nations will remain parasitic on capitalism, and thus on the perpetual exploitation of our lands and labour. Consider, for example, an approach to resurgence that would see Indigenous people begin to reconnect with their lands and land-based practices on either an individual or small-scale collective basis. This could take the form of "walking the land" in an effort to re-familiarize ourselves with the landscapes and places that give our histories, languages, and cultures shape and content; to revitalizing and engaging in land-based harvesting practices like hunting, fishing, and gathering, and/or cultural production activities like hide-tanning and carving, all of which also serve to assert our sovereign presence on our territories in ways that can be profoundly educational and empowering; to the re-occupation of sacred places for the purposes of relearning and practicing our ceremonial activities.

Although all of these place-based practices are crucial to our well-being and offer profound insights into life-ways that provide frameworks for thinking about alternatives to an economy predicated on the perpetual exploitation of the human and non-human world, at the micro-political level that these practices tend to operate they still require that we have access to a mode of subsistence detached from the practices themselves. In other words, they require

that we have access to a very specific form of work – which, in our present economy depends on the expropriation of our labour and the theft of our time for the profit of others – in order to generate the cash required to spe[illegible] regenerative time on the land.

A similar problem informs self-determination efforts that seek to ameliorate our through resource revenue sharing, more comprehensive impact benefit agreemer employment strategies negotiated through the state and with industries tearing though the capital generated by such an approach could, in theory, be spent sub cultural traditions and practices, in the end they would still remain dependent c entirely at odds with the deep reciprocity that forms the cultural core of many In with land.

Developing Indigenous political-economic alternatives

What forms might an Indigenous political-economic alternative to the intensific our territories take? For some communities, reinvigorating a mix of subsistence- contemporary economic ventures is one alternative. In the 1970s, for example, the Dene Nation sought to curtail the negative environmental and cultural impacts of capitalist extractivism by proposing to establish an economy that would apply traditional concepts of Dene governance – decentralized, regional political structures based on participatory, consensus decision-making – to the realm of the economy. At the time, this would have seen a revitalization of a bush mode of production, with emphasis placed on the harvesting and manufacturing of local renewable resources through traditional activities like hunting, fishing, and trapping, potentially combined with and partially subsidized by other economic activities on lands communally held and managed by the Dene Nation. Economic models discussed during the time thus included the democratic organization of production and distribution through Indigenous co-operatives and possibly worker-managed enterprises.

Revisiting Indigenous political-economic alternatives such as these could pose a real threat to the accumulation of capital on Indigenous lands in three ways. First, through mentorship and education these economies reconnect Indigenous people to land-based practices and forms of knowledge that emphasize radical sustainability. This form of grounded normativity is antithetical to capitalist accumulation. Second, these economic practices offer a means of subsistence that can over time help break our dependence on the capitalist market by cultivating self-sufficiency through the localized and sustainable production of core foods and life materials that we distribute and consume within our own communities on a regular basis. Third, through the application of Indigenous governance principles to non-traditional economic activities we open up a way of engaging in contemporary economic ventures in an Indigenous way that is better suited to foster sustainable economic decision-making, an equitable distribution of resources within and between Indigenous communities, Native women's political and economic emancipation, and empowerment for Indigenous citizens and workers who may or must pursue livelihoods in sectors of the economy outside of the bush. Why not critically apply the most egalitarian and participatory features of our traditional governance practices to all of our economic activities, regardless of whether they are undertaken in land-based or urban contexts? Cities are on Indigenous land too, and a hell of a lot of us currently live in them.

New alliances, new opportunities

The capacity of resurgent Indigenous economies to challenge the hegemony of settler-colonial capitalism in the long term can only happen if certain conditions are met, however. First, all of the colonial, racist, and patriarchal legal, political obstacles that have been used to block our access to land need to be confronted and removed. Of course capitalism continues to play a core role in dispossessing us of our lands and self-determining authority, but it only does so in concert with axes of exploitation and domination configured along racial, gender and state lines. Given

the resilience of these equally devastating relations of power, our efforts to decolonize must directly confront more than just economic relations; they must account for the complex ways that capitalism, patriarchy, whit supremacy, and the state interact with one another to form the constellation of power relations that sus patterns of behavior, structures, and relationships. Dismantling these oppressiv require that we continue to assert our presence on all of our territories, coupled w with the forces of colonization through the forms of direct action that are current communities like Elsipogtog.

Second, we also have to acknowledge that the significant political leverage requi economic exploitation of our people and homelands while constructing alternati generated through our direct actions and resurgent economies alone. Settler-colo populations too small to affect this magnitude of change. This reality demands t if not actively seek out and establish, relations of solidarity and networks of trad transnational communities and organizations that are also struggling against th capital, including other Indigenous nations and national confederacies; urban In organizations; the labour, women's, GBLTQ2S, and environmental movements; ethnic communities that find themselves subject to their own distinct forms of economic, social and cultural marginalization. The initially rapid and relatively widespread support expressed both nationally and internationally for the Idle No More movement last spring, and the solidarity generated around the Elsipogtog anti-fracking resistance today, gives me hope that establishing such relations are indeed possible.

It's time for our communities to seize the unique political opportunities of the day. In the delicate balancing act of having to ensure that one's social conservative contempt for First Nations doesn't overwhelm one's neoconservative love of the market, Prime Minister Harper has erred by letting the racism and sexism of the former outstrip his belligerent commitment to the latter. This is a novice mistake that Liberals like Jean Chrétien and Paul Martin learned how to manage decades ago. As a result, the federal government has invigorated a struggle for Indigenous self-determination that must challenge the relationship between settler-colonization and free-market fundamentalism in ways that refuse to be co-opted by scraps of recognition, opportunistic apologies, and the cheap gift of political and economic inclusion. For Indigenous nations to live, capitalism must die. And for capitalism to die, we must actively participate in the construction of Indigenous alternatives to it.

#IDLENOMORE IN HISTORICAL CONTEXT

Glen Coulthard

Much has been said recently in the media about the relationship between the inspiring expression of Indigenous resurgent activity at the core of the #IdleNoMore movement and the heightened decade of Native activism that led Canada to establish the Royal Commission on Aboriginal Peoples (RCAP) in 1991. I offer this short analysis of the historical context that led to RCAP in an effort to get a better sense of the transformative political possibilities in our present moment of struggle.

The federal government was forced to launch RCAP in the wake of two national crises that erupted in the tumultuous "Indian summer" of 1990. The first involved the legislative stonewalling of the Meech Lake Accord by Cree Manitoba MLA Elijah Harper. The Meech Lake Accord was a failed constitutional amendment package negotiated in 1987 by then Prime Minister of Canada, Brian Mulroney, and the ten provincial premiers. The process was the federal government's attempt to bring Quebec "back in" to the constitutional fold in the wake of the province's refusal to accept the constitutional repatriation deal of 1981, which formed the basis of the *The Constitution Act, 1982*. Indigenous opposition to Meech Lake was staunch and vocal, in large part due to the fact that the privileged white men negotiating the agreement once again refused to recognize the political concerns and aspirations of First Nations. In a disruptive act of legislative protest, Elijah Harper initiated a filibuster in the days immediately leading up to the accord's ratification deadline, which ultimately prevented the province from endorsing the package. The agreement subsequently tanked because it failed to gain the required ratification of all ten provinces within three years of reaching a deal.

The second crisis involved a 78-day armed "standoff" beginning on July 11, 1990, between the Mohawk nation of Kanesatake, the Quebec provincial police (SQ), and the Canadian armed forces near the town of Oka, Quebec. On June 30, 1990, the municipality of Oka was granted a court injunction to dismantle a peaceful barricade erected by the people of Kanesatake in an effort to defend their sacred lands from further encroachment by non-Native developers. The territory in question was slotted for development by a local golf course, which planned

on extending nine holes onto land the Mohawks had been fighting to have recognized as their own for almost 300 years. Eleven days later, on July 11, one hundred heavily armed members of the SQ stormed the community. The police invasion culminated in a 24-second exchange of gunfire that killed SQ Corporal Marcel Lemay. In a display of solidarity, the neighbouring Mohawk nation of Kahnawake set up their own barricades, including one that blocked the Mercier Bridge leading into the greater Montreal area. Galvanized by the Mohawk resistance, Indigenous peoples from across the continent followed suit, engaging in a diverse array of solidarity actions that ranged from leafleting to the establishment of peace encampments to the erection of blockades on several major Canadian transport corridors, both road and rail. Although polls conducted during the standoff showed some support by non-Native Canadians outside of Quebec for the Mohawk cause, most received their information about the so-called "Oka Crisis" through the corporate media, which overwhelmingly represented the event as a "law and order" issue fundamentally undermined by Indigenous peoples' anger and resentment-fuelled criminality.[2]

For many Indigenous people and their supporters, however, these two national crises were seen as the inevitable culmination of a near decade-long escalation of Native frustration with a colonial state that steadfastly refused to uphold the rights that had been recently "recognized and affirmed" in section 35 (1) of the *The Constitution Act, 1982*. By the late 1980s, this frustration was clearly boiling over, resulting in a marked rise in First Nations' militancy and land-based direct action. The following are some of the more well-documented examples[3] from the time:

1. The Innu occupation and blockade of the Canadian Air Force/NATO base at Goose Bay, Labrador. The occupation was led largely by Innu women to challenge the further dispossession

2 On the lasting signifance and impact of the Mohawk resistance at Kanesatake, see Leanne Betasamosake Simpson and Kiera Ladner (Eds.), *This is an Honour Song: Twenty Years Since the Blockades* (Winnpeg: Arbeiter Ring Press, 2012).

3 For a useful discussion of these and other examples of First Nations activism of the time, see Boyce Richardson (Ed.), *Drumbeat: Anger and Renewal in Indian Country* (Ottawa: Published by Summerhill Press and The Assembly of First Nations, 1989).

of their territories and the destruction of their land-based way of life by the military industrial complex's encroachment onto the Innu peoples' homeland of *Nitassinan*;

2. The Lubicon Cree struggle against oil and gas development on their traditional territories in present-day Alberta. The Lubicon Cree have been struggling to protect a way of life threatened by intensified capitalist development on their homelands since at least 1939. Over the years, the community has engaged in a number of very public protests to get their message across, including a well-publicized boycott of the 1988 Calgary Winter Olympics and the associated Glenbow Museum exhibit, *The Spirit Sings*;
3. First Nations blockades in British Columbia. Throughout the 1980s, First Nations in B.C. grew extremely frustrated with the painfully slow pace of the federal government's comprehensive land claims process and the province's racist refusal to recognize Aboriginal title within its borders. The result was a decade's worth of very disruptive blockades, which at its height in 1990 were such a common occurrence that Vancouver newspapers felt the need to publish traffic advisories identifying delays caused by First Nation roadblocks in the province's interior. Many of the blockades were able to halt resource extraction on Native land for protracted periods of time;
4. The Algonquins of Barriere Lake. By 1989, the Algonquins of Barrier Lake were embroiled in a struggle to stop clear-cut logging within their traditional territories in present-day Quebec because these practices threatened their land and way of life. Under the leadership of customary chief Jean-Maurice Matchewan, the community used blockades to successfully impede clear-cutting activities affecting their community.
5. The Temagami First Nation blockades of 1988 and 1989 in present-day Ontario. The Temagami blockades were set up to protect their nation's homeland from further encroachment by non-Native development. The blockades of 1988-89 were the most recent assertions of Temagami sovereignty in over a century-long struggle to protect the community's right to land and freedom from colonial settlement and development.

From the vantage point of the colonial state, by the time the 78-day standoff at Kanesatake had begun, things were already out of control in Indian Country. If settler-state stability and authority are required to ensure "certainty" over lands and resources to create a climate friendly for expanded capitalist accumulation, then the barrage of Indigenous practices of disruptive counter-sovereignty that emerged with increased frequency in the 1980s was an embarrassing demonstration that Canada no longer had its shit together with respect to managing the so-called "Indian Problem." On top of this, the material form that these expressions of Indigenous sovereignty took on the ground—*the blockade*, explicitly erected to impede constituted flows of racialized capital and state power from entering Indigenous territories—must have been particularly troubling to the settler-colonial elite. All of this activity was an indication that Indigenous people and communities were no longer willing to wait for Canada (or even their own leaders) to negotiate a just relationship with them in good faith. There was also growing concern that Indigenous youth in particular were no longer willing to play by Canada's rules—especially regarding the potential use of political violence—when it came to advancing their communities' rights and interests. As then National Chief of the Assembly of the First Nations, Georges Erasmus, warned in 1988: "Canada, if you do not deal with this generation of leaders, then we cannot promise that you are going to like the kind of violent political action that we can just about guarantee the next generation is going to bring to you." Consider this "a warning," Erasmus continued, "We want to let you know that you're playing with fire. We may be the last generation of leaders that are prepared to sit down and peacefully negotiate our concerns with you."[4]

In the wake of having to engage in one of the largest military operations since the Korean War, the federal government announced on August 23, 1991 that a royal commission would be established with a sprawling 16-point mandate to investigate the abusive relationship that had clearly developed between Aboriginal peoples and the Canadian state. Published two years behind schedule in November 1996, the $58 million, five-volume, approximately 4,000-page *Report of the Royal Commission on Aboriginal Peoples* (RCAP) includes 440

4 "Act or Face threat of violence, native leader warns Ottawa," *Toronto Star* (June 1, 1988), A1.

recommendations which call for a renewed relationship based on the core principles of "mutual recognition, mutual respect, sharing and mutual responsibility." The material conditions that informed the decade of Indigenous protest that led to the resistance at Kanesatake created the political context that RCAP's call for recognition and reconciliation was supposed to pacify—namely, the righteous anger and resentment of the colonized transformed into an insurgent reclamation of Indigenous difference that threatened to *un-settle* settler-colonialism's sovereign claim over Indigenous people and our lands.

With respect to the emergent #IdleNoMore movement, although many of the conditions that compelled the state to undertake the most expensive public inquiry in Canadian history are still in place, a couple of important ones are not. The first condition that appears to be absent is the perceived threat of political violence that was present in the years leading to the resistance at Kanesatake. #IdleNoMore is an explicitly non-violent movement, which accounts for its relatively wide spectrum of both Native and non-Native support at the moment. However, if the life of Attawapiskat Chief Theresa Spence continues to be recklessly put in jeopardy by a Prime Minister who negligently refuses to capitulate to her reasonable demands, it is my prediction that the spectre of political violence will re-emerge in Indigenous peoples' collective conversations about what to do next. The responsibility for this rests solely on the state. The second condition that differentiates #IdleNoMore from the decade of Indigenous activism that led to RCAP is the absence (so far) of widespread economic disruption unleashed by Indigenous direct action. If history has shown us anything, it is this: if you want those in power to respond swiftly to Indigenous peoples' political efforts, start by placing Native bodies (with a few logs and tires thrown in for good measure) between settlers and their money, which in colonial contexts is generated by the ongoing theft and exploitation of our land and resource base. If this is true, then the long-term efficacy of the #IdleNoMore movement would appear to hinge on its protest actions being distributed more evenly between the malls and front lawns of legislatures on the one hand, and the logging roads, thoroughfares, and railways that are central to the accumulation of colonial capital on the other. For better and for worse, it was our peoples' challenge to these two pillars of colonial sovereignty that led to the recommendations of

RCAP: the Canadian state's claim to hold a legitimate monopoly on use of violence and the conditions required for the ongoing accumulation of capital. In stating this, however, I don't mean to offer an unqualified endorsement of these two challenges, but rather a diagnosis of our present situation based on an ongoing critical conversation about how these differences and similarities ought to inform our current struggle.

WHY ARE WE IDLE NO MORE?

Pamela Palmater

The Idle No More movement, which has swept the country over the holidays, took most Canadians, including Prime Minister Stephen Harper and his Conservative government, by surprise. That is not to say that Canadians have never seen a native protest before, as most of us recall Oka, Burnt Church, and Ipperwash. But most Canadians are not used to the kind of sustained, coordinated, national effort that we have seen in the last few weeks—at least not since 1969. 1969 was the last time the federal government put forward an assimilation plan for First Nations. It was defeated then by fierce native opposition, and it looks like Harper's aggressive legislative assimilation plan will be met with even fiercer resistance.

In order to understand what this movement is about, it is necessary to understand how our history is connected to the present-day situation of First Nations. While a great many injustices were inflicted upon the indigenous peoples in the name of colonization, indigenous peoples were never "conquered." The creation of Canada was only possible through the negotiation of treaties between the Crown and indigenous nations. While the wording of the treaties varies from the peace and friendship treaties in the east to the numbered treaties in the west, most are based on the core treaty promise that we would all live together peacefully and share the wealth of this land. The problem is that only one treaty partner has seen any prosperity.

The failure of Canada to share the lands and resources as promised in the treaties has placed First Nations at the bottom of all

Declaring War on KXL: Indigenous Peoples Mobilize

by Nick Estes

We're going to declare war on the Keystone XL Pipeline," Oglala Sioux Tribe President Bryan Brewer told a crowd of several hundred Natives and non-Natives on March 29 at the opening ceremony of the Rosebud Sioux Tribe's (RST) Oyate Wahacanka Woecun ("shield the people") camp. The next day, at the "Stand Sacred Ground" meeting in Lower Brule, South Dakota (SD), RST President Cyril Scott similarly stated, "It's time for a declaration of war." A five-year limbo of uncertainty about KXL has prompted outrage from the Oceti Sakowin ("The Great Sioux Nation"). It has even galvanized an unlikely "Cowboy-Indian Alli-ance" with non-Native Nebraskan landowners. Thousands of members of this alliance recently marched and camped on the Washington National Mall in honor of Earth Day on April 22—just days after the State Department announced an "indefinite" delay on making any decision on KXL.

In spite of continued political foot dragging, anti-KXL actions continue to unite communities along the proposed pipeline corridor, across the nation, and even with Canadian First Nations, whose lands and communities are most directly affected by the highly exploitive oil sands extraction. Urgency grips the Oceti Sakowin, who make up a majority of the populations in six of the ten poorest counties in the U.S. Social and economic precarity, however, has not stopped grassroots organizations such as the Owe Aku, Wica Agli, and Protect the Sacred from creating protest camps at Witten, SD on the Rosebud Reservation and Bridger, SD on the Cheyenne River Reservation. Debra White Plume of Owe Aku has for the last several years offered training workshops in non-violent direct action against heavy machinery that would be used to construct the pipeline. Other grassroots organizations have begun planning and setting up protest camps to thwart construction plans.

Regardless of strategy, the Oceti Sakowin, among North America's most disenfranchised populations, have pledged to halt TransCanada's pipeline, which spans 875 miles from Montana to Nebraska alone, at all costs. Stakes are high. KXL's planned path would cross ancestral Lakota territory protected under the 1868 Fort Laramie Treaty, which includes 24 million acres comprising all of Western South Dakota and parts of Nebraska, Wyoming, North Dakota, and Montana. Treaty rights have reignited claims to defend what many consider tribal national territory protected under international law, even if that land was dispossessed.

TransCanada, however, has neglected these rights. The Final Supplemental Env-ironmental Impact Statement for the Keystone XL Project requires programmatic agreements with tribal nations regarding culturally and historically sensitive sites and rights of way for ancillary infrastructure that would cross tribal trust land, but many argue that the way TransCanada carried out tribal consultation directly violates UN Declaration on Rights of Indigenous Peoples' provision of "prior and informed consent" and undermines tribal sovereignty. For example, the 2010 and 2013 tribal programmatic agreements set up a

three-tiered system of "consent," determining certain privileges in negotiating tribal rights to cultural resource management and rights of way. Non-participating tribes are completely exempt from negotiations. This presents a double-bind for tribes opposed to KXL: only by consulting with TransCanada can a tribe negotiate cultural resource management and its rights of way.

Tribal Nations' flags line the Rosebud Sioux Tribe's Oyate Wahacanka Woecun ("shield the people") camp.

Many are also concerned that leaks or spills would contaminate vital freshwater resources. KXL would slurry toxic and high viscosity oil sands bitumen (830,000 barrels per day) heated to 150°F across tribal freshwater utility services, the Mni Wiconi Rural Water Supply; across approximately 357 rivers and streams, all direct or indirect tributaries to North America's largest drainage system, the Mississippi River; and across the Ogallala Aquifer, one of the world's largest aquifers that provides a major source of freshwater for agriculture and individual consumption in eight states (South Dakota, Nebraska, Wyoming, Colorado, Kansas, Oklahoma, New Mexico, and Texas). The contamination of these highly fragile, interconnected water systems could be catastrophic for all plants, animals, and humans (an estimated 30 million) dependent on them for life.

While Canadian First Nations have called for a moratorium of oil sands extraction in the Western Canadian Sedimentary Basin in province of Alberta, U.S.-based Native nations are mounting legal and political resistance against KXL, a pipeline that would connect Alberta oil sands extraction with refineries in the Gulf of Mexico. "Declaring war" on KXL and TransCanada should not be taken lightly. Grassroots organizations and tribal governments are leading the opposition against KXL on the Northern Great Plains, but they need resources and legal support. The Obama's administration's ambivalent stance on KXL only raises the stakes for tribal communities, whose lands and lives are most vulnerable. A district court recently ruled Nebraska's state government's approval for KXL "unconstitutional," revealing avenues for legal resistance and challenge.

However, the challenge of building effective opposition is also contingent upon grassroots action. While many of the grassroots organizations are plugged into the large anti-KXL movement, they do not have the financial and legal support necessary to carry out sustained resistance. Many operate on a volunteer basis and also work on community-based projects, such as providing social and economic services, cultural and language revitalization, environmental protection and conservation, defending tribal lands and resources,

and working on international Indigenous human rights. Immediate action and financial resources are desperately needed for these small-scale, tribally-based movements for not only anti-KXL work, but also sustained community development programs that provide much needed services and resources in the U.S.'s poorest counties. If these movements are to succeed beyond stopping KXL, they will require financial and legal support to continue their projects.

Accumulation of the primitive: the limits of liberalism and the politics of occupy Wall Street

Sandy Grande*

Education Department, Connecticut College, New London, CT 06320, USA

This article examines the Occupy Wall Street (OWS) movement and its basic elision of Indigenous peoples as the first and already "occupied" peoples of this land; illuminating the so-called 99% as not simply united in their collective indignation, but also their settler status. Thus, by deploying the discursive trope and strategy of "occupation" as its central organizing principle, OWS reconstitutes (territorial) appropriation as the democratic manifest and fails to propose something distinct from or counter to the settler state. In so doing, the movement dissolves colonialism into capitalism by courting a limited and precarious equality predicated on (or more pointedly in exchange for) the "elimination of the Native". In contradistinction, critical Indigenous theories disrupt the colonial architecture that frames Indigenous/state relations in ways that not only mark the (Foucauldian) shift from sovereign to discursive forms of power, but also insist upon the conciliatory and accommodationist discourses of liberalism as equally, if not more, effective in reproducing settler hegemony.

You can almost see Ground Zero from Zuccotti Park. Where there was once an eerie void in the lower Manhattan skyline, the "Freedom Tower" now looms spectacular. The Tower's twin reflecting pools are edged with bronze panels featuring the 2,983 names of every person who died in the 2001 and 1993 attacks on the World Trade Center. The roughly 16-acre site (re)named Memorial Plaza is designed to serve as a, "powerful reminder of the largest loss of life resulting from foreign attack." The other edifices of lower Manhattan – the U.S. Customs House, the World Financial Center, the American International Building – serve as the quotidian backdrop to this spectacle and stand as memorials of a different sort. They are the monuments of American Empire, the eliminate-to-replace markers of settler colonialism. Missing are the names of the millions of men, women, and children who were sacrificed – killed but not murdered – at the altar of primitive accumulation.

Within days of the initial occupation of Zuccotti Park in lower Manhattan a number of Indigenous scholar-activists took to the blogosphere to register their critiques. Most notably, John Montano's (Nishnaabe) *Open Letter to the Wall Street Activists*; Jessica Yee's (Mohawk) *The Game of Colonialism and Further Nationalism to be Decolonized from the Left;* and, Joanne Barker's (Lenape) *Manna-hata* posts[1] each called attention to the inconvenient truth that Wall Street, New York and, for that matter all of the Americas were/are already in the perennial state of occupation. Together they challenged the Occupy Wall Street (OWS) movements' basic elision and erasure of Indigenous peoples as the first and already "occupied" peoples of this land. These critiques among others put OWS immediately on the defensive, compelling passionate refutations of the movement as too White, too elitist, too patriarchal, too colonialist.

*Corresponding author. Email: smgra@conncoll.edu

My purpose here is not to rehearse these central antagonisms but rather to deepen them – to recover the Indigenous critique from the bankrupt and distortional field of "identity politics" (where it has been improperly relegated) and undertake the wider problem that OWS represents: liberalism's underwriting of settler colonialism. From the standpoint of Indigenous peoples the so-called 99% are not simply united in their collective indignation, but, more significantly, by their settler status. This is Indigenous Land.

While this work is informed by the familiar theorizations of Arendt, Foucault, Fanon and Agamben[2] on state power and colonial subjectivities, it builds more closely upon the growing body of critical literature that brings liberal and/or continental political philosophy to bear upon questions of colonialism and Indigeneity.[3] Such work examines the colonial architecture that frames Indigenous/state relations in ways that not only mark the (Foucauldian) shift from sovereign to discursive forms of power but also insist upon the conciliatory and accommodationist discourses of liberalism as equally, if not more, effective in reproducing settler hegemony. The forthcoming analysis of OWS is one example of such discourse.

To begin, the discursive trope and strategy of "occupation" reconstitutes (territorial) appropriation as the democratic manifest and, in so doing, fails to propose something distinct from or counter to the settler state. Indeed, activists are adamant in their assertions that OWS is not a protest (one time event) but rather a form of "place-based activism" contingent on local (re)possession. As such, "occupiers" take over public spaces, constructing virtual homesteads complete with kitchens, outdoor classrooms, libraries, sleeping areas, etc.; a strategy that presupposes a colonialist logic that not only proffers its citizens the right to assemble but also the freedom to settle.

As Patrick Wolfe[4] articulates, settler colonialism is distinctive from other forms of colonialism in that it is "first and foremost a territorial project" where land (as opposed to natural or human resources) is the precondition.[5] Since the priority is to eradicate, dissolve, and remove Indigenous peoples in order to expropriate their lands, Wolfe defines "the logic of elimination" as the central organizing principal of settler colonialism.[6] In other words, he writes, "invasion is a structure not an event".[7] Thus, the central argument of this essay is that while OWS may be the largest social movement to take on class or economic inequality in a long time and, thus, presumes a "radical" or "revolutionary" politics, it ultimately retains a liberal (which is to say Eurocentric) center. Specifically, it dissolves colonialism into capitalism by courting a limited and precarious equality predicated on the "elimination of the Native".

The OWS protestor as liberal-subject would undoubtedly contest their complicity with (settler) state power and authority. Indeed, they have been victims of state power and its abuses (i.e. police sweeps, arrests, and imprisonment). The issue here is not to minimize such violations of citizen rights but rather to call attention to the distinction between the liberal, protestor-subject and Indigenous or "other" non-subjects that are discussed later as "surplus subjects".[8] The aim is to work beyond a simple rehashing of the philosophical limits of liberalism and examine the *political function* of liberal discourse in solidifying settler colonialism.[9]

To begin, I provide an analysis of OWS as a fundamentally liberal project preoccupied with: the fetishization of diversity, spectacle and the spectacular,[10] and a conciliatory, multicultural rhetoric. All of which works together to fashion a politics of inclusion that seeks to absorb Indigenous peoples. That is, accumulate the primitive. In the second section, the so-called "place-based"[11] activism of Occupation is interfaced/contrasted with the land-based resistance movements of Indigenous peoples who confront primitive accumulation as the pre- and ongoing condition of the settler colonial state. This essential "difference" marks the irreducible distinction between the OWS protestor and Indigenous subject as well as the politics of liberal democracy and decolonization.

The makings of a movement (an event)

The one-year anniversary of OWS was recently celebrated with minimal fanfare; the thousands have dwindled to hundreds. This was quite an anemic showing for a movement that was, at its height, hundreds-of-thousands deep, attracting the hot media spotlight and celebrity[10] attention. If nothing else, OWS pulled back the curtain from the global capitalist class, creating opportunities for political engagement, public intellectualism, and popular education. Through these efforts, awareness of the socio-economic gulf between the 99% and 1% has been forever etched into the collective consciousness of the "average American". Despite these accomplishments, unsustainable rates of (un)der-employment, foreclosure, bankruptcy and job loss endure for the working class while CEO salaries and multi-national profits continue to rise.[13] When considered alongside the withering state of OWS, the persistent inequalities have raised questions about the efficacy and sustainability of the movement.

Many point to Occupy's lack of a coherent agenda and explicit demands as the reason for its "failure".[14] But it's deeper than that. I argue that the consensus, demand-free platform and collectivist politics of OWS inherits a liberal philosophy that not only neuters the formation of substantive alternatives to the status quo but, more significantly, fails to disrupt liberalism's justifications for the settler-state. While the loss of traction is undoubtedly also an effect of the forces of state repression (e.g. harassment, arrests, surveillance, and eviction), the movement's refusal to relinquish the fantasy of the liberal state (and its collaboration with it) is what ironically or, perhaps predictably, rendered it vulnerable to such forces. To better understand this outcome, it is useful to examine the beginnings of the movement.

In July 2011, long-time activist, anthropologist, and self-described anarchist David Graeber posted a blog entry in the reader-supported Canadian magazine, *Adbusters*. Inspired by the events in North Africa and the Middle East, Graeber wondered aloud if the USA was due its own Tahir moment. Following Graeber, Kalle Lasn the editor and co-founder of *Adbuster,* created the hashtag #OccupyWallStreet, registered the domain name, and chose the date – 17 September 2011.[15] In a few short weeks, Graeber and other on-the-ground organizers developed the basic framework for OWS by holding a series of consensus building "general assemblies" that were galvanized under the tagline, "We are the 99%". Less than two months later, about 2000 people converged on Zuccotti Park, the small plot of land in lower Manhattan just north of Wall Street.

The non-affiliated, non-programmatic, grass-roots movement that emerged on that day is described on their official website as follows:

> Occupy Wall Street is a leaderless resistance movement with people of many colors,[16] genders and political persuasions. The one thing we all have in common is that We Are The 99% that will no longer tolerate the greed and corruption of the 1%. We are using the revolutionary Arab Spring tactic to achieve our ends and encourage the use of nonviolence to maximize the safety of all participants.[17]

Despite the rhetoric, rumblings about the lack of racial diversity emerged almost immediately, particularly from the Black, Native, and Latino communities. In terms of the actual statistics, the earliest online survey reported that the protestors were 81.2% White while another (conducted about a month later) reported that they were 68% White; 61% male; 55% college educated; with a mean age of 33.[18] Beyond the numbers, however, the exclusionary *experience* of folks of color also began to circulate. For example, a mere two weeks into Occupy, an editorial appeared in *The New York Times*, "Occupy Wall Street Struggles to make the '99%' Look Like Everybody".[19] The article recounted the story of a group of Bronx community organizers who rode down to Zuccotti Park "only to find a 99% that bore little resemblance to them".[20]

One of the group members, Rodrigo Venegas, described the OWS massive as "white, liberal, young people who for the first time in their life are feeling a small percentage of what black and brown communities have been feeling for hundreds of years".

The absence of racial diversity was further codified when the General Assembly drafted their "Declaration of the Occupation of New York City". On that day a small group of activists of color present at the assembly reported being "appalled" by the proposed first sentence of the declaration: "As one people, formerly divided by the color of our skin, we acknowledge the reality: that there is only one race, the human race." Sonny Singh, a Sikh musician from Brooklyn New York who became an early leader among Occupiers of color expressed his outrage and dismay stating "(that sentence) was obviously not written by a person of color … Race is a reality in the lives of people of color, you can't put out a statement like that without alienating them". Eventually the phrase was changed to read:

> As one people, united, we acknowledge the reality: that the future of the human race requires the cooperation of its members; that our system must protect our rights, and upon corruption of that system, it is up to the individuals to protect their own rights, and those of their neighbors; that a democratic government derives its just power from the people, but corporations do not seek consent to extract wealth from the people and the Earth; and that no true democracy is attainable when the process is determined by economic power.[21]

Nevertheless, the experience prompted Singh and others to form the "People of Color Working Group" with the aim to build a "racially conscious and inclusive movement".[22] Similarly, Malik Rhasaan from Queens, New York and Ife Johari from Detroit took action after seeing the "whiteness" of OWS, starting an "Occupy the Hood" movement. Johari states, "They're gonna have a problem with people of color [getting involved] if they don't connect effects of capitalism to racism".[23] While the categorical dismissal of OWS activists as a bunch of white, middle-class, hippie kids is problematic, the early emergence of distinct, OWS affiliate groups defined by race and class is also problematic.

Beyond issues of racial homogeneity, Kenyon Farrow[24] of the *American Prospect* summarizes the ways in which the discursive and semiotic fields of the movement served to alienate people of color:

> Comparing debt to slavery, believing police won't hurt you, or wanting to take back the America you see as rightfully yours are things that suggest OWS is actually appealing to an imagined white (re) public. Rather than trying to figure out how to diversify the Occupy Wall Street Movement, white progressives need to think long and hard about their use of frameworks and rhetoric that situate blacks at the margins of the movement.[25]

Farrow's critique of Occupy's "frameworks and rhetoric" came on the heels of the equally vigorous intervention by Indigenous scholars and activists who had already raised the specter of race framed by colonization. Joanne Barker's (Lenape) *Manna-hata* post succinctly summarizes the general critique. She writes:

> "Wall Street" is only possible because of (the) history of land fraud and treaty violation.
>
> The "United States" is only possible because of its still imperial-colonial relations with Native peoples. What "Wall Street" and the U.S. have become – an imperial-colonial power over the world's economics and the laws that protect it – is a direct legacy of the fraud and violence committed against Native nations. Perhaps those who now claim to OCCUPY WALL STREET in the name of reforming America's economy could remember their history and call it something else. *Wall Street is, after all, already an occupied territory.* (emphasis in original)[26]

The OWS response to the mounting criticisms? Further entrenchment in the key ideals of liberalism: individual rights, freedom, unity, tolerance, and an unproblematized multiculturalism. For instance, in an article for *The Nation,* entitled "Compassion is Our New Currency", Rebecca Solnit,[27] one of the movement's key sympathizers and long-time activist-author, defends the multicultural merits of the movement:

> Occupy has created a shared space, in which people of all kinds can coexist, from the homeless to the tenured, from the inner city to the agrarian. Coexisting in public with likeminded strangers and acquaintances is one of the great foundations and experiences of democracy, which is why dictatorships ban gatherings and groups—and why our First Amendment guarantee of the right of the people to peaceably assemble is being tested more strongly today than in any recent moment in American history. Nearly every Occupy has at its center regular meetings of a General Assembly. These are experiments in direct democracy that have been messy, exasperating and miraculous: arenas in which everyone is invited to be heard, to have a voice, to be a member, to shape the future. Occupy is first of all a conversation among ourselves.

Solnit's musings exude the liberal fantasy that "democracy" proceeds from the absence of (substantive) difference, a space where the "homeless" seamlessly coexist with the "tenured". Moreover by contextualizing the occupation as a space for the public expression of (guaranteed) rights, she constructs OWS as a *nomos* for the enfranchised citizen to speak out and against in a collective assertion of their grievances, rights and perceived just dues. There is no mention of the differentiated landscape for the "surplus-subject" in these spaces: the undocumented, subaltern, *homo sacer,* refugee, the dispossessed.

In other words, Occupiers foreclose any deep engagement with race/colonization by simply reinvigorating their commitment to create a more inclusive, pluralistic space. In the context of such radical "inclusion" political conflict is dismissed as either misrepresentation (by the media) or misunderstanding (among activists) or, most problematically, as the problem of certain individuals. Consider the following blog entry posted by "occupier" Tammy Kim in direct response to Farrow's critique:

> If you don't agree with the messaging, it's on you to change it. If you feel it's not diverse enough, add your body to the mix. In this consensus-based process, participation is our most valuable critical faculty. One should also recognize the instability of OWS as observable spectacle. It's an evolving, self-made, messy space whose signs, statements, and local demographics change day-to-day, hour to hour".[28]

While this is one response, by one activist, at one time and may not be representative of OWS as a whole – that's the whole point. OWS refuses representation at the same time it has built an entire movement around a deeply representative claim: "We are the 99%".[29]

This is not surprising since the construction of the settler state has, at every stage, relied on identity and cultural politics for its reconsolidation.[30] Specifically, it requires and solicits certain ways of being, desiring, and knowing at the same time as it destroys others.[31] In this instance, the (OWS) protestor-subject is both solicited and required by the liberal state – employed as examples of "democracy-at-work" – to legitimate business as usual. The question is, "what bodies, desires, and longings must be criminalized and annihilated to produce" the (desirable) protestor-subject in order to destroy the (undesirable) non-subject – the "human surplus".[32]

Journalist Maya Schenwar graphically concretizes the distinction between the protestor-subject and the "surplus-subject" in her powerful piece "35,948". She reports that on the

same day the NATO 3 were spectacularly arrested in Chicago, 35,948 "others" were arrested across the USA:

> Unlike the NATO 3 (or the Chicago Seven, or the Haymarket Eight), these people will go on to become part of a vast, near-voiceless crowd of 2.3 million incarcerated Americans, most of whom … will be charged, convicted, prosecuted and jailed … For them, there is no grass roots bail fund, Facebook or Twitter. They can't attend town hall meetings, call Congress, boycott corrupt corporations and they certainly can't march in the streets. For these 2.3 Million, all signs point to a devastating conclusion: they're not only punished, violated, dehumanized and ignored – they are abandoned.[33]

Similarly, while 7263 "occupiers" have been arrested since the movements' inception, over 10 million "others" have been arrested nationwide, with no fanfare. Such statistics are not intended to belittle the gross violations of civil rights that have been enacted upon OWS protestors, but rather to urge and put forth the distinction that makes a difference. It also serves to illustrate the difference between (abandonment by?) the political projects of the liberal-progressive class (including folks of color, women and queers through the homonationalist turn) and the more revolutionary and redistributive politics of decolonization.

If OWS was sincere in its commitment to construct a new social order, it would begin by abandoning the presupposition that the just principles of a new social order can be arrived at deductively from a liberal theory of justice.[34] They would interrogate the ways in which deployment of "spectacle as social critique" ultimately serves to solidify state power and ask how the movement tactically and optically remains a space reserved for some at the cost of others.

In the following section, beginning with a history of lower Manhattan, I continue to draw the distinction between the "place-based activism" of OWS and the land-based resistance movements of Indigenous peoples, many who have disappeared in defense of their homelands. There are no celebrities here.

The makings of settler colonialism (a structure)

Geographically, Zuccotti Park is located in the Financial District at the intersection of Broadway, Trinity Place, Liberty and Cedar Street. This public space is actually privately owned by Brookfield Properties; a transnational real estate company that works with high-end assets in North America and Australia. It acquired the property in 2006 and after some renovations (re)named the park after Brookfield's CEO, John Zuccotti. At least, that's the settler narrative. In actuality, "the park", isn't a park at all but rather Indigenous land and, more specifically, Lenape territory. The land only became a "park" through successive acts of dominion-as-domination all legitimated under the legal fiction of the Doctrine of Discovery.[35]

The Dutch (1626) were the first colonizers, ostensibly buying Manhattan for the mythic $24 worth of trinkets and beads and subsequently renaming it (New) Amsterdam.[36] In order to protect their bounty from outside encroachment, they purportedly built a wall along the northern boundary of the settlement. Over the next century, the wall served as the line of demarcation in several skirmishes between the Dutch and other European interlopers, particularly English.[37] Eventually, the English prevailed and promptly presumed the right of dominion, renaming the territory (New) York.

By the time the Americans came on the scene, the original fortifying wall had been torn down, paved over and, in commemorative fashion, renamed "Wall Street". The prior elimination and removal of thousands of Lenape at the hands of their European forebears, allowed the Americans to adopt the more "civilized" strategy of domination through juridical means. Specifically, they entered into the first-ever formal treaty between the USA and an Indian nation: the Treaty of Delaware (1778). In letter, the Treaty recognized Lenape sovereignty and even included a proviso for the possible formation of a Delaware state (likely used as the inducement to sign). In practice, however, it was mainly an agreement of alliance, providing Americans safe passage through Lenape territory during times of war with the British. Even so, less than a year into the agreement, the Lenape filed formal grievances with the Continental Congress, citing US violations of terms.

As noted by Barker (2011), this essential fraud would be enacted again and again over the course of history. Until, by the end of the Civil War, the Americans had all but completed elimination of the Native from *Manna-hata*. In its place, they built Manhattan, a spectacular display of US economic virility and global competitiveness.[38] By the 1930's Lower Manhattan was already piercing the skyline, with each multi-story tower built to be bigger than the last. In the late 1960's United States Steel (one of the original conglomerates of JP Morgan) set its sights on being the biggest and tallest and proposed a spectacular 54-story skyscraper. Since the size exceeded existing zoning laws, the company brokered a deal with the city; in exchange for permission to build it agreed to develop an adjacent plaza for public use. Once permits were secured, the corporation razed all the buildings between Broadway, Liberty, Cedar and Church, replacing them with Liberty Plaza Park (built, 1972).

On 11 September 2001, in the wake of the attack, Liberty Plaza Park served as a central staging area for rescue workers and, at times, a makeshift morgue. Eventually, the sheer weight of all the vehicles required for the various rescue–demolition–construction processes proved too much for the Plaza and it cracked. Four years later, Brookfield properties commenced the requisite renovations and when it re-opened in 2006, the Plaza was (re)named Zuccotti Park. And so ends the latest episode in the continued occupation of Lenape territory, for over 500 years it has been callously violated and exchanged, passed from settler to settler. As Deborah Bird Rose points out, "to get in the way of settler colonization, all the Native has to do is stay at home" (as cited in[39]).

In contrast to Wolfe's observation that the logic of elimination maintains the refractory imprint of the Native counter-claim, if nowhere else, than on the symbolic level – there are no traces of Native peoples in lower Manhattan – not in street name, structure, architecture or motif.[40] There are no monuments, commemorative plaques, or statues to mark the quotidian removal and dispossession of the Lenape peoples. Apparently, "cadastral effacement" pays in spectacular dividends. Property in the financial district is currently worth about $1500 per square foot, with the average residential property selling for over $1.2 million. Meanwhile, according to the last US census, the median income of American Indian peoples in the United States is estimated at $35,000 a year, well below the $50,046 for the nation as a whole.

This is the soil upon which OWS (carelessly? arrogantly?) launched its "occupation". The movement's continued denial of the racialized landscape of inequality and history of settler colonialism inheres the logic of elimination. Moreover, its dismissal of the Indigenous call to "unoccupy" or decolonize as "unrealistic" and "too complicated" reflects its deeper commitment to the imperatives of the settler state. The question should not be *if* a praxis of decolonization is relevant to OWS and, other reformist struggles, but *how* and *why* it is.[41] These glaring aporias of OWS illuminates the more general abandonment of grand narratives/explanatory frameworks (i.e. hegemony) within the liberal project, opting instead for the "messiness" of so-called direct democracy where the agenda is made and remade on a daily basis. Meanwhile,

the conservative Right has been more than happy to fill this void with their very un-messy brand of "us" vs. "them" Manichean politics.[42] All of which suggests that the left needs to resuscitate the binary – not in a way that rehearses or reifies the Manichean worldview – but, rather, helps to articulate Indigenous specificity.

That being said, it seems insufficient to simply unveil the liberalism that underlies OWS. A decolonial project requires a more complicated mapping of the geopolitical configurations and contemporary articulations of the Indigenous political horizon: If not inclusion, then what? Sovereignty? Autonomy? After all, Indigeneity is not simply the dialectical underbelly of the modern nation state nor is it simply outside, excluded, or abandoned by it. And, the Indigenous subject is not the same as – is more than – the colonized subject.

In their efforts to map the borders of Indigeneity, critical scholars (e.g. Coulthard, Nichols, Rifkin, and Simpson)[43] target liberalism itself, recognizing it as the philosophical and ideological viscera of settler consciousness. Their collective works reveal the ways in which the undetermined, messy, multicultural, politics of "occupation" undermine the prior, definitive, Indigenous politics of (home)land-based activism. It is the difference between working to "build a new society in the shell of the old" (OWS Handbook[44]) and fighting for the sovereign right to maintain societies that are autonomous from the shell. In so doing, some of the key antagonisms raised by Indigenous scholar-activists pertain to: questions of self-formation, governance and political power; the disruption of normative conceptions of justice; the articulation of Indigenous structures within the grammar of empire (i.e. sovereignty, nationhood, and recognition); the desirability of statist/electoral forms of governance vs. autonomist forms; and, the dialectics between governance and economic systems (i.e. capitalism, socialism, and non-monetized systems of reciprocity).

As an educator I am also interested in examining the ways in which settler colonialism inheres a continuous *episteme.* That is, how settler colonialism encodes a positivist discourse that crystallizes the dynamic flux of experience into static, observable blocs that render other knowledges either invisible or disappeared.[45] Consider for example how the past 500 years of state sanctioned language suppression has led to 80% of existing American Indian languages to be classified as "moribund" and, over the next century, 90% of the world's languages are predicted to be "extinct", with most supplanted by the colonizers tongue.[46]

Epistemicide is a structure not an event.

Within this context, I am particularly interested in the processes by which relations of mutuality are eroded by capital and in exploring competing forms of epistemic disobedience. The hope is to imagine political/pedagogical strategies that go beyond simply resisting settler relations of power and work instead to redefine the epistemological underpinnings through which the colonial world order is conceived. More specifically, I am to contribute to the development of an Indigenous counter-claim that engages knowledge and, knowledge making, for the purposes of well-being not contingent on the management or control of imperial interest.

In the end, the OWS moment refracted through an Indigenous lens, compels us to be attentive to both the larger ontological and epistemic underpinnings of settler colonialism; to discern the relationship between our struggles and others; to disrupt complicity and ignite a refusal of a capitalist promise built upon a series of non-promises for Indigenous peoples; and, to more appropriately theorize the relationship between "spectacular" and "surplus" subjectivities. The aim, as urged by Mark Rifkin, is to discern and map the relationship between biopolitics (and the production of race) and geopolitics (the production of space).

Thus, in response to the question provocatively posed by the OWS poster: "What is our one demand?" My answer is: abandon "occupy" and take up "decolonization". Such a shift would bring the colonial present into sharper relief and, more significantly, allow us to *reframe* what is happening to workers in Detroit; public school children in Newark, NJ; and, brown, black and poor folks in the nations urban centers as not simply about racism, unemployment, outsourcing, downsizing, and privatization – but as *removals.* A dispossession executed by an elite class still intent on the eliminate-to-replace vision of settler colonialism.

5. Ibid., 388.
6. According to Wolfe, 'Settler Colonialism' strategies of elimination not only include genocide but also "officially encouraged miscegenation, the breaking down of Native title into alienable individual freeholds, Native citizenship, child abduction, religious conversion, resocialization in total institutions such as missions or boarding schools, and a whole range of cognate biocultural assimilations" (388).
7. Wolfe, 'Settler Colonialism', 388.
8. Angela Davis develops the notion of "human surplus" in reference to those aberrant subjects "cordoned off" and criminalized by the capitalist imperatives of the "new world order". See also A. Davis, *Are Prisons Obsolete?* (New York: Seven Stories Press, 2003).
9. Robert Nichols makes the important distinction regarding the political function of discourse in his paper, R. Nichols, 'Indigenity and the Priority of the Settler Contract Today' (unpublished paper presented at 'The Governance of the Prior' Workshop, Center for the Comparative Study of Ethnicity and Race, Columbia University, 2010).
10. The idea of spectacle and the spectacular here refers to the aura of OWS – that has attracted intellectual and Hollywood celebrities, costume, confetti, balloons, dances, flash mobs – that suggests more of a party than protest. It also marks the asymmetries of power that privilege "Whites" over other racialized bodies as they engage in various acts of civil disobedience. The circulating privilege calls attention to their plight, which in turn makes it/them "newsworthy", rendering the whole "experience" as "exhilarating" for participants. Such sentiments inspired *Adbuster* editor Kalle Lasn to proclaim in an interview with NPR that it is once again, "cool to be a leftie" http://www.npr.org/2012/02/09/146649883/occupy-wall-street-the-future-and-history-so-far. 36. The "sale" was a gross "misunderstanding" engaged by a people who "did not believe that land could be privately owned, any more than could water, air, or sunlight" (Georgetta Stonefish Ryan as cited in Barker, 2011). As such, the Lenape failed to "realize that the Dutch claimed the lands for their *exclusive* use" a right they would later violently defend (Barker, 2011).
37. The British invoked the Discovery principle of contiguity, which allowed a European settlement to not only claim a particular territory but also a large area around its vicinity. Since the English had already "discovered" lands from Virginia to Newfoundland they contested Dutch claims to New Amsterdam on the principle that they were there first.
38. Among the first corporate settlers were the Lidgerwood Manufacturing Co., American Telegraph Co., and Western Union. In testament to the level of newly amassed wealth, two of the tallest buildings were the Washington Life and Title Insurance Co. of New York; the original twin towers.
39. Wolfe, 'Settler Colonialism', 388.
40. The word "seemingly" here is operative as it suggests more of a nuance to Wolfe's work than a contestation. In his seminal article, "Settler Colonialism", Wolfe draws a distinction between settler colonialism and genocide with regard to the act of "renaming". He observes that while "the prospect of Israeli authorities changing Hebrew place-names … back to their Arabic counterparts is almost unimaginable", in settler societies, renaming is essential. He explains the contradiction as follows: First, the settler state is faced with undertaking the practical elimination of the Native as means of establishing itself and then it must seek to "recuperate indigeneity in order to express its difference – and, accordingly, its independence – from the mother country". Given that "Indian" names exist in virtually all other locations of the USA but remain absent form lower Manhattan indicate that both genocide and settler colonialism are activated in this space. Or perhaps suggest that settler colonies retain a kind of "ground-zero" where erasure is essential in order to maintain the legitimacy of the broader state.

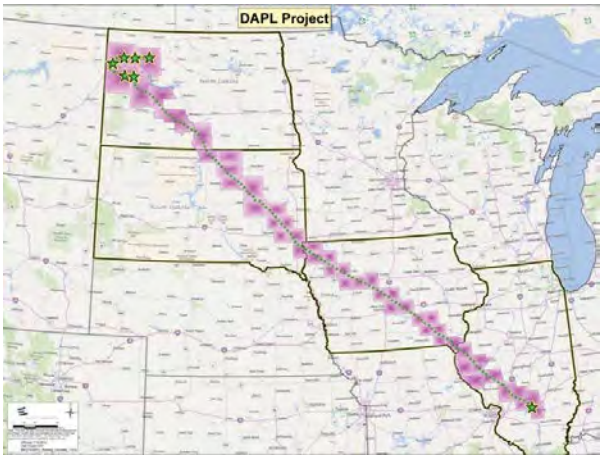
WE NEED TO BE TALKING ABOUT STANDING ROCK

Ari Laurel
September 6, 2016

Photo by Robyn Beck. Youths hold signs in English and the Navajo language before the start of a march to a burial ground that was disturbed by the building of the Dakota Access Pipeline.

What is going on at Standing Rock right now is historic, and if you need a moment to catch up, here's your chance. Not unlike the Keystone XL proposal, The Dakota Access Pipeline (DAPL) is comparable in length, and would begin at the border of Eastern Montana, cutting through North Dakota, South Dakota, Iowa, and Illinois. If built, the pipeline will transport up to 570,000 barrels of crude oil daily. For the Standing Rock Sioux Tribe this is simply the latest slight against tribal lands and the people who inhabit them. Current laws prohibit the tribe from doing little more than assessing the safety of construction and having a cultural dialogue around the effects of a project this massive. At this point, dialogue is useless when construction is already underway. This $3.8 billion project is the government's decision to further assert its power over Native lands and is sure to damage the community during its construction and onward. The United States has had a horrible track record with tribal nations. Between 1779 and 1871, the US entered over 500 treaties with Native American tribes, all of which have been broken or nullified. One of the largest acts of abuse was the Dawes Act, which allowed the federal government to divide land for Westward expansion and began a period of forced assimilation by turning Native Americans into subsistence farmers and removing tribal governments. The consequences of this act carried on into the 1970s during the Boarding School Era, where Native American children were taken from their families, made to cut their hair, change their names, and relinquish their language and traditions, often while facing physical and sexual abuse. Today, the Bakken oil boom has turned Montana and North Dakota into areas of economic prosperity, promising employment and opportunity to laborers from out of state. However, it is also one of the latest offenses, as the consequences of the boom have negatively impacted the surrounding tribes. It has invited the setup of what people have colloquially called "man camps," or work sites for drilling that are largely inhabited by men. It is in these areas where a high number of sex crimes take place, especially against Native women and girls. When Native women are subject to these crimes, there is little faith in seeking justice. Native women are murdered at more than 10 times the national average, and neither federal government nor local law enforcement have acted to investigate or even track the many murders and disappearances.



The greatest concern is that the pipeline will affect the drinking water as it runs under the Missouri River. This concern isn't unfounded; pipelines leak all the time. In 2016 alone, the US experienced 15 pipeline accidents, including the Shell Oil leak in Tracy, California, which let 21,000 barrels of crude into the soil. Shell waited three days to report the spill, the line's second rupture in 8 months, at which point there began a hefty cleanup, moving over 6,500 tons of polluted soil to a nearby landfill. California's Central Valley is another area largely inhabited by migrant workers who work on farms where 8% of the nation's agriculture is grown, and investigations are still in progress. When it comes to pipeline accidents, it is not a question of if, but a question of where and when. The quality of the Missouri River is critical to the health and economic well being of the tribe. One cannot help but think of the crisis in Flint, Michigan, where families are now struggling with lack of filters, the high cost of bottled water, dangerous levels of lead exposure over the course of years, no mobility for evacuation, and little support from local and state government. While witnessing Flint, we now have the opportunity to better understand and even address the Standing Rock Sioux's concern over a vital resource—water.

At least 30 tribes have come together over this issue, setting aside many years of conflicts. In addition, Black Lives Matter has shown up to protest with them in solidarity. Black Lives Matter organizer Miski Noor commented in *Truthout*:

> "As Black Lives Matter, we have built power and we have a platform. And as a movement, we have a duty to uplift and amplify the stories and struggles of all marginalized folks, as our liberation is intertwined."

Asian Americans, especially young activists, have taken to working in solidarity with Black Lives Matter. We have no hesitation to say that Black folks are our friends, teachers, mentors, coworkers, neighbors—it is easier for us to extend our empathy and work within communities we inhabit. However, as a political community, we have been largely quiet on the matter of #NoDAPL. For as many articles, open letters, and organizations that voice support of Black Lives Matter, few to none can be found in support of #NoDAPL. This may be due to the fact that Cannon Ball, North Dakota is miles away from many of our communities, which tend to be urban and coastal. The topographic distance perhaps extends to mental and emotional distance—but this is no excuse. Black Lives Matter was quick to respond, and so must we be.

It is a running joke that high school graduates claim Native identity on their college applications to reap the financial "benefits" that Native Americans purportedly receive. Living in Montana, I hear insensitive remarks all the time about Native Americans living off government assistance. For Asian Americans, the model minority myth comes with perceptions that that obscure our oppressions. A hard look at our communities shows how we still struggle: we face rapidly increasing evictions from gentrification, immigration laws which harm undocumented families, voter suppression, trafficking, and the exploitation of migrant workers. For Native Americans, many tribes suffer from high mortality rates, unemployment as high as 95%, and with more than 80% of people living below the federal poverty line. Racial profiling, sexual assault, trafficking, and lack of access to adequate healthcare is common among marginalized communities. The truth is that the challenges faced by Standing Rock and communities like it are not so different from ones we know to exist in ethnically diverse cities all over the US. We are now witnessing a continuation of this shameful history. However, it's not the only history we need to consider.

It is easy to succumb to the desire to focus on our own communities, our own challenges. Among marginalized groups, anxieties crop up about resource scarcity, the feeling that certain groups will be advocated and provided for, while others will not be. This makes us less willing to throw our support behind other groups who may be struggling. Asian Americans worry about being forgotten, a side effect of listing ourselves as "other" in official documents. To echo Miski Noor, our labor, our histories, and our freedom are connected, and therefore we have a responsibility to uplift one another. Hyphen has compiled rich histories and key figures of Asian American solidarity, a tradition which younger generations of Asian American activists are boldly carrying on. In this case, we must put our money where our mouth is if we are to continue this radical tradition of solidarity work. Asian Americans are the fastest growing minority in the US, and when possible, we have the power to rally our communities in numbers, instead of taking comfort in them.

SO WHAT CAN WE DO?

- Protesters at Standing Rock are in need of supplies, including pots, pans, utensils, blankets, non-perishable food, tents, batteries, and drinking water. You can find an entire list of needs here. Supplies may be sent to the following address:

  Bldg #1, N. Standing Rock Ave
  PO Box D
  Fort Yates ND, 58538

- You can also donate to the DAPL Fund on their site to help with supplies and legal defense.
- You may also adapt the sample letter here for the use of your organization to support the efforts of #NoDAPL and the Standing Rock

festival features over 65 artists from multiple disciplines exploring the landscape of Asian Pacific American art, identity, and

You may also adapt the sample letter here for the use of your organization to support the efforts of #NODAPL and the Standing Rock Sioux Tribe.

- Call North Dakota governor Jack Dalrymple at (701) 328-2200. You can leave a message stating your thoughts.
- Call the White House at (202) 465-1414.
- Sign the petition to the White House to stop the DAPL.
- Lastly, do not let news of this be drowned out by the theater of national politics. Regardless of who is elected, this $3.8 billion project will want to advance.

Chapter Ten

RHYTHMS OF CHANGE
MOBILIZING DECOLONIAL CONSCIOUSNESS, INDIGENOUS RESURGENCE AND THE IDLE NO MORE MOVEMENT

Jarrett Martineau

On the evening of the 2012 winter solstice, I was up late editing a post written by Anishinaabe comedian and media producer Ryan McMahon for the Indigenous music platform Revolutions Per Minute. According to the Western world's dubious and anxious misreading of the Mayan calendar, it was the day before the world was supposed to end — the eve of the apocalypse. But the apocalypse was the furthest thing from my mind. The week prior, Chief Theresa Spence of the Attawapiskat First Nation began a hunger strike, demanding a meeting between Indigenous leaders, the Crown, and the Harper government "to meet with First Nation leaders and engage in meaningful dialogue on our rights" (IPSMO 2012) and to discuss the broken treaty relationship between Canada and Indigenous nations. Spence began her hunger strike "in protest of continuing governmental abuses against First Nations," contending that "Canada is violating the right of Indigenous peoples to be self-determining and continues to ignore our constitutionally protected Aboriginal and treaty rights in their lands, waters, and resources" (IPSMO 2012). Her calls went unanswered, however, and as her fast deepened into its first week, Grand Chief Derek Nepinak, head of the Assembly of Manitoba Chiefs, boldly declared that "The 'long silent war drums' of First Nations people will pound again if [Chief] Spence dies from her hunger strike" (APTN 2012: 1). But the drums had already started.

Idle No More was exploding all around us. Ryan's piece, appropriately titled "The Round Dance Revolution," tried to make sense of this spontaneous unfolding of Indigenous cultural and political action and the "mind-boggling confusion, anger, sadness and happiness" that it invoked (McMahon 2012: 1).

Ryan and I messaged back and forth as I was editing to compile a list of flash mob round dances being planned in the days ahead. More than two dozen events were being organized in urban centres and Indigenous communities across Turtle Island in that week alone. An update blinked across my timeline. The Indigenous DJ crew A Tribe Called Red had just released a new song on its SoundCloud. I clicked through to listen. It began with the drums. "The Road" is an introspective instrumental with a haunting lead melody, an insistent rhythm and a pow-wow–sampled vocal chorus that departs from the group's more overtly dance floor–oriented club tracks. It reverberated with a prescient sense of the movement's evolving form and affective potency: at once melancholic and triumphant, longing, hopeful and defiantly resistant. It captured in sound and carried in spirit the essence of the movement's resonant tension between force and restraint, outrage and introspection; it pushed and pulsed with a determined, rhythmic insistence and restless *motion* — an intangible, dynamic and energetic flow that, haunted by memory, resounded a renewed presence. It was moving. Inevitably, relentlessly forward. "The Road" was the calm before the storm, the anticipation of a *future anterior* world that will have already arrived. The world was not ending; it was beginning again.

We published Ryan's "Round Dance Revolution" piece late that evening, and I woke up the following morning to find the world still very much intact, albeit synchronously transformed. I woke up to the news that the Zapatistas had re-emerged. Masked-clad and silent, they mobilized 40,000 strong and marched through five towns in Chiapas, marking exactly 20 years to the day since the EZLN had first taken them over by military force. But this time there were no weapons. There was only the sound of their steps and the occasional cries of support from local villagers. Their message was clear: *To be heard, we march in silence.* Later in the day, the EZLN issued a brief communiqué that stated, simply:

> To whom it may concern:
> Did you hear it?
> It's the sound of your world crumbling.
> It's ours re-emerging.
> The day that was the day, was night.
> And night will be the day, that will be day
>
> —*Translation Collective 2013: 1*

This is a story of re-emergence.

Idle No More

#IdleNoMore flashed onto screens and then exploded into public consciousness in the late fall of 2012. Its hashtag origin belied the fact that the movement marked the resurgent transformation of Indigenous activism on Turtle Island, forged in the mediatized spaces of the digital, that bloomed into a wave of resistant action shaped by a heady mix of spectacular protest, cultural assertion and spirited dissent. Idle No More not only gave renewed voice to the long continuum of Indigenous resistance struggles against colonialism and the ongoing, lived oppression of our peoples but also to our continued survival, presence and fugitive movement to "break *from* and *through* colonial enclosures to (re)discover ... open spaces of imagination and creativity" (Martineau and Ritskes 2014: X). Critically, it was a movement conceived and organized by the leadership of Indigenous women, operating outside of the mainstream Canadian political establishment and Indian Act governance structures and organizations. Idle No More grew rapidly: virally accelerating across media platforms and through flash mob round dances staged in shopping malls across Turtle Island and around the world. Striking simultaneously at the heart of capitalist consumerism at the height of the holiday shopping season and at the contemporary state of Indigenous absence in the public imaginary — in which Indigenous peoples have been disappeared, forcibly erased or rendered invisible — Idle No More signalled a collective rejection of colonial abjection and dispossession, a communal return to presence. The movement gave form and force to long-standing currents of Indigenous frustration against Settler society's biopolitical push to force us into the margins of bare-life survival (Agamben 1998: 65).

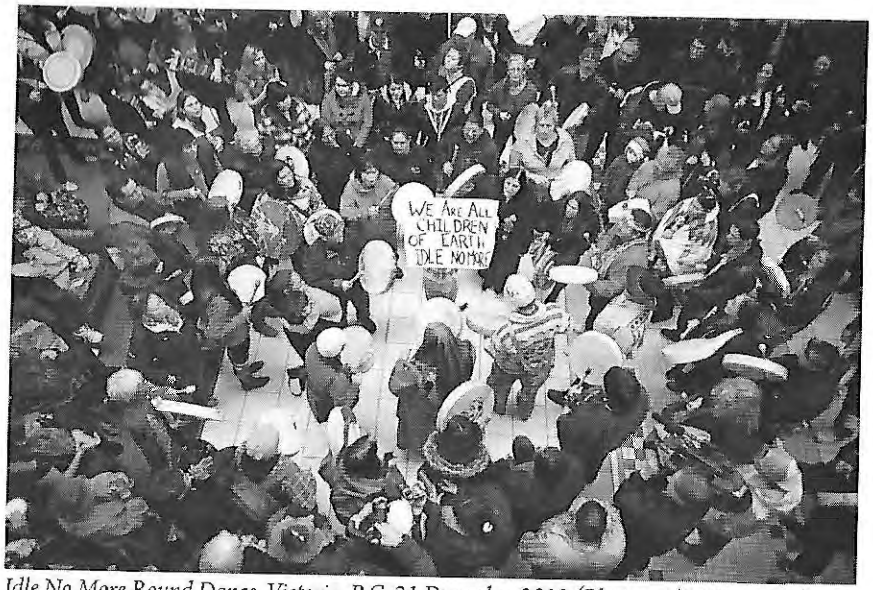
Idle No More promised an affirmative politics of presence in resistance to the imminent encroachment of death by neglect wrought by the destruction of our lands, waters and air through large-scale, transnational corporate development and resource extraction; and institutionalized forces of colonialism advanced by Settler governments through legislation and policy. Idle No More embodied the corporeal represencing of our peoples in a collective *becoming together* enacted through the Indigenous reoccupation and reclamation of public space. The movement drew inspiration, in tactical form if not in purpose, from recent contemporary global social movements that have also performed resistance through place-based actions discursively framed in the language of occupation. "Occupation," as W.J.T. Mitchell suggests, "is not only a visual and physical presence in a space but a discursive and rhetorical operation ... It is a demand in its own right, a demand for *presence*, an insistence on being heard" (2012: 10). Idle No More occupied multiple spaces and modalities of Indigenous resistance that were rooted in, and dynamic expressions of, Indigenous cultural, political, artistic and ceremonial praxis.

In this chapter, I argue that the Idle No More movement was mobilized in conflicted and contradictory sites of visibility and vulnerability in which its technologically coded communicative forms enabled, but also limited, its transformative political potential. I trace the movement's mediatization and concurrent attempts to forge resurgent languages of decolonial struggle constituted in flux and motion. "To create new forms of politics," which Saul Newman suggests "is the fundamental theoretical task today — requires new forms of subjectivity" (2012: 147). Idle No More sought to mobilize decolonial consciousness and grounded collective action, but its reliance on communicative technologies both precoded and limited its efficacy and potential. Although the movement initially created an affective transformation of public consciousness in Canada among both Indigenous and non-Indigenous populations, Idle No More's spontaneity produced an unsustainable aesthetics of immediacy, urgency and intensity. The movement thus reconfigured the temporality of Indigenous resistance according to the flow of code and the logic of the network, where circulation and movement are both generative and restrictive; powerfully immediate, yet deeply mediated. As Federico Campagna and Emanuele Campiglio note, "Politics of rebellion seem increasingly to incorporate the struggle between the voice and the limiting conditions in which it can be heard, between resistance and the annihilating counter-revolution of its spectacle" (Campagna and Campiglio 2012: 3). Idle No More occupied the dialectical space of this contested opening; where the ruptural performance that gives the struggle voice and spectacular visibility simultaneously marks its discursive limits and re-enclosure within the networked logics of colonial-capitalism.

The Round Dance Revolution

The Round Dance Revolution was both a representational gesture of Indigenous resistance and performance, and a self-affirmation of Indigenous continuity, presence and struggle. It operated at both levels and frequencies simultaneously, making visible the disparity between Settler colonial realities and the lived experiences of Indigenous peoples, dispossessed from our homelands and territories. The round dances were an evocative interimage of indigeneity that reterritorialized Indigenous presence beyond the normative borders in which it is often inscribed (reservation and rural communities), or otherwise erased. The dual character of the round dance form was underscored by its repetition in public spaces: shopping malls, main intersections and government buildings.

The first Idle No More teach-in was organized by a group of Indigenous and non-Indigenous women in Saskatchewan in November 2012 to discuss the impending passage of omnibus Bill C-45 — which proposed unilateral changes to the Indian Act, the Fisheries Act, the Canadian Environmental Assessment Act and the Navigable Water Act — all with serious implications for Indigenous nations, treaty rights and the radical reduction of environmental protection for lakes and rivers (Coulthard 2014: 160). Following the teach-in, the flash mob round dance was mobilized as a tactical form of resistant performance that self-authorized Indigenous presence in public spaces and brought Indigenous cultural and ceremonial practices into the view of Settler society. The round dance is a cultural form that originates among Indigenous nations of the prairies, but finds parallels and equivalence in the tea dances and drum dances of the north, and social and ceremonial dance forms among many Indigenous nations (Martin, 2013: 1). The form's inherent variability and transmutability, with its emphasis on social inclusion, participation and healing, encouraged broad-based participation; and the round dances spread rapidly and virally from urban centres to far-reaching and remote communities throughout Turtle Island. In one week in December 2012, for example, movement organizers in the greater Vancouver area mobilized more than one thousand people daily, in a wave of round dances held throughout the city.



Idle No More Round Dance, Victoria, B.C. 21 December 2012 (Photo credit: Keri Coles)

The technique was simple: Create a Facebook event page, call local drummers and singers to perform, and invite community members and supporters to attend at a specific time and place. Gather, sing, disperse. In the early weeks of Idle No More, hundreds and then thousands of Indigenous bodies filled shopping malls across Turtle Island for temporary gatherings, where the sound of our hand drums and traditional songs echoed through the hallways of capitalist consumption, interrupting shoppers' attention, and bringing new acoustic resonance into the semipublic and Muzak-filled banal spaces of the everyday. The round dances brought spirit,

energy and music *inside* the atriums of capitalism; and our songs and dances into auditory contact and visible dialogue with Settler society and government. And many did not know what to make of these simultaneously defiant and celebratory actions. Were they acts of resistance? Performance? Celebration? Or all the above?

The Idle No More round dances performed what Stephen D'Arcy calls a "disruptive convergence," in which "a crowd physically overruns a space, so that it can no longer be used in the way required by [a governing] institution or system" (2014: 91). The round dances ruptured both physical and symbolic spaces by transforming them through ceremony and bodies. This convergent technique of "disruptive outburst," as D'Arcy suggests, took "the form of insurgent street theatre performances in unauthorized spaces" (2014: 91) that disrupted the quotidian rhythms of the colonial-capitalist status quo by calling attention to asymmetries of power and the irrepressible spirit of Indigenous presence.

The heartbeat of Idle No More was, is and remains the drum. In the many territories in which round dances were held, the drum was the centre; the organizing principle and rhythmic force by which resistance was given voice in song. The songs performed at the round dances ranged from warrior songs and ceremonial chants to social and contemporary songs, thereby making visible not only the intergenerational survival and continuance of the songs themselves — and the song carriers who bring them forth in the present — but also their resilience and adaptability to new contexts and iterations. In this way, the round dances performed an apposite movement through remembrance and futurity, presence and return. As one CBC news report noted: "The Idle No More flash mobs are a part of ... returning a beat, a song and a dance to the heart of the territories where they were born, and where they still thrive" (Martin 2013: 2).

The round dances' spirit of defiance against colonial erasure and self-affirmative celebration of Indigenous resistance called on Settler society to witness them as *performance*, join them in *celebration* of Indigenous resilience and survival, and to heed them as a *call to responsibility* — to account for historical injustice and to literally join hands with our people in building new relationships of solidarity and mutual understanding. For our own nations and peoples, this spectacularized performance brought Indigenous Peoples into mutual visibility for *each another*, thereby reaffirming and recognizing our shared presence and resistance.

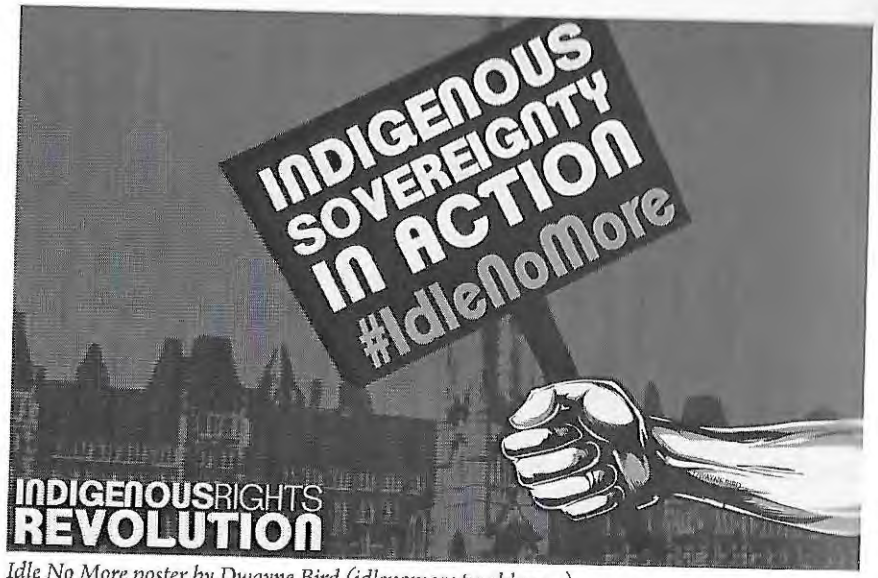
Although the Idle No More movement was extensively documented and shared on social media, while its dynamic archive of evolving digital content was distributed across these channels, its techniques of circulation also called attention to the fleeting temporality of "disruptive outbursts," in which autonomous assertions of indigeneity (like the round dances) produced affective appeal, but not systemic change. Although the round dances were at once irruptive, eruptive and disruptive, their détourning of popular consciousness could only temporarily reconfigure

the transit of indigeneity in the public mind. Indigenous struggles that had long remained marginalized or invisible were now brought into hypervisibility, thereby making them legible (and susceptible) to power, control and surveillance. In this conflicted push to give voice to our struggles and bring attention to our grievances, the movement was recast within an aestheticized regime of political performance, drawn into the machinic gaze of technology, and encoded according to the representational logic of spectacle.

Networked Resistance

Idle No More embodied the dialectical nature of contemporary social movements that are bolstered by digital technologies of distribution and dissemination. They provide multiple actors with voice, influence and access to audience beyond established political channels and structures, yet such movements remain subject to the privatized strictures of code that dictate their spectacularized rise and fall in the public imagination. Although movements that are accessible to diverse publics and ostensibly to democratic or horizontal organizational forms are lauded for their inclusive and participatory forms, the metrics used to celebrate their success can also be used to denigrate their failure as they decline in public presence and pageviews. To this extent, mediatized movements remain vulnerable to shifting public sentiment and criticism by virtue of the form of their articulation and the techniques used in their creation and dissemination. Idle No More — as digitally encoded hashtag and social movement — was already subject to a latent potential for formal "collapse," even at the height of its online popularity.

But the movement moved within and beyond the limits of the digital to create an affective experience of potentiality among participants: the *sense* that change was imminent (despite this not being borne out by reality). Idle No More refused the confinement and enclosure of coloniality and cultivated decolonial consciousness: "the freedom to imagine and create an elsewhere in the here; a present future beyond the imaginative and territorial bounds of colonialism ... a performance of other worlds, an embodied practice of flight" (Martineau and Ritskes 2014: IV). The movement was born out of the common experience of lived crisis that is coextensive with Indigenous survival under colonialism, but with the desire to transform it through performance and practice. Campagna and Campiglio describe this spontaneous re-visioning of the present as "the direct practice of *an affective necessity*" (2012: 4, emphasis added), in which the sense of emotional urgency and critical agentic capacity engendered by Idle No More compelled a young generation of digitally connected Indigenous youth and non-Indigenous allies to heed its calls to action. As we asserted our cultural practices, aired our grievances, proclaimed our desires and raised our voices in song, new political potentialities emerged in the discursive break that Idle No More had opened and claimed.



Idle No More poster by Dwayne Bird (idlenomore.tumblr.com)

Idle No More poster by Andy Everson (idlenomore.tumblr.com)

Like the Occupy Wall Street movement before it, Idle No More both welcomed and encouraged *multiplicity*, without conflating plurality and difference into the nebulous rhetoric of an inchoate multitude. The movement was Indigenous-centred, but neither exclusive nor exclusionary. Idle No More called on "all people," from every background and walk of life, "to join in a peaceful revolution, to honour Indigenous sovereignty, and to protect the land and water" (Idle No More 2013: 1). These broadly stated goals enabled organizers to interweave a vibrant evolving network of intergenerational, intercommunal and international participants. In a literal refusal of "idleness," Idle No More called for collective action against the stasis of the status quo; embodying a self-reflexive call to physical, symbolic, spiritual and cultural *movement* that mobilized supporters around the world.

The movement also sparked a wave of Indigenous cultural production. Art, music and media creation proliferated. Digital content went viral. Videos, visual art, posters, images, slogans and digital memes were continuously published, reproduced, and shared across social media. And the round dances brought our traditional songs into a newly emergent public lexicon. Idle No More took digital and Indigenous cultural forms and remixed them: détourning and repurposing photography, news stories and other artwork as the source material for shared social content and resistant truth-telling. But the movement's virality and memetic diffusion were possible only to the extent that Indigenous participation in digital and online media had reached a necessary critical mass.

Cultural production in contemporary social movements offers a recursive form of creativity that refigures individuated speech acts and communicative action within and through emergent networked collectivities. During Idle No More, Facebook and Twitter provided focal points for the amplification of movement messaging and the real-time coordination of public actions, but the movement enabled a dialogic interplay of forces and voices to be absorbed and reincorporated into its representational flows. These incorporative strategies are tactically effective because of their mobility and fluidity: their adaptive, formless and continuously reforming figuration of *movement* is expressed as constitutive of contemporary resistance. However, movement is also coded by the networks within which it circulates. Idle No More amplified Indigenous participation online, but this also contributed to a disjunction between the perception of the movement's digital reach and influence and its asynchronous impact within "offline" communities and place-based sites of struggle.

Mediatized Subjects and Spectacular Dissent

In contemporary social movements, temporality and spatiality work both in concert and in conflict. Insofar as the contemporary injunction of social media is to *participate* (users are compelled to write, to represent, to speak), this injunction is primarily temporal: demanding one's *time* (within an economy of attention) rather than a specified *place* of participation. Hardt and Negri have observed that although in previous eras "political action was stifled primarily by the fact that people didn't have sufficient access to information or the means to communicate and express their own views[1] ... today's mediatized subjects suffer from the opposite problem, stifled by a surplus of information, communication, and expression" (2012: 9). This communicative surplus overwhelms us with limitless data and communicative possibilities, and the temporal occupation of our attention becomes spatialized through mediatization, the occupation of consciousness. Mediatization is an emblematic form of contemporary subjectivity in which we are "subsumed or absorbed in the web" (Hardt and Negri 2012: 10). In this view, the "mediatized subject" is not so much alienated, as perpetually *occupied*:

> The consciousness of the mediatized is not really split but fragmented or dispersed. The media, furthermore, don't really make you passive. In

> fact, they constantly call on you to participate, to choose what you like, to contribute your opinions, to narrate your life. The media are constantly responsive to your likes and dislikes, and in return you are constantly attentive. The mediatized is thus a subjectivity that is paradoxically neither active nor passive but rather constantly absorbed in attention. (Hardt and Negri 2012: 9)

To effect social transformation without becoming fully "absorbed" by technologically mediated engagement, new subjectivities must be generated through collective action. "Facebook, Twitter, the Internet, and other kinds of communication are useful," Hardt and Negri suggest, "but nothing can replace the being together of bodies and corporeal communication that is the basis of collective political intelligence and action" (2012: 11). Although we would be wise to question the incontrovertibility of this claim, it is clear that one of the subsuming effects of mediatization is to displace other forms of collective action. A central challenge for the Idle No More movement was to navigate (and renegotiate) the tension between digital engagement and "offline" community-based organizing.

The movement first entered this representational regime on Twitter in late November 2012. Within weeks of its first mention, #IdleNoMore took hold of a massive public conversation online. The hashtag trended repeatedly on Twitter, reaching a precipitous height of 58,000 mentions in a single day on January 11, 2013 (Blevis 2014: 1). Until mainstream media reports began to amplify its signals, however, knowledge about the movement and its objectives and goals remained limited. But if access to influence can be redeployed to diffract the focus and intensity of a movement's demands, under mass media scrutiny and attention the movement's internal contradictions and limits can also be brought to light and exaggerated. Online debates routinely degenerate into futile flame wars between and among movement participants and dissenting voices. And the platforms used to coordinate movement planning and resistant actions can be, and are, continuously searched and surveilled by the State and its agencies.

The dual logic of the contemporary aesthetic regime of politics in the digital age is to order space and data as sites of visibility and access. The digital space of circulation is the grid of code, the matrix of big data. In Rancièreian terms, this involves the discursive partitioning of space, the distribution of the sensible; where the normative order is governed by the police, which "disavows ruptures, seams, sutures, gaps because the police is a horizon or landscape of continual continuity" (Gharavi 2011: 2). Social movements like Idle No More, which seek to disrupt this matrix of asymmetrical power must contend with the repressive force of the State (and, by extension, the regime of the police), who work to control circulation and surveil communication to prevent precisely those "ruptures, seams, sutures,

[and] gaps" that movement participants aspire to create. Representational practice within networked movements must be necessarily self-reflexive and attuned to this fraught relationality with power. "Rather than being spectators in a mediated struggle," the South London Solidarity Federation claims, "we must act for ourselves and represent ourselves" (SLSF 2012: 190). Yet self-representation is no guarantor of state-recognized self-determination. Like the Occupy Wall Street movement that preceded it, Idle No More's twinned tendencies toward self-affirmation and external recognition were deeply conflicted. Although Idle No More brought Canadian colonialism into stark focus and public view, it also engendered a significant public backlash.

As the movement circulated, the latent racism of Canadian society became plainly, painfully visible. Indigenous women were increasingly targeted by acts of gendered violence in many communities, including Thunder Bay, Ontario, in which Idle No More was perceived to have "inflame[ed] long-standing tensions between Aboriginal and non-Aboriginal communities" (CBC 2013b). In late December 2012, an Indigenous woman from the Nishnawbe-Aski Nation was brutally sexually and physically assaulted, an attack that was linked directly to Idle No More and investigated by local authorities as a racially motivated hate crime. Following the attack, the survivor, whose name has been protected, issued a public statement in which she urged Indigenous community members to be careful: "Right now with the First Nations trying to fight this Bill [C-45] everyone should be looking over their shoulder constantly because there are a lot of racists out there" (Kappo 2012: 1). Following the attack, and with rising racial tensions and violence in Thunder Bay, "more than a dozen [Indigenous] parents from remote communities chose not to send their children back to Thunder Bay for school [in the winter 2013] semester" (CBC 2013b).

For many movement organizers and participants, contending with increased threats of physical violence and responding to vicious debates in blog comment sections, racist editorial pieces in mainstream media, and a seemingly endless parade of anti-Indigenous "trolls" waging war on social media became a constant preoccupation. The terrain of struggle had been shifted, but an important transformation had also taken place: The movement had forced colonialism into view and, in so doing, into new spaces of discursive contention.

Idle No More made Indigenous resistance to colonialism a front-page story in every major newspaper and media outlet across the country by calling on the State, the Crown, and Settler society to account for ongoing injustices against our peoples and "the broken relationship" (CBC 2013b) between Indigenous Peoples and Canada. The movement successfully interrupted the State's narrative ordering of the colonial present by using embodied acts of performative resistance and communicative dissent to bring attention to the continuity of Indigenous presence

amid the state's parallax push to consign colonialism to a "closed chapter" in its soon-to-be-reconciled mythic Settler history. These actions demonstrated that Indigenous Peoples were prepared to contest the State's (re)conciliatory objectives and resist the assimilative passivity of the status quo. And it *represented* this resistant capacity as an "affective necessity" (Campagna and Campiglio 2012: 4). But despite its spontaneous flourishing, Idle No More could not translate its power into sustained transformations of the juridico-political regimes against which the movement had first been mobilized.

After the Storm

Idle No More's explosive spectacle crested in the early winter of 2013, due in no small part to the increasing urgency of Attawapiskat First Nation Chief Theresa Spence's hunger strike. Her fast continued for six long weeks. Chief Spence stated that she would continue to fast until the Harper government and representatives of the Crown met with Indigenous leaders to discuss the repeated violation of treaty agreements and Indigenous inherent and treaty rights. She boldly declared that until a meeting was set, she would remain "ready to die for my people" (COO 2013: 1). Flaunting its disregard for her life and well-being, the Harper government refused to respond or agree to a meeting. Protests continued in the streets. Highways, railways and borders were shut down. Round dances were held around the world. Marchers and walkers began spiritual journeys to Ottawa. Others fasted in solidarity with Chief Spence. And the media storm began to swirl around Idle No More.

But after widespread debate and outcry over her prolonged fast and its unmet demands, Chief Spence decided to end her hunger strike on January 24, 2013. Following two months of massive public protests, and a disastrously inconsequential January 11th meeting between Prime Minister Harper and First Nations Chiefs (many of whom boycotted the meeting), Spence signed a defanged declaration in partnership with opposition party leaders and Assembly of First Nations Chiefs that called for thirteen points of action. Intended to outline steps for Canada and Indigenous nations to work "towards fundamental change," the declaration was met, instead, with skepticism and disappointment. The movement's first wave of energetic force had been depleted. Idle No More had expected immediate action on its demands, but none had occurred. Although subsequent "days of action" were called for; and more demonstrations, rallies and marches were organized, the movement shifted from its intensifying crescendo of outrage and defiance to a decidedly more moderate (and modest) advocacy for incremental political reform.

The Spence declaration marked a passage from Idle No More's first phase, a cry of urgent protest emphasizing external representation toward a differential spatial configuration of protest actions recentred in place-based knowledge and

community. The movement turned away from the overt spectacle of mass protest actions and toward self-affirmative, self-valorizing actions. But for witnesses to the communicative rise of Idle No More through its signifying practices and representational forms, its collapsing statistical metrics were quantified and equated with the movement's veritable "decline." Idle No More began as a spontaneous, horizontal and autonomous movement with organizers distributed across a wide geography of urban, rural, reservation and remote communities. There was no defined leadership, central hierarchy or organizing platform; actions were spontaneously organized through decentralized networks; and anyone could participate. As the movement progressed, there was much discussion of the so-called "grassroots" people, whom Idle No More claimed to represent. But as the movement continued from winter 2012 into spring 2013, Idle No More ignited a debate over the revolutionary subject of the movement's resistance and the question of its leadership. *Where* and *who* were the "grassroots" people? Who has the right and authority to *represent* Indigenous Peoples?

Mainstream media pundits used these questions as evidence of internal "divisions" within the movement. But as Anishinaabe scholar Hayden King wrote, "While we all may dance to a similar beat, our footwork can take us in different directions. And there is nothing wrong with that" (King 2013: 1). Nevertheless, perceived divisions and contestations over representational authority within the movement led some participants and organizers to disengage from and disidentify with Idle No More. Despite two months of unprecedented global mobilization on Indigenous issues that sought to reconfigure the very terms and form of our collective organizing, action and representation, what had been accomplished? The political unrest generated by the movement had intensified and continued, albeit unresolved. Chief Spence's demands remained unmet. Bill C-45 passed into law. And Idle No More kept moving, seeking new ways to sustain the momentum of the "Native Winter."

"Reactivism" and Sustaining Momentum

For many Indigenous communities, the political status quo functions through a colonial modality of governance in response and reaction to crisis. Necessarily short-term and highly localized, this strategy demands that resources and action be mobilized in situations of immediacy, often with limited jurisdiction. Idle No More called attention to this crisis–based mode of governance by confronting multiple colonial temporalities and contexts simultaneously: the *immediate* (the imminent passage of Bill C-45), the *historical* (the abrogation of treaty and inherent rights) and the *present* (continuing forms of social suffering, colonial racism and violence). As such, it was a crisis-based response to crisis-based governance: a

cross-temporal and multivalent expression of indignation that captured historical and contemporary Indigenous *ressentiment*, or "righteous resentment" (Coulthard 2014: 126), against evidence of our continued state of collective, colonial abjection. Dene scholar Glen Coulthard names this affective response to colonialism as necessary for overcoming colonial disempowerment; that is, "our bitter indignation and persistent anger at being treated unjustly by a colonial state both historically and in the present," is not only a valid response to colonial injustice but it is also "a sign of our critical consciousness" (2014: 126) and our love for our lands and people.

Although Idle No More mobilized this righteous form of resentment as a form of collective catharsis, it also operationalized a *reactive* mode of resistance that reinscribed indigeneity as the injurious site of "wounded subjectivity" and politicized identity (Brown 1995: 65). As an exclusively *oppositional* political practice, this mode of resistance risks reproducing the very "injury" it seeks to refuse. But "states of injury" cannot be the only basis from which to re/articulate Indigenous political claims. To be effective and transformative, decolonial struggle must move beyond a definitional frame determined exclusively by colonial interference and imposition. Resurgent forms of resistance that revalue and revitalize Indigenous governance systems, natural laws and self-valorizing political practices are equally necessary. Idle No More sought creative contention with the State and Settler society, but also posited alternate pathways of self-affirmative action that did not seek recourse to colonial authority for validation or recognition. As Coulthard notes, Indigenous resistance actions (such as blockades and, to a lesser extent, round dances) that disrupt the normative order (by blocking the flow of capital, access to infrastructure or the rote procession of consumerism) are also "affirmative gesture[s] of Indigenous resurgence insofar as they embody an enactment of Indigenous law and ... uphold the relations of reciprocity that shape our engagement with the human and nonhuman world — the land" (2014: 170). Indigenous resistance, even in its most defiant, oppositional forms — *as the negation of domination* — always suggests the possibility of an affirmative counterpart hidden within.

By creating new networks of interconnected actors and rapidly increasing public consciousness *en masse* through social media, Idle No More effected a profound shift in the speed of *conscientization*. These networks created new spaces in which to coordinate collective action and strengthened existing connections between Indigenous communities and movement organizers. But the movement also captured the imagination and energy of a rising generation of Indigenous youth who were mobilized into action, many for the first time. Idle No More cut across territorial borders and nation state–based identifications: it was intergenerational, intercommunal and geographically distributed. On the #J11 Global Day of Action held on January 11, 2013, for example, 265 events were organized in more than 17 countries (J11Action 2013). But despite the movement's global expansion,

Idle No More needed to relocalize action and organizing at the community level by reprioritizing local struggles and longer-term political transformation. The movement refocused around three key areas. First, it shifted emphasis from direct contention with the State to the imminent ecological and political threats posed by large-scale resource development projects and extractive industries (pipelines, tar sands expansion, mining and hydraulic fracturing, and so on) to Indigenous homelands. Second, the movement turned to a self-reflexive analysis of challenges internal to Indigenous communities. Third, movement organizers began reorienting around shared commitments to the resurgence of Indigenous nationhood and governance. Idle No More has since directed much of its energy toward addressing these interrelated and contested sites of engagement.

Idle No More's "winter of discontent" expressed a collective surfacing of decolonial consciousness that shifted the terrain of struggle by refusing established modalities of resistance — lawful, expected and existent forms of "protest" — and creatively interjecting new forms of collective action into public discourse. The movement disrupted the expected terms of Indigenous engagement with Settler society, and brought Canada's colonial foundation into full view and contestation. In resistance, Indigenous Peoples affirmed our continuance and coherence as viable political communities that refused to be silenced. As journalist Stefan Christoff noted, "Canada's political landscape now faces an alarm on colonial questions commonly evaded in the halls of power" (2013: 1). But Idle No More could not transform this foundation; it could only call attention to it. Although it remained affectively powerful, the movement proved incapable of compelling the State to respond to its demands. And in the face of Idle No More's bold calls to action, the Harper government has remained intransigent.

Communicative Capitalism and Possible Politics

Social media theorist Zeynep Tufekci argues that the disjunction between the spectacle of mass protests and their inability to produce substantive institutional and policy transformations is characteristic of contemporary social movements:

> Protests ... fueled by social media and erupting into spectacular mass events, look like powerful statements of opposition [and] ... pundits speculate that the days of a ruling party or government, or at least its unpopular policies, must be numbered. Yet often these huge mobilizations of citizens inexplicably wither away without the impact on policy you might expect from their scale. (2014: 1)

According to Tufekci, the seemingly contradictory and "muted effect" of the massive popular uprisings in Turkey, Egypt and the Ukraine — to which I would

add the Idle No More movement — is not a result of their inherent inefficacy; it is a constitutive feature of their architecture. Social media–fuelled movements prioritize immediacy and networked communicative action over sustained and incremental infrastructural development:

> Digital tools make it much easier to build up movements quickly, and they greatly lower coordination costs. This seems like a good thing at first, but it often results in an unanticipated weakness: Before the Internet, the tedious work of organizing that was required to circumvent censorship or to organize a protest also helped build infrastructure for decision making and strategies for sustaining momentum. Now movements can rush past that step, often to their own detriment. (2014: 1)

Movements like Idle No More can collapse under the temporal "weight" of their speed-driven dissemination and metric "success," resulting in a vacuum of strategies for sustaining momentum after spectacular forms of public protest have exhausted their communicative currency. Tufekci argues that media is a powerful force for activism seeking to claim legitimacy in the public sphere, but she rightly points out that contemporary social movements and activists "who have made such effective use of technology to rally supporters, still need to figure out how to convert that energy into greater impact. The point isn't just to challenge power; it's to change it" (2014: 1).

To this end, it is critical to consider how communicative praxis circulates within global capitalist networks. Movements like Idle No More make use of available digital technologies to mobilize consciousness, action and resistance; however, these same technologies operate within tightly regulated circuits of power and control. Jodi Dean describes this technological entanglement, in which circulation usurps content, as *communicative capitalism:*

> Communicative capitalism designates that form of late capitalism in which values heralded as central to democracy take material form in networked communications technologies ... Ideals of access, inclusion, discussion and participation come to be realized in and through expansions, intensifications and interconnections of global telecommunications. But instead of leading to more equitable distributions of wealth and influence, instead of enabling the emergence of a richer variety in modes of living and practices of freedom, the deluge of screens and spectacles undermines political opportunity and efficacy for most of the world's peoples. (2005: 56)

The foreclosure of politics that Dean suggests inheres under communicative capitalism is the product of techniques wherein "communicative exchanges rather than being fundamental to democratic politics, are the basic elements of capitalist production" (2009: 56). The commodified circulation of information in and for itself displaces "on-the-ground" political struggle: content becomes secondary to the process of circulation that "is crucial to the ideological reproduction of capitalism" (2009: 59). This effects a depoliticization of networked communication "because the form of our involvement ultimately empowers those it is supposed to resist" (2009: 61).

Idle No More's ostensibly liberatory digital forms (tweetstorms, trending hashtags and Facebook petitions, and so on) did not compel power to respond and risked displacing forms of grounded place-based political struggle, that contended directly with oppressive institutions and policies, into "imaginary site[s] of action and belonging" (Dean 2005: 67). Further, this displacement tacitly supported the circulation of capital rather than its disruption. Movement organizers recognized the contradiction between making revolutionary calls for social change on social networks and being unable to realize such changes within the disciplinary spaces of privatization, commodification, surveillance and control instantiated by communicative technologies. This perception also risked reproducing the false binarism of "digital dualism," in which the online and offline worlds are understood as "separate" and "virtual," rather than enmeshed within lived reality under capitalism. As Nathan Jurgenson argues, "our reality is both technological and organic, both digital and physical, all at once. We are not crossing in and out of separate digital and physical realities ... but instead live in one reality, one that is augmented by atoms and bits" (2011: 1). Rather than perceiving the digital as a discrete site of "virtual liberation," it is necessary to consider the ways in which networked action, communication and activism are inscribed within pre-existing social and power relations.

Indeed, as Astra Taylor suggests, the digital intersects with the analog in ways that can actually "magnify inequality" and exacerbate asymmetries of power:

> Despite proclamations to the contrary, the online and off-line worlds are not separate; the digital is not distinct from "real life," a realm where analog prejudices are abandoned. While the Internet offers marginalized groups powerful and potentially world-changing opportunities to meet and act together, new technologies also magnify inequality, reinforcing elements of the old order. Networks do not eradicate power: they distribute it in different ways. (2014: 108)

As Idle No More and other contemporary movements have effectively demonstrated, the network is a site of contradiction and contestation that marks the

discursive battleground in a war over representation, influence and communicative control. For Idle No More, serious considerations began to arise over the long-term strategic utility and efficacy of mass mobilizations coordinated through social media: What alternative pathways could the movement pursue to break from this discursive trap of self-enclosure?

Idle No More's diverse tactics and open-ended goals were not coherently organized, and its multiform digital articulations subtended resistance actions oriented beyond the State. As the movement worked to address both the immediate states of crisis in our communities and ongoing forms of colonialism, there was a marked discursive turn among some organizers away from viral memes and mass mobilizations, and toward the strategic reaffirmation of Indigenous nationhood and the reclamation and reoccupation of our homelands and sacred sites. In late January 2013, Kanien'kehaka scholar Taiaiake Alfred observed that the movement had "plateaued," noting that "the kind of movement we have been conducting under the banner of Idle No More is not sufficient in itself to decolonize this country or even to make meaningful change in the lives of people" (2013: 1). Although Alfred recognized that the movement had drawn broad-based support from many Indigenous nations and Settler society, he argued that in order for the movement to revive its initial momentum for "fundamental change," Indigenous peoples

> need to focus our activism on the root of the problem facing our people collectively: our collective dispossession and misrepresentation as Indigenous peoples. Now is the time to put ourselves back on our lands spiritually and physically and to shift our support away from the Indian Act system and to start energizing the restoration of our own governments ... *Restoring our nationhood in this way is the fundamental struggle. Our focus should be on restoring our presence on the land and regenerating our true nationhood.* These go hand in hand and one cannot be achieved without the other. (2013: 1, emphasis added)

Alfred said that to break out of the echo chamber enclosure of social media's endless calls to action,

> we need to alter our strategies and tactics to present more of a serious challenge on the ground to force the federal government to engage our movement and to respond to us in a serious way ... we need to go beyond demonstrations and rallies in malls and legislatures and on public streets and start to reoccupy Indigenous sacred, ceremonial and cultural use sites to re-establish our presence on our land and in doing so to educate Canadians about our continuing connections to those places and how important they are to our continuing existence as Indigenous peoples. (2013: 2)

Although Idle No More continued to organize public demonstrations, rallies and marches of precisely the kind Alfred criticized, the movement also began to reterritorialize. Idle No More's reterritorialization marked the movement's need to relocalize and reground its organizing and action *within* Indigenous communities and homelands. Although the strategic reorientation of the movement made sense among participants and organizers, mainstream Canadian media used the opportunity to declare the death of Idle No More. Other recent social movements have been subjected to a similar critique, however, as they effect strategic reterritorializations following a first wave of mass mobilization:

> Since the intention is to transform not just the occupied [square or shopping mall] but society as a whole, movements have gradually shifted into spheres more directly related to the lives of their participants, such as neighbourhoods and workplaces, where local needs can be addressed. Generally, this is when the media and many on the institutional left tend to declare the movements "dead," but ... this is no reliable guide to the life of the movement." (Sitrin and Azzelinni 2014: 12)

To relate directly to the lives of its Indigenous participants, Idle No More sought out new forms of organizing that could be deployed at the local level in support of community struggles for nationhood and autonomy.

The Indigenous Nationhood Movement and Reclaiming PKOLS

In May 2013, Indigenous community members, organizers, activists, academics and allies gathered at the University of Victoria to participate in an Indigenous Leadership Forum (ILF). Over the course of the week-long gathering, participants discussed the wave of resurgent action catalyzed by Idle No More and the possibility of building an Indigenous Nationhood Movement to carry the movement's momentum forward. ILF participants developed a collaborative framework and set of movement principles oriented toward long-term anticolonial social transformation and supporting Indigenous communities and community members in the restoration and reassertion of Indigenous laws, languages, governance and political autonomy.

The Indigenous Nationhood Movement (INM) was launched with a sacred act of reclamation and reoccupation on May 22, 2013. Under the guidance and leadership of hereditary chiefs and elders from the WSÁNEĆ nations, INM supported the reclamation and reinstatement of PKOLS: the original SENĆOTEN place name of a

sacred site at the summit of a promontory in Saanich, B.C. PKOLS, which can be translated as "White Head" or "White Rock," was formerly known by its colonial name, Mount Douglas, after Captain James Douglas (Reclaim PKOLS 2013). It is a sacred site for the WSÁNEĆ people and a historic meeting place for the Indigenous nations in the area; it is part of the WSÁNEĆ creation story and the site where the WSÁNEĆ first entered into treaty with Douglas in 1852 (Lavoie 2013: 1). Hereditary chief WEC'KINEM (Eric Pelkey) of STÁUTW (Tsawout) First Nation led the reclamation with support from Indigenous and non-Indigenous volunteers, who worked with the local Indigenous nations to build public support for the campaign. The reinstatement of the original name fulfilled a long-standing request by local elders to "bring back the names we have always used to where they belong" (IC 2013: 1). I was fortunate to have been asked to participate and help with the reclamation. Following several months of planning, WEC'KINEM and the WSÁNEĆ nations led close to eight hundred supporters and community members to reclaim PKOLS.

On the evening of May twenty-second, marchers gathered at the base of the mountain and hiked to the summit, where they joined in a ceremony to reinstate the original name. The signing of the Douglas Treaty was re-enacted by a volunteer group of performers at the site where it was originally (and coercively) signed, but the inscribed colonial violence of dispossession was *inverted*: Instead of ceding land and territory to the invading colonial power, local Indigenous leaders presented and signed a new declaration honouring the restoration and reinstatement of PKOLS and committing to the future reclamation of other traditional place names throughout the WSÁNEĆ and neighbouring territories. The PKOLS declaration asserted WSÁNEĆ and LEKWUNGEN nationhood in terms consistent with their natural laws, traditions, inherent authority over their homelands, and rights as Indigenous Peoples and Nations (PKOLS Declaration 2013). Coast Salish master carver TEMOSEN (Charles Elliott) of WJOŁEŁP (Tsartlip) First Nation designed a large PKOLS sign from yellow cedar that was carried to the summit and installed at a high viewpoint — overlooking the surrounding mountains, ocean and the city of Victoria. Participants from the Indigenous Leadership Forum wore T-shirts identifying themselves as members of the INM and worked with local organizers to provide security; assist community members and elders; help carry and install the PKOLS sign; and liaise with civic authorities, media and law enforcement. During the reclamation ceremony, WSÁNEĆ community members recounted the story of PKOLS, first in SENĆOŦEN and then in English. After the declaration was signed, the event concluded with the sharing of food, songs and drumming by the local nations.

Having generated high-profile endorsements and support from intellectuals and organizations including Noam Chomsky, Naomi Klein, Tom Hayden, Greenpeace and the Sierra Club (PKOLS 2013), the reclamation gathered communicative momentum across social media channels; and photo, video and audio content

shared online during the event provided witnesses who were unable to attend the event in person with a vicarious experience of immediacy and presence.

The reclamation of PKOLS was a potent assertion of Indigenous nationhood and autonomy that signalled new possibilities for Indigenous-Settler alliances, collective action and decolonizing praxis. The WSÁNEĆ did not seek permission from the State; they took action in alignment with their natural laws, customs, and inherent rights. In doing so, they were supported by a large community of local Indigenous nations, Indigenous visitors to their traditional territory and Settler allies. Against the strictly delimited forms of "permissible" Indigenous activism, the reclamation of PKOLS was empowering and emboldening, not only for the local nations but also for communities and supporters in solidarity across Turtle Island. The reclamation of PKOLS was simultaneously a symbolic, communicative and embodied enactment of autonomous movement within and against the colonial demarcations of "settled" territory and in refusal of Indigenous *displacement*. In literal terms, PKOLS refuted the dispossession of original place names by *re-placing*, or returning, the name to its rightful originary place.

In this way, PKOLS worked to overturn the binarism of Settler colonial relations by enacting a participatory process of renewal that inverted the colonial frame and proposed an "affirmative *enactment* of another modality of being, a different way of relating to and with the world" (Coulthard 2014: 169). This resurgent return to an originary form of place-based knowledge — rooted in the SENĆOŦEN language — presupposes the alterity of an *Indigenous* ontoepistemic foundation that comes from the land and is, quite literally, *of* that place. In reclaiming PKOLS, treaty-making was re-visioned as a processual form of collective action in the present. Demanding both an understanding of interdependent relationality and respect for WSÁNEĆ forms of life derived from millennia of embodied praxis in place, PKOLS marked multiple forms of embodied resurgence and return: It recuperated the spiritual force of Idle No More's round dance revolution and refigured resistance through ceremony. The return of original names to "where they belong" is, as Anishinaabe author Leanne Simpson suggests, not simply a symbolic action, but "a mechanism for reconnecting our peoples to the land, our histories and our cultures ... Building a strong, connected Indigenous Nationhood Movement rests on reclaiming the lands and sacred sites we have been removed from" (2013: 1). Reconnection, reclamation and renaming are essential acts of decolonization.

PKOLS thus provided a resonant example of prefigurative decolonial politics in motion—a gesture of renewal that affirmed the critical potentialities inherent in affirmative forms of resistance that seek to make structural and historical injustice *visible* while self-valorizing Indigenous forms of life on our own terms and in our own languages. As one speaker declared during the reclamation: "We're Idle No More [and] acting outside the confines of Indian Affairs ... *we are acting this time,*

The Reclamation of PKOLS, May 22, 2013 (Photo credit: Amos Scott)

not reacting." PKOLS pointed a pathway forward that drew from a long continuum of Indigenous resistances against colonialism, and reaffirmed the efficacy and power of an embodied praxis of presence made visible through *reclamation* and *reoccupation*. Although the reclamation of PKOLS was not a new form of resistance, it was a generative provocation that inspired other Indigenous people and communities to see the continuity and interconnections in our struggles to decolonize.

As Leanne Simpson observed:

> We all have within our territories our PKOLS, many PKOLS — sacred places waiting to be restored to their place within the fabric of Indigenous societies. Whether it is a mountain, burial ground, hot springs or spring water, buffalo rubbing stone, tipi ring, teaching rocks, a medicine picking spot, or a travel route or a city street, *the PKOLS reclamation provides us with impetus to not just feel inspired, but to act.* (2013: 2)

Against colonial legacies of dispossession and displacement, PKOLS embodied and compelled action: "to take up our responsibilities to our homelands ... to inhabit them, to maintain relationships with their features and to pass that presence down to our children and grandchildren" (Simpson 2013: 2). This dual movement of refusal and affirmation did not stop with the rejection of colonial naming; it renewed a place-based vision of Indigenous presence and continuity. And it is this "place-based imaginary," Coulthard argues, that "serves as the ethical foundation from which ... Indigenous peoples and communities continue to resist and critique the dual imperatives of state sovereignty and capitalist accumulation that constitute our colonial present" (2010: 82). PKOLS was not unique, but it was "an extraordinarily important act for the STÁUTW, Songhees and the WSÁNEĆ because it physically connects them to a powerful place, alive with story, and breathing with history" (Simpson 2013: 1). PKOLS reinstated a new history of the *Indigenous* present. "This action to reclaim #PKOLS is truly one of the most exciting I've seen in Canada," said one observer on Twitter. "This is the beginning of something" (Martineau 2013: 2).

Conclusion: New Beginnings

Idle No More is about beginnings, not origins. It was a moment of rupture, a movement of return, a break in our collective consciousness that awakened new possibilities for creative resistance. The struggle to resurge and decolonize is continuous; and our survival compels our action. But resistance reaffirms our force and power; and resurgence reminds us why we are fighting. Idle No More marked both this continuation as well as the search for new languages and practices of struggle. By rejecting stasis and refuting fixity, the movement set in motion new rhythms of change. Idle No More was a movement of *movement* that mobilized decolonial consciousness among Indigenous people and newcomers alike, and it has enabled us as Indigenous Peoples to reorient our political practices toward rebuilding power and autonomy. Decolonization demands that we forge new political subjectivities through self-affirmative and transformative resurgent praxis. And as our lives and lands continue to be threatened by Settler colonial dispossession and capitalist exploitation, decolonization remains our critical imperative. The transformative becoming of resistant subjectivity is activated by affirming Indigenous ontological priorities and practices (Indigenous land-based knowledges, lifeways, natural laws, songs and ceremonies) and by navigating the shifting terrain of struggle. Our movement demands continual creative transformation.

Indigenous peoples must struggle *within and against* regimes of representation by mobilizing collective action on multiple fronts: through technology, art, music, culture and ceremony. Demands for accountability from the State and Settler society and to protect the land and water, to uphold treaty relationships, to renew balanced Indigenous-Settler relations, and, perhaps most importantly, for colonialism to end, have yet to realized. But Idle No More's *politics in motion* drew from the power of our collective ancestral and historical memory to bring a renewed sense of urgency to our ongoing struggle for decolonization. In so doing, new rhythms of resistance began to sound. New forms of transformative praxis began to be forged. And an emergent force of Indigenous resurgence was sparked that will resonate in the generations to come. Melancholic and triumphant, hopeful and defiant, with Idle No More we begin again. We continue. We move. We rise.

Note

1. It is important to note that within Settler colonialism, Indigenous "political action" is consistently "stifled," silenced and delimited by State-sanctioned forms of violence and repression. For more on the effects of framing Indigenous political action as a threat to the state, see Craig Proulx (2014), "Colonizing Surveillance: Canada Constructs an Indigenous Terror Threat." *Anthropologica* 56, 1, 83–100.

What began as a movement based out of Canada has grown and erupted across landscapes, through rivers and oceans, and eventually into the hearts and minds of those we never thought it possible to reach. Demonstrations against enslaving the earth to create mining corporations; round dances showcasing how honouring the treaties within Canada can create viable, healthy relationships; and blockades significantly valuing the land for what it truly is—a living entity—are growing globally. It is through these demonstrations that we begin to see how strong the heartbeat of mother earth truly is, how this prophecy will never sleep, and how all Indigenous peoples around the world are honouring their realities, their truths, and the lives of their ancestors.

An international community is quite difficult to contain. Yet, while stepping onto the land of the Maori, and hearing the stories of how they feel the same struggle we do, or listening to the truth from a young Sami man, discussing the fights they fight based on the life of the land, the truth unfolds. No matter how large the distance is between us as Indigenous peoples, we live similar realities. Not only has this movement proved this true, but it has allowed us to join in complete solidarity, to reach out to one another, and to share in a way we may have never shared before.

Because of this movement, an understanding of global Indigenous issues has developed outside of using the United Nations system. We do not need a declaration to show us that treaties in other countries are not being honoured, we do not need a United Nations system to provide us space to share stories of our traditional livelihoods, we do not need governmental bodies trying to tell us they are fixing the problems, we need one another. There is strength in numbers, as this movement is showing us. We gain partnerships without colonial, indoctrinated processes. We gain unity through ceremony, through traditional knowledge, through language, through storytelling. We are continuously honouring our oral traditions globally in spite of the difficulties we are facing throughout the development of this movement. And we stand side by side with our future generations and ancestors, honouring one another internationally and decolonizing public spaces universally.

There is one more thing that stands out within this international revolution: the voices of youth. These youth are leading the way by speaking up at the rallies, by organizing the demonstrations, and by

transforming public space into traditional space. Partnered with ceremony, the youth are truly the voices behind, and in front of, the movement. Whether the event is taking place on a small reservation in Northwestern Ontario, on the steps of Parliament in the capital city, coordinating events for Sami Parliament, or in an academic space within a university in New Zealand, we see the youth at the microphone. It is through this that we know that this movement is prophecy, but it hasn't been encased within the colonized borders of Canada—it has surpassed those borders, it decolonizes those borders, and it reaches out to the brothers and sisters globally.

The youth are engaging in global prophecy, global ceremony, and global traditions. This revolution embodies traditional livelihoods, oral traditions, stories from our ancestors, and the heartbeat of mother earth in a multitude of ways; and this is why it's growing and thriving. This movement has become us, we have become this movement. International barriers implemented by colonial governments will not keep us apart and we have united by indigenizing and decolonizing global space. The strength and power stems from ceremony and traditions, and the voices that are heard around the world come from our younger generations, understanding why they're doing what they're doing, and why we fight the same fight globally. For this we put our hands together, and recreate the war cry that was so often portrayed in Hollywood movies. This war cry is our truth, and this movement is our reality.

THE RISE OF THE NATIVE RIGHTS-BASED STRATEGIC FRAMEWORK:

Our Last Best Hope to Save our Water, Air, and Earth

Clayton Thomas-Muller

Years ago I was working for a well-known Indigenous environmental and economic justice organization known as the Indigenous Environmental Network (IEN). During my time with this organization

I had the privilege of working with hundreds of Indigenous communities across the planet who had seen a sharp increase in the targeting of Native lands for mega-extractive and other toxic industries. The largest of these conflicts, of course, was the overrepresentation by big oil who work—often in cahoots with state, provincial First Nations, Tribal and federal governments both in the US and Canada—to gain access to the valuable resources located in our territories. IEN hired me to work in a very abstract setting, under impossible conditions, with little or no resources to support grassroots peoples fighting oil companies, who had become, in the era of free market economics, the most powerful and well-resourced entities of our time. My mission was to fight and protect the sacredness of Mother Earth from toxic contamination and corporate exploration, to support our Peoples to build sustainable local economies rooted in the sacred fire of our traditions.

My work took me to the Great Plains reservation, Three Affiliated Tribes of Fort Berthold to support a collective of mothers and grandmothers fighting a proposed oil refinery, which if built would process crude oil shipped in from a place called the tar sands in northern Canada. I spent time in Oklahoma working with Sac and Fox Tribal EPA under the tutelage of the late environmental justice warrior Jan Stevens, to learn about the legacy of 100 years of oil and gas on America's Indian Country—Oklahoma being one of the end-up points of the shameful indian relocation era. I joined grassroots on the Bay of Fundy, in an epic battle against the state of Maine and a liquefied natural gas (LNG) producer who wanted to build a massive LNG terminal on their community's sacred site known as Split Rock. The plant, had it been built, would have provided natural gas to the City of New York for their power plants.

I worked extensively witb youth on the Navajo reservation in America's Southwest, who were fighting the Peabody Coal mining company, trying to stop the mining of Black Mesa, a source of water and a known sacred site in the Navajo Nation. On the western side of the Navajo Nation, I worked to support Dine/Navajo who were fighting an attempt to lift the ban on uranium mining, which would have seen the introduction of a dangerous form of uranium mining called in situ or "in place" extraction that could've poisoned precious groundwater resources in the desert region. Uranium had already left a devastating legacy on

the Dine/Navajo in the 40s and 50s. I worked in the Great Lakes at a community of Walpole Island (Bkejwanong First Nation) to stop an oil company from drilling for oil in their community—a place where First Nations peoples harvest for wild rice, muskrat, and fowl grains. It had also become a place of local economic importance as ecotourism from American duck hunters, providing income to the community. Walpole Island was already dealing with the impacts of 60 petrochemical facilities within 60 kilometres of their nation. I worked to support groups in Montana's Northern Cheyenne and Crow Indian reservations who were fighting massive expansion of coal bed methane in their region. The encroachment was decimating local ground water resources. I worked in Alaska and was a co-founder of the powerful oil-busting network known as Resisting Environmental Destruction on Indigenous Lands (REDOIL) that was created to take on the corrupt Alaska Native Corporations and big oil who had been running roughshod trying to start development in fragile places like the Arctic National Wildlife Refuge (ANWR). I worked with groups in British Colombia's Nortbeast, where natural gas companies were ripping apart the landscape with massive gas developments. I worked in dozens and dozens of other territories and places across the globe, many not mentioned in this story.

During my five years as an IEN Indigenous oil campaigner (2001–2006) I learned that these fights were all life and death situations, not just for local communities, but for the biosphere; that organizing in Indian Country called for a very different strategic and tactical play than conventional campaigning; that our grassroots movement for energy and climate justice was being led by our Native women and, as such, our movement was just as much about fighting patriarchy and asserting as a core of our struggle the sacred feminine creative principle; and that a large part of the work of movement building was about defending the sacredness of our Mother Earth and helping our peoples decolonize our notions of government, land management, business and social relation by going through a process of re-evaluating our connection to the sacred.

In the early years I often struggled with the arms of the non-profit industrial complex and its inner workings, which were heavily fortified with systems of power that reinforced racism, classism, and gender discrimination at the highest levels of both non-profit organizations

and foundations (funders). It was difficult to measure success of environmental and economic justice organizing using the western terms of quantitative versus qualitative analysis. Sure, our work had successfully kept many highly polluting fossil fuel projects at bay, but the attempts to take our land by agents of the fossil fuel industry—with their lobbyists pushing legislation loopholes and repackaging strategies—continued to pressure our uninformed and/or economically desperate Tribal Governments to grant access to our lands.

The most high-profile victory came during the twilight of the first Bush/Cheney administration when our network collaborated with beltway groups like the Natural Resources Defense Council and effectively killed a harmful US energy bill containing provisions that would kick open the back door to fossil fuel companies, allowing access into our lands. The Indian Energy Title V campaign identified that if the energy bill passed, US tribes would be able, under the guise of tribal sovereignty, to administer their own environmental impact assessments and fasttrack development in their lands. Now this sounds like a good thing, right? Well, maybe for tribal governments that had the legal and scientific capacity to do so, but for the hundreds of US Tribes without the resources, it set up a highly imbalanced playing field that would give the advantage to corporations to exploit economically disadvantaged nations to enter into the industrialization game.

Through a massive education campaign and highly negotiated and coordinated collaborative effort of grassroot, beltway, and international environmental non-governmental organizations (eNGOs)—as well as multiple lobbying visits to Washington DC, led by both elected and grassroots Tribal leaders—we gained the support of the National Congress of American Indians who agreed to write a letter opposing the energy bill to some of our champions in the US Senate, most notably the late Daniel Akaka who was Hawaii's first Native Senator. Under the guidance of America's oldest Indian advocacy group he would lead a vote to kill the energy bill in the Senate. This was my first view into the power of the Native rights-based strategic and tactical framework and how it could bring the most powerful government on earth (and the big oil lobby) to its knees. Of course upon the re-election of the Bush/Cheney administration we lost the second reincarnation of the energy bill and the Title V was passed.

What I learned in these battles is that our sacred treaties outlining our priority rights and the fiduciary obligations governments have to us, are an important tool in this fight. We are the keystones in a hemispheric social movement strategy that could end the era of big oil and eventually usher in another paradigm from this current destructive time of free market economics.

The challenge would be to get people with power, both real and falsely perceived, to understand this reality. It is a task not easily accomplished. For example, with the passing of the US energy bill under the second Bush/Cheney administration, the US climate movement began to ramp up its attempts to have the administration pass a domestic climate bill. A massive investment by the administration focused on strategies developed by the foundations and individual donors; most of it was earmarked for policy makers instead of building an inclusive movement for climate justice that would take into account the environmental and economic justice framework in the struggle to force the US to lead the world in emissions reductions.

This movement saw the rise of mega-labour/eNGO coalitions like the Blue/Green Alliance, Apollo Alliance and mega-eNGO groups like 1sky and 350.org. Citizen groups like the US Public Interest Research Group (US PIRG) received millions of dollars to try to organize people to put pressure on President Bush, and later President Obama, to adopt some form of climate policy. However, the strategy screamed that age-old saying "what goes around comes around." There would be no climate bill under Bush and, to the surprise of the people who voted for him, no climate bill under Obama (yet).

The groups that ended up receiving resources from that limited pot of climate funding did what they did best, which was to invest in top-heavy policy campaigns. They did not focus on mobilizing the masses to get out in the streets to target and stop local climate criminals or build a bona fide social movement rooted in an anti-colonial, anti-racist, anti-oppressive foundation to combat the climate crisis. Instead, they kept the discourse focused on voluntary technological and market-based approaches to mitigating climate change, such as carbon trading or carbon capture and storage. I would argue that this frame is what kept this issue from bringing millions of Americans into the streets to stop the greenhouse gangsters from wrecking Mother

Jean Sock from Elsipogtog and Shelley Young from Eskasoni begin fasting to protest a lack of leadership in their communities. March 1, 2013, Millbrook, NS. (BRYSON SYLIBOY)

Earth. Groups like the Indigenous Environmental Network, Southwest Workers Union and others fought tooth-and-nail to try and carve out pieces of these resources to go towards what we saw as the real carbon killers, which were local campaigns being led by Indigenous Nations and communities of colour to stop coal mining, coal-fired power, and big oil (including gas).

During the early hours of the Obama administration there was a massive effort to "green" the economic stimulus, a package of job creation funding that was to be doled out by the Obama administration to counter the recession which had crippled the US economy. I had the opportunity to sit with some of the leaders of some of the biggest NGOs and foundations at a New York City round table, including members of the Obama White House team. High-profile individuals like former Green Jobs Czar Van Jones, and Energy Action/Mosaic Solar founder Billy Parish were also in attendance. At this table I told a story.

In the 80s and 90s America was in the grips of a recession, and groups rose up from all sectors to create a strategy to combat the crisis. Alliances were formed between the trade unionists and the NGOs and social justice groups. When the negotiated target of funding was in sight and Congress was about to write a cheque, groups became divided, and what was plentiful turned to scarcity and in the end AmeriCorp was born. Unions, NGOs, and social justice groups. And more importantly, the unity they had created, was shattered. Political games and divisive tactics were used by those in power. They used race, class and gender politics to divide a movement. I said that we were in the exact same moment in time, that we were seeing big oil ram through an energy bill loaded with corporate welfare for the one percent during the collapse of Americas middle-class and the stalling of a US climate bill, would impact the most vulnerable to our rapidly destabilizing climate—poor communities of colour and Native American communities.

America's wealth, and more directly, America's energy infrastructure was built on our backs. Efforts should be made to invest locally first—from training green jobs workers locally to using local building materials to producing energy locall. This would close the financial loop and help revitalize Native America's strangled economies, making them less vulnerable to volatile external costs while maximizing the positive impact of the new green revolution.

A green jobs economy and a new, forward-thinking energy and climate policy would transform tribal and other rural economies, and provide the basis for an economic recovery in the United States. In order to make this possible we had to encourage the Obama administration to provide incentives and assistance to actualize renewable energy development by Tribes and Native organizations and our allies.

I made the argument that we could use the attributes of a predatory economic paradigm that had disproportionately targeted our communities, to flip the script on our enemies and that Native Americans, with our unique rights-based and trust relationship with the US government, could be a strategic and tactical asset to a diverse social movement trying to lobby for an economic stimulus bill that would actually help empower the most vulnerable while not exacerbating an ecological crisis. For this to work we would have to make moral agreements and not, under any circumstances, be denied. On the table was $750 million earmarked for green jobs and the task at hand was to determine how to equitably share the pot. In the media, the numbers of jobs created versus the amount of workers unemployed went from one million to five milliou and then back to one million and again. Once we got to the point where Congress was ready to write a cheque, we saw the downfall of mega groups like the Apollo Alliance and the absorption of 1SKY by 350.org. Many groups that started off at the table fell, one by one, with the first being groups representing racialized constituencies. Meanwhile in Indian Countty, Tribes saw Congressional allocations from this economic stimulus packaged in the billions (rightfully so) and kept on keeping on.

The point of the story was that if we could truly understand the aspects of our struggle that kept us united, and more importantly, understand our unique contributions to a successful social movement paradigm, we could effectively expand the pot from $750 million to billions. By converging struggles in a solidarity framework rooted in anti-racism, anti-oppression, and anti-colonialism and by creating economic and political initiatives uniting urban and rural centres, we could wield a power never seen by our oppressors and actually gain economic independence and community self-determination. We could develop economies that didn't force people to have to choose between clean air, water, and earth or putting food on the table. I did not attend this meeting to ask for handouts, but rather as an ambassador of a strategic framework that I had come to know as the Native rights-based approach, which could be used to bring to an end what Native American activist, author, and Vice Presidential candidate Winona LaDuke described as "predator economics" and what activist and author Naomi Klein rightfully describes as "shock doctrine" economics.

Little did I know that all of these experiences were preparing me for what would be one of the biggest battles of my life. During the IEN Protecting Mother Earth Summit in 2006 in Northeru Minnesota, three women from a small mostly native village called Fort Chipewyan, Alberta came to share their Dene people's struggle. Years later it would be known as the most destructive industrial project on the face of the earth, the tar sands mega-project. These three women were related to each other and represented three generations of one prominent family in Fort Chip known as the Deranger clan. They listened to the dozens of stories told in the energy and climate group about the injustices happening because of oil companies and complicit governments across Turtle Island. They told us about a project so large, so devastating that you had to see it to believe it. They spoke of a wild west of sorts, one of the last bastions of earth were big oil was ramping up, and they spoke of the deaths in their community from rare cancers, auto-immune diseases, and boomtown economics that plagued people living downstream from the tar sands. They said that we needed to go up to Fort Chipewyan and help.

I was taking time off from organizing and living in Ottawa with my wife and newborn son, Felix. My lifetime mentor and friend Tom Goldtooth, Executive director of the Indigenous Environmental Network, took this invitation from the Deranger matriarch Rose Desjarlais very seriously. IEN immediately organized a fact-finding mission in the Athabasca region of the tar sands with our Native energy and climate director, Jihan Gearon, and Rainforest Action Network campaigner, Jocelyn Cheechoo, from the James Bay Cree in Northern Quebec. I was invited because of my experience in fighting big oil across Turtle Island.

When we flew into Fort McMurray, the boomtown in the heart of the tar sands, I was immediately struck by how much it reminded me of Anchorage, Alaska. That was the only other city I had ever been to

that also reeked of oil money. The town had an infrastructure to support 35,000 people but was bursting at the seams with a population of 75,000. Most were men between the ages of 18 and 60 and all working directly or indirectly for the tar sands sector. We took a tour of the infamous Highway 63 loop to Fort McKay Cree Nation that carves though man-made desert tailings ponds so big you could see them from outer space. We marvelled at the 24-hour life of the city and the incredible traffic jams at shift change. I think what struck me most was the level of homelessness in a town where there was a six-figure salary for anyone who wanted it. To see the tar sands themselves was devastating, to fly over endless clear cuts, open-pit mines and smokestacks surrounded by pristine Cree and Dene peoples' homelands was gut-wrenching. When we drove through and walked in the tar sands the smell of bitumen filled our noses and lent to the trauma that locals live with every day.

We got on a bush plane at the Fort McMurray airport and flew to Fort Chipewyan. We flew the route of the Athabasca River—a critical life path of the people of that land, a source of water, fish, and transportation and a spiritual connection to a past. We were told of how the river had changed, become poisoned, was no longer safe and how every year the water levels became lower due to industry use. When we got to Fort Chip we were well taken care of, and we met many elders, the elected leadership and youth who all told the same stories of hardship, the untimely sickness and death, and the destruction of a subsistence way of life—all by the tar sands. We heard about the history of the peoples going out into the Athabasca Delta and on to Lake Athabasca for food and medicine and how that was becoming impossible due to the massive regional contamination by industry. Again, we were told that we needed to help local grassroots people magnify this scandal to the world by amplifying their voices as the face of the issue.

After we took in the horrifying science fiction of the tar sands—and more importantly the power, beauty, and resiliency of the people of this land they call Athabasca—Tom Goldtooth asked me to build the Canadian Indigenous Tar Sands Campaign. The first thing we did was raise funds for an action camp in Fort Chip where we could do a proper power mapping and skill share with community members who were leading local campaigns and wanted to scale them up. Our first action camp had around 15 community members, including tar sands

warriors and climate movement folk heros like former Mikisew Cree Nation Chief George Poitras, local Dene activists Mike Mercredi and Lionel Lepine, Melina Lubicon Massimo, a Lubicon Cree activist, and Eriel Deranger, a Dene woman also of Fort Chipewyan.

We brought in resource people from the NGO sector. With the direction of local Indigenous leaders we organized a series of workshops on Aboriginal law, organizing, campaign planning, power mapping, and the Native rights-based approach. The outcome of the camp formed directives to launch a Native-led campaign to stop the expansion of the tar sands; to utilize a treaty and Aboriginal rights-based framework; to ensure that Indigenous peoples on the front line were the face of the campaign; to raise the human health impacts as a moral issue; and to follow the money financing the tar sands and to target those controlling it. Also, we were to advocate in the non-profit industrial complex that a meaningful proportion of funding and resources earmarked for tar sands work go directly to First Nations.

What came next would consume most of my waking time on Mother Earth for the next seven years. When IEN launched our tar sands campaign we knew that this issue was about to become one of, if not the most, visible campaigns on the planet. The local grassroots peoples were engaging with the most ruthless, powerful, well-resourced, and just plain old evil corporate entities on the face of the planet. We knew that these companies had bought every level of colonial government, and many were in bed with our own First Nations governments. But we knew that if executed properly we would see victory. This multi-pronged campaign would contain elements of legal intervention, base-building, policy intervention (at all levels of government, including the United Nations), narrative-based story-telling strategies in conventional and social media, civil disobedience and popular education, and a whole lot of prayer and ceremony.

Again, I found myself at a table of funders and eNGO directors discussing a massive campaign that would impact every segment of our society including our biosphere. I found myself viewed by my peers as without power and that perhaps I was at the table for handouts rather than with something to offer. The same old tricks of top-heavy, policy-focused pitches by the usual suspects happened again. And I found myself repeating the need to take the time to understand and work in

solidarity with the Native rights-based strategic framework. I talked about how in the last 30 years of Canadian environmentalism there had not been a major environmental victory won without First Nations at the helm asserting their Aboriginal rights and title. This included many of the victories that those in the room counted in their own personal careers. I argued passionately that we should agree on the fact that we needed to dedicate meaningful resources to this approach and the decision would mean the difference between a fight lasting years or decades. During that meeting the facilitator representing the collective of foundations and donors that had contributed to a pot of money to fund anti-tar sands work became noticeably frustrated with our platform and things escalated to a point where he was yelling and swearing that our IEN campaign was "in the way" of plausible strategies that were actually going to work. Once the chastising was over I proceeded to say, "Well, now that I know where you're coming from and you know where IEN is at, how much of this funding are we going to get?" We walked out of that meeting with $50,000 seed money to start our campaign.

From that moment to now, our Indigenous heroes, or should I say, "Sheroes," have successfully built an international movement to stop the Canadian tar sands. Supported by thousands of Native and non-Native allies, the campaign is now active in the United States, Canada, and Europe with hundreds of First Nations, unions, NGOs, private-sector companies, municipalities, foundations, and individuals participating and elevating First Nations and our rights-based strategic approach as the keystone to the campaign. Part of this success was achieved through some seriously gutsy moves, one being a visit of high-profile Hollywood director James Cameron to tour the tar sands right when his blockbuster movie *Avatar* had become the highest grossing film in history.

Cameron's tour was done at the time when IEN was pushing hard for our Keystone XL campaign to be funded. It was an uphill battle since everyone knew that pipeline fights historically have usually been defeats. We had done an analysis on the viability of victory in a Keystone XL campaign for the funders, because we were one of the few groups that had taken on the Keystone pipeline. Our analysis told us a couple of things. In the US, the Oglala aquifer would be the primary ecological card, as millions depended on this source of water and the pipeline was right through the heart of it. We knew that the dozen or so US Tribes could

be educated to use the power of their unique rights-based approach to fight the pipeline. We also knew that no one in the US, especially in the heartland of the Dakota states, Nebraska, Oklahoma, and Texas knew what the tar sands were. We knew by bringing James Cameron to the tar sands, and by having him talk about the human rights scandal unfolding in First Nations communities, during a time when *Avatar* was on every theatre screen on the planet, would be huge boost to our cause.

Jim Cameron came, he saw, he met with the tar sands industry, the Alberta government, and with First Nations. He made a lot of promises about direct support of the legal strategies of First Nations against the oil sector and the government of Canada. As an avid supporter of technological remedies, he did not condemn the tar sands. He spoke highly of nuclear energy as an alternative—as well as the emerging theoretical carbon capture and storage technologies. What he did do was to say in front of the international press "I did not make *Avatar* until the technology was available for me to tell the story right, and the Canadian government should not develop the tar sands until they have the technology to not poison and kill First Nations people with cancers."

Avatar parts 2 and 3 are set to come out in 2015. I have a feeling that Cameron and his commitments to First Nations about directly funding the rights-based strategic framework are yet to be tested. The fallout from his visit was that every newspaper, television, computer, and smartphone in America was comparing the story of *Avatar* to the real-life situation unfolding between First Nations in the tar sands. The result was the emergence of the Keystone XL campaign as the lightning rod of the US environmental movement, a fight that's still raging today and it was done through the lens of human rights.

The tar sands campaign of IEN started at a time when direct community funding was in the tens of thousands but over time and through pressure it is now in the millions. We're still dealing with a non-profit industrial complex that is its own worst enemy. But Harper's corrupt, totalitarian federal government—with its extremism—is pushing a larger base of non-Native allies to our side of the equation.

With the current Harper government and the passing of recent omnibus legislation, Canada has seen 30 years of environmental, social, and economic policy thrown out. In response, we seen the rise of Idle No More, a catchy social media and education campaign launched—again

by First Nations woman—and the result was a quickening of Canadian reconciliation with its own violent history of colonization as well as the rapid politicization of tens of thousands of Indigenous peoples occurring not just in Canada, but in all occupied lands across Mother Earth. Left without a pot to piss in, the conventional non-profit industrial complex and their supporters are trying to figure out their next steps in dethroning Harper, a daunting task after the unsuccessful bid to elect the New Democratic Party in British Colombia.

The one area where the Harper government has not been able to stack the cards is the courts, and a Native rights-based tactical and strategic framework—supported by labour, NGOs, students, and other social movements scaled up to the proportions of the 1960s US civil rights movement—is what's going to not only dethrone Harper, but is the last best effort to save our resources from Canada's extractive industries sector and the banks that finance them. This rights-based approach has been tested time and time agaiu, it is enshrined in section 35 of the Canadian constitution, it has been validated by more then 170 supreme court victories, it is validated by all of the Indian treaties, it is validated by the United Nations Declaration on Indigenous Peoples, it is validated by the ILO convention 169 and many, many other legal instruments. The racism that Idle No More has met in the media, reminiscent of a 1950 Mississippi era, toward Native peoples and our winning rights-based strategy has driven even the most conservative of Canadians to our side and even toppled some of the biggest architects of the free market neoliberal agenda such as the infamous US-trained lawyer and mentor to Canadian Prime Minister Harper, Thomas Flanagan. We have come too far as Indigenous peoples to give up who we are. We have always been kind and again we will share the wealth and abundance of our homelands with our relatives from across the pond. Instead of lessons on how to survive the harsh winters of our lands, today we are offering lessons on how to be resilient and to overcome the oppression from the archaic oil sector and in our own government who have lost their minds with power.

We are faced with tremendous odds, the end of the era of cheap energy, the loss of ecosystems to sustain unfettered economic growth and, of course, the global climate crisis. We must understand that these are all symptoms of a much larger problem called capitalism. This

economic system was born from notions of manifest destiny, the papal bull, the doctrines of discovery, and built up with the free labour of slaves, on stolen Indian lands. We have much to do in America and Canada to bring our peoples into a meaningful process of reconciliation. I have learned that our movement is very much led by women. This is something I am very comfortable with given the fact that I am a Cree man and we are a matriarchal society. There is a powerful metaphor between the economic policies of this country Canada and the US and their treatment of our Indigenous women and girls. When you look at the extreme violence taking place against the sacredness of Mother Earth in the tar sands, for example, and the fact that this represents the greatest driver of both Canadian and US economies, then you look at the lack of action being taken on the thousands of First Nations women and girls who have been murdered or just disappeared, it all begins to all make sense. It's also why our women have been rising up and taking power back from the smothering forces of patriarchy dominating our economic, political, and social, and I would say spiritual institutions. When we turn things around as a people, it will be the women who lead us, and it will be the creative feminine principle they carry that will give us the tools we need to build another world. Indigenous peoples have been keeping a tab on what has been stolen from our lands, which the creator put us on to protect, and there is a day coming soon where we will collect. Until then, we will keep our eyes on the prize, organize, and live our lives in a good way. we welcome you to join us on this journey.

THIS IS A CEREMONY

Tara Williamson

The children and adults are scattered across the small clearing gathering wood. There is the sound of crunching leaves and the snapping of twigs and branches, mingled with laughter, and the soft soothing voices we use to teach our children. Every dried-out twig that fell has a purpose

Idle No More arose with scant planning—using social media and tapping into the deep sense of unfairness and the political abandonment of their voice felt by educated Aboriginal women. It has resonated with many others, including men, and generations young and old, because it speaks a bitter truth about Canada—it has failed to deliver on human rights and equal opportunity for Aboriginal peoples.

This brings us back to the key point about the Indian Act. Why hasn't it changed or transitioned into a more meaningful government regime designed to be effective or responsive to the needs of First Nations citizens, especially those in crisis? I reflect back on the failed constitutional renewal process that followed the conclusion of the Charlottetown Accord. This accord offered a transition process out of the Indian Act to a new arrangement that preferred an obligation for a negotiated settlement but clearly recognized a legally enforceable and existing inherent right of self-government, as well as a fiscal arrangement to support that transition. Those provisions, and the protocols that supported them, would have represented a new path forward, but it was quickly put to rest when constitutional reform politics was shut down.

Some First Nations women had deep suspicions about the Charlottetown Accord at the time and felt they were mistreated when the Native Women's Association of Canada was not represented at the discussion table. They worried self-government might not address issues such as caregiving support and equality, or redress their grievances about their treatment at the hands of band leadership. They were right to be worried. Twenty years later there is still no improvement in meaningful government services or policies to make caregiving and raising children easier than it was then.

I'm not advocating a new constitutional round. The constitutional discussions ended because of the unworkable amending formula and a lack of public appetite for them. The *Report of the Royal Commission on Aboriginal Peoples* recommended a nonconstitutional reconciliation approach with a negotiated process for change. Its recommendations have merit and deserve thoughtful consideration, but it too has been ignored, either because of the scope of change required or a lack of political will at the national level. Crucial issues about the scale and viability of First Nations communities and economies require a broad and pragmatic discussion in an appropriate political forum.

So where does that leave us? The Prime Minister and his government do not appear to have suffered any major setback in popular opinion from Idle No More and other protests. But not even the most Machiavellian of strategists can be sanguine about the uncertainty that now characterizes the relationship between Aboriginal leaders and their grassroots. We are in uncertain terrain and a state of stasis, and the system that maintained it can no longer be counted on to keep the peace. The failed policy of the Indian Act era has run its course, and no one can make a deal without the support of the people.

The glimmer of hope lies with the women. They understand that solutions lie in forging relationships that respect the rights of all and that address the social and economic issues that blight the lives of so many of our most vulnerable. With Idle No More, they have shown they are prepared to make noise. Canadians would be unwise to think the drumming and celebratory atmosphere of Idle No More has no substance or will soon subside. Aboriginal politics will never be the same.

IDLE NO MORE:
Strong Hearts of Indigenous Women's Leadership

Wanda Nanibush

On January 26, 2012, I found myself marching down a busy Toronto street beside grandmother Pauline Shirt and a number of Indigenous women in front of hundreds of marchers. As a water carrier, I was holding a part of lake Ontario in my hands. This water walk and ceremony was called together to bring attention to the Idle No More movement and the fight against the changes to the Navigational Waters Protection Act under Bill C-45 that legalized resource development's precedence over environmental protection. We weren't protesting—we were speaking the spirit of the water. We were attempting to heal her from the pollution choking her life force, which in turn chokes our own.

The actions under the Idle No More banner have largely been peaceful and ceremonial in nature, thus markedly different from any other massive international Indigenous-led movement in history. It is a movement led largely by grassroots Indigenous women. The movement exhibits a post-Cartesian Indigenous ethos where the mind, body, spirit, and emotions are engaged together. Like the drum at the centre of the round dances is the heart of the mother earth, the women maintain the heart at the centre of the movement. It's a rare feeling to go to a political action and want to hug every stranger around you, to feel vulnerability at the centre of life and a desire to protect it.

Indigenous women's leadership has always been at the grassroots level, having historically been shut out of Indian Act-based leadership until 1952. Many have forged their leadership skills in ceremonial spaces where pre-contact cultural values around the roles of women have allowed us significant influence and power. The teachings gathered at the skirts of our grandmothers have also required a different set of principles for working cross-culturally. While a return to and education about the Nation-to-Nation relationship that exists between Canada and the many Indigenous nations on whose soil this country was birthed has been the centre of the movement, it has also required understanding how we are to work together now and in the future. When the relationship is not defined from thought alone but also includes the spirit and the heart the work takes on a different character. Wampum belts hold the history of our treaties with other Nations and speak of these Nation to Nation relationships being based on peace and friendship with the values of trust, integrity, honesty, and truth as the basis for interaction. This is not a written contract to be analyzed and assessed but a contract of spirit and heart to be lived together.

Women who have worked at the ground level healing their communities from historical trauma, who deal with large socio-economic disparities and have counteracted cultural discontinuity—all brought on by colonialism and racism—bring a considerable knowledge base to the movement. Cross-cultural conflicts that are quite common in Canada come to the fore in an Indigenous-led movement like Idle No More. Canadians have been denied access to an education, which leads to deep mistrust and misunderstanding between Indigenous and Non-Indigenous participants in a struggle to protect the earth and water.

Unity has been stressed and yet unity in difference is the goal. For this movement to work we must remain unified. This means no behind-the-back talk against each other. It means putting aside petty jealousies, envy, dislikes, and old grudges. It means not having an ego. Indigenous concepts of the human that are non-ego based become important. It means true humility that listens before speaking, and that understands before judging, it means letting go of negativity and holding the fragility and dignity of fellow humans close.

It does not mean that we will all agree but the way we disagree is the main question. If I disagree I choose to disagree openly in front of the person, without anger or passive aggression as a form of peace offering towards understanding. I choose to ask questions and seek understanding, to deliberate before forming opinion. I choose to care for strangers. I choose to set aside my own desires for the larger picture. I choose to step forward and shate my knowledge and skills for others. I choose to take the heat. I choose peaceful disobedience. I choose to obey ancient laws of respect. These tenets, if you will, are women's teachings that they bring to the movement and affect how it operates. The earth, for us, is considered a mother; mothering and creation is foregrounded for our identity. This does not mean that women cannot choose men's roles or have sexual relations with women. It does mean that there are specific knowledges within the acts of creation for both earth and women that are essential to the sustenance of our world and humanity. Creation is also an act of futural imagining which is what is at the heart of women's work. The creativity of the actions and the focus on our children's children's etc. future is part of what is expected of a woman living in a good way. Humanity is the weakest link in all of creation because it relies on all of creation to exist—that is why they must ultimately protect it. The focus on male leadership under colonial rule has not quieted the voices of Indigenous women leaders. There is a strength derived from the attempted silencing in their closeness to the community, ceremony, children, and creativity.

WE ARE FREE HUMAN BEINGS, PART TWO

Lori M. Mainville

"We do this for our future generations" are words describing legacies. It suggests presence and, depending on the tone and inflection, it suggests action. These words are sounds of life, of choice, of freedom.

I was privileged to listen to the late elder Peter O'Chiese, who spoke of such things as the power of sound. Our original language had this built right within it, it was co-relational to the vibration of sound of the land. Our words not only sound like the world around us, but so did the spaces between the words. One need only sit in silence near water or trees to understand the deep sense of connection we carry in sound.

Our voices are sacred binds with one another. The oral tradition demonstrates that to us, it is a relational reciprocity of speaking, listening, and witnessing as a group. It also demonstrates how a nation can interact with another nation. Language connects us, it teaches us to maintain our social connections with living beings from all over the world, and the universe. Sometimes we speak different words, but we must keep trying to communicate. We can close that gap of understanding with action.

Part of this is found in Idle No More, an awakening of this very opportunity. The past months have been challenging. This may have been by the leaderless nature of the movement, which made it at times tough to negotiate and communicate widely. It may have been the challenging nature of bringing so many nations into a complex discussion involving so many key issues. Another might have been some of the concerns around "copyrighting" the movement. It's impossible to control energy and harness it under a couple sets of fingers. Our original governance resided with clans, societies, and collectivities, not a few.

It is now that we have opportunities to make sounds of our own, and explain these to others. They must understand too. It is time to think of what will happen next to ensure that we do this for our future generations. It is my prediction that in the coming months we will:

- Reflect and discover the lessons learned from the movement.

An Indigenous View on #BlackLivesMatter

I was reminded over and over this week that black and indigenous communities of struggle are deeply connected through our experiences with colonialism, oppression, and white supremacy.

Indigenous activists participate in the People's Climate March in September 2014. Photo by Allan Lissner / Flickr.

posted Dec 05, 2014

Like many others, I watched the live stream of St. Louis County Prosecutor Robert McCulloch delivering what was clearly a public relations campaign, justifying the grand jury's decision not to indict white police officer Darren Wilson in the murder of 18-year-old Michael Brown.

Although few were surprised by the decision, McCulloch's orchestrated performance contributed to the systemic expression of anti-blackness that began on Turtle Island, when African people were violently stolen from their indigenous homelands and brought by white

> I have seen an expression of tremendous black love for children and family.

people to ours. It is an anti-blackness intrinsically linked to the genocide, white supremacy, hetero-patriarchy, and colonialism used to maintain the dispossession of indigenous people from our homelands on Turtle Island and to erase our bodies from society. That anti-blackness is just as real and alive in Canada as it is in the United States.

As black communities respond to the Ferguson decision in cities across the United States this week, their rage resonates with me in a familiar way because it comes from a similar place as my own. On the streets that night and in the days that have followed, rage.

I have seen an expression of tremendous black love for children and family, a tremendous black love for culture, body and people, coupled with a tremendous outrage against a colonial system that is designed at its core to destroy black and indigenous love. This same fertile ground birthed the so-called "Oka Crisis" and the Idle No More movement. This same ground compels the ongoing resistance of indigenous women and Two Spirit people—an indigenous term for queer or LGBT people—to all forms of colonial gendered violence.

Amid the mainstream media's coverage of these events, it seems difficult for Canadian and American society to see that love and rage are justified—to see indigenous and black people as fully human. I am repeatedly told that I cannot be angry if I want transformative change—that the expression of anger and rage as emotions are wrong, misguided, and counterproductive to the movement. The underlying message in such statements is that we, as indigenous and black people, are not allowed to express a full range of human emotions. We are encouraged to suppress responses that are not deemed palatable or respectable to settler society.

But the correct emotional response to violence targeting our families is rage.

> Policing in Turtle Island was born of the need to suppress black and indigenous resistance to colonialism and slavery.

We have survived 400 years of racialized, gendered violence designed to remove us from our lands and assimilate us into the colonizer's agenda. The idea that we should all remain positive and calm, while 1,200 indigenous women and girls are disappeared in Canada, while black people are gunned down in the streets by white police officers, security guards, and vigilantes every 28 hours, while the legal system will not even provide a trial to the perpetrators of violence, is unfathomable.

I've asked myself more than once this week, why is there more outrage in American and Canadian societies over property damage than toward the state-sanctioned violence that is normalized in the everyday lives of indigenous and black people? I believe that our lives matter more than a burned police car, even if the state and other narratives do not.

I was reminded over and over this week that black and indigenous communities of struggle are deeply connected through our experiences with colonialism, oppression, and white supremacy. Indigenous and black people are disproportionately attacked and targeted by the state, and, in fact, policing in Turtle Island was born of the need to suppress and oppress black and indigenous resistance to colonialism and slavery.

Indigenous and black women are consistently decentered from our communities and targeted by four centuries of gendered violence, while black queer and indigenous Two-Spirit communities are targets of multiple sites of oppression, violence, and erasure. Black and indigenous children have been stolen from their families throughout colonial history through the institutions of slavery, and in Canada the residential schools and the child welfare system. We are interconnected through systems of oppression that would prefer us not to exist unless it can exploit us as commodities for labor.

In both of our communities of struggle, however, youth are brilliant leaders in resistance and resurgence. The work of the Native Youth Sexual Health Network and the Dream Defenders—just two of many for-youth, by-youth organizations—remind me to nurture our relationships to each other by creating decolonizing constellations of resistance and love as a mechanism to ensure that we are no longer complacent in the oppression of each other. These young leaders are showing us through their lives that, by collaborating with each other, we can build collective power and grow mutually caring communities of support and resistance.

> I have a responsibility to center and amplify black voices.

I was also reminded that my liberation as an indigenous woman is linked to the liberation of black women and the Two Spirit and queer community, and I've learned by listening to black feminists like Audre Lorde, bell hooks, Angela Davis, Luam Kidane, and Hawa Y. Mire that resurgent indigenous and black feminisms are the spine of our collective liberation.

The hashtag #BlackLivesMatter is "an online platform developed after the murder of Trayvon Martin, designed to connect people interested in learning more about and fighting back against anti-black racism," according to the three black queer women who created it: Alicia Garza, Patrisse Cullors, and Opal Tomet. I am grateful to them for the platform, discussion, and action their work has inspired because it is a reminder that in the face of a system that seeks to also erase us, #IndigenousLivesMatter too.

To me, Ferguson is a call not only to indict the system but to decolonize the systems that create and maintain the forces of indigenous genocide and anti-blackness. I have a responsibility to make space on my land for those communities of struggles, to center and amplify black voices, and to co-resist.

We both come from vibrant, proud histories of mobilization and protest, and it is the sacrifices of our elders and our ancestors that ensured that our communities of struggle continue to exist today. They believed in their hearts that there is no justice and no peace until we are all free, and so must we.

Thanks to Jarrett Martineau, Tara Williamson, Glen Coulthard, Eric Ritskes, and especially Luam Kidane for comments on previous drafts.

The Misery of Settler Colonialism: Roundtable on Glen Coulthard's Red Skin, White Masks and Audra Simpson's Mohawk Interruptus

January 4, 2016
American Studies Association Annual Meeting
October 8, 2015

Aaniin Kina Wiya, Segoh

I'm so very honoured to be on this panel in Chi Aangiikeyang, which is the name my people, the Mississauga Nishnaabeg, have for Toronto. I'm also very grateful to be on this panel and for the opportunity to engage in the consideration of RSWM and MI together because they are both groundbreaking interventions in their own right, and there is an interesting synergy between these two minds and therefore between these two works. Both Glen and Audra have very clearly demonstrated Indigenous excellence in not only their chosen fields but within the collective intelligence of their respective Indigenous nations.

So to begin with I say Niawen kowa/Mahsi Cho to Audra and Glen for the sacrifice, the bravery, the worry, the fierceness, the confidence and the sheer intellectual labour of resistance that dances off of each these pages. I come out of your books a better Anishinaabe person, and to me that's the ultimate test of excellence in Indigenous thought and writing.

Both of these works have been taken up in extensively in the academy particularly in Indigenous Studies and I also want to point out that the front covers of both have images from the Idle No More movement. This makes complete sense to me because I see a tremendous potential for these two works to carry weight and influence both inside and outside the academy. That's far too rare, but crucial for Indigenous peoples because not all of us have the privilege of thinking through the insidious and ubiquitous nature of settler taken up colonialism and it's strangulation to use Audra's word, of our bodies, minds and nations, primarily because we are being strangled by it and basic survival necessarily, comes first.

And so while each of these books yield a tremendous responsibility to academics in the transformation of the fields of Anthropology, Political Science and Theory, & Indigenous Studies, from colonizing entrenchment to decolonial practices, they also make crucial interventions on the ground in terms of Indigenous struggle and how we chose to frame the issues we respond to and mobilization around. Red Skin White Masks does this through its meticulous discussion of recognition, reconciliation, resentment and the example of the Dene nation and Mohawk Interuptus accomplishes this through its discussion of refusal with extensive examples from the Mohawk nation of Kahnawake.

The aftermath of the Idle No More movement clearly demonstrates that the ways we are organizing and mobilizing are simply not working. Those of us involved in the movement learned very acutely that we desperately need different strategies and approaches to movement building because the state's infrastructure of surveillance, of the policing and the criminalization of dissent, the entrenchment of the mass media in a parroting function rather than a critical or analytical one, and the use of policy and negotiation as a mechanism to neutralize resistance has simple caught up to and I'd argue surpass what we can achieve with our current set of tools whether it's through the normal strategies of direct action or the normal tools of democratic protest. Yet, it is clear to many of us and evidenced in history, that mass mobilization is the only mechanism through which we can bring about the significant transformation we need to spark in Canada in order to ensure that our children will be able to live on their lands as Indigenous peoples.

As a starting point, both RSWM and MI are crucial interventions into how we account, frame and tell the truths of the political and cultural lives of Indigenous peoples that moves away from a constriction of our intelligence within the confines of western thought and the dumbing down of the issues for the non-Indigenous outside and takes a meticulous, critical, robust and layered approach that accurately contextualizes and reflects the lives and the thinking of Indigenous peoples on our own terms. As an example, Audra re-embeds membership issues into a living Haudenosaune matrix of relatedness and tension over membership and belonging in Kahnawake, by naming the root: fear of disappearance – a basic, terrifying, omnipresent reality of being Indigenous and particularly of being an Indigenous woman or queer person and occupied by Canada. She re-embeds belonging in a productive place of refusal, which I read as a spectacular animation of Mohawk theory as Mohawk life and Mohawk land, a productive place of refusal is one that generates grounded normativity, to use Glen's term. If we mobilize around "fear of disappearance" rather than encoding that fear into policy in the form of a membership code, what does that mobilization look like? What happens when we build movements that refuse colonial recognition as a starting point and turn inwards building a politics of refusal that isn't just productive, but that is generative – you get things like the Dene Declaration, you get things like the Iroquois Nationals refusing to participate in the World Lacrosse League Championship tournament in Manchester because the UK refused to recognize their sovereignty.

At this point, one of the biggest out come of the Idle No More movement has been an increased interest in Canadian electoral politics. That's heartbreaking to me, as someone who dedicated a significant amount of time and energy to that movement during the fall of 2012 and the winter of 2013. At the time, there was a diversity of organizing under the umbrella of Idle No More – everything from resurgent-based organizing focused on sovereignty and nation building to very recognition based organizing focusing on state legislation. There was Chief Theresa Spence's ultimate act of refusal that was then co-opted by the male Indian Act Chiefs into an ultimate act of seeking recognition, which was by all accounts, how the state brought down the movement. Again. This continual pattern of the gutting of mass mobilization by royal commissions, national inquiries, or this time, the promise of a couple of "high level meetings", is not a trick we can continually fall for and RSWM clearly outlines why. Here we are two years later, with the components of the movement that were begging for colonial recognition continuing to act out that approach by appealing to the moral compass of Canadians to act on the social ills that plague "the poor Indigenous peoples", a foster parent's plan approach to organizing. Attention is now focused on facilitating change through voting or running for office, which seems so ridiculous to me it matters how change is achieved. Movement building is a productive or generative politics of refusal when we are building and reinvigorating and embodying and amplifying our instance of acting as peoples who belong to

specific Indigenous nations. We are creating the alternative on the ground and in real time. You can sign a petition and stage a demonstration because you don't want a Canadian passport or you can make your own passports and travel on them. No one is going to give you tenure or pay your rent or stroke your ego or give you a medal at the World Lacrosse League Championship for creating the alternative on the ground and real time, and that's why we have to do it.

Building movements that reject the politics of recognition and centre generative refusal inherently create bodies more connected to each other, the land, and that act out, through relationality, Indigenous thought. They inherently amplify grounded normativity, which is the basis of Indigenous political existence. In a sense both books asked the same question to me as a reader: What the best way to ensure we do not disappear as unique distinctive Indigenous peoples and placed-embedded nations? Or asked another way how do I live free in this Indigenous body? Or asked another way, how do I live in a way, as an individual and as part of a collective that ensures I recognize my great great great grandchildren as Indigenous peoples?

***

My favorite part of Audra's book, the part I've thought the most deeply about is a tiny moment shared between two Mohawk nationals in a bar in Greenwich Village. The researcher, Audra, asks her interviewee "What is the ideal form of membership for us? What do you think makes someone a member of the community?" (p.168) He looks her squarely in the eye, and doesn't answer. Instead he says, "When you look in the mirror, what do you see?"

Brilliant.

When I look into the mirror, what do I see? How do I recognize myself as an Michi Saagiig Nishnaabekwe? Do my ancestors recognize me as one of their own? How does Audra, as a Mohawk woman recognize me as a Mississauga Nishnaabeg woman? How are we related? When I am hunting does the spirit of the moose see me and recognize me in the same way she recognized my Ancestors? Does the moose see me as someone who is seeking their consent through my offerings, prayers and practices to harvest their body so that my family can live? Does that moose see me as someone who is engaging with them in the relational terms set out in our diplomacy? Do they feel respected and that they have sovereignty and agency over the act of harvesting? Or have my actions made them feel like a resource? Do they see me as the enemy? Do they feel exploited? Unseen? Unrecognized? Hunted?

What do I see when I look in the mirror?

What does my nation see when we look in the mirror?

Let's talk about how relationality plays out in Indigenous contexts. Part of being in a meaningful relationship with another being is recognizing who they are, it is reflecting back to them, their essence and worth as a being, it is a mirroring. Positive mirroring creates positive identities, it creates strong, grounded individuals and families and nations within Indigenous political systems. So at the same time I am looking into the mirror, I am also am the mirror. What do I mirror back to my kin? Dysfunction? Criticism? Cynicism? What do this two books mirror back to Dene and Haudenosaunee peoples? That's easy – they mirror back strength, pride, connection, beauty, love, fierceness, courage, bravery and the very best parts of being Dene or Haudenosaunee.

I started my talk today by saying the word Aaniin, which is a way of saying hello that is common for Mississauga Nishnaabeg people to use. I spent some time with my Elder Doug Williams from Curve Lake First Nation last week, sitting around a fire talking about Anishinaabeg conceptualizations of recognition. We talked about the word Aaniin. He told me the Ah sound place us in a spiritual context, in the context of the Anishinaabe universe. The Ni is “a taking notice as sound”. When put together, he understands the word to be asking how do you see yourself in all of this? Or put another way, taking in all the thought and feeling of your journey in the universe how do you see or recognize yourself?

This conversation was really sparked by RSWM because Glen made me think a lot about recognition with inside Anishinaabeg thought. My people recognize through song, when spirits enter our lodges and ceremonies. We recognize our family members who have passed on to the Spirit World through particular ceremonies. We recognize and greet the sun every morning, and the moon each night through prayer and ceremony. We recognize when particular animals return to our territory in the spring, and when plants and medicines reappear after winter rests. Recognition for us is about presence, about profound listening and about recognizing and affirming the light in each other, as a mechanism for nurturing and strengthening internal relationships to our Nishnaabeg worlds. It is a core part of our political systems because they are rooted in our bodies and our bodies are not just informed by but created and maintained by relationships of deep reciprocity. Our bodies only exist in relation to Indigenous complex, non-linear constructions of time, space, and place which are continually rebirthed through the practice and often coded recognition of obligations and responsibilities within a nest of diversity, freedom, consent, non-interference and a generated, proportional, emergent reciprocity.

In our language, Basil Johnson uses the term Maa maa ya wen du moowin to means the process or the art of recognizing, of understanding of fully comprehending, of being aware, cognizant and enlightened, literally it means the blending of all thoughts and feelings into recognizing another being . When I took this word to Doug, he talked about the wendamoowin part meaning “what is your thought process as you move through life?” He talked about the first maa in maa maa ya meaning “it’s in my heart” He made a distinction between Baamaaya, meaning searching for recognition and maamaaya – have it, finding, fully understanding yourself or another being.

I want to think about that for a minute. Recognition within Anishinaabeg intelligence is a process of seeing another being’s core essence, it is a series of relationships. It is reciprocal, continual and a way of generating society. It amplifies Anishinaabewin- all of the practices and intelligence that makes us Anishinaabeg. It cognitively reverses the violence of dispossession, because what’s the opposite of dispossession in Indigenous thought again? Not possession because we’re not suppose to be capitalists, but connection– a coded layering of intimate interconnection and interdependence that creates a complicated algorithmic network of presence, reciprocity, consent, & freedom.

When another Native person recognizes and reflects back to me my Nishnaabe essence, when we interact with each other in an Nishnaabeg way, my Indigeniety deepens. When my Indigeniety grows I fall more in unconditional love with my homeland, my family, my culture, my language, more in line with the idea that resurgence is my original instruction, more inline with the thousands of stories that demonstrate how to live a meaningful life and I have more emotional capital to fight and protect what is meaningful to me. I am a bigger

threat to the Canadian state and it's plans to build pipelines across my body, clear cut my forests, contaminant my lakes with toxic cottages and chemicals and make my body a site of continual sexualized violence.

One of the things about Indigenous movements in Canada is that the state actually has to do very little to bring them down and they've figure this out. Basically, if you wait long enough, Indigenous movements will bring down themselves through in fighting. Go check twitter from the late winter of 2013. When the Indian Act Chiefs disappeared Thersea Spence's generative space of refusal, by engaging in recognition politics, they facilitated the collapse of the movement. And because we had no internal process of Maa maa ya waendumoowin, because Idle No More was not a movement that thoroughly embraced the generative politics of refusal, because we were not tightly connected to each other in bonds of trust, the pain of that betrayal was too much for us to survive and we ended up replicating it within our communities in micro and macro ways. Because we weren't significantly engaged in Indigenous reciprocal recognition that has been such a key component of Indigenous mobilizations in the past. Pontiac walk around for several years visiting, building relationships of trust, recognizing and affirming the bodies and minds that would make up his mobilization, expanding the base, conversing with and acknowledging people in the most acutely difficult positions of colonialism. Nurturing leadership.

What then happens if collectively and fully reject the politics of recognition in politics with the Canadian state? What if we collectively and fully reject the politics of recognition in our mobilizations and organizing? Why have we not used RSWM and MI to ask these questions?

Let's go back to this idea of mirroring. Right now, to a great degree in Indigenous life we are looking into the colonizers mirror and that mirror is reflecting back that we are shameful, that we are not good enough, that we are not smart, or successful or rich enough or white enough or Canadian enough or together enough to organize. And much, much worse if we are Indigenous women.

Why is the colonizer the mirror? Because the colonizer will always reflect back to me what the state wants to see: An Aboriginal that shops at the gap, votes in the election, skips happily to Revenue Canada on income tax day, perhaps knows her language and participates in a ceremony instead of church on Sunday, perhaps even attends a vigil for MMIW, because wow, those poor Indigenous peoples just can't get their shit together. But they certainly do not reflect back anything that has to do with land, sovereignty or my power as an Anishinaabekwe.

Yet, collectively we still keep looking and begging, and educating and appealing to the morality of benevolent Canada. If only they knew better.

Look where that has got us.

Fuck benevolence and fuck misery.

Let's take the brilliance of RSWM and MI, and the Indigenous excellence of these two scholars and use it the way I believe these two intended, to build a generation of Indigenous nationals from varies Indigenous nations who think and act from within side their own intelligence systems, who generate viable Indigenous political systems, who are so in love with their land, they are the land, who simply refuse to stop being themselves, who

refuse to let go of this knowledge and who use that refusal as a site to generate another generation who enact that with every breath, birth, political engagement and in every moment of their daily existence.

Let’s use the intelligence of RSWM and MI to create a future that never has to ask how do I live free, because they’ve never known anything else.

Chi’miigwech

in Aboriginal budgets that cannot be tied down. In 2010, the Aboriginal Healing Foundation lost funding, an organization that financed community-based programs to address abuse suffered at residential schools. That same year, Harper's Conservatives cut funding to the Sister in Spirit research project that brought to light hundreds of cases of missing and murdered Indigenous women. Most recently, Department of Aboriginal Affairs Minister John Duncan announced upcoming budget cuts to his department amounting to a $100 million slash.

The wealth of the nation still depends fundamentally on land. Financial investment for resource development projects is funneled through the same banks protested against across the U.S. and Canada, such as RBC Royal Bank that funds tar sands development on Treaty 8 lands. Global structural inequality can only be addressed then by questioning the sources of authority by which resources are bought and sold. If you don't own it, Canada, how can you give it away?

DECOLONIZING TOGETHER:
Moving Beyond a Politics of Solidarity Toward a Practice of Decolonization

Harsha Walia

Canada's state and corporate wealth is largely based on subsidies gained from the theft of Indigenous lands and resources. Conquest in Canada was designed to ensure forced displacement of Indigenous peoples from their territories, the destruction of autonomy and self-determination in Indigenous self-governance, and the assimilation of Indigenous peoples' cultures and traditions. Given the devastating cultural, spiritual, economic, linguistic, and political impacts of colonialism on Indigenous people in Canada, any serious attempt by non-natives at allying with Indigenous struggles must entail solidarity in the fight against colonization.

Non-natives must be able to position ourselves as active and integral participants in a decolonization movement for political liberation,

social transformation, renewed cultural kinships, and the development of an economic system that serves rather than threatens our collective life on this planet. Decolonization is as much a process as a goal. It requires a profound recentering on Indigenous worldviews. Syed Hussan, a Toronto-based activist, states: "Decolonization is a dramatic reimagining of relationships with land, people, and the state. Much of this requires study. It requires conversation. It is a practice; it is an unlearning."

Indigenous Solidarity on its Own Terms

A growing number of social movements are recognizing that Indigenous self-determination must become the foundation for all our broader social justice mobilizing. Indigenous peoples in Canada are the most impacted by the pillage of lands, experience disproportionate poverty and homelessness, are overrepresented in statistics of missing and murdered women, and are the primary targets of repressive policing and prosecutions in the criminal injustice system. Rather than being treated as a single issue within a laundry list of demands, Indigenous self-determination is increasingly understood as intertwined with struggles against racism, poverty, police violence, war and occupation, violence against women and environmental justice.

Incorporating Indigenous self-determination into these movements can, however, subordinate and compartmentalize Indigenous struggle within the machinery of existing leftist narratives. Anarchists point to the antiauthoritarian tendencies within Indigenous communities, environmentalists highlight the connection to land that Indigenous communities have, anti-racists subsume Indigenous people into the broader discourse about systemic oppression in Canada, and women's organizations point to the relentless violence inflicted on Indigenous women in discussions about patriarchy.

We have to be cautious not to replicate the Canadian state's assimilationist model of liberal pluralism, forcing Indigenous identities to fit within our existing groups and narratives. The inherent right to traditional lands and to self-determination is expressed collectively and should not be subsumed within the discourse of individual or human rights. Furthermore, it is imperative to understand that being

Indigenous is not just an identity but a way of life, which is intricately connected to Indigenous peoples' relationship to the land and all its inhabitants. Indigenous struggle cannot simply be accommodated within other struggles; it demands solidarity on its own terms.

The Practice of Solidarity

One of the basic principles of Indigenous solidarity organizing is the notion of taking leadership. According to this principle, non-natives must be accountable and responsive to the experiences, voices, needs and political perspectives of Indigenous people themselves. From an anti-oppression perspective, meaningful support for Indigenous struggles cannot be directed by non-natives. Taking leadership means being humble and honouring frontline voices of resistance as well as offering tangible solidarity as needed and requested. Specifically, this translates to taking initiative for self-education about the specific histories of the lands we reside upon, organizing support with the clear consent and guidance of an Indigenous community or group, building long-term relationships of accountability, and never assuming or taking for granted the personal and political trust that non-natives may earn from Indigenous peoples over time.

In offering support to a specific community in the defence of their land, non-natives should organize with a mandate from the community and an understanding of the parameters of the support being sought. Once these guidelines are established, non-natives should be proactive in offering logistical, fundraising and campaign support. Clear lines of communication must always be maintained, and a commitment should be made for long-term support. This means not just being present for blockades or in moments of crisis, but developing an ongoing commitment to the well-being of Indigenous peoples and communities.

Organizing in accordance with these principles is not always straightforward. Respecting Indigenous leadership is not the same as doing nothing while waiting around to be told what to do. "I am waiting to be told exactly what to do" should not be an excuse for inaction, and seeking guidance must be weighed against the possibility of further burdening Indigenous people with questions. A willingness to decentre oneself and to learn and act from a place of responsibility

rather than guilt are helpful in determining the line between being too interventionist and being paralyzed.

Cultivating an ethic of responsibility within the Indigenous solidarity movement begins with non-natives understanding ourselves as beneficiaries of the illegal settlement of Indigenous peoples' land and unjust appropriation of Indigenous peoples' resources and jurisdiction. When faced with this truth, it is common for activists to get stuck in their feelings of guilt, which I would argue is a state of self-absorption that actually upholds privilege. While guilt is often a sign of a much-needed shift in consciousness, in itself it does nothing to motivate the responsibility necessary to actively dismantle entrenched systems of oppression. In a movement-building round table, long-time Montreal activist Jaggi Singh said: "The only way to escape complicity with settlement is active opposition to it. That only happens in the context of on-the-ground, day-to-day organizing, and creating and cultivating the spaces where we can begin dialogues and discussions as natives and non-natives."

Sustained Alliance Building

Sustaining a multiplicity of meaningful and diverse relationships with Indigenous peoples is critical in building a non-native movement for Indigenous self-determination. "Solidarity is not the same as support," says feminist writer bell hooks. "To experience solidarity, we must have a community of interests, shared beliefs and goals around which to unite, to build Sisterhood. Support can be occasional. It can be given and just as easily withdrawn. Solidarity requires sustained, ongoing commitment."

Who exactly one takes direction from while building networks of ongoing solidarity can be complicated. As in any community, a diversity of political opinions often exists within Indigenous communities. How do we determine whose leadership to follow and which alliances to build? I take leadership from and offer tangible support to grassroots Indigenous peoples who are exercising traditional governance and customs in the face of state control and bureaucratization, who are seeking redress and reparations for acts of genocide and assimilation, such as residential schools, who are opposing corporate development

"Idle No More Peguis" at the Manitoba Legislature Winter Solstice Rally, December 21, 2012. (DAWN THOMAS)

on their lands. I support those who are pushing back against the oppressions of hetero-patriarchy imposed by settler society, who are struggling against poverty and systemic marginalization in urban areas, who are criticizing unjust land claims and treaty processes and who are affirming their own languages, customs, traditions, creative expression, and spiritual practices.

Alliances with Indigenous communities should be based on shared values, principles, and analysis. For example, during the anti-Olympics campaign in 2010, activists chose not to align with the Four Host First Nations, a pro-corporate body created in conjunction with the Vancouver Olympics organizing committee. Instead, we took leadership from and strengthened alliances with land defenders in the Secwepemc and St'át'imc nations and Indigenous people being directly impacted by homelessness and poverty in the Downtown Eastside. In general, however, differences surrounding strategy within a community should be for community members to discuss and resolve. We should be cautious of a persistent dynamic where solidarity activists start to fixate on the internal politics of an oppressed community. Allies should avoid trying to intrude and interfere in struggles within and between communities, which perpetuates the civilizing ideology of the white man's burden and violates the basic principles of self-determination.

Building intentional alliances should also avoid devolution into tokenization. Non-natives often choose which Indigenous voices to privilege by defaulting to Indigenous activists they determine to be better-known, easier-to-contact or "less hostile." This selectivity distorts the diversity present in Indigenous communities and can exacerbate tensions and colonially imposed divisions between Indigenous peoples. In opposing the colonialism of the state and settler society, non-natives must recognize our own role in perpetuating colonialism within our solidarity efforts. We can actively counter this by theorizing about and discussing the nuanced issues of solidarity, leadership, strategy, and analysis—not in abstraction, but within our real and informed and sustained relationships with Indigenous peoples.

Decolonizing Relationships

While centring and honouring Indigenous voices and leadership, the obligation for decolonization rests on all of us. In "Building a 'Canadian' Decolonization Movement: Fighting the Occupation at 'Home,'" Nora Burke says: "A decolonization movement cannot be comprised solely of solidarity and support for Indigenous peoples' sovereignty and self-determination. If we are in support of self-determination, we too need to be self-determining. It is time to cut the state out of this relationship, and to replace it with a new relationship, one which is mutually negotiated, and premised on a core respect for autonomy and freedom."

Being responsible for decolonization can require us to locate ourselves within the context of colonization in complicated ways, often as simultaneously oppressed and complicit. This is true, for example, for radicalized migrants in Canada. Within the anticolonial migrant justice movement of No One Is Illegal, we go beyond demanding citizenship rights for racialized migrants as that would lend false legitimacy to a settler state. We challenge the official state discourse of multiculturalism that undermines the autonomy of Indigenous communities by granting and mediating rights through the imposed structures of the state, and that seeks to assimilate diversities into a singular Canadian identity. Andrea Smith, Indigenous feminist intellectual, says: "All non-Native peoples are promised the ability to join in the colonial project of settling indigenous lands. In all of these cases, we would check our aspirations against the aspirations of other communities to ensure that our model of liberation does not become the model of oppression for others." In B.C., immigrants and refugees have participated in several delegations to Indigenous blockades, while Indigenous communities have offered protection and refuge for migrants facing deportation.

Decolonization is the process whereby we create the conditions in which we want to live and the social relations we wish to have. We have to commit ourselves to supplanting the colonial logic of the state itself. Almost a hundred years ago, German anarchist Gustav Landauer wrote: "The State is a condition, a certain relationship between human beings, a mode of behaviour; we destroy it by contracting other relationships." Decolonization requires us to exercise our sovereignties differently and to reconfigure our communities based on shared

experiences, ideals, and visions. Almost all Indigenous formulations of sovereignty—such as the Two Row Wampum agreement of peace, friendship, and respect between the Haudenosaunee nations and settlers—are premised on revolutionary notions of respectful coexistence and stewardship of the land, which goes far beyond any Western liberal democratic ideal.

I have been encouraged to think of human interconnectedness and kinship in building alliances with Indigenous communities. Black-Cherokee writer Zainab Amadahy uses the term "relationship framework" to describe how our activism should be grounded. "Understanding the world through a Relationship Framework ... we don't see ourselves, our communities, or our species as inherently superior to any other, but rather see our roles and responsibilities to each other as inherent to enjoying our life experiences," says Amadahy. From Turtle Island to Palestine, striving toward decolonization and walking together toward transformation requires us to challenge a dehumanizing social organization that perpetuates our isolation from each other and normalizes a lack of responsibility to one another and the Earth.

HARPER LAUNCHES MAJOR FIRST NATIONS TERMINATION PLAN:

As Negotiating Tables Legitimize Canada's Colonialism

Russell Diabo

On September 4, the Harper government clearly signalled its intention to:

1. Focus all its efforts to assimilate First Nations into the existing federal and provincial orders of government of Canada;
2. Terminate the constitutionally protected and internationally recognized Inherent, Aboriginal, and Treaty rights of First Nations.

Abstract
This paper introduces the special issue of *Decolonization* on land-based education. We begin with the premise that, if colonization is fundamentally about dispossessing Indigenous peoples from land, decolonization must involve forms of education that reconnect Indigenous peoples to land and the social relations, knowledges and languages that arise from the land. An important aspect of each article is then highlighted, as we explore the complexities and nuances of Indigenous land-based education in different contexts, places and methods. We close with some reflections on issues that we believe deserve further attention and research in regards to land-based education, including gender, spirituality, intersectional decolonization approaches, and sources of funding for land-based education initiatives.

Keywords: *land based education; Indigenous Knowledge; Indigenous Resurgence; decolonization*

Introduction

What does it mean to think of land as a source of knowledge and understanding? How do our relationships with land inform and order the way humans conduct relationships with each other and other-than-human beings? How do we offer education to people on the land in ways that are grounded in Indigenous knowledge? What does it mean to understand "land" – as a system of reciprocal social relations and ethical practices – as a framework for decolonial critique? These are a few of the central questions that have been answered by contributors to this special edition on land-based education, in *Decolonization: Education, Indigeneity and Society*.

Settler-colonialism has functioned, in part, by deploying institutions of western education to undermine Indigenous intellectual development through cultural assimilation and the violent separation of Indigenous peoples from our sources of knowledge and strength – the land. If settler colonialism is fundamentally premised on dispossessing Indigenous peoples from their land, one, if not the primary, impact on Indigenous education has been to impede the transmission of knowledge about the forms of governance, ethics and philosophies that arise from relationships on the land. As Leanne Simpson argues in the feature article of this issue, if we are serious about decolonizing education and educating people within frameworks of Indigenous intelligence, we must find ways of reinserting people into relationships with and on the land as a mode of education.

Key to the set of inquiries contained in this special issue is moving from *talk* about the land within conventional classroom settings, to studying instances where we *engage* in conversations with the land and on the land in a physical, social and spiritual sense. In addition to the comprehensive theoretical engagement with land based practices, the ten articles in this issue provide us with a specific examples of how land based activities are occurring on and with the land. What is gained from moving the classroom to the land? As Leanne Simpson, in a recent interview conducted by Eric Ritskes with her and Glen Coulthard, summarizes, land-based education sustains and grows Indigenous governance, ethics and philosophy – and life:

> We're practicing conflict management, agency and transparency and the things that Indigenous political cultures value. We're asking students to engage in a fairly rigorous process from a Dene perspective, in an intellectual, emotional and a spiritual and a physical way… we have to remember the ways that we replicated our nations through education and what were those critical components that produced people who could embody our political cultures and survive in our lands and think within Nishinaabeg or Dene thought and live a life where they were promoting more life in the coming generations. (Simpson & Coulthard, 2014)

In that same interview, Glen Coulthard also reflects on how land based education has been fundamental to his own understanding of Dene knowledge:

> I had learned as much as I could in the archive, talking to people, and reading about that history, but it was only when I started to commit myself to re-learning those practices and re-embedding myself in those social relationships with place, that I understood in a more concrete and embodied way, what was wrong with the forms of economic development that have come to be dominant in the North and elsewhere. (Simpson & Coulthard, 2014)

Land-based education, in resurging and sustaining Indigenous life and knowledge, acts in direct contestation to settler colonialism and its drive to eliminate Indigenous life and Indigenous claims to land.

In their own unique ways, each contribution to this volume aims to sever the historical and contemporary relationship between education and the reproduction of settler-colonial power and associated forms of knowledge. On the one hand, the pairing of colonial domination with western education has had a devastating effect on Indigenous students, contributing to a contemporary educational deficit that expresses itself in lower academic success rates and experiences of racism and alienation in the classroom. On the other, institutions of mainstream education have fostered high levels of ignorance regarding Indigenous issues within the non-Native student and educator community. In different ways, each paper in this collection takes stock of what settler colonialism makes lost, damaged, and destroyed, as well as what is being and can be changed, gained and restored through various forms of land-based resurgence. In doing so, the examples of Indigenous land-based pedagogy discussed in this volume all offer a way of fostering individual and collective empowerment for students by re-embedding them in the land-connected social relationships that settler-colonialism, through education and otherwise, sought to destroy. The initiatives discussed in this issue, each focused on resurging Indigenous knowledges, leaves us with room for optimism despite the stranglehold that colonial education currently has in Canada and other settler nations. But, contrary to mainstream discourse, ours is not an optimism grounded in the ideal or hope of reconciliation through inclusion. Our optimism is grounded in a call for Indigenous resurgence and settler reckoning.

This issue highlights the diversity of land-based education and is a major contribution to the *Indigenous Resurgence* paradigm of intellectual thought. For scholars working on Indigenous political issues within Canadian universities and elsewhere, Indigenous resurgence has become one of the most robust scholarly paradigms to study Indigenous politics from. The term owes its intellectual origin to Taiaiake Alfred's (2009) work in *Wasase: Indigenous Pathways of Action and Freedom* and is now widely used by many scholars in the field including many of the editors and contributors to this journal issue. For Alfred, the resurgence paradigm was a way of theorizing how a shift in the consciousness of Indigenous peoples, away from reconciliation and towards decolonization, would provide the foundation of an Indigenous social movement capable of transforming Canadian society.

To create this social movement, what was needed was initially a *regeneration* of Indigenous cultural, spiritual and political practices. This revitalization would provide the

personal and collective strength necessary for a confrontation with Canadian society. Having undergone cultural regeneration, an Indigenous resurgence would engage in an outward, disciplined confrontation with settler society. Due to the protracted struggle and engagement with this Indigenous movement, settler society would be forced into reckoning with its colonial past and present and undertake in its own decolonizing journey.

This issue can then be read as a useful contribution to the resurgence paradigm in its emphasis on both the importance of cultural regeneration, as well as outward resurgence and contestation with settler colonial incursions and violence in the realms of education, and more broadly against Indigenous peoples, knowledges, languages, and the relationships with the land that sustain these. This issue is a reminder that Alfred's original formulation equally emphasized regeneration of Indigenous knowledges and ways of being in the world, as well as their necessary contestation with settler colonial power.

The issue begins with a feature article by Leanne Simpson and then traverses ten articles, two creative writing pieces, a video and a poem. We encounter Mohawk lives disrupted by industrial pollution and Métis landscapes transformed through the rise of industrial capitalism; Tlingit and Mono places whose names, stories and ecological realities have been overwritten by colonial relations; contributions from three Anishnaabe authors who discuss land as both culturally grounding and contested; the social relations of Chisasibi Cree; stories from the land provided by a Swampy Cree author and a Tłı̨chǫ author; and we see the perspective of a Maori knowledge keeper in film. Many of these contributions include collaborations between settler scholars working in the academy and Indigenous community members, and we also have two great contributions from settler scholars working in collaboration with Indigenous peoples of Denedeh/NWT. Including the cover from a Coast Salish artist and the work of Plains Cree and Yellowknives Dene editors, we have here an edition with contributions from Indigenous people from 12 different nations.

Taken together, we believe the issue offers a nuanced and diverse appreciation for the significance of land based pedagogy and practices as a catalyst for regenerating Indigenous social, spiritual and physical land-connection. In lieu of descriptions of each piece, our introduction will highlight important insights provided by the ten articles and two creative writing pieces. These insights provide only a small sample of the theoretical complexity and empirical richness developed by the authors. We conclude by examining areas for further exploration and inquiry in land-based education.

Issue overview

Leading off the issue, Leanne Simpson's article prompts deeper thinking about ways in which mainstream education is at odds with resurgent life ways. Simpson provides a compelling argument for the necessity of raising Indigenous youth who are strongly connected to the land and the Indigenous cultures and languages that the land sustains. Employing the story of Kwezens, she anchors her argument within a Nishnaabeg intellectual framework. Using this

frame provides a "critical intervention into current thinking around Indigenous education, because Indigenous education is not Indigenous or education from within our intellectual traditions unless it comes through the land, unless it occurs in an Indigenous context using Indigenous processes" (p. 9). For people working in Indigenous education at any level or locale, this article represents one of the most definitive statements on the importance of land-based education for Indigenous cultures and the resurgence of them.

As Simpson states in her opening footnote, her paper was generated "inside a community of intellectuals, artists, Elders and cultural producers to whom I am both influenced by and accountable to" (p. 1). While her article did not go through a standard academic peer review process, it is important to note that drafts were peer-reviewed by four prominent Nishnaabeg thinkers. Given that the majority of our articles in this issue were written or co-written by Indigenous scholars, and written in conversation and collaboration with Indigenous communities and educational projects, Simpson's approach is a powerful challenge to how peer review is conducted in the context of land-based education and Indigenous resurgence. Namely, we should not assume that 'peers' in these circumstances are university professors, nor demand that the review process require submitting papers for anonymous feedback. It is a challenge to think about how we create review processes that involve people from the communities that support and foster these land-based initiatives. As Coulthard points out about his role as an academic in collaboration with community, "we're not renegades that are dropped into territories and determine what the most radical and transformative educational experiences *we* think would be relevant for *them*; it's done in a spirit of reciprocity, with community engagement and input" (Simpson and Coulthard, 2014). This requires academics to think further about how we can practice and foster reciprocity with communities in order to create land-based sites of education.

Aldern and Goode, in part, focus on how Indigenous intellectual thought can be mobilized in land management decision-making. Their article provides an account of ways that land-based methods influence ecological policy in the traditional territory of the North Fork Mono peoples, in what is today known as the Sierra National Forest area in central California. They expertly outline a method that combines traditional Mono narratives with site visits that happen with the leadership and presence of Mono elders and other knowledge holders. They discuss how this method is applied to government policy decisions with respect to the endangered Pacific Fisher (weasel). Critically, Aldern and Goode demonstrate that including Mono knowledge within ecological decision-making is not done solely for the sake of fulfilling requirements of consultation. Rather, Mono knowledge arises from deeply rooted land relationships that can improve ecological outcomes, while at the same time transforming settler-privilege, which is further discussed by Irlbacher-Fox in her contribution. After a site visit to the forest with author Ron Goode, a federal biologist "remarked that he saw the forest in a new way …something that was not easy to imagine without getting out onto the land" (p. 43). Being present on the land provides powerful ways of seeing one's relationships to the land and other-than-humans, as well as new ways in contesting settler colonialism and its sense making mechanisms.

While Goode and Aldern's article offers an example of ways to challenge settler colonialism's formula of Indigenous dispossession, Jennifer Adese provides a careful account of ways in which industrial modes of production structure Métis relations to land. Adese relies on Métis Elders' life stories to illustrate changing relationships with land. She shows that industrial life ways have fundamentally and negatively impacted Métis relations with land. Importantly, this argument avoids any reliance on tropes that believe contact with modernity renders Indigenous peoples 'inauthentic' (see Raibmon, 2005) by bringing forward descriptions from Métis autobiographies about their changing relationship with land and the various ways in which Métis peoples navigate these changes. Quoting from the biography of Elmer Ghostkeeper, Adese describes the transition as moving from "living with the land to living off the land," requiring Ghostkeeper to deny and suppress "his inclination to understand the world around him through the prism of relatedness, leading to his detachment from the land" (p. 62). Building on the work of Chris Andersen and Adam Gaudry, this contribution is also a counter to Métis histories authored by non-Indigenous writers that essentialize the Métis and their histories through racialized understandings of 'mixedness', without reference to how Métis actually understood their own lifeways through relationship to place and land.

Erin Freeland Ballantyne, in her article, positions Dechinta Bush University as a site of decolonizing praxis in her analysis of settler colonial capital and the history of the public education system in Denendeh. Arguing that Indigenous-led land-based education has the potential to undermine petrocapitalism in the north, she draws from Dechinta's five years of land-based programming to demonstrate that land-based learning supports individuals and communities ability to live and envision life outside of the enclosures of capital. While self-identifying as a settler and calling for settler people to take responsibility for settler colonialism, the site of decolonizing praxis she describes is inclusive of people and families who are both Indigenous and non-Indigenous. She articulates a site of multi-cultural decolonizing praxis where all students learn from the land in a shared space in which Indigenous epistemologies are central. She writes, "Building strong relationships of reciprocity with the land results in the crumbling of settler capitalism because it fundamentally shifts the relationships people experience and what they believe about who they are, how they are in relation to and with land, and what they believe to be true" (pp. 76-77).

Equally intriguing, Ballantyne argues that settler capital can and should be realigned and reconfigured to serve the resurgent goals of Indigenous communities. This is an important and probably contentious point in the world of anti-colonial activism, as many organizers and activists are vocally apprehensive about 'buying into' what's termed the non-profit industrial complex or funding mentality. This article addresses this question in an important way by grounding this dilemma within a space of learning that is reliant on funding from social innovation funders, but that has also consistently received evaluations from students who speak of Dechinta as providing a transformative experience.

One of the most comprehensive overviews of land-based programming is provided by Radu, House, and Pashagumskum. The three-year old "Chisasibi land-based healing program"

provides a space for those seeking to overcome addictions and mental health issues. Participants learn from two elders who combine counselling methods with "teaching Indoh-hoh[1] (Cree bush skills) and values embedded in the Cree language" (p. 88). This article shows how combining land-based activities can work in conjunction with other institutional requirements. The authors make two valuable theoretical contributions. First is an exploration of how ecological connectedness promotes good health. For Eddie Pash, one's connection to nature encourages reflection upon what healthy relationships look like. He states: "All through these traditional ways of living we respect nature. If you respect nature, you have to respect each other too, and you have to respect yourself… Respect is a gift in our traditions, because it is the way to be happy" (p. 94). Second, the article positions healing as a central component of decolonization. For the authors, healing is a "relational process that fosters spaces in which social and familial bonds are strengthened and make possible community conversations about what is needed to mend local relationships that is in line with Indigenous life-worlds" (p. 97). While this is important for the decolonizing journey of the community, it also creates a situation where: "healing fosters decolonization by empowering individuals and communities to engage in transforming the Indigenous-State relationship" (p. 97).

The article by Schreyer, Corbett, Gordon and Larson describes the development of a place names website using participatory mapping and crowd sourcing techniques. The website was created through a collaboration between the Taku River Tlingit and a team from University of British Columbia – Okanagan. The authors provide a description of their website, where users can manually upload place names onto the traditional territory of the Taku River Tlingit. This approach is guided by a commitment to stewardship as a guiding principle of decision making and promoting an appreciation of the close connection between the Tlingit language and the landscape. The authors describe the application of these values as being able to "talk to the land." The website has only recently been completed and the authors also provide a useful discussion of the potential pitfalls in such a project, such as the possible decontextualization of Indigenous knowledge from place. In response, they also point out how the website can be used in conjunction with people engaging in land based activities. In doing so, their honest and reflexive description of their project animates the kinds of difficulties encountered in the course of land-based initiatives which is instructive for others considering similar approaches to foster language learning and land-based connections.

Taiaiake Alfred details a cultural apprenticeship program in the Mohawk community of Akwesasne. For those familiar with the work of Alfred, this piece provides an important corrective to those who claim Alfred's theorizing is impractical in the face of societal and institutional constraints. Alfred details his work as principle consultant for the Mohawks of Akwesasne as they moved through the Natural Resources Damages Assessment process, remediation projects that are more commonly known as "Superfund" sites. While the Mohawks of Akwesanse clearly face legal and legislative barriers in undertaking the process, they were also able to "put forward and defend their understanding of cultural loss within the context of

[1] See the glossary at the end of their article for a detailed definition of the term.

their nationhood" (p. 135). The "superfund" process asks groups to negotiate settlements that remediate the natural environment and establishes a monetary settlement to compensate for lost economic opportunities. The Mohawks of Akwesasne were able to alter the terms of compensation to focus on how 'cultural injury' caused by pollution would be addressed by instituting measures and mechanisms aimed at restoring "relationships that are crucial to the expression of Mohawk identity" (p. 139). Alfred summarizes how the restoration plan for the Mohawks of Akwesasne created a land-based cultural apprenticeship program targeting youth, instead of the typical approach that asks groups to simply negotiate a monetary figure that will compensate for past harm.

Irlbacher-Fox focuses on what decolonization requires in settler colonial contexts. Drawing on a combination of personal experience and scholarly thought, Irlbacher-Fox traces the role settler privilege plays in blocking the establishment of structures that enable Indigenous peoples from having effective political power and control. Here we see how self-reckoning with settler privilege is fundamental to creating spaces of respect, in order to work towards creating a context of co-existence in which Indigenous knowledge and practice can safely circulate. Many of the contributions in this special issue describe Indigenous-funded or controlled and/or Indigenous generated initiatives; here, Irlbacher-Fox provides an important addition by focusing on a conceptual framework for how settler people can work towards enacting decolonization. For Irlbacher-Fox, in order to achieve respectful co-existence in the future, settlers must engage in forms of co-resistance that challenge settler privilege in the present. Irlbacher-Fox provides us with an important conceptual framework for settlers attempting to tear down institutional barriers, such as those described by Leanne Simpson's observations on mainstream education or Goode and Aldern's on curriculum and policy development.

The final two articles deal with sites of Anishnaabe resurgence. Unlike the other land-based programs described in the edition, both of these sites do not receive funding or material support from government, non-profit or corporate sources. Yerxa provides us with an examination of a recent resurgence project she is involved in. For the past two years, Anishnaabe from multiple communities have come together to Gii-kaapizigemin (we roast) manoomin (wild rice) neyaashing (at The Point). In this article, Yerxa characterizes this collective organizing as a 'Manoomin Movement' and, building on the work of Avery Kinew, Yerxa outlines how "making manoomin is a ceremonial act, as much as it is a practical act, as much as it is a political act" (p. 108). Roasting manoomin at the point is a political act because it foregrounds a history of dispossessing Anishnaabe jurisdiction in the area. In 2009, a ninety-nine year lease expired on The Point and Anishnaabe moved to reassert ownership and control. Four Anishnaabe Nations are pursuing the matter through the specific land claims process to regain control of The Point, an approach Yerxa problematizes. She states: "Through this process we automatically negate what we are trying to assert - Anishinaabeg nationhood - because we grant authority to the Canadian state to decide matters over our lives and our lands" (p. 109). As an alternative, people from four communities have come together to roast wild rice and 're-presence' themselves on their traditional territory. Yerxa calls for a 'Manoomin movement', where roasting wild rice at

The Point every fall provides the basis of a resurgence that has the ability to overwrite the land with Anishnaabeg law.

Continuing the themes explored by Yerxa, Gardner and Giibwanisi discuss the creation and maintenance of the Oshkimaadziig Unity Camp. The authors describe the camp as a land reclamation conducted in the same spirit as other camps such as Grassy Narrows, Kitchenuhmaykoosib Inninuwug, or Elsipogtog. One notable difference is that this camp arose in response to the settlement of a Specific Land Claim by four surrounding First Nations, instead of in response to incursions by resource extraction projects, and the authors contextualize the camp within Canada's attempt to retroactively legitimize its claimed sovereignty through the specific land claims process. Although the Oshkimaadziig Unity Camp is meant to challenge the legitimacy of Canadian law over the claim area, an action that aligns with Audra Simpson's (2014) theorizing on 'refusal', the camp is equally focused on internal acts of regenerating Anishnaabe connections to land. From this standpoint, the authors concisely discuss four modes of internally directed regeneration. First, establishing connection with land as a necessary aspect of Anishnaabe ceremony and governance. Second, the camp as a method of passing on teachings to the next generation. Third, the camp as a method of establishing just relations between Indigenous and settler peoples. And, finally, the camp as a source of alternative social relations and practices that model a more just world.

To conclude, the special issue takes a more creative turn. Tłı̨chǫ writer and storyteller Richard Van Camp and our editor, Maskîkow graduate student and Dechinta Program Manager Mandee McDonald, provide us with two pieces of creative writing, fiction and non-fiction respectively. Van Camp's story introduces us to two young cousins, recent high school graduates facing the next stage of life. We follow the young men on a hunting trip with their Father/Uncle. Van Camp's piece is an important illustration of how spending time on the land allows generations to connect and form bonds, but it also depicts the land as a source of joy and happiness for the characters. This same theme illuminates the creative non-fiction piece written by Mandee McDonald. Her story telling approach is enlivened by the emotions of her experiences on the land, which in turn determines the flow of her narrative: Moose Hides, Bears, Fish, and Hunting. McDonald's account of her experiences on the land brings some of the broad theoretical insights from the issue into focus as they circulate in her lived experience. Her story situates the land as an animating force of teaching and learning. McDonald also reminds us that to build self-determining futures, Indigenous peoples must find ways to practice governance that centres love for the land and each other as the basis of the courage necessary to see it through.

Future directions

Although the contributions made in this issue are substantial and important, many readers will no doubt have questions or concerns about the lack of discussion on some issues. We would like to reflect on three issues that deserve further attention in future research on land-based education. These are gender, spiritual values, and intersectional approaches to settler colonialism.

Gender is touched upon by a number of the authors, but it is not the primary focus of any author. Discussing the story of Kwezens, a young girl discovering maple syrup, Simpson points out how the discovery could only be made in a context where observation and creativity are fostered in young children, and trust is reciprocated between the young girl, her family and other community members. In this story, trusting the teaching of the young girl is central to Nishnaabeg intelligence. Many other contributions bring forward and value the voices of women, and those wanting to think about those issues will find important contributions to think about, especially in the contributions of Adese, McDonald and Irlbacher-Fox. Yet, as a whole, the issue reveals rather than addresses the need for more thoughtful consideration towards gender. These considerations include focusing on gender relations in contemporary land-based contexts, how we might queer land-based pedagogy, and discussing the role gender plays in understanding the land as a source of knowledge.

Such analyses might illustrate how the internalization of colonial patriarchy and heteropatriarchy in Indigenous communities informs contemporary gender relations, values and roles when it comes to land-based practices - specifically regarding ceremony and harvesting protocols. The prevalence of violence against women in land-based contexts is also an unfortunate reality requiring critical attention, support and awareness, as land-based educational settings are often remote and novice learners or practitioners can be in vulnerable positions of dependence and isolation.

Spirituality or spiritual beliefs are clearly infused throughout the issue, or at least seem to inform many of these articles. In particular, Radu, House and Pashagumskum speak to the spiritual healing that occurs at Chisasibi's land-based healing program, stating that "the reciprocal and dialogic relationship with nature provides not only the material needs but also the ethic, moral and spiritual underpinnings of living a good life" (p. 93). Spiritual healing and grounding is an important benefit that comes with cultivating a strong relationship to land. This is more than a fortunate by-product of engaging in land-based practices. Teachings and practices based in spiritual values are critical components of learning and teaching on the land. Protocols that demonstrate respect and reciprocity, such as putting down tobacco, making offerings, ceremonies, or particular ways of harvesting or treating unused animal parts, are a part of Indigenous land-based education. The question that arises from this discussion is, how does the internalization and adoption of Euro-western religious values impact our abilities to pass on traditional land-based knowledge that is rooted in Indigenous spiritual values, and how are the knowledge and practices themselves potentially altered?

Many of the articles in this issue deal with settler-Indigenous relations, and the impact of settler colonialism in our contemporary context. The discussions of settler colonialism within the issue implicitly revolve around white settler – Indigenous relations. We do not have contributions that broach the much discussed topic of how non-Indigenous people of colour do or do not fit into the concept of settler and how this impacts discussions of land-based education and solidarity against colonialism. Nor does the issue deal with how Indigenous critiques of settler colonialism intersect with other anti-colonial critiques and radical traditions connected to

place. Various other intersections with other axes of oppression could be pointed out here, such as racism, heteronormativity, ablelism or ageism and the list could go on. It might be easy to write these concerns off as beyond the scope of discussing Indigenous land-based pedagogy but recent scholarship on settler colonialism and within critical Indigenous studies has continued to make it clear that we must bring intersectional and nuanced approaches to the fore of our analysis.

Land-based education and funding

Finally, we cannot ignore the issue of funding and institutional capacity for land-based initiatives. One of the reasons we believe Leanne Simpson's article is a vital read for people working in Indigenous education is because she calls on us to increase the energy we devote to fostering sites of land-based education. Yerxa and Gardner & Giibwanisi show us how it is possible for people to undertake these activities without funding from mainstream institutions. These and other grassroots initiatives provide us with an important baseline for those who may argue that we lack the funds to undertake land-based practices.

Yet, simply saying funding is not an issue ignores how economic disparities within Indigenous communities gives those with resources greater access to the land. This is a tension brought to light by Eden Robinson (2008), "For instance, you have to be fairly well-off to eat traditional Haisla cuisine. Sure, the fish and game are free, but after factoring in fuel, time, equipment, and maintenance of various vehicles, it's cheaper to buy frozen fish from the grocery store than it is to physically go out and get it" (pp. 214-215). Freeland also discusses this phenomenon, in her discussion of students who have grown up in northern communities, where histories of dispossession have hindered young people from acquiring bush skills and denied them access to the land.

This brings us to the dilemma outlined by Coulthard (2013) in regards to land-based practices:

> Although all of these place-based practices are crucial to our well-being and offer profound insights into life-ways that provide frameworks for thinking about alternatives to an economy predicated on the perpetual exploitation of the human and non-human world, [these practices require participation in capitalist economies] in order to generate the cash required to spend this regenerative time on the land.
>
> A similar problem informs self-determination efforts that seek to ameliorate our poverty and economic dependency through resource revenue sharing, more comprehensive impact benefit agreements, and affirmative action employment strategies negotiated through the state and with industries tearing-up Indigenous territories. [Although these resources could be spent on cultural revitalization, they are] entirely at odds with the deep reciprocity that forms the cultural core of many Indigenous peoples' relationships with land.

Freeland-Ballentyne makes a valuable first foray into addressing this dilemma but more work needs to be done to explore the forms of education that are capable of fostering Coulthard's call for the creation of "Indigenous political economic alternatives." At the very least, this will mean creating forms of education that allow us to teach people within Indigenous philosophies and pedagogies, that in turn will guide how we select economic activities to engage in, how we organize work and labour within our economic activities, and how we distribute the products and resources generated through our economic activities.

To create these sites of education we must also think about how we can push forward institutional capacity. Although Indigenous peoples as a whole remain in an impoverished condition and resources are scarce, furthering land-based education is a necessary undertaking. Increasing capacity to offer land-based education is going to require a discussion of how various First Nation governments and organizations might cooperate with each other in order to foster these sites of learning. This is going to require moving beyond a practice where individual First Nations governments undertake programs and services in isolation from each other, as well as in isolation from other parts of the Indigenous political landscape such as urban communities, and Métis and non-status people. As Giibwanisi states in regard to the Oshkimaadziig Unity camp, "We want to be a connector between the city and the land. The broader work of being a connector is bringing together community-building strategies in urban areas and community building work at Oshkimaadziig. Settler colonialism, here and now, affects and implicates us all" (p. 173).

Of course, this does not mean centralizing or standardizing the delivery of land-based education. While we will learn from each other, the delivery of land-based education must always be rooted in place and the histories of Indigenous peoples from those places. Rather, the call to consider how we foster cooperation in service of furthering land-based education is a call to consider how we practice forms of governance between communities. While grassroots initiatives will always remain important within land-based learning, the institutional funding that Indigenous peoples do have control of must also contribute to land based initiatives. Typically, Band Councils in Canada have political authority over a membership and territory (both reserve and traditional) that is held in exclusion to other Band Councils and other aspects of the Indigenous political landscape. If we maintain these rigid boundaries, First Nations governments will not only limit their ability to support land-based education, but we will hinder traditional forms of governance that fostered connections between communities. As James Anaya (2004) argues: "Any conception of self-determination that does not take into account the multiple patterns of human association and interdependency is at best incomplete and more likely distorted" (p. 103). In short, we need to find ways for multiple communities to weave their authority together in service of fostering sites of land-based education.

Conclusion

Although we feel this issue is a valuable and important contribution to the literature on land-based education, it only represents a beginning. Rather than filling a gap in the literature on Indigenous land-based education – a gap far too large for any one volume to fill – we hope this issue provides a platform for further study. The research of the editors, as well as the editorial process of this issue, has made it clear that further studies and publications focusing on land-based education are required. Longitudinal evaluations of existing land-based healing and education programs that indicate the impacts these experiences have on participants would be incredibly useful research. Such findings would prove useful for organizations in their efforts to secure funding for programs already known and understood to be vitally important. While a diverse range of land-based initiatives is contained in this special issue, this edition only represents a small sample of efforts that we are aware of. This means there is a great need to continue and further the conversation moving into the future.

Acknowledgements

This issue is based in part on research conducted under a Partnership Development Grant from Canada's Social Science and Humanities Research Council. The grant was entitled "Building Economic and Social Prosperity: Connecting a Northern University Vision Through Dechinta Bush University." Dechinta offers university-accredited, land-based programming on Chief Drygeese Territory of the Akaitcho Region of Denendeh, the traditional territory of the Yellowknives Dene First Nation. The co-principal investigators for the grant are Dr. Stephanie Irlbacher-Fox and Dr. Glen Coulthard. Matthew Wildcat and Mandee McDonald were the PhD and MA research assistants for the grant in its final year of study. Research assistance was also provided during the first two years of the grant by PhD student Darcy Leigh and MA student Elaine Alexie. The grant was expertly administered throughout its tenure by Ms. Nina Larsson, in Yellowknife, and Ms. Elaine Maloney and Ms. Cindy Mason at the Canadian Circumpolar Institute at the University of Alberta, and more recently by Mr. Reg Cardinal at the University of Alberta's Faculty of Native Studies.

The editorial team would like to thank Eric Ritskes for his excellent work and support in bringing this journal edition to completion. His dedication to *Decolonization* is tireless and

without this venue to publish in, our path towards publishing research on land-based education would surely have been much more difficult. The issue also received help from Janey Lew, who provided much needed expertise and advice in publishing our poetry submission. David Gaertner provided excellent suggested readings to help advance one of our articles. Kelsey Wrightson also helped Matthew Wildcat work through the introduction.

We would also like to thank the board and staff of Dechinta, all of the students, Kids U alumni, Elder Professors and academic instructors who have, since 2011, participated in the research associated with this grant. All of the editors have participated in Dechinta and have supported the program in different ways. Glen Coulthard and Mandee McDonald have now been involved with Dechinta for six and four years respectively. Many people have contributed to sharing Dene knowledge over that time, but Coulthard and McDonald's relationships with elders Terese Sangris and Modeste Sangris, and with Melaw Nakehk'o have been the most consist and extensive during this time and they deserve special mention.

The grant itself focuses on building key institutional structures of Dechinta through developing organizational tools and evaluating programming, and assisting in expanding partnerships with and within academia in support of land based education. This grant was possible given the strength of the original partners, involving academics from the universities of Alberta, UBC, Carleton, McGill, and Aberdeen, with many more organizations who lent support and expertise along the way. Specifically we would like to thank Dr. Frances Abele, Dr. Linda Starkey, Dr. Allice Legat, Dr, Ellen Bielawsi, and Dr. Marianne Douglas.

We would also like to thank the Dene, Metis and Inuvialuit, and Coast Salish peoples from whose territories most of the work by the editorial team was conducted on. We would also like to thank all people who defend the land and promote alternative relationships with landscapes and non-human beings who exist in the places we live.

"But I Know It's True": Environmental Risk Assessment, Justice, and Anthropology

Melissa Checker

Few social issues depend as heavily on scientific information as environmental problems. Yet activists, governmental officials, corporate entities, and even scientists agree that much of the science behind environmental risk assessments is controversial and uncertain. Using a low-income African-American neighborhood as a primary case example, this paper illustrates in concrete terms how environmental risk assessments can exclude the experiences of the poor and people of color. Further, race and class experiences intensify a community's susceptibility to, and perceptions of, risk. These experiences and perceptions underpin the ways that communities contest scientific biases in everyday practice. After discussing alternative approaches to contemporary risk assessment that combine ethnographic research with other kinds of scientific expertise, I conclude by offering a four-fold model for resolving some of the problems raised by this essay. This model draws upon multiple kinds of knowledge bases and includes research, advocacy, policy recommendations, and theoretical innovation.

Key words: environmental justice, science and culture, racism, United States

In September 1993, over 200 residents living in the Hyde Park area[1] of Augusta, Georgia gathered in the Jenkins Elementary School cafeteria. Residents had come together that night to attend a meeting with officials from the Environmental Protection Agency (EPA). The meeting's purpose was to announce the results of a $1.2 million EPA study of the area's air, groundwater, and soil. Data from this study had provided the basis for a health consultation, compiled by the Agency for Toxic Disease Registry (ATSDR), the results of which were also to be discussed that evening. The health consultation was of primary concern to meeting attendants, as it would determine whether and to what degree their health was at risk from environmental contaminants. Although most of the people living in the area were homeowners, they could not afford to move unless they sold their homes for a competitive price. Rumors of contamination and the area's general economic and social decline (Hyde Park was especially known to be a drug-dealing hub) made selling homes extremely difficult. The results of the ATSDR's risk assessment would determine whether or not residents would find assistance—either from the U.S. government or through legal action—to move out of a neighborhood that they firmly believed was contaminated by the surrounding industries.[2]

The EPA's Field Investigation divided the Hyde Park area into five neighborhoods. Investigators found high levels of arsenic, chromium, and dioxin in the surface soils and groundwater of two of those. In all five neighborhoods, they found significant levels of PCBs and lead. However, the ATSDR announced that night that these chemicals did not constitute a significant threat to residents' health unless they "inadvertently ingested it on a daily basis for many years" (Health Consultation Final Release 1994).[3] Residents received this news in a fury. At one point in the meeting, one man presented the EPA's division director with a four-gallon bucket of sludge he had just taken from the ditch in his backyard. Offering the EPA official the sludge, the man asked him to smell it and then say whether he would want to live anywhere close to it. The crowd in the packed cafeteria shouted, "Answer, answer," and the official replied, "No." Over the next few minutes, tensions continued to escalate until one man threw a chair onto the Jenkins stage, marking the culmination of three year's worth of mounting frustrations, tensions, and fear.

When they tell this story, Hyde Park residents shake their heads and chuckle. They argue for a little while over who threw the chair. Yet, eight years later, they still puzzle over why the EPA and its sister agency, the ATSDR, are unable to correlate unusually high levels of contaminants with high

Melissa Checker is assistant professor of Urban Studies at Queens College, City University of New York. *She is eternally indebted to the residents of Hyde Park and others who participated in this research. She also acknowledges that she received crucially helpful comments on earlier drafts of this essay from Laura Helper Ferris, Satish Kedia, Katherine Lambert Pennington, Charles Utley and Nora Haenn, who of course, bear no responsibility for the final result. She is also appreciative of anonymous reviewers' insightful critiques. An earlier version of this paper was presented Environment, Resources, and Sustainability: Policy Issues for the 21st Century Policy Conference organized by Peter Brosius and Kendall Thu. A grant from the National Science Foundation (Doctoral Dissertation Improvement Award 9806988) made on-site ethnographic research possible. Support while analyzing the research was provided by a New York University Dean's Dissertation Award and a Morris K. Udall Dissertation Fellowship.*

local rates of certain illnesses. "But I know it's true" is the oft-repeated refrain of environmental justice communities across the country, who similarly find dangerous chemicals in their soil, air, or water. Although these people know that they and their neighbors suffer from uncommon health problems, they have been unable to secure scientific proof that the chemicals are the cause. Because governmental and legal decision makers rely on environmental science to determine whether they are going to assist environmental justice communities, scientific methods and procedures are for some people, a matter of "life and death."

Over the past two decades, the environmental justice movement has called attention to the disproportionate siting of hazardous waste facilities in neighborhoods of color. In so doing, environmental justice activists have expanded their definition of the environment to include all of the resources (i.e., adequate housing, education, employment, etc.) to which they have historically been denied access (Adams, Evans, and Stein 2002; Checker 2002, 2005; Cole and Foster 2001; Novotny 2000). Similarly, environmental risks include an array of social categories—health, justice, science, and community—all of which are culturally contingent and socially constructed (Haenn 2003). Because it is beyond the scope of this paper to address all of these categories in depth, I limit my focus to science, environment, and justice. From that vantage point, I also problematize the ways that hazards and risks are currently defined. It is my contention that, as it is currently practiced and conceptualized, environmental science does not necessarily serve environmental justice (Brullel and Pellow 2006).

Few social issues depend as heavily on scientific information as environmental problems (Kriebel et al. 2001). Yet activists, governmental officials, corporate entities, and even scientists agree that many scientific aspects of environmental risk assessment are uncertain, mainly because they are based upon probabilistic information (see Cutter 2002; Finkel 1994; Israel 1995; Kroll-Smith and Floyd 1997; Montague 2003; Scoones 1999). Such uncertainties are all too clear to members of communities struggling for environmental justice, whose perceptions of risk contrast sharply with official evaluations of risk. In recent years, environmental anthropologists have begun to examine the subject of risk more closely. In particular, much important work has been done on how different societies (especially on a national level) perceive, categorize, and prioritize risk.[4] Fewer anthropologists, however, have entered debates over risk-assessment methodologies and practices.[5]

This paper demonstrates how an ethnographic methodology complements studies of risk analysis and risk perception. Ethnographic research cannot replace epidemiological studies. However, as I will show, it sheds light on some of the biases that shape risk assessment and environmental science. Such research becomes a valuable tool in developing less biased, more accurate assessments of risk (see also Brown 1992, 1995; Brown and Mikkelsen 1997; Brullel and Pellow 2006; Clapp 2002; Griffith 1999).[6] Using a low-income African-American neighborhood as a primary case example, I first illustrate how risk assessments often fail to account for the experiences of poor people and people of color. Second, I show how, aside from varying internationally, risk perceptions also vary intranationally, according to socioeconomic factors. More specifically, I contend that race and class experiences intensify a community memebers' susceptibility to risk and their risk perceptions. By demonstrating how such experiences underpin the ways communities contest environmental science, I illustrate the cultural contingency of conceptions of environmental justice.

I conclude that eventually, environmental justice necessitates the reformulation of certain environmental science practices and conceptualizations. I thus finish the paper by exploring how anthropologists can build upon and facilitate the efforts of community groups in developing more holistic and comprehensive means of assessing environmental risk in contaminated communities. While we work to reform risk assessment, I also propose that anthropologists and other environmental scholars draw upon their combined research and knowledge to theorize new paradigms that obviate the need for risk assessments and find alternative, realizable avenues for an environmentally just society.

Anthropological Perspectives on Risk Assessment

Hyde Park residents joke that they live on the wrong side of *two* tracks. In other words, their neighborhood is lined on both its east and west sides by railroad tracks. For approximately 30 years, a large, unsightly junkyard abutted the backyards of residents living on Walnut, Hyde Park's westernmost street. Just down the street from the junkyard is a Georgia Power plant, and beyond it rises a large smokestack belonging to Thermal Ceramics, an industrial ceramics factory. About a half a mile away lies the site of a former wood preserving factory, which closed in 1988 several years after it was found to be leaking chemicals into its immediate vicinity. Two auto repair shops and a brickyard complete the neighborhood's industrial perimeter. Inside that perimeter, the homes of approximately 200 mostly low-income African-American families spread across seven streets. It is no wonder that Hyde Park residents refer to their neighborhood as a "toxic donut."[7]

Hyde Park's development began in the 1940s. Only six miles from the heart of downtown Augusta, the neighborhood lay on the edge of the city and was within walking distance of a number of local industries. Because the land was swampy and had extremely low value, African-American sharecroppers from nearby rural areas could afford to buy it. Lots were relatively large, and families were able to raise enough vegetables to sustain them while working in the surrounding factories, or as domestics in Augusta's wealthier neighborhoods. As people settled in, they invited relatives from the country to join them, and many households in Hyde Park remain "kin" to one another.

Despite its proximity to downtown, Hyde Park did not have running water, gas lines, streetlights, or paved roads until 1970. Residents pumped their own water and used outhouses. This lack of infrastructure, however, paled in comparison to the fact that the neighborhood would flood with each heavy rain. Floods were so bad that residents could not get in or out of the neighborhood and children could not get out to attend work or school until the waters receded. In 1968, one resident initiated the formation of a neighborhood association called the Hyde and Aragon Park Improvement Committee (HAPIC) to lobby for improved living conditions. Within two years, HAPIC had made itself known to county commissioners and other local lawmakers and successfully secured running water, paved streets, street lights, sewer lines, and drainage ditches.

Throughout the 1970s and 1980s, however, as the blue collar jobs that had helped keep Hyde Park families afloat left Augusta, the neighborhood began to decline. In 1998, approximately 61 percent of Hyde Park's 200 families owned their homes; yet, 77 percent of them earned less than $20,000 per year (Sociology Research Methods Students 1998). Some younger residents had turned to drug dealing, and the neighborhood became a popular place to purchase crack cocaine. Hyde Park also appeared rundown: while some houses were freshly whitewashed, others had fallen into startling states of disrepair.

In 1988, routine soil tests at Southern Wood Piedmont (SWP), a wood preserving factory located approximately one-half mile from Hyde Park, revealed unsafe levels of arsenic, chromium, and lead in the soil surrounding the plant (Governor's Task Force 1996). Soon after, the EPA ordered a major cleanup of the factory area. Some time around 1990, HAPIC leaders discovered that the mostly white residents of Virginia Subdivision (another neighborhood bordering SWP) had filed a lawsuit charging SWP with contaminating their properties. The plaintiffs in this lawsuit had just received a small settlement. Recognizing that ditches from SWP's property ran directly into Hyde Park, HAPIC leaders began alerting their neighbors to possible contamination. Soon after, two local attorneys approached them and started to organize a class action lawsuit. Hyde Park residents believed that they had been left out of the initial settlement because they were black.[8] HAPIC, which had always considered itself a civil rights organization, now made environmental justice its main priority.

Methods

Eight years later, in September 1998, I began 14 months of fieldwork in Hyde Park. During that time, I volunteered as a full-time staff member for HAPIC and focused my research on that organization. I found that in maintaining the broad definition of the environment I described earlier, HAPIC tackled a host of neighborhood problems including education, unemployment, crime, and drug trafficking. They also held after school tutoring and summer youth programs for children, neighborhood cleanups, and holiday food giveaways. In short, nearly all residents of the neighborhood came into contact with HAPIC in one way or another. Although, HAPIC's membership is open to anyone, most of its participants live in Hyde Park.[9]

Participation in the group tends to wax and wane. For example, the 1993 meeting I described earlier was packed. In 1998 and 1999, when public officials were scheduled to appear or when large-scale projects (such as a $200,000 EPA Brownfield Grant, which I will describe later) were addressed, as many as 50 members attended. On the other hand, when there were no specific or pressing issues being discussed, I attended meetings with a dozen people. In all, a cadre of approximately ten residents stayed consistently active.

As a volunteer staff member, I participated in all of HAPIC's events and spent many hours working and socializing in the neighborhood. My volunteer position also allowed me access to HAPIC's records, including meeting minutes, notes, past newsletters, flyers, and correspondence. During fieldwork, I got to know many members of the Hyde Park community, as well as a number of environmental justice activists from across the United States (and especially the South), with whom HAPIC had affiliations. Since the official end of fieldwork in 1999, I have returned to Hyde Park eight times to continue my research. I have also continued to develop my relationships with environmental justice activists in other parts of the South and Northeast. In addition to numerous informal conversations about the matters discussed here, I have conducted approximately 26 interviews with key informants, several of whom I have interviewed two or three times. Interviews have taken place in people's homes, in the Hyde Park community center, and over the telephone. With permission, all interviews have been tape recorded. To develop my history of environmental justice in the area, I collected newspaper articles on neighborhood events both past and present and analyzed them along with examining HAPIC's archival records. The critique I turn to in the following section is based upon this ethnographic and archival research, as well as academic literature on environmental risk assessment.

Risky Business: Critiquing Environmental Science Methodologies

When the EPA conducted its 1993 study to determine the degree to which Hyde Park had been contaminated, testers took 93 soil samples and 14 groundwater samples. They then isolated the chemicals they found and measured them. Next, they compared chemical levels to EPA/ATSDR standards for toxicity. While most levels fell below the toxicity threshold, one area had an arsenic level of 59 mg/kg (ATSDR 1994). The ATSDR has determined that a cancer risk exists at 1.5 mg/kg of arsenic, ingested per day; however, their final assessment was that there were not enough instances of levels in the hazardous range to constitute a significant health risk. The agency based its conclusions upon a typical four-stage risk

assessment methodology: hazard assessment or identification; hazard characterization or dose-response analysis; exposure assessment; and risk characterization. The final stage in this process deals with consolidating and communicating the findings of the first three, which are ostensibly its most objective. Yet, as I will argue in the following section, each of these phases can be biased or based on uncertain assumptions.

Lab v. Real World: Determining Which Chemicals are Hazardous

Hazards identification determines whether a particular substance causes a disease or other adverse health effect. Generally, hazard identification focuses on one health effect at a time, called an "endpoint." Endpoints can include cancer, reproductive and developmental disorders, central nervous system symptoms, trauma, infections, and rashes (Israel 1995:483). Currently, it is up to individuals (who may be subject to a variety of influences) to decide which endpoint to use. For example, because it tends to be particularly sensitive, is easy to identify and is a prominent public concern, cancer is frequently chosen as an endpoint over other possible harms (Anglin 1998; Israel 1995).

The next stage of the risk assessment process moves to a lab to study dose response. These experiments are primarily based on animal studies and then extrapolated to humans, despite the fact that animals and humans can react very differently to chemicals. The tests are also performed at high doses and then extrapolated to low dose situations; yet, this process, too, is plagued with uncertainty. First, because the costs of such tests are high, only a few hundred animals are used. Second, individual chemical sensitivities vary widely in both animals and humans—many chemicals often leave large segments of a population untouched (Dark 1998; Tesh 2000:27-28). The smaller the pool of animals, the more difficult it is to spot adverse health effects. Third, many lab rodents are bred to be genetically similar. This uniformity makes them even less comparable to genetically and geographically diverse people (Douglas and Wildavsky 1982; Schettler, et al 2002;).

Most studies extrapolate using healthy white male workers as a standard (Israel 1995:486). The ATSDR study on Hyde Park, for instance, analyzed fish samples from a nearby fishing pond. Estimating the likelihood that a 70 kg adult who consumed 18 grams of fish a day for more than one year would get sick, they found that the fish posed no danger (Agency for Toxic Disease Registry 1994). However, it is well-known that people of color (including children, the elderly, and sick people) consume closer to 20 to 24 grams of fish per day (West et al. 1992). In other words, standard comparison techniques fail to provide information on the range of ways women, children, elderly, or already sick people—far more susceptible subgroups—might react to a chemical.

Fourth, environmental hazards are studied under "normal" conditions in laboratories rather than as they are released or disposed of. As a result, scientists often base their assessments of risk on conditions that are actually very different from those a particular community is experiencing (Novotny 1998:141). Finally, high dose studies concentrate on immediate responses to exposures. But, many diseases have long latency periods and their link to harmful chemicals may not become evident for many years. For example, birth defects have especially delayed onsets, and many cancers do not show up for 20 to 40 years. Thus, it is difficult to estimate a chemical's potential for harm without studying it over long periods of time (Fitchen 1988). In sum, although scientists might be able to establish cause and effect relationships between one chemical and one disease under controlled conditions, the chances of establishing definitive cause and effect relationships in the real world are slim (Montague 2003).

A Matter of Multiplicity: Assessing Exposures

As difficult as it is for scientists to resolve the precise level at which a chemical will pose a risk to humans (Wigley and Shrader-Frechette 1996), perhaps the most significant problem with risk assessment comes in its third phase—exposure assessment. When asked to evaluate environmental exposures in a particular community, environmental scientists follow the same procedures I mentioned earlier, isolating data and focusing on one chemical at one time (Anglin 1998; Bryant 1995; US EPA 2003; Wigley and Shrader-Frechette 1996). This procedure thus emphasizes the determination of whether one chemical is harmful, at what dose it is harmful, and whether community members are exposed to the chemical at that dose (Kriebel et al. 2001). However, many environmental justice communities are exposed to dozens of different chemicals from a number of different existing and abandoned factories, not to mention particles emitted from cars, trucks, and trains (Novotny 1998).

For example, because Hyde Park is located between two sets of railroad tracks and adjacent to a highway, its residents inhale truck and car emissions on a daily basis. As I mentioned, approximately six factories and plants surround Hyde Park, and nearly all of them produce some kind of toxins. In addition to living in the middle of these factories, many residents have worked in them. According to these people, their working conditions were far from hazard-free. For example, those who worked in the industrial ceramics factory report leaving their jobs covered in a fine, white dust. As one man said, "black as I am, I used to come out white." Others who worked at the wood preserving factory complained of frequent headaches and suspicious tasting water at the plant.[10]

Up until 1970, when the neighborhood received access to public utilities, a common chore for Hyde Park children was to go into SWP's field, gather leftover creosote-treated wood chips, and then take them home to fuel wood-burning stoves. And, until Hyde Park got its water lines, residents pumped bathing and drinking water from underground wells in their backyards. Annie Wilson, one of Hyde Park's first residents recalled: "That water one year, it was stinking. And we really hadn't paid it that much attention.... In Aragon Park, my niece

was living over there, one time, that water was so stinking they couldn't take a bath in it."[11]

Regular exposure to groundwater occurred outside of people's homes as well as inside. As I mentioned, Hyde Park is a flood plain, and major floods have been so bad that residents have literally had to leave the neighborhood by boat. Particularly severe floods often left suspicious debris in their wake. Hyde Park resident David Jackson remembered: "My yard used to flood out more than anybody in this whole area because all the water from the junkyard would flow right in my yard. And when it leave, it leave all kinds of grease-filled and black looking dirt with the oil and stuff that just shot up in here."

Jackson and his neighbors, however, did not seriously question the effects of these floods and their debris for a number of reasons. First, they had grown used to the inconveniences of living in a neighborhood surrounded by industry. Second, historically, issues other than the environment have traditionally been a priority issue for African Americans (Checker 2002, 2005). Third, the industries producing flood debris and odiferous water had for many years, put food on residents' tables and paid their bills.

However in 1990, a particularly bad flood swept over Hyde Park and left in its wake a foul smelling bluish-white mud and houses full of corroded furniture. Johnnie Mae Brown remembered the "high water" of 1990: "Most people in the neighborhood didn't even think about [the environment] until we had that flood. After the flood we knew that something was wrong because that water, everything that the floodwater touched, it was no good no more." Hyde Park residents were thus exposed to chemicals in their workplaces, in their homes, and outside of their homes over a period of several decades before they began to agitate for environmental justice.

The reason for this is that many residents did not link the everyday nuisances described above to local health problems. Often, residents told me they "were too busy trying to live" to address such issues. In addition, activists of color traditionally did not prioritize the environment on their agendas for social change–rather, they were more concerned about housing, schools, and employment (Checker 2002, 2005). However, once they heard about the wood preserving factory's closing, Hyde Park residents realized that their natural resources were subject to the same discrimination as other urban resources. Thus, they began to frame "the environment" as another civil rights issue. As I demonstrate later in this essay, these framings then shaped how residents disputed scientific claims and interacted with agency officials. For now, I will return to my arguments about the biases of risk assessment procedures.

Not only do risk assessments generally overlook the kinds of multiple exposures that Hyde Park residents faced, but even if those exposures were included, scientists are still only beginning to learn about the cumulative effects of toxins. In recent years, the EPA has acknowledged the need to address cumulative risk, and has begun to develop mechanisms for its inclusion in the risk assessment process (these steps are discussed later in this essay). However, the EPA also recognizes that it has only taken initial steps, partly because methodologies for the quantification of combined risks are only in their nascent stages (US EPA 2003).

Making things even more complex, the illnesses that many environmental justice communities like Hyde Park complain of, such as developmental disorders, asthma, and circulatory and respiratory problems generally result from a range of genetic, environmental, and social factors. Indeed, in some cases, they may not be directly related to a particular chemical; but these health disorders are exacerbated by toxic exposure. For example, two common health problems in low-income African-American communities are hypertension and diabetes. Hypertension can lead to kidney disease, and diabetes creates metabolic impairments. Both situations then inhibit the body's ability to process toxic exposures (Israel 1995:506). In sum, measuring whether the level of contaminants in one ditch on one particular day is linked to one particular disease provides little insight into the cumulative picture of whether, and to what degree, a community's health is at risk, especially if that community faces a host of other risks related to their socioeconomic status.

Scientific Slants

Despite all of the uncertainties and biases I have mentioned, our social valuations of science persistently overestimate its abilities to provide an objective resolution to issues like environmental risk assessment. In part, because capitalism underlies the production of scientific knowledge (especially in the area of hazards research), its accumulation is both materially and socially valued (Escobar 1994). Moreover, societies that place a high value on science see scientific knowledge as a one-way process, where information flows from scientists to passive recipients (Martin 1984). Rather, as environmental justice activists frequently point out, science is embedded in power relations and subjective interests (Brullel and Pellow 2006:103). Questions about the neutrality of science are not new (Bryant 1995; Dove 2001; Franklin 1995; Haraway 1989, 1991; Janasoff et al. 1995; Nelkin 1987, 1992; Satterfield 1997). However, it is worth briefly revisiting this well-trod terrain to reiterate the degree to which environmental science, in particular, can be influenced and thus biased by cultural, political, and economic factors.

As mentioned earlier, much of environmental science is based on probabilities that certain chemicals will cause harm. But as Mary Douglas and Aaron Wildavsky emphasize in their classic cultural analysis of risk, "There is a delusion that assigning probabilities is a value-free exercise" (1982:71). Other studies clearly affirm this point. For example, in addition to choosing which endpoints to study, risk assessors also choose from a variety of toxic indices as they develop their analyses. A recent study conducted by several geographers and reported in the *American Journal of Public Health* applies six toxic indices to the same area and finds that they yield widely varying results. The study concludes that "comparing

findings across studies and developing generalizations about levels of risk to low-income and minority populations is difficult, if not impossible" (Cutter et al. 2002:420). The fact that individual risk assessors can choose which indices and models they will base their evaluations on raises important questions about cultural constructions of science and the biases that may lie hidden in those constructions (Oliver-Smith 1996:320). For instance, when assessors estimate the risk that a contaminant poses to a community, in addition to making assumptions about the age and size of the "typical" exposed individual, they must also presume what kind of clothes that person wears and how sensitive he or she will be to that pesticide. If assessors are unfamiliar with the community they are evaluating, they may rely upon cultural stereotypes when determining such factors.

More concrete biases also underlie risk assessments and the development of research on toxic chemicals more generally. For example, most risk assessments are prepared when a business, an agency, or a corporation seeks to initiate or continue a hazardous activity. These entities hire the risk-assessment agency to conduct their evaluations, making assessors highly vulnerable to pressure (O'Brien 2000). Political motivations can also weight scientific testing. In 2006, this issue came to an unprecedented head when union leaders representing EPA scientists issued a letter to the EPA administrator alleging that pesticide-industry officials and agency managers were pushing them to skip steps in their testing, compromising "the integrity of the science upon which agency decisions are based" (Fialka 2006: ; Griffith 1999).[12]

If politics and economics can substantially influence the evaluation of a community's environmental risks, it is not surprising that we find significant disjunctures between community risk perceptions and official risk assessments. The next section addresses those disjunctures and how one local community contested them.

Through the Magnifying Glass: Local Perceptions of Risk

Over the years, Hyde Park residents have recognized that environmental science can be biased. Early on in their environmental justice struggle, they realized that, as Revered Charles Utley said, "If I set up the test and the test instrument, I can pretty well dictate the outcome." Accordingly, HAPIC activists disputed environmental science in a variety of ways. Such challenges exemplify how residents and activists of Hyde Park perceive environmental risk through the lens of their race and class experiences.

Challenging and Critiquing Science

HAPIC activists did not passively accept the EPA's 1993 test results. First, they investigated the consulting firm that conducted the study and discovered it had contracted with the polluting factory in the past. They then filed a complaint with the EPA. Second, the EPA designed its tests according to the protocols I have described, which do not generally include community input. Hyde Park residents immediately called attention to this fact, arguing that it skewed the test's results. For instance, in many cases, in collecting surface soil samples, testers had actually sampled new dirt that residents had imported and put over their old, contaminated dirt. David Jackson explained, "They sent out some people to do that testing out here and they scooped a little bit of dirt with spoons on the ground. Hey, I done put dirt on top of dirt trying to get rid of the floods and things we been having out here for years." As Jackson describes, he "put dirt on top of dirt" to protect his home and his family. After this instance, Hyde Park activists found their own testing agency and conducted another set of soil studies to counter the EPA's. This time, they directed boring depths and locations, indeed, these tests yielded much more dangerous chemicals levels, which were later determined to be hazardous to human health. Here, activists recognized the limitations of scientific objectivity and accuracy; yet they also recognized that science is often best contested on its own terms.[13] By combining local knowledge with scientific expertise, they believed that, at the very least, they could raise the level of the tests' accuracy.

Activists also found that health officials seemed to be biased against them. Reverend Bobby Truitt, for example, described how at an early visit to the Richmond County Health Department, officials acted "hostile" and told residents that their health complaints were "a figment of [their] imagination." Similarly, other environmental justice activists I have worked with find that health officials often allow stereotypes about the poor eating, smoking, and exercise habits of low-income minorities to cloud their willingness to link health problems with toxic contamination (Checker 2001). As one man succinctly put it, "Often those [health officials] who are passing judgment on the community do not live in the community."

In 1991, Richmond County hired an African-American health commissioner. Activists immediately believed that, because he was black, the new commissioner would be more sympathetic to their situation. Indeed, after presenting him with their case, they convinced him to conduct a mortality study that compared death rates in Hyde Park to those in other neighborhoods with similar socioeconomic demographics. The study concluded that Hyde Park had higher than average death rates due to cancer and circulatory and respiratory diseases (Dever 1991). Activists also lobbied their black elected officials on a local and national level with some success. In 1992, state representative Ron Brown persuaded the governor to appoint a 13-member task force to look into the Hyde Park situation. Brown oversaw the appointing of task force members. He assigned the new health commissioner as its chair and included four neighborhood residents along with several doctors and a member of the Georgia Environmental Protection Division.

In the end, the Task Force concluded that it could not find sufficient evidence to support claims of contamination.

However, an appendix to the report, which is almost as long as the report itself, contains 10 rebuttals—half are written by physicians or researchers and one is from the Task Force Chair himself. In that rebuttal, the health commissioner notes that he has "heard about too much illness and observed too much death" in the Hyde Park area. He also criticizes the EPA's soil testing study pointing out that EPA scientists themselves implied that their model may have been inadequate. And he highlights the fact that initially the ATSDR found no exposure from well water, but after community complaints, the agency retested the water and reversed its findings. Finally, the commissioner pointed out flaws in environmental science more generally. He asks,

> Has it occurred to anyone that, just maybe, science is too far behind to adequately address the effects that hazardous chemicals have on humans?...Is 10 parts per million (ppm) of a chemical normal for me who weights 195 pounds and also my daughter who weighs 40 pounds, and is normal the same whether we are exposed one year or ten years? (Governor's Task Force 1996:2).

In his official recommendations to the governor, the health commissioner calls for a full medical evaluation of the residents of these neighborhoods, and for their relocation while the studies are conducted. Subsequent to the report's publication, he applied for and received a grant from ATSDR to conduct a long-term health study.[14]

A Heavy Knot

The fact that HAPIC activists found African-American health officials and politicians more supportive of their cause was not surprising to them. Nor were they surprised to recognize scientific expressions of bias. As their difficulties in securing water, sewer, and gas lines illustrate, residents were used to not receiving governmental assistance without concerted and sustained agitation for it. This history, combined with the daily struggles they continue to face as poor, black Americans, lead Hyde Park residents to perceive their risks as multiple. In other words, not only are they being exposed to toxic chemicals on a daily basis, but also, due to biases against them, they do not believe that they will find much relief or remedy for their problems.

Toxic exposures and institutional barriers to accessing relief from those exposures are only two aspects of the total risks that Hyde Park residents faced. For instance, when they develop asthma, or experience skin conditions from lupus or arsenic keratosis, many residents have to rely on Medicaid, which in Augusta is inefficient and does not usually cover the full cost of expensive inhalers or skin creams. In addition, as the years wore on and they increasingly realized that they were unable to leave a neighborhood which they strongly believed was contaminated, residents' mental health was compromised. Certain activists, who had devoted themselves to the cause of relocation throughout the 1990s, fell into severe depressions. In the late 1990s, mental health disorders in the neighborhood were becoming of such concern that the health department added psychiatric studies to its health assessment.

Ill health in Hyde Park also led people to lose educational and employment opportunities. Developmental delays and severe bouts of asthma caused some children to miss school. In turn, parents had to stay home from work to care for sick children. One mother, whose middle child developed a rare cancer at the age of seven and whose youngest child was born with debilitating asthma, quit a stable job in 1996 to care for her children and lived on public assistance. Finally, as I mentioned earlier, with news of contamination the property that Hyde Park residents had invested in became valueless. Residents had extreme difficulty selling their homes, and they complained that they had problems getting home insurance as well as bank loans.[15] Because many people either worked in low-wage jobs or lived on fixed incomes, they teetered on the edge of impoverishment. In short, Hyde Park residents face a "heavy knot" of risks that derive from both ecological and social circumstances (Cernea 2000:31).

Economically and politically marginalized communities like Hyde Park often depend upon social institutions, especially those that might bring them out of their current environmental predicament. One resident said, "When we first heard about the EPA study, it was like the cavalry was coming in." Instead of controlling their risks, however, these institutions compound them by denying community claims. As a result, residents' extant mistrust of governmental agencies increases. For instance, in 1990 and 1999, when they spoke about their distrust of scientists, some people brought up the notorious Tuskegee syphilis experiments. Anthropologists have termed this magnification of mistrust "risk perception shadows," which can be defined as "a predisposition to distrust projects involving potential adverse health or social impacts and to doubt agency or company statements regarding the potential dangers associated with these projects" (Stoffle et. al 1988:6). Given their historic exposures as poor, black Southerners, such shadows certainly loomed over Hyde Park and were only darkened during the risk communication process. Moreover, their experiences of race and class exclusions were foundational to activists' ideas that environmental justice meant engaging in a participatory and holistic process.

Yet agency communication tends to be unidirectional. In other words, not only do they deny community claims, but they neglect to solicit community input or recognize the value of local knowledge (Liebow 1988; Wolfe 1988). "Risk perception shadows" and cultural experiences then combine with agencies' top-down communication techniques to fuel community-agency conflagrations like the one I described at the beginning of this essay. The need to avoid such debacles is all too clear to governmental officials. Over the past few years, the EPA and the ATSDR in particular have taken steps to improve risk communication and to develop somewhat more holistic accounts of community environmental problems. In the following section, I discuss some of these steps and how environmental justice activists have responded to them.

Towards Remedies

As early as the late 1980s, the EPA began to develop a comparative risk assessment methodology for prioritizing and addressing risk situations. This method evaluates two or more risks simultaneously to prioritize the allocation of resources to control or manage that risk. Data used in comparative risk falls into two categories—"hard" and "soft." The former focuses on quantifiable factors such as predicted numbers of fatalities, or the size of affected areas, and then compares them to the costs of reducing those risks. In contrast, the latter is premised on the idea that risk is multidimensional and socially constructed; thus, it gives public values equal weight to scientific facts, and it includes factors such as mistrust and the equity of how various subgroups bear each risk (Finkel 1994a:7-8). Although comparative risk is mainly used to set priorities for allocating governmental resources, and reports find that the EPA continues to rely more heavily on hard than soft data (Finkel 1994b:336-338), in its combination of data comparative risk illustrates some significant institutional shifts toward a broader conception of risk.

In 1993 these shifts took shape again in the EPA Brownfield Redevelopment program. Brownfield grants generally fund environmental assessments of unused, abandoned sites, and they facilitate cleanup and redevelopment plans. The grants are geared toward low-income areas and they include job training, community outreach, and environmental justice components. Significantly, the program defines brownfields as having "actual or perceived contamination and an active potential for redevelopment or reuse" (Governor's Task Force 1996: Appendix C). That this definition includes *perceived* contamination comes as the result of heavy lobbying by national environmental justice activists. Indeed, it has opened doors for some communities like Hyde Park, which are in officially indeterminate situations. In 1999, Hyde Park activists persuaded the city of Augusta to apply for a Brownfield Pilot Grant to assess and redevelop the scrap metal yard that bordered their neighborhood. The application was successful and although the project, which is still underway, does not provide residents with their ultimate goal of relocation, it has facilitated the cleanup of the scrap yard, which initial investigations found to be highly toxic.[16]

Further inroads have been made in the area of cumulative risk assessment. Responding to several reports (including the National Research Council's 1994 report "Science and Judgment in Risk Assessment" and a 1997 report by the Presidential/Congressional Commission on Risk Assessment and Risk Management entitled "Risk Assessment and Risk Management in Regulatory Decision-Making") as well as to sustained pressure from grassroots environmental justice groups, the Clinton administration began exploring cumulative risk assessments. In 2003, the EPA released the results of this exploration in its "Framework for Cumulative Risk Assessment," which offers guidance for the cumulative risk assessment process. In acknowledging the importance of understanding the accumulation of risks from multiple environmental stressors, the document represents a critical first step. However, it does not lay out protocols; nor is it attached to any regulatory requirements. The framework also notes that some of the methodologies and techniques for doing the risk analysis discussed may not yet exist (U.S. EPA 2003:17).[17]

To reiterate, sustained pressure and input from environmental justice groups has expedited progress on cumulative risk assessments. The National Environmental Justice Advisory Council (NEJAC), which provides advice, consultation, and recommendations to the EPA administrator leaders on matters related to environmental justice[18] (and includes national environmental justice leaders), designated two working groups to address some of the issues raised in this essay. One of them proposed ways for the EPA to implement Cumulative Risk Assessments. The other has recommended ways "to achieve more effective, integrated community based health assessments, intervention and prevention efforts" as well as how to improve communications with community members and how to consider socioeconomic and cultural factors in community health assessments.[19] Among other things, the work group recommended that the government let affected communities know how it can help them, even if a causal relationship between health and environmental toxins cannot be proven. The work group also called for the consideration of socioeconomic and cultural factors in community health assessments. It is interesting to note that the crux of the NEJAC Work Group's recommendations is the implementation of all the findings and plans set up in the various workshops, reports, and guidelines I have mentioned. In other words, reports sit on shelves and change happens extremely slowly, if at all. Many environmental justice activists have thus concluded that reforming risk assessment is a dead-end and declined to serve on NEJAC.[20]

Instead, some people have devoted their energies toward advocating alternatives that would reduce our reliance on the science of risk assessment and emphasize more participatory and citizen-centered conceptions of justice. For instance, a number of activists promote the implementation of the Precautionary Principle. Very briefly, the principle is based upon the idea that precautionary measures should be taken when an activity raises threats of harm to human health or the environment, even if scientific cause and effect relationships are not fully established. Importantly, the initiator of such an activity bears the burden of proving that an activity is safe. This reverses the current standard, where the public must prove that a particular activity is risky (Montague 2003).

A second alternative is an autonomy paradigm that capitalizes on local knowledge and self-determination by advocating for local communities' rights and abilities to manage and protect natural resources themselves. Pena, for instance, cites a successful example in Colorado where local farmers formed a partnership with their county government in the design and implementation of a long-term watershed monitoring system. In addition, they received EPA funding to develop restoration ecology projects (Pena and Valdez 1998; Pena 2003). Another successful and oft-cited autonomy model is the case of the

Dudley Street neighborhood in Boston, Massachusetts, where in the late 1980s, activists convinced the city government to grant them the power of eminent domain. Under community control, the neighborhood has been able to transform over 1,300 abandoned parcels into affordable housing, gardens, and public spaces.[21]

Those activists still participating in NEJAC certainly agree that prevention and autonomy models are a necessary and important part of the environmental justice process, and they have worked hard to ensure that such principles are included in NEJAC documents. But, they also recognize that proposed alternatives do not necessarily address the immediate needs of communities like Hyde Park, which are desperate to move out of their contaminated circumstances. Therefore, they are not yet willing to relinquish the idea of risk reform. Concurrently, NEJAC members note that EPA-generated reforms are only half the battle: The rest will consist of convincing industries to accept changes in risk-assessment procedures and of making sure that regional EPA's enforce them.[22] Fundamental to this latter effort is the valuing of local knowledge equally with expert "facts." In other words, what is required is a far more holistic and comprehensive approach to science itself.

As environmental justice activists work toward engendering paradigmatic shifts in the prevention, management, and control of environmental risks, and as government agencies move toward broader conceptions of risk, anthropologists have ample opportunities to contribute by combining their expertise with those of others. The next section describes some specific ideas for such applications.

Into the Breach: Roles for Anthropologists

Anthropological research demonstrates how ethnographic information can offer an important complement to the risk-assessment process (Griffith 1999). Anthropologist Michael Cernea, for instance, studies risk among refugees and displaced people in various parts of the world and calls for on-the-ground assessments that account for the multiple contexts in which people experience risk. As Cernea cautions, however, risk identification is not enough: it must also lead to risk reversal (Cernea 2000). Accordingly, Cernea has developed the impoverishment risks and reconstruction (IRR) model, which has a dual emphasis on assessing risks to be prevented *and* on implementing reconstruction strategies and policies (ibid:20). I would argue that we might address environmental risk assessment in the United States from a similar perspective and add to it a third component of theoretical innovation. Below, I outline my recommendations for a three-pronged anthropological approach to the problem of risk assessment and environmental justice.

On the reform side, anthropologists can continue to advocate for the expedited implementation of cumulative risk assessment strategies. In other words, until federal officials relinquish the idea of risk assessment, and while environmental justice communities continue to reside in life-threatening conditions, anthropologists can work together with environmental scientists to develop more comprehensive and accurate assessments of risk. One means of doing this is to facilitate the pairing of scientific and lay expertise in developing risk assessments (Brown 1992, 1995; Brown and Mikkelsen 1997; Brullel and Pellow 2006; Clapp 2002; Dove 2001; Scoones 1999).

For, not only do community members hold invaluable local knowledge about their risk exposures and histories, but they also have the greatest motivation for compiling that knowledge and monitoring their environmental conditions. As anthropologists Ben Wisner (1997:277) writes, "Residents themselves are not only capable of contributing considerably to [hazard identification and mitigation], but in many cases they are the primary actors by default." In Hyde Park, community residents could be trained to collect cumulative exposure data, create records of neighborhood health complaints and illnesses, and track signs of contamination such as foul odors, discolored water, or changes in local fauna.

In addition, residents and scientists could partner to draw random samples, design questionnaires, and collect and analyze data according to more empirical traditions (Brown 1992, 1995; Brown and Mikkelsen 1997; Brullel and Pellow 2006; Bryant 1995:589; Clapp 2002; Kroll-Smith and Floyd 1997). Community members can then present the final research product to the EPA and ask it to reconsider their eligibility for federal assistance. The end result is that residents share control of the research process.[23] A community-based, participatory research model not only improves the quality of the risk assessment, but it also increases community members' environmental literacy. In other words, participating in environmental research equips community members with the knowledge and awareness they need both to remedy their current conditions and to develop prevention strategies.

Another benefit of participatory research is that it can help communities improve their relations with governmental agencies. As they conduct research in partnership with scientific and governmental agencies, greater understandings between communities and officials will develop and solidify. But, more immediately, anthropologists can strengthen the quality of community-agency communications to prevent scenes like the EPA meeting debacle I described earlier. For instance, federal and state offices are highly segmented and can only address specific issues. However, community members often grow frustrated that various departments and agencies do not cooperate with one another to create more effective resolutions. When governmental officials encounter such frustrations, they may view community members as irrational, overly angry and/or uninformed. One way that anthropologists can apply their research to this problem is by "studying up," or investigating the practices of scientists, extension agents, field managers, and governmental officials (Scoones 1999: 479).[24]

Returning to Hyde Park, for example, there is much to learn about the various entities—Georgia Environmental Protection Division, EPA Region IV, the ATSDR, and

industries—that affect the neighborhood's situation. Ethnographic study with these entities enables the researcher to gain a greater understanding of how environmental issues are conceptualized and acted upon. The tools of ethnography are especially important here in that they elicit a diversity of perspectives that may not be evident in more quantitative surveys and questionnaires. Anthropologist Terre Satterfield (2002:170) notes, environmental values are "typically articulated discursively; they are embedded in the contextually, emotively, and morally rich stories and conversations through which we define ourselves and our actions in relation to natural systems" (see also Griffith 1999). After developing a better understanding of all aspects of a particular issue, anthropologists can work with each side to find some basis for negotiation and compromise.

Once again, the kinds of intervention I am proposing here represent only a first step toward building the communication capacity of both communities and agencies. Community members can and should speak for themselves. However, until federal, state, and local officials are willing to value community perspectives and voices to a much greater extent than they currently do, some communities may still find it helpful to have a mediator. At a recent environmental justice workshop I attended, for instance, one grassroots African-American activist from Chicago explained that she and some of her neighbors have backgrounds in science, so they understand the technical words that EPA officials use, and they can "translate" them back to other community members who do not have scientific backgrounds. At the same time, this activist pointed to the need for education on the EPA's side so that officials might better understand community perspectives. Often, such insights come from outsiders. Or, as Hyde Park activists have argued, because I do not live in the neighborhood and have not grown up there, my analysis of its conditions pulls more weight with various institutional bodies.[25] Simultaneously, anthropologists and residents can lobby for the meaningful inclusion of community members in environmental decision-making processes. For, as other anthropologists have noted, efforts to incorporate a diversity of "stakeholder" voices in such decisions often fail because the standards for which voices are heard are determined by those setting the terms of discussion (Brosius 1999; Satterfield 2002).

This move toward more inclusive, democratic action leads to the policy arena, which constitutes the final prong in Cernea's reform-oriented research model. Here, anthropologists can combine their research findings with those of "hard" scientists and residents and work preemptively to make specific recommendations and strategies for how to reduce a community's current risk exposure. Creative and preventive policy solutions are a particularly important component of risk-assessment reform. If we succeed in convincing decision makers and corporations to accept cumulative assessments of risk that give local knowledge equal status with scientific knowledge, it follows that a far greater number of communities will be classified as "at risk." In turn, such classifications mean that some entity becomes responsible for alleviating that community's risk—a potentially expensive process. We may stand a better chance of substantively reforming risk assessment, therefore, if we can develop and promote less costly ways to relocate or clean up communities.

Finally, innovative policy solutions serve as a point of departure for new theories of environmental justice. In this paper, I have problematized conceptions of both science and justice and presented ways that each is culturally contingent. However, we have much more to learn about how "justice" is constructed cross-culturally if we are to develop new environmental justice paradigms.[26] Here again, by investigating how different groups of people understand and perceive justice, anthropological research can combine with other forms of local and professional scientific expertise to contribute to broadly conceived and workable solutions for abating disproportionate environmental risk and creating a more environmentally just society.

Notes

[1]The five adjacent neighborhoods that comprise what I refer to as "the Hyde Park area" have no official designation. Individually, they are Hyde Park, Virginia Subdivision East, Virginia Subdivision West, New Savannah Road and Gravel Pit Road. Together, they comprise approximately a three-square mile area just south of downtown Augusta.

[2]Some of the information in this article is also found in Checker 2005.

[3]Although this "term of art" is commonly used, the African American residents of Hyde Park interpreted it as a racial slur, implying that they routinely ate dirt.

[4]See for example Cernea and McDowell 2000; Douglas and Wildavsky 1982; Griffith 1999; Stoffle, et. al. 1988; Pollnac 1998; Wolfe 1988. See also Renn and Rohrmann 2000 for a more psychological perspective on cross cultural risk perceptions.

[5]For some exceptions to this see Dove 2001; Gerlach and Rayner 1988; Fitchen 1988; Liebow 1988.

[6]Griffith's study notably offers a counterpoint to many of the examples provided in this paper. In the case of Pfiesteria, Griffith argues that local and pervasive ideas about the organism's danger prevailed over scientific evidence about its relative safety.

[7]It should be noted that this term was originally coined by Hazel Johnson of People for Community Recovery, a grassroots environmental justice organization in Chicago, Illinois.

[8]Southern Wood Piedmont representatives disagree with this assumption and contend that the Hyde Park neighborhood has in no way been affected by wood preserving chemicals.

[9]The organization does not require dues, so no official membership records exist.

[10]It should be noted that there is no conclusive evidence that SWP workers were exposed to harmful toxins in the workplace.

[11]Aragon Park used to be part of Hyde Park until the early 1950s and the building of the Gordon Highway, which divided the neighborhoods in two.

[12]See also Griffith 1999, detailing how politics similarly influenced scientific outcomes in the case of Pfiesteria.

[13]For further information on the use of science by environmental activists, see Brown 1992, 1995; Brown and Mikkelsen 1997; Brullel and Pellow 2006; Clapp 2002; Satterfield 1997.

[14]The Study's main conclusion was to call for further study.

[15]See Governor's Task Force 1996, Appendix C.

[16]Some cities have also recently taken serious steps towards recognizing the problems with risk assessment methods. In 2003, both the city of San Francisco and Berkeley adopted Precautionary Principle resolutions stating that if there is reasonable suspicion of harm and scientific uncertainty, then anticipatory action must be taken to prevent harm.

[17]These can be found at http://www.epa.gov/OSP/spc/2cumrisk.htm.

[18]See http://www.epa.gov/compliance/environmentaljustice/nejac/.

[19]This quote is taken from the cover letter to the National Environmental Justice Advisory Council's report entitled, "Environmental Justice and Community-Based Health Model Discussion: A Report on the Public Meeting Convened by the National Environmental Justice Advisory Council, May 23 - 26, 2000." The letter and the report, itself, are available at www.epa.gov/compliance/environmentaljustice/nejac.

[20]Interview with Devon Pena, November 11, 2003.

[21]For more information on Dudley Street, see their website www.dsni.org. For a more scholarly account of the neighborhood's transformation, see Medoff and Sklar 1994.

[22]Interview with Connie Tucker, November 13, 2003.

[23]For a similar research model whereby residents of contaminated neighborhoods collect their own health data, see Brown's (1992) description of "popular epidemiology".

[24]This idea stems from a short, untitled presentation given by Professor Bunyan Bryant at a workshop entitled, "Crossing the Divide: Anthropologists and Effective Environmental Justice Policy Intervention" held at the 2003 American Anthropological Association Annual Meetings.

[25]See also Halperin 1998 for a more detailed discussion of the anthropologist's role as advocate.

[26]For a notable effort in this direction, see Haenn 2003.

Key Words petroleum, environmental justice, energy policy, health impacts

■ **Abstract** This review presents existing data and research on the global distribution of the impacts of oil production and consumption. The review describes and analyzes the environmental, social, and health impacts of oil extraction, transport, refining and consumption, with a particular focus on the distribution of these burdens among socioeconomic and ethnic groups, communities, countries, and ecosystems. An environmental justice framework is used to analyze the processes influencin the distribution of harmful effects from oil production and use. A critical evaluation of current research and recommendations for future data collection and analysis on the distributional and procedural impacts of oil production and consumption conclude the review.

I. INTRODUCTION

The National Energy Policy of the United States asserts that the country currently "faces the most serious energy shortage since the oil embargoes of the 1970s,"

which has been precipitated by "a fundamental imbalance between supply and demand" (1). The National Energy Policy Development Group (NEPDG), the panel convened by Vice-President Dick Cheney to develop the national energy policy, argues this crisis is driven by declining reserves in the United States and by "overly burdensome" and "often excessive and redundant" regulations that hinder new exploration and production of oil.

This panel asserts that the answer to today's oil problems lies in supporting more domestic oil exploration, increasing access to overseas oil, and developing more refinin capacity in the United States. The NEPDG thus calls for (a) streamlined and more fl xible regulation of oil exploration, production, and refinin and (b) the opening of oil exploration in the National Petroleum Reserve-Alaska, the Outer Continental Shelf coastal regions, and the Arctic National Wildlife Refuge; it further recommends "an Executive Order to rationalize permitting for energy production . . . to expedite permits and other federal actions necessary for energy-related project approvals" (2).

President Bush has made this one of his top policy priorities, arguing that "It is in our nation's national interest that we develop more energy supplies at home" (3). Vice-President Cheney has added, "One of the things we need to do is to build more refineries (4).

The administration is thus advancing energy policies that will significantl increase oil production and refinin in the United States and that facilitate increased U.S. access to and investment in oil production and refinin overseas. It is worth noting that the Bush administration is not the firs to pursue increased access to oil as a matter of national interest. In January 1980, the Carter Doctrine identifie the Persian Gulf as a "vital interest" of the country and declared that "an attempt by an outside force to gain control of the Persian Gulf region would be regarded as an assault on the vital interests of the United States." The Carter administration subsequently established a Rapid Deployment Force for use in the Middle East, deployed a permanent U.S. naval force in the Persian Gulf, and acquired new military bases in the region (5).

Although the case for the economic and political benefit of increased production and control over oil has been clearly articulated, the environmental, health, and social costs of increased oil fl ws are largely absent from government policy deliberations. And perhaps more importantly, the actual distribution of costs and benefit of increased oil production among countries, communities, and individuals is almost completely absent from public discourse.

Clearly, there are very real trade-offs resulting from increased oil production and consumption. But how well do policy makers and the public understand the costs and benefit of such a commitment to oil? What data are available to evaluate the impacts of oil production and consumption at different stages in the oil life cycle? What evidence and analysis are available to compare trade-offs in security, economic development benefits energy dependence, environmental harm, health costs, and cultural consequences of increased oil production? The purpose of this review is to examine these trade-offs and to assess the distribution of economic, environmental, and health impacts of petroleum production and consumption.

Oil obviously provides significan benefit to society. Oil serves a wide diversity of purposes, which include transportation, heating, electricity, and industrial applications, and is an input into over 2000 end products (6). Oil is a high energy density abundant fuel, which is relatively easy to transport and store, and is extremely versatile in its end uses (7).

Oil is also the most valuable commodity in world trade. As Doyle (8) notes, "Roughly two billion dollars a day now change hands in worldwide petroleum transactions. It is the world's firs trillion-dollar industry in terms of annual dollar sales." The oil industry is phenomenally profitabl for some corporations and governments. Taxes from oil are a major source of income for some 90 governments. Petroleum is the largest single item in the balance of payments and exchanges between nations and a major factor in local level politics regarding development, jobs, health, and the environment. For many countries, oil is crucial to national economic viability, accounting for upwards of 80% of total national exports for Libya, Iran, Kuwait, Saudi Arabia, and Venezuela (9).

The global oil industry also provides significan jobs, profits and taxes. As the International Labour Organisation (ILO) notes (6) the oil industry directly employs more than 2 million workers in production and refining The ILO further estimates that each job in oil production or refinin generates one to four indirect jobs in industries that either supply needed inputs or benefi from value added activities.

Interestingly, there are limited public data on the benefit of oil. Revenue and investment data from oil producing regions are sparse. This lack of transparency on oil's benefit has, in fact, motivated an international "Publish What You Pay" campaign (10) to require oil companies to disclose their payments to developing country governments for oil concessions. Dispersed information sources indicate that some countries, such as Ecuador and Angola, receive up to 50% of their revenue from oil taxes and profi sharing (11, 12).

Oil, also, obviously creates significan and varied negative impacts and costs to human health, cultures, and the environment. Thus, it is critical to evaluate the costs as well as the benefit of oil. Although the NEPDG report encourages more oil development, it provides little information on the negative consequences of this development. Instead, the report cites only technological advances that have minimized the impacts of oil exploration and refining

Past analyses of the oil industry have fallen into several categories. First, there are a wide number of industry sources of data and analysis on the locations, production levels, technological challenges, and economics of oil production and refinin (13, 14). There have also been a wide range of historical analyses of political and economic developments in the oil industry around the world (15–17). And more recently, there have emerged a growing number of exposes and reports on the environmental and social impacts of oil exporation, transport, and refining

Unfortunately, there is no comprehensive source of data available to analyze the global distribution of impacts of oil production and consumption. A wide range of sources—government data, academic analyses, media coverage, nongovernmental organization (NGO) reports—must be consulted to evaluate the costs and benefit of oil.

II. ENVIRONMENTAL JUSTICE FRAMEWORK

This review presents existing data and analyses of the global distribution of the impacts of oil. Using an environmental justice framework (18, 19), we describe and evaluate the environmental, social, and health impacts of oil extraction, transport, refining and consumption. This perspective seeks to provide a lens through which to examine the distributional and procedural impacts (and inequities) of oil extraction, transport, refining and consumption among socioeconomic and ethnic groups, communities and countries, and ecosystems. Within this conceptualization, major concerns include the distribution of control over oil, the distribution of environmental and socioeconomic costs of oil, the hazards and risks from oil, and the procedures and politics surrounding the regulation of these risks.

The environmental justice framework stresses the need to evaluate power in driving the distribution of benefit and costs of industrial activities. In industries such as oil, it is not just ownership, as we will discuss below, but rather control over key stages of the oil chain that significantl influence who benefit and who pays the costs of oil development. Thus, we begin with an inquiry into current patterns of control over oil resources, infrastructure, and refinin and follow with an assessment of the distribution of power and influenc over government decisionmaking and regulation of the industry (Section III).

Next, we evaluate the distribution and regulation of environmental and health hazards from oil production and consumption. We are interested particularly in the distribution of risks and costs, both at the local and global level, of oil exploration, drilling, and extraction (Section IV), transport (Section V), refinin (Section VI), and consumption (Section VII).

We also seek to analyze whether existing regulatory systems adequately protect impacted communities at each stage in the life cycle of oil. Extensive regulations govern oil exploration and refining However, there is also wide variation in the implementation of these regulations, weak enforcement in many locales, and failures of regulation in certain arenas. We are thus interested in whether enforcement is effective at different stages in the oil supply chain and whether regulatory mechanisms are sufficien to motivate remediation and prevention of future impacts (Section VIII).

The review concludes with a critical evaluation of current research and data and with recommendations for further analysis of the distributional and procedural impacts of oil production and consumption.

III. CONTROL OVER OIL

Perhaps the most critical and historically contentious questions related to oil are simply who owns, controls, or has access to this resource? Control over reserves, production, distribution, and refinin is critical to the distribution of benefit and costs of oil and to deeper global, economic, and political dynamics.

Approximately 90 countries produce oil, although a few major producers account for the bulk of world output. The Energy Information Agency estimates

that the eleven Organization of Petroleum Exporting Countries (OPEC) members (Algeria, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela) account for roughly 77% of the world's proven oil reserves and 40% of world oil production (20). The Persian Gulf contains approximately 680 billion barrels of proven oil reserves, which represents approximately 66% of the total world oil reserves (21). The Persian Gulf maintains 31% of the world total oil production capacity (just over 22 million barrels per day) (22).

In 2001, Persian Gulf countries had oil exports of approximately 16.8 million barrels per day of oil. As would be expected, Saudi Arabia exported the most oil of any country in 2001, with an estimated 7.4 million barrels per day (22). Major non-OPEC oil producing countries include the United States, Mexico, Denmark, Norway, the United Kingdom, the Russian Federation, China, and Vietnam.

Proven reserves—the most basic measure of who has the oil, and how much—have actually changed over the past 20 years. Proven reserves increased 54% between 1980 and 1990, largely due to improvements in exploration and drilling, but were then stagnant between 1990 and 2000 with an increase of only 1.4% globally (23). As would be expected, many countries' reserves are declining significantl . In the United States for instance, proven reserves declined from 36.5 billion barrels in 1980 to 30.1 billion barrels in 2000 (24). Table 1 presents basic information on oil reserves, production, and exports from leading oil producing nations.

While the physical location of oil does not change, systems of control over oil have changed significantl over the past two decades. In particular, there has been a

TABLE 1 World oil reserves, production, and exports in 2001 (25, 26)

Country	Total oil reserves (billion barrels)	Total oil production (million barrels per day)	Net oil exports (million barrels per day)
United States	22.0	9.02	0.9
Saudi Arabia	261.7	8.73	7.38
Russia	48.6	7.29	4.76
Iran	89.7	3.82	2.74
Mexico	28.3	3.59	1.65
Norway	9.4	3.41	3.22
China	24.0	3.30	0.1
Venezuela	76.9	3.07	2.60
Canada	6.6	2.80	1.8
United Kingdom	4.9	2.59	1.7
Iraq	112.5	2.45	2.00
United Arab Emirates	97.8	2.42	2.09
Nigeria	22.5	2.26	2.00
Kuwait	96.5	2.15	1.80

major restructuring and concentration of ownership in the global oil industry. This change in power and control has had significan implications for the distribution of benefit accruing to oil producers and refiner and for the distribution of costs to oil producing regions and consumers.

Historically, state-owned companies controlled most oil in the world. The four largest state oil companies, Saudi Aramco, Petroleos de Venezuela, Iran's NIOC, and Mexico's Pemex, produce 25% of the world's oil and hold 42% of the world's reserves (27). Physical ownership over oil, however, may not be as important as mechanisms of control and distribution. Access to and control over oil is as important today as actually owning it, and increasingly, private oil companies are exerting critical control over the industry. In this regard, privatization has progressed rapidly during the 1990s. In virtually every region of the world, an industry that was previously considered critical to economic and physical security and that was owned by the government has been partly or wholly sold to local and foreign private investors.

A recent wave of mergers, worth over $200 billion, has further changed the face of the industry during the 1990s (28). A top echelon of "super majors" has been created that far surpasses other publicly traded oil companies by any measure of size. "The scale of the super majors puts them on a par with the largest state companies. The four super majors—ExxonMobil, Royal Dutch/Shell, BP-Amoco, and Total Fina Elf—have a preponderance in the downstream, with about 32 percent of global product sales and 19 percent of refinin capacity. This counterbalances to a large extent the dominant upstream positions of the four large state oil companies, Saudi Aramco, Petroleos de Venezuela, Iran's NIOC, and Mexico's Pemex. With the super majors and the largest state oil companies, the industry is now dominated by a handful of 10 or 12 giant concerns that dwarf those immediately beneath them" (27).

The recent concentration of the industry is particularly stark among firm operating in the United States. By 2001, fi e corporations (ExxonMobil, BP-Amoco-Arco, Chevron-Texaco, Phillips-Tosco, and Marathon) controlled 61% of the U.S. retail gas market, 47% of the U.S. oil refiner market, and 41% of U.S. oil exploration and production. These firm currently control 15% of world oil production—more than Saudi Arabia, Yemen, and Kuwait combined (29).

This change in control over oil extraction and distribution has had significan impacts on the very countries that own oil. The economic strength of a nation directly affects its ability to negotiate with the super majors and in turn to benefi from selling or leasing oil. Poor nations that are dependent on oil sales for key revenues are often adversely affected by their ownership of the resource (30). As Ross (12) has shown, poor countries that are oil dependent often have slower rates of economic development, higher levels of corruption, higher military spending, worse performance on reducing child malnutrition and adult illiteracy, and are more vulnerable to economic shocks.

There are also clear inequities in the distribution and consumption of oil. Advanced industrialized countries use orders of magnitude more oil than many

TABLE 2 World oil net importers in 2001 (25)

Country	Net oil imports (million barrels per day)
United States	10.8
Japan	5.4
Germany	2.7
South Korea	2.1
France	2.0
Italy	1.7
China	1.6
Spain	1.5
India	1.3

developing countries. Table 2 shows that the United States is by far the largest importer and consumer of oil in the world.

The United States imports almost 11 million barrels of oil per day. Interestingly, the United States currently only imports approximately 24% of its oil from the Persian Gulf; Canada is its top source of imported oil (15%), followed by Saudi Arabia (14%), Venezuela (14%), Mexico (12%), and Nigeria (6%) (31).

The United States is also the largest refine of oil in the world, with overall refinin capacity of approximately 16.6 million barrels per day. The average capacity of U.S. refinerie increased from 70,000 barrels per day in 1985 to 115,000 barrels per day in 2001 (32). However, during this period, the number of U.S. refinerie actually decreased by half from 324 to 143, further concentrating control in a handful of corporations and impacts in fewer communities. Russia, Japan, and China are the only other countries with refiner capacities exceeding 3 million barrels per day. Russia's refiner capacity stands at an estimated 5.4 million barrels per day, Japan's at 4.8 million, and China's at 4.5 million (25).

IV. IMPACTS OF EXPLORATION, DRILLING, AND EXTRACTION

Oil exploration, drilling, and extraction are the firs phase—or what the industry calls the "upstream" phase—in the long life cycle of oil. There are currently approximately 40,000 oil field in the world, (33) and there have been over 4000 new oil exploration licenses granted in the past 10 years (34). Increasingly complicated and expensive processes for locating oil deposits in remote and inhospitable locations, bringing the oil to the surface, and then getting it to a market have major environmental, cultural, and health impacts (35–37).

On- and off-shore exploration, drilling, and extraction activities are inherently invasive and affect ecosystems, human health, and local cultures. Oil companies combine the use of remote sensing and satellite mapping techniques with seismic testing to identify potential oil reserves. When reserves are identifie remotely, companies build roads, platforms, and pipelines, bring in crews and vehicles, and drill exploratory test wells. Once oil is discovered, exploration activities are expanded for commercial-scale extraction, which requires more wells and infrastructure. Techniques for oil extraction include a range of drilling techniques and the use of subsurface explosives (including in a few historical cases the use of nuclear charges) (38).

The physical alteration of environments from exploration, drilling, and extraction can be greater than from a large oil spill. Major impacts include deforestation, ecosystem destruction, chemical contamination of land and water, long-term harm to animal populations (particularly migratory birds and marine mammals), human health and safety risks for neighboring communities and oil industry workers, and displacement of indigenous communities.

Exploration requires moving heavy equipment (mobile rigs for temporary drilling can weigh over 2 million pounds) into remote environments. Clearing land for roads and platforms can lead to deforestation and erosion (38). Drilling during both exploration and extraction phases uses significan quantities of water, which are contaminated through drilling and then discharged along with cuttings into the environment. These discharges result in chemical contamination of land and water from petroleum waste, drilling fluids and by-products of drilling such as water, drill cuttings, and mud. As Epstein & Selber assert, "The general environmental effects of encroachment into natural habitats and the chronic effects of drilling and generating mud and discharge water on benthic (bottom-dwelling) populations, migratory bird populations and marine mammals constitute serious environmental concerns for these ecosystems" (38).

The oil and gas industry in the United States alone creates more solid and liquid waste than all other categories of municipal, agricultural, mining, and industrial wastes combined. Oil and gas drilling and pumping produce most of the sector's waste. Approximately 20% of nonhazardous waste produced in the United States every year comes from oil and gas exploration and production. However, the majority of production waste from the industry is the hazardous and toxic effluen known as *produced water*. Produced water is extracted from the ground along with oil and is often reinjected into wells under high pressure to force more oil to the surface. Produced water not reinjected is discharged into surface waters (8). As Doyle explains, this "produced water is at least four times saltier than ocean water and often contains 'industrial strength' quantities of toxins such as benzene, xylene, toluene, and ethylbenzene. Heavy metals such as barium, arsenic, cadmium, chromium, and mercury have also been found in produced water. Produced water can also be radioactive—in some cases, as much as 100 times more radioactive than the discharge of a nuclear power plant" (8).

In 1995, it was estimated that 15 billion barrels of produced water were extracted annually in the United States. Over 90% of onshore produced water is reinjected

into wells (39). Reinjection is permissible under the Resource Conservation and Recovery Act (RCRA), because Congress conditionally exempted drilling fluids produced waters, and other wastes from crude oil production (39).

Water used in oil production can also be contaminated by chemicals used during extraction. For example, the oil industry uses millions of tons of barium, a toxic heavy metal, in drilling fluid each year. Common components of drilling fluid can solubilize the barium, creating hazardous waste, which is often discharged into the environment from leaks of reinjected materials (8).

Exploration and extraction also produce voluminous amounts of solid wastes known as *drilling wastes* and *associated wastes*. In 1995, the U.S. sector produced 146 million barrels of drilling waste and 22 million barrels of associated wastes (39). Although associated wastes constitute a relatively small proportion of total wastes, they are most likely to contain a range of chemicals and naturally occurring materials that are of concern to health and safety. Each year 58% of associated wastes in the United States are reinjected, 9% are sent to commercial facilities, and 8% are disposed of through evaporation pits (39). In oil fields virtually every stage in production has a waste pit. As Doyle notes, during drilling, "various muds, oily fluids lubricants, and other chemicals are used to cool the drill bit, stabilize the walls of the bore hole, or liquefy earthen cuttings. These fluid and additives accumulate in large quantities during the drilling process, and are often stored or finall disposed in waste pits" (8). Exposed waste pits pose a danger not only to aquifers but also to animals and birds that mistake the pits for water holes and become coated with toxic wastes (8).

In addition to operational leaks, oil spills also occur during extraction. In 2002, the National Academy of Sciences estimated that 38,000 tons of petroleum hydrocarbons were released into the world's oceans each year during the 1990s as a result of oil and gas operations (40). On- and offshore oil production can also create significan air pollution. Emissions from drilling equipment, hydrocarbons escaping from wells, flarin of natural gas, and emissions from support vehicles can degrade local air quality (41).

Oil exploration, drilling, and extraction can also lead to a range of acute and chronic health impacts. These risks occur through exposure to naturally occurring radioactive materials brought to the surface during drilling, as well as through the bioaccumulation of oil, mercury, and other products in mammals and fis that humans consume (38). Noise, vibration, and exposure to toxic chemicals are also issues in upstream and downstream operations. Many of the substances used in daily extraction work cause adverse dermatologic and pulmonary reactions among workers. The most common dermatologic conditions are contact dermatitis and acne, but other conditions include keratotic facial and neck lesions, neoplastic change from exposure to oil and sunlight, and acquired perforating disease and calcinosis of the hands and fingers Adverse pulmonary reactions to hard metal (a mixture of tungsten carbide and cobalt used for oil well drilling bits) include asthma, hypersensitivity pneumonitis, and interstitial pulmonary fibrosi (38).

The risk of explosions, injuries, and fatalities during exploration and extraction are also cause for concern. Virtually every segment of oil and gas production

involves risk of fire and explosions, particularly offshore drilling operations that are vulnerable to blowouts. The handling of heavy pipes and other equipment also creates safety risks. Thus, oil workers around the world face significan occupational hazards. Oil exploration and drilling is the most dangerous sector of the oil industry. Recently, the oil and gas sector has experienced a series of major fire and explosions in both extraction installations and refineries For example, in 1998 in Africa and the Middle East, there were 54 fatal incidents in onshore operations and 17 fatal incidents offshore (6).

Oil exploration often occurs in remote and harsh environments, such as deserts, jungles, the Arctic, and far offshore. Workers live in or near these harsh workplaces for long periods. These working conditions can create additional risk during transport, and stress from long shifts and social isolation.

There are no good international data or comprehensive analyses of the distribution of impacts from oil exploration, drilling, and extraction. However, a number of recent studies have shown that current oil exploration has a disproportionate impact on indigenous populations and sensitive, remote ecosystems (42). Kretzmann & Wright, for instance, report that indigenous groups in 6 continents and 39 countries "face an immediate to medium-term threat from new oil and gas exploration" (42). In the western Amazon alone, at least 50 indigenous groups, many of which are the world's last isolated indigenous peoples, live within oil and gas concessions that are under exploration or preproduction. These groups include the Tagaeri and Huaorani of Ecuador; the Mascho-Piro, Nahua, and Kugapakori of Peru; and the Nukak and U'Wa of Columbia. Beyond the Amazon, oil exploration, drilling, and extraction affect the Baka, Bakoli, and Ogoni of Central Africa; the Tavoyans, Mon, and Karen of Burma; the Eastern Khanty peoples of Western Siberia; and the Gwich'in of Alaska (42).

Oil production activities not only disrupt sensitive environments, but threaten the survival of indigenous populations that live in these ecosystems. Kretzmann & Wright argue that "territorial integrity and control are necessary for the cultural reproduction and ultimately the survival of Amazonian indigenous populations whose way of life and well being are closely tied to a thriving rainforest" (43). Throughout the Amazon basin, road building causes deforestation, which contributes to the loss of territory and displacement of native groups. The opening of access roads allows settlers with competing interests such as logging and mining to enter indigenous communities and colonize the areas (43). This colonization can also bring infectious diseases to previously unexposed native populations (38).

The contentious nature of these interactions can often lead to conflic over oil resources and infrastructure. At least four types of conflict occur over oil: (a) conflic with indigenous groups over oil development; (b) civil unrest or war that uses disruption of oil operations as a tactic; (c) superpower geopolitics (e.g., control over Middle East oil reserves); and (d) terrorism targeting oil facilities. Table 3 summarizes examples of just one type of conflict incursions into indigenous lands to control oil. Though by no means comprehensive, this table demonstrates the widespread impacts of oil development on indigenous peoples.

TABLE 3 Incursions into indigenous lands to control oil (44–46)

Location	Indigenous group	Companies and agencies involved

Migration of oil crews to new reserves also creates socioeconomic and human rights concerns, especially in the Middle East and other regions of the developing world, because poor and lower class populations move both by choice or are motivated (sometimes forcibly) to relocate to oil development centers. In Saudi Arabia, for example, 35% of the population is composed of immigrant workers. In addition, foreign workers account for 61% of the total workforce of Oman, 83% in Kuwait, and 91% in the United Arab Emirates (47).

This supply of cheap foreign labor, primarily from South Asia, is essential to the profitabilit of oil production in the Middle East. Countries, such as India, Pakistan, Nigeria, Egypt, Sudan, Bangladesh, Sri Lanka, Thailand, Indonesia, and the Philippines, provide both skilled and unskilled labor to the Middle East. In several Persian Gulf states, these temporary immigrant workers outnumber citizens by a factor of two to one or even three to one. Their presence in the region underscores the wealth disparity between those who bear the costs and those who benefi from oil production. Although the ruling classes in these kingdoms are among the richest people in the world, much of the citizenry does not benefi from the significan profit earned by the industry (48).

Even the most basic workplace rights and health and safety protections are abridged in some of the largest oil-producing countries. In Saudi Arabia, labor laws prohibit the right of workers to organize unions or bargain collectively and grant employers extensive control over foreign workers' movement. Human Rights Watch reports that many foreign workers suffer under oppressive working conditions and are denied legitimate claims to wages, benefits and compensation (49).

V. IMPACTS OF OIL TRANSPORT

The current separation between the location of oil reserves and the location of oil consumption necessitates that crude oil be transported great distances to refinerie and consumer markets. This has led to the development of increasingly complex transportation systems that allow oil to be delivered virtually anywhere in the world. Major oil routes now stretch from the Middle East to Japan, from South America to Europe, and from Africa to the United States. Transport of oil occurs via supertankers, barges, trucks, and pipelines. Oil tankers are currently the primary means of transportation, but oil is increasingly being transferred through pipelines. Today, oil makes up over half of the annual tonnage of all sea cargoes, and there are now more miles of oil pipelines in the world than railroads (50).

Transportation of oil results in regular oil spills throughout the world. Although large oil spills are well publicized, smaller but cumulatively significan spills from shipping, pipelines, and leaks often go undocumented. As Doyle explains, "oil transport—by pipelines, railcar, or truck—generates an unknown and untabulated amount of waste, including tank bottom sludges, contaminated water from storage tanks, oil/water separator sludge, solvent degreasers, used oil, contaminated

product, product that does not meet specifications lubricants, spent antifreeze, and clay filtratio elements" (8).

Accidents occur along all segments of the transport system and at each point of transfer. Since the 1960s, large-scale oil spills have occurred almost every year. Transport by water is currently more likely to result in a spill than transport by pipeline. Ocean transport of crude oil and petroleum products accounted for 3000 gallons spilled per billion ton-miles in 1983 and nearly 8000 gallons per billion ton-miles in 1984. Pipeline spills contributed less than 100 gallons per billion ton-miles for both years (41).

In the past 20 years, there have been over 30 oil spills of 10 million gallons or more each. One to three spills of this size occur each year (50). In fact, a few very large spills are responsible for a high percentage of oil spilled annually. From 1990 to 1999 there were 346 spills over 7 tons, which totaled approximately 1.1 million tons, but 830,000 tons (75%) were spilled in just 10 incidents (just over 1% of incidents). Annual figures therefore, can vary greatly depending on the number of large spills. For example, in 1999, 29,000 tons were spilled, but in 2001 only 8000 tons were spilled (51).

A key to the size of spills has been the trend in tanker construction toward massive ships. In the 1930s, large tankers carried about 20,000 tons of oil. By the early 1970s, tankers could carry 800,000 tons of oil. This increase in size (some tankers are over three football field long) also increases the likelihood of accidents because supertankers are harder to maneuver (50). Table 4 highlights the largest oil spills on record.

To provide some perspective, the *Exxon-Valdez* spill, which released 12 million gallons of oil (53), was the largest U.S. spill recorded to date, but only the 28th largest oil spill in world history (38). The *Prestige* oil tanker that split in half off

TABLE 4 Ten largest oil spills in history ranked by volume (52)

Rank	Name	Year	Volume in gallons
1	Persian Gulf: tankers, pipelines and terminals, offshore Saudi Arabia	1991	240,000,000
2	Ixtoc I oil well, Ciudad del Carmen, Mexico	1979–1980	140,000,000
3	Nowruz Field, Persian Gulf	1983	80,000,000
3	Fergana oil well, Uzbekistan	1992	80,000,000
5	*Castillo de Bellver* tanker, offshore Cape Town, South Africa	1983	78,500,000
6	*Amoco Cadiz* tanker, offshore Brittany	1978	68,670,000
7	*Aegean Captain* tanker, offshore Tobago	1979	48,800,000
8	Production well D-103, Tripoli, Libya	1980	42,000,000
9	*Irenes Serenade* tanker, Pilos, Greece	1980	36,600,000
10	Kuwait storage tanks	1981	31,170,000

TABLE 5 Hot spots for tanker oil spills since 1960 (55)

Location of hot spot	Number of spills
Gulf of Mexico	267
Northeastern United States	140
Mediterranean Sea	127
Persian Gulf	108
North Sea	75
Japan	60
Baltic Sea	52
United Kingdom and English Channel	49
Malaysia and Singapore	39
West Coast of France/North and West Coasts of Spain	33
Korea	32

the coast of Spain in 2002, causing major ecological and economic damage, was carrying approximately 22 million gallons of oil.

Oil spills occur literally all around the world. The Oil Spill Intelligence Report has documented spills of at least 10,000 gallons in the waters of 112 nations since 1960. However, they also note that spills occur more frequently in certain areas (54). Table 5 shows a number of "hot spots" for oil spills from tankers.

In recent years there has been a steady increase in number of small spills while large-scale spills have stayed relatively constant. The cumulative impact of small spills of less than 100,000 gallons adds up to about 10 million gallons per year worldwide (50). Table 6 shows that the greatest quantity of oil from marine transport is actually released in the form of bilge and fuel oil. In fact, emissions of

TABLE 6 Sources of oil spills from marine transport, 1990 (56)

Emission source	Tons per year
Bilge and fuel oil	250,000
Tanker operations	160,000
Tanker accidents	110,000
Nontanker accidents	10,000
Marine terminal operations	30,000
Dry-docking and scrapping of ships	10,000
Total	570,000

bilge and fuel oil are equivalent to approximately fi e *Exxon-Valdez* spills per year. For many years, it has been common practice to dump oil-contaminated ballast water and tank washings directly into the sea. So while most of the large-scale spills result from grounded tankers or tanker collisions, the cumulative contamination from numerous relatively small accidents, leaks, and intentional discharges can actually surpass that of large spills from shipping (38).

Pipelines, which are highly prone to corrosion, are also a source of spills, leaks, and fires Many pipelines are used long after their engineering life span (an estimated 15 years) (38). Using the U.S. Offic of Pipeline Safety database, Nesmith & Haurwitz have estimated that 67 million gallons of crude oil, gasoline, and other petroleum products leaked from U.S. pipelines in the last decade. However, "there is consensus—among the industry, its regulators and its critics—that the database underrepresents the quantity of oil products that escapes from pipelines." The actual amount of leakage is potentially twice as high as the annual reported average (57). Even the U.S. government, in the National Energy Policy, acknowledges that inland oil spills are a major source of oil emissions and that these spills appear to be on the rise. As they report, "the federal government receives many more inland oil spill notification (9,000 notification a year in the early 1990s versus 10,000 to 12,000 a year in the late 1990s)" (2).

The main impacts of vessel oil spills obviously fall on marine ecosystems and coastal communities. A number of factors influenc the scale of these impacts, including the size of the spill, the kind of oil, the season of the spill, and the vulnerability of local plants and animals (40). The spill size often determines the area affected, whether it reaches the shore, and how much of the shore it covers. The extent of contamination also depend on the nature of the coastal ecosystems and the types of birds and mammals affected (58). Some ecosystems, such as mangroves, salt marshes, coral reefs, and polar bear habitats, are particularly sensitive to oil spills and can take years to recover (59).

Oil spills also threaten human health through illness and injury during the spill, during cleanup, and through consumption of contaminated fis or shellfish Drinking water supplies can also be contaminated through spills (50). But as Burger notes, "There are remarkably few studies of the health responses of local people exposed in the months following a spill" (50). In one study in Scotland following an oil spill, community members reported increased health problems, including increased psychiatric symptoms (50).

Oil spills can also have long-lasting economic consequences by damaging fish eries, excluding fisherfol from fishin grounds, fouling fishin gear, and reducing fis stocks in succeeding years (50). Commercial fisherie can also be negatively impacted by the simple perception of tainted fish Public concern about eating fis exposed to oil spills can damage the market for fis from an affected region. Even a few oiled fis can taint an entire region's catch. In the case of the *Exxon Valdez* oil spill in Alaska, closing the fisherie in Prince William Sound resulted in a season's loss of income for commercial fisherme and an estimated $135 million in lost revenues (50).

Subsistence communities are often even more severely harmed by oil spills. Unfortunately, there is no global database on impacts of oil releases on indigenous communities or sensitive ecosystems. Recent cases, however, highlight troubling impacts. The *Exxon Valdez* oil slick covered shorelines used by the Chugach people of Alaska for subsistence hunting, fishing and gathering. Fifteen Aleut communities in Prince William Sound and the Gulf of Alaska were affected by the oil spill. Subsistence harvests came to a virtual halt after the oil spill. Communities decreased their harvests between 14% and 77% depending on whether they had access to oil-free upland species. One community on Chenaga Bay on the Prince William Sound reduced its harvest from 342 to 148 pounds per person per year. Another community in English Bay on the Kenai Peninsula reduced consumption from 289 to 141 pounds per person per year. The variety of species harvested also declined from 23 to 12 (50).

Oil pipelines have also caused disproportionate impacts on low-income and minority communities in the United States and been connected to human rights violations around the world. In the United States for example, the Pacifi Pipeline, a project constructed by a consortium of Chevron, Unocal, and Texaco in the late 1990s, faced a lawsuit from the City of Los Angeles that alleged their routing of the pipeline constituted an environmental injustice. Pacifi Pipeline is a 132-mile long heavy crude pipeline that transports 130,000 barrels per day of oil from Bakersfield California, through the heart of Los Angeles, into the refiner district on the Pacifi Coast (60). In transit through the City of Los Angeles, it bisects 75 neighborhoods. Analysis conducted by Impact Assessment Inc. for the City of Los Angeles demonstrated that 74 of the 75 communities had minority populations higher than the national average; 72 of the 75 had minority populations higher than the California average; 42 of the 75 had minority populations over 90% of the total tract population; all of the tracts had a higher percentage of non-English speakers than the national average; and 62 of 75 had per capita income lower than the national, state, county, and city levels (61).

Construction of oil pipelines in developing countries has also been associated with human rights abuses. The current debate regarding the construction of the Chad-Cameroon Pipeline highlights the potential for corruption and violations of human rights in such projects. The project, sponsored by an international consortium lead by ExxonMobil and ChevronTexaco involves the development of the Doba oil field in southern Chad and the construction of a 1070-kilometer pipeline to an offshore oil-loading facility on Cameroon's Atlantic coast. Advocacy groups such as Rainforest Action Network (RAN) have raised concerns about increasing violence and human rights abuses, corruption, and devastation of the Bakola (or Pygmie) peoples who live along the pipeline. RAN notes that "both the US State Department and Amnesty International have documented serious human rights abuses by Chad and Cameroon governments, including extrajudicial killings, torture, abuse, rape, limiting freedom of the press and arresting opposition politicians and other civilians. Many believe that there has already been an increase in violence and human rights abuses in Chad as a result of the pipeline project" (62).

VI. IMPACTS OF OIL REFINING

Oil in its crude form has limited uses. It must be separated, converted, and refine into useful products such as gasoline, heating oil, jet fuel, and petrochemical feedstock. The basic oil refinin process involves thermal "cracking" which applies both pressure and intense heat to crude oil in order to physically break large molecules into smaller ones to produce gasoline and distillate fuels. Any crude-oil constituents that are not converted into useful products during this process, or captured by pollution-control technologies, are released to the environment (63). Refinerie produce huge volumes of air, water, solid, and hazardous waste, including toxic substances such as benzene, heavy metals, hydrogen sulfide acid gases, mercury, and dioxin (64).

There is no single source of data on global refiner emissions or impacts. However, U.S. refiner emissions are reported by the Environmental Protection Agency (EPA) through the Sector Facility Indexing Project (SFIP) and the Toxic Release Inventory (TRI). Several independent studies have also examined refiner emissions in the United States (63, 65, 66). In the 1990s, the U.S. EPA targeted oil refinerie as their top enforcement priority (64). According to the EPA, in 1999, 54% of refinerie were in "significan non-compliance" (meaning they have committed persistent, serious violations) of the Clean Air Act; 22% were in significan noncompliance with the Clean Water Act; and 32% violated the Resource Recovery and Conservation Act (67).

The Emergency Planning and Community Right-to-Know Act of 1986 requires that manufacturing facilities above a certain size provide information about toxic chemical releases and offsite waste transfers to the national TRI. The oil refinin sector, but not exploration or extraction, is required to report to the TRI. Each refinin facility in the United States must report annual emissions of roughly 600 listed chemicals. Unfortunately, as Epstein et al. note, "Of the hundreds of toxic chemicals in crude oil and refiner products, only a few are typically reported to TRI. Many of those not included have similar structural, physical, and toxicological properties to those that are reported . . . . According to the Amoco Yorktown study, this refinery s TRI report forms cover only 9% of the total hydrocarbons released" (63).

Local environmental impacts from oil refinerie result from toxic air and water emissions, accidental releases of chemicals, hazardous waste disposal, thermal pollution, and noise pollution. Analysis of the TRI data reveals that the petroleum refinin industry releases 75% of its toxic emissions to the air, 24% to the water (including 20% to underground injection and 4% to surface waters), and 1% to the land (39). The primary hazardous air pollutants released by the industry are benzene, toluene, ethyl benzene, mixed xylenes, and n-heptane (39). The accumulation of refiner air emissions such as hydrocarbons, sulfur dioxide, and particulates in the atmosphere also contributes to acid rain (38). U.S. refinerie are the second largest industrial source of sulfur dioxide, the third largest industrial source of nitrogen oxides, and the largest U.S. stationary source of volatile organic

compounds (VOC) emissions, producing more than twice as many VOCs as the next sector, organic chemical plants. Refinerie are also the fourth largest source of toxic air pollutants (65). Paul Templet, former head of the Louisiana Department of Environmental Quality and professor at Louisiana State University's Institute for Environmental Studies, has measured jobs and tax subsidies per pound of pollutants emitted and shown that petroleum refinin produces 1048 pounds of pollution per job, as compared to 460 pounds of pollution per job for paper manufacturing, 222 pounds for plastics manufacturing, 61 pounds for tobacco production, and 28 pounds for food production (68).

The majority of refiner emissions actually occur through leaks rather than through regulated smokestacks or effluen pipes. In 1999, Congressman Henry A. Waxman commissioned an investigation into fugitive emissions from oil refinerie by the minority staff of the House of Representatives Government Reform Committee. The study found that oil refinerie significantl underreport leaks from valves to regulators and that these fugitive emissions add millions of pounds of pollutants to the atmosphere each year, including 80 million pounds of VOCs and 15 million pounds of toxic pollutants (65). Production pressures in the oil industry are such that it is more economical to allow fugitive emissions and to lose some oil than to close down leaky facilities for repair (8).

An EPA study of the Amoco oil refiner in Yorktown, Virginia, demonstrated that the cumulative effects of refiner leaks can lead to major impacts. Although only 0.3% by weight of crude oil by-products from the Amoco refiner was released into the environment, this led to over 11,000 gallons of oil components released (66). Because the oil refinin industry in the United States processes more than 16 million barrels of crude oil each day, approximately 50,000 barrels of byproduct likely are released per day.

Refinerie also use thousands of gallons of water per day for production and cooling processes. Treatment of liquid effluen does not entirely eliminate contaminants such as aromatic hydrocarbons (benzenes and napthenes) that enter waterways utilized by humans, fish and wildlife (38). For example, one recent study of water pollution from oil refinerie found significan levels of aromatic hydrocarbons that contributed to important differences in the diversity and abundance of fis between stations located up- and downstream from refinerie (38). Thermal pollution from the release of refiner effluent which is warmer than surrounding waters also disrupts marine ecosystems.

The operation of refinerie results in fires explosions, and chemical spills. In California, for example, refinerie are responsible for over 90% of all accidental releases in the state. Hazardous-waste disposal from refiner facilities also threatens nearby communities. According to the EPA, oil refinin is one of the top hazardous waste producing industries: "Disposal methods for toxic refiner wastes have tended to take advantage of wide open spaces instead of environmentally sound waste management techniques" (8). In fact, approximately two thirds of solid wastes from U.S. refinerie are disposed of through burial in onsite reserve pits (39).

Wastes from oil refinerie can create health risks to facility workers and surrounding communities. Workers are at risk of accidents involving fires explosions, and chemical leaks and spills. Health hazards include exposure to heat, polluted air, noise, and hazardous materials, including asphalt, asbestos, aromatic hydrocarbons, arsenic, hexavalent chromium, nickel, carbon monoxide, coke dust, hydrogen sulfide lead alkyls, natural gases, petroleum, phenol, and silica. Epstein & Selber (38) report a number of health impacts from exposure to these materials; these include the following:

1. severe burns or skin and eye irritation from high levels of benzene and hydrogen sulfid fumes, which may lead to dermatitis, bronchitis, and chemically induced pneumonia;
2. headaches and mental disturbances from carbon-monoxide exposures;
3. chronic lung disease from long-term exposures to coke dust, silica, and hydrogen sulfide
4. psychosis and peripheral neuropathies from exposures to lead alkyls used as gasoline additives; and
5. increased cancer risks from exposures to carcinogenic materials such as benzene, xylene, arsenic, and hexavalent chromium.

Management of refinerie and their impacts are also increasingly being outsourced to service companies. Conoco and ExxonMobil, for example, have contracted Philip Services to operate and maintain oil refineries which minimizes the actual owners' liability and keeps contract employees' wages low. Contract workers are usually nonunion and often poorly trained; this results in more accidents and more risk to workers and surrounding communities.

Philip Services also operates landfill and other treatment, storage, and disposal (TSD) facilities for the oil industry and has disposed of waste materials at more than 200 third-party disposal facilities. Many of these sites have been declared superfund sites, although Philip's liability for cleanup of these sites is unknown. Even tracking Philip's current pollution record is difficult given the loopholes in disclosure for TSD operations and as Philip has dozens of subsidiaries. In fact, in June 1999, Philip declared Chapter 11 reorganization.

Health impacts extend outside the walls of refineries where studies have demonstrated the relationship between proximity of communities to refinerie and cancer. For example, a 1994 analysis of 264 childhood leukemia clusters in the United Kingdom showed relative, nonrandom proximities to oil refinerie (38). A similar study of all 22,458 children aged 0–15 years dying from leukemia or cancer in England, Wales, and Scotland between 1953 and 1980 found increased incidence of leukemia and other cancers near industrial facilities, particularly oil refineries oil storage facilities, and railside oil distribution terminals (38).

A 1995 report by the Environmental Defense Fund, which used 1992 TRI data on the refinin industry, developed a ranking of refinerie throughout the United States. The study compared the pollution produced per barrel refine at each

facility. Through this comparative analysis, it showed wide variation in emissions (and thus impacts) from facilities on local environments and human health. The report identifie West Virginia, Kansas, Texas, Mississippi, and Wisconsin as the fi e worst states in terms of emissions per pound of product. Nevada, Georgia, New York, Alaska, and New Jersey were ranked as the fi e most efficien states (63).

The EPA SFIP brings together similar types of comparative environmental performance data on refineries The SFIP reports production levels, compliance and inspection data, chemical releases and spills, and, interestingly, demographics of the surrounding population. By combining TRI data with inspection reports and demographic data, the SFIP is a unique resource for evaluating the distribution of impacts from oil refineries These data show for instance that 56% of people living within three miles of refinerie in the United States are minorities—almost double the national average.

Anecdotal evidence from areas surrounding particularly polluting refinerie seems to confir that low-income and communities of color are disproportionately affected by these facilities. For instance, predominantly African-American communities in Louisiana report long-term exposures to toxics and general disregard for health impacts from refinerie located in the so-called Cancer Alley region along the Mississippi River. The residents of Saint Charles Parish in Louisiana provide graphic examples of these problems. At just one refiner , the Shell Norco facility, there have been repeated explosions that have claimed workers' and community members' lives, including a boy mowing a lawn and an older woman sleeping inside her house (personal interview with M. Richards member of Concerned Citizens of Norco, February 28, 2001). An explosion of a catalytic cracker at the refiner in 1988 resulted in the death of seven workers and the destruction of millions of dollars in property (69). In addition to these major events, numerous episodes of leaks, fires tank car derailments, flares and other problems have plagued the community. An entire website, funded by the Sierra Club Legal Defense Fund, has been established to track incidents of flarin in Norco (70).

Oil refinin also has major impacts on poor communities in developing countries. In his recent book *Riding the Dragon* (71), Doyle documents environmental injustices observed at Shell's South African Petroleum Refiner (SAPREF) in Durban. Doyle's inventory of pollution concerns and major accidents at this one facility is staggering: underreporting of as much as 10 million pounds of sulfur dioxide per year; massive unreported oil leaks; explosions and fire releasing tons of hydrogen fluoride More specifi reports in 2001 include two fires a chemical solvent spill, and a fuel spill all in January; a March leak of 25 tons of tetra-ethyl lead; a July underground pipeline leak of 1,000,000 liters of gas into the ground; a June failure of a refiner flar resulting in the release of unburned gases, including substantial amounts of hydrogen sulfide a mid-August failure of the asphalt plant at the refinery a September, marine fuel oil pipeline leak and about ten days later, another flar failure; and an October spill of 2000 liters of oil into Durban Harbor during a ship refueling operation.

Community organizing and monitoring in response to these events has led to documentation of emissions, contamination levels, and disease incidence in neighborhoods adjoining the SAPREF refiner . Residents have documented "very high benzene levels in the air—levels 30 times those permitted in the US . . . . In Durban, leukemia rates are 24 times the South African national average. Respiratory problems there are four times the national average" (71). Residents report ongoing acute health effects such as coughing, burning eyes, headache, dizziness, and nausea. They also complain about cases of severe asthma in the community, as well as cases of rare immune diseases, such as teenage lupus erythematosus and childhood kidney cancer.

Unfortunately, here again, no national or international agencies currently collect or publish data on community health impacts from oil activities. Data on mortalities from oil accidents are collected by different agencies depending on whether a worker or community member is killed and whether the accident is caused by a pipeline explosion, a refiner accident, or a tanker. The best data currently available, and even these are limited, cover workplace injuries and deaths in oil production and refinin (72, 73). However, virtually no data are available on chronic health impacts among communities living close to refineries

VII. IMPACTS OF OIL CONSUMPTION

The combustion of petroleum products contributes to numerous environmental impacts including air pollution, water pollution from gasoline and gasoline additives, and global warming. All three of these problems often disproportionately affect low-income, minority populations and developing nations.

Gasoline is composed of hydrocarbons, which as we have noted, include a number of carcinogenic compounds. In addition, substances, such as alkyl lead, oxygenates, and additional aromatic hydrocarbons (which include benzene, xylene, and toluene) are added to gasoline to improve its performance during combustion. The acute and chronic health effects from exposure to gasoline and its additives have been documented and include cancer, central nervous system toxicity, and poisoning from additives. These impacts tend to be concentrated particularly among lower-income populations that live closer to service stations, refineries and transfer or storage facilities (38).

The combustion of oil results in six primary air pollutants: VOCs, oxides of nitrogen (which combine with VOCs to produce low-level ozone), carbon monoxide, particulate matter, oxides of sulfur, and lead. Although gasoline in the United States is now required to be unleaded, lead emissions from combustion of gasoline in the developing world are still common.

The International Center for Technology Assessment has quantifie the externalized costs of using internal combustion engines with gasoline. According to their calculations, the unquantifie environmental, health, and social costs of gasoline usage in the United States total between $231.7 and $942.9 billion per year. The cost

of damage from automobile fumes is estimated to be between $39 and $600 billion per year. The estimate of the annual uncompensated health costs associated with auto emissions is $29.3 to $542.4 billion, which may be low given that auto pollution has been conclusively linked to increased health problems and mortality (74).

The environmental and health impacts of air pollution from gasoline combustion tend to occur disproportionately among low-income communities, communities of color, and poorer populations in developing nations. For example, although leaded gasoline is banned in the United States, its use is still widespread throughout the developing world where residents living in congested, high-traffi areas are exposed to lead emissions. In the United States, diesel emissions pose a similar risk to inner-city populations that face the highest level of exposure to diesel exhaust emissions from buses and trucks. Furthermore, "within cities, the highest density of buses and bus stations are found in the poorest neighborhoods, and poverty, race, and asthma rates are positively correlated" (38).

A study by Gotlieb et al. further demonstrates that asthma morbidity and mortality disproportionately impact minority populations, pointing out that in the early to mid-1980s the asthma mortality rate among black residents of the United States, aged 5 to 34 years, was three to fi e times as great as the rate among whites. This study, which was conducted in 1992, concluded that the asthma hospitalization rate in Boston was positively correlated with poverty rates and percentages of nonwhite residents and inversely correlated with income and educational levels. The asthma rate varied significantl within the city, from a low of 0.7/1000 persons in the Kenmore Square area to a high of 9.8/1000 in Roxbury (75).

It is now widely believed that human activities, primarily the burning of fossil fuels, are modifying natural atmospheric processes and contributing to global warming. Approximately three quarters of the anthropogenic emissions of carbon dioxide to the atmosphere have come from the combustion of fossil fuel (76). The Intergovernmental Panel on Climate Change has forecast major changes in ecological systems (and agricultural systems) and particularly stark impacts in some of the poorest countries in the world.

The United Nations Environment Program (UNEP) has also warned that the populations most vulnerable to climate changes are the landless, poor, and isolated. UNEP explains that "poor terms of trade, weak infrastructure, lack of access to technology and information, and armed conflic will make it more difficul for these people to cope with the agricultural consequences of climate change. Many of the world's poorest areas, dependent on isolated agricultural systems in semi-arid and arid regions, face the greatest risk. Many of these at-risk populations live in sub-Saharan Africa; South, East and Southeast Asia; tropical areas of Latin America; and some Pacifi island nations" (77). It is also anticipated that low-lying islands may become totally uninhabitable, and entire populations will become environmental refugees (78). As some advocacy groups have argued, "On a global scale, climate change is likely to be the biggest environmental justice issue ever. The reason is simple: the poor are most vulnerable to the effects of climate change" (78).

The impacts of changes in global climatic patterns have already been witnessed throughout the developing world. Examples of devastating episodes include

Hurricane Mitch in Central America in 1998, which killed over 10,000 and created hundreds of thousands of environmental refugees; floodin in Bangladesh in 1998 that affected millions of people in one of the poorest nations on Earth; severe storms and floodin in Venezuela in 1999 that killed an estimated 20,000 and left 150,000 homeless; and extensive flood in Mozambique in 2000 and 2001 (38, 78).

VIII. REGULATING THE OIL INDUSTRY

The oil industry is regulated at each stage of its life cycle through a patchwork of environmental, health, and safety laws. The current U.S. administration and the oil industry itself have argued that the industry is actually "over-regulated" (1, 79). Environmental advocacy groups argue, conversely, that while the industry is subject to many formal regulations, the implementation of these regulations is often inadequate, particularly in poor communities and developing countries (8).

As each nation has its own regulations, it is not possible here to summarize global oil regulation. Instead, we focus on the regulatory framework of the United States and look in particular at the effectiveness of these regulations and their implementation.

The U.S. oil industry is regulated under a dispersed, fragmented, and sometimes overlapping set of statutes (39), which include the Federal Land Policy and Management Act; the Federal Oil and Gas Leasing Reform Act; the Outer Continental Shelf Lands Act; the National Environmental Policy Act; the Oil Pollution Act; the Clean Air Act's National Emission Standards for Hazardous Air Pollutants, National Ambient Air Quality Standards, New Source Review (NSR), and New Source Performance Standards; the Clean Water Act's National Pollutant Discharge Elimination System and Spill Prevention Control and Countermeasure Requirements; the Emergency Planning and Community Right-to-Know Act; and the Underground Injection Control program of the Safe Drinking Water Act.

Several states have also implemented local environmental standards for oil extraction and refining which, in general, are stricter than federal standards. California, for instance, has implemented regulations for reformulated gasoline that are stricter than the Clean Air Act; an Air Quality Maintenance Plan which seeks to reduce emissions from stationary sources such as refineries and comprehensive leak identification maintenance, and inspection programs (80).

Both the production processes and the products of oil refinin are regulated for their impacts. The formulation and composition of fuels is thus regulated to prevent environmental and health impacts (81). U.S. fuel regulation programs include the Oxygenated Fuels Program, the Highway Diesel Fuel Program, the Reformulated Fuels Program, and the Leaded Gasoline Removal Program.

Workplace hazards from oil production and refinin are regulated by the Occupational Safety and Health Administration (OSHA). OSHA regulates occupational exposures to chemicals such as benzene, a common emission in petroleum refine - ies. OSHA has also developed safety management rules requiring refinerie to

conduct detailed reviews of their processes to determine workplace risk and injury potentials to workers (81).

Not withstanding this long list of statutes and agencies, the oil industry also benefit from a number of exemptions, or what their critics call loopholes, from federal environmental laws. A coalition of community groups in the United States recently complained that "despite a broad patchwork of regulations on refinin operations, numerous loopholes allow refiner operators to skirt the law and operate their plants in a manner dangerous to public health" (82).

For instance, there is a "petroleum exclusion" exemption under the Comprehensive Environmental Response, Compensation, and Liability Act (81). Petroleum and the toxic components of crude oil, such as benzene, are exempted from classificatio as hazardous substances unless the concentration of these substances is increased by contamination or by addition after refinin (39). The oil extraction industry is exempted from reporting toxic chemical releases to the TRI (39). Under the 1980 Amendments to the RCRA, Congress conditionally exempted drilling flu ids, produced waters, and other wastes associated with exploration, development, or production (39). Oil exploration and production activities in offshore waters of Texas, Louisiana, Mississippi, and Alabama are exempt from Clean Air Act standards (39). Oil stripper wells are exempt from the Clean Water Act's standards. Crude oil gathering pipelines under six inches in diameter are exempt from the Hazardous Liquid Pipeline Safety Act. Oil barges are exempt from double hull requirements of the Oil Pollution Act (39).

The Bush Administration also recently loosened a major regulatory burden on oil refinerie by rescinding "new source review" requirements when refinerie upgrade technology or expand their capacity (83). By eliminating this regulatory requirement, oil refinerie can now significantl expand capacity without applying for new permits or undergoing additional evaluations of Clean Air Act compliance. Environmental groups have criticized this change, arguing that the initiative "will allow virtually all pollution increases from old, high-polluting sources to go unregulated and public participation to be excluded" (84).

Another exemption in U.S. regulation relates to grandfathering of old refine ies. Grandfathered plants, those built before environmental laws came into force, can operate without meeting current federal emissions standards (64). Accidental releases, upsets, and flaring which the Waxman report documented, occur quite frequently at oil refineries these allow significan emissions to go unregulated during nonpermitted events (64, 65). For example, the EPA has reported incidents of sulfur-dioxide releases through flarin in a single day that exceed annual permitted releases (65).

As we have noted, the EPA itself reports significan levels of noncompliance of the industry with air regulations, water standards, and solid waste regulations (85). But EPA enforcement resources have recently been cut back, thereby reducing the EPA's ability to police this noncompliance. The EPA's top enforcement office recently resigned in frustration over the agency's reduction in inspections and fines In an unusual public critique, he lamented, "We don't have an EPA anymore. We just have the White House and the energy lobby" (86).

Oil pipeline regulation is also limited in a number of regards. The U.S. government relies on an underfunded, understaffed agency, the Offic of Pipeline Safety, to monitor over 2 million miles of oil and gas pipelines (enough to reach around the Earth 88 times). The agency has only 55 inspectors, and it rarely imposes fine for leaks, explosions, or even worker deaths. As Jim Hall, the former chairman of the National Transportation Safety Board, stated, "there is almost an absence of regulation" for oil pipelines (57).

The Offic of Pipeline Safety reported annual leaks of approximately 6.7 million gallons of oil and gas per year during the 1990s, the equivalent of over one *Exxon Valdez* spill every two years. There were also 23 reported fatalities from pipeline accidents during the 1990s, which included several children (87). Because federal inspectors cannot monitor all 2.2 million miles of pipeline, the government asks industry to self-report pipeline problems. Unfortunately, industry metering systems are not accurate enough to detect most leaks or spills. This has led to the operation of leaking pipelines, unreported spills, and an increase in spills and incidents over the last 10 years (57). According to an audit conducted for the California State Assembly, actual pipeline spills outnumbered industry reported spills by ten to one (57).

As mentioned, levels of compliance and performance of oil refinerie vary widely across the United States (63). Community groups have documented, largely through anecdotal reports, accompanying variations in regulatory enforcement. Some assert that Texas and Louisiana, the largest oil refinin states, have the weakest enforcement agencies (64). California agencies appear to be stricter and more effective. A simple analysis of data from the EPA's SFIP shows that high minority communities (those communities with over 30% minority populations within 3 miles of a refinery were subject to fewer inspections and enforcement actions than refinerie in predominantly white communities. Figures 1 and 2 present simple trend lines of variations in inspections and enforcement actions with respect

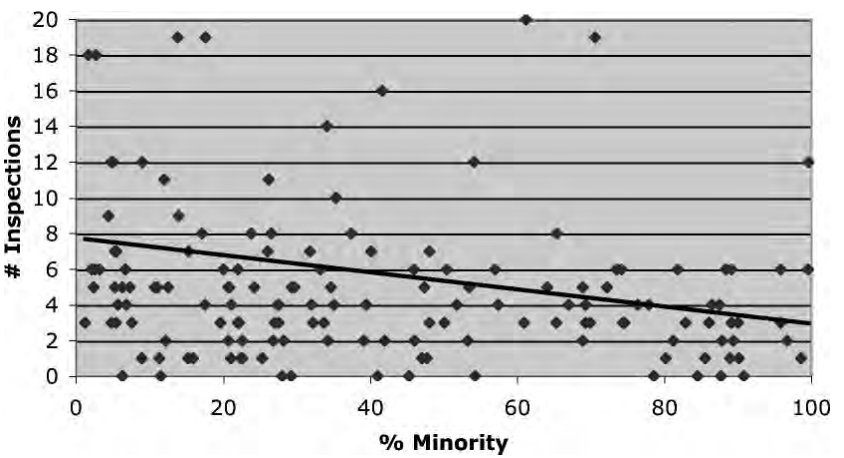

Figure 1 Incidence of inspections shown using least squares fit

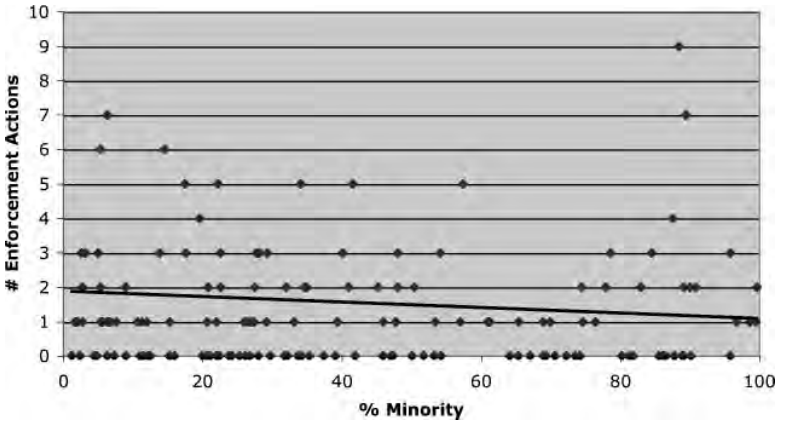

Figure 2 Incidence of enforcement.

to minority populations living in proximity to refinerie in the United States. These data, while preliminary, seem to indicate a correlation between race and regulatory enforcement and, at a minimum, makes clear the need for further analysis of variations in the implementation of environmental regulations.

Environmental and health regulations in developing countries, although almost impossible to evaluate systematically, appear to be even weaker and more variable than U.S. regulations. A number of key oil-producing countries have either weak environmental laws, weak enforcement of these laws, or no environmental policies at all. The U.S. Energy Information Administration reports that "Nigeria does not have a pollution control policy" (88), and the laws that do exist are not enforced. Ecuador lacked environmental regulations until 1990, and dependence on oil revenue has since hindered environmental enforcement (11). Saudi Arabia did not have an environmental protection agency until 2001 (89).

IX. CONCLUSIONS, FURTHER RESEARCH, AND POLICY IMPLICATIONS

The impacts of oil production, transport, refining and consumption are significan and widespread. From environmental impacts on fragile ecosystems, to cultural impacts on indigenous groups, health impacts on workers and communities, global climatic impacts, and military conflicts oil is perhaps the single most controversial and influentia commodity in the world. Our analysis of existing data has shown that oil's adverse impacts, which spread out virtually everywhere oil fl ws, appear to disproportionately affect groups such as indigenous communities, migrant workers, and poor communities living near refineries pipelines, and gas stations. However, further research is needed to specify the distribution of environmental and social impacts from oil.

Although numerous studies have analyzed individual, discrete impacts of oil, little data or analysis is available assessing the overall distribution or cumulative impacts of oil. Current research and government data fail to evaluate the global distribution of benefit and costs from oil. It is virtually impossible to access even basic data on the spatial or demographic distribution of impacts from oil. One exception is the EPA's SFIP, which provides data on the demographics of populations living in proximity to oil refinerie in the United States. But even these data are limited to simple measures of environmental performance of refineries

Past studies have also failed to evaluate critical issues influencin the distribution of these impacts. Changing systems of control over the industry are particularly important in determining both who makes decisions over oil production, transport, and refinin and who benefit from these decisions. The super-major oil corporations control an increasing percentage of oil extraction and refinin and increasingly set the terms of oil's distribution and impacts. There is also very little information available to evaluate the implementation and effectiveness of government regulation of oil.

Thus, significan research is required to better measure and evaluate impacts of oil. There is a need for more and better data on environmental releases from oil extraction, transport, and refining And there is a need for more and better analysis of the distribution of these impacts. Most governments currently rely on industry self-reporting of emissions, leaks, and accidents. Even in the United States, inspectors for key segments of the industry are scarce; ambient air sampling around facilities is limited; and monitoring of point sources, leaks, and accidents is minimal. Additionally, virtually no epidemiological or toxicological data are available on exposed communities, such as those living near refineries

Greater public disclosure of data on the environmental, social, and financia impacts of oil exploration, production, and refinin is also needed. Greater transparency regarding the performance of the oil industry would, at a minimum, help alert stakeholders to the true costs of oil consumption. A number of groups have called recently for reporting of oil revenues and payments to developing country governments and of the social and environmental impacts of these investments. Nongovernmental organizations and community groups around the world have also been calling for increased government inspections and enforcement authority over the oil industry. Even in the United States, exemptions and loopholes specifi to the oil industry create a range of problems in environmental regulation. Finally, governments will have to engage and struggle with regulating oil companies if they are to seriously advance mechanisms to regulate global carbon emissions and mitigate climate impacts.

Oil is clearly at the center of current industrial development and economic activities. However, oil is also at the heart of some of the most troubling environmental, health, and social problems we face. How we manage both the benefit and costs of oil production and consumption will help determine the wealth, health, and safety of the planet. Understanding the distribution of impacts of oil and the effectiveness of current systems of regulation over these impacts is critical to advancing more

democratic control over oil and to maximizing the benefit of oil while minimizing its adverse impacts. More open and robust debates in the United States and around the world regarding oil extraction, transport, refining and consumption are critical to making our oil economy more just, equitable, and sustainable.

TOWARD A CRITICAL ENVIRONMENTAL JUSTICE STUDIES

Black Lives Matter as an Environmental Justice Challenge

David N. Pellow
Department of Environmental Studies, University of California, Santa Barbara

Abstract

In this paper I expand upon the recent use of the term "Critical Environmental Justice Studies." This concept is meant to capture new developments in Environmental Justice (EJ) Studies that question assumptions and gaps in earlier work in the field. Because this direction in scholarship is still in its formative stages, I take this opportunity to offer some guidance on what Critical Environmental Justice (CEJ) Studies might look like and what it could mean for theorizing the relationship between race (along with multiple additional social categories) and the environment. I do so by (1) adopting a multi-disciplinary approach that draws on several bodies of literature, including critical race theory, political ecology, ecofeminist theory, and anarchist theory, and (2) focusing on the case of Black Lives Matter and the problem of state violence.

Keywords: Environmental Justice, Black Lives Matter, State Violence, Racism, Speciesism, Scale, Expendability, Indispensability

INTRODUCTION

Black Lives Matter (BLM) is a social movement centered on the problem of state-sanctioned racist violence. The movement began as a response to the acquittal of George Zimmerman, a man who killed Trayvon Martin, a seventeen-year old African American boy in Sanford, Florida, in 2012. From that moment on, social media, mainstream media, and the Black Lives Matter movement would routinely intensify the national focus on racialized state-sanctioned violence when yet another video or testimony surfaced featuring an African American being shot, beaten, choked, and/or killed by police or White vigilantes. The role of social media technology was pivotal. As one writer put it, "Social media could serve as a source of live, raw information. It could summon people to the streets and coordinate their movements in real time. And it could swiftly push back against spurious media narratives . . ." (Bijan 2015).

BLM co-founder Alicia Garza explained what the movement stands for: "Black Lives Matter is an ideological and political intervention in a world where Black lives are systematically and intentionally targeted for demise. It is an affirmation of Black

Du Bois Review, (2016) Page 1 of 16.

doi:10.1017/S1742058X1600014X

folks' contributions to this society, our humanity, and our resilience in the face of deadly oppression" (Garza 2014).

In this paper, I draw links between what I view as the most important insights and questions that emerge from the Black Lives Matter movement and the struggle against environmental racism. This is a connection that many scholars might not make at first glance because police brutality and environmental politics would appear to be only tangentially related, but I argue they are in fact closely intertwined and that we must explore their myriad connections in order to excavate the roots of racist violence no matter the form it takes. The questions I explore here include: How can Black Lives Matter's emphasis on police violence against African American communities inform our understanding of the scourge of ecological burdens facing those same communities? Conversely, what can the violation of Black bodies and spaces by ecologically destructive agents produced by states and corporations tell us about the violation of those same bodies by police and law enforcement agents? I find that a "first-" and "second-generation" Environmental Justice Studies framework can assist in this effort, but can only take us so far. Therefore, I propose that a Critical Environmental Justice Studies framework can more fully address these pressing concerns.

ENVIRONMENTAL JUSTICE STUDIES

The Environmental Justice (EJ) movement is composed of people from communities of color, indigenous communities, and working-class communities who are focused on combating environmental injustice—the disproportionate burden of environmental harm facing these populations. For the EJ movement, social justice is inseparable from environmental protection.

In the early 1970s, researchers in the United States found strong correlations between social class status and air quality in the United States. As a result of social movement activism, however, the focus began to broaden from social class to race and from air pollution to a range of environmental hazards (Pulido 1996; Walker 2010). For example, in 1982, hundreds of civil rights leaders and community activists protested a toxic waste dump in the majority African American community of Warren County, North Carolina. That action sparked the discourse of environmental racism and the growth of Environmental Justice Studies, and since that time, scholars and other researchers have documented the reach of environmental racism/inequality in the United States and around the globe, as well as the social movement that has emerged to highlight and challenge this phenomenon (Bullard 2000; Cole and Foster, 2000; Pellow and Brulle, 2005).

Thus, hundreds of studies have documented that people of color, people of lower socioeconomic status, indigenous and immigrant populations, and other marginalized communities are disproportionately affected by ecologically harmful infrastructures, such as landfills, mines, incinerators, polluting factories, and destructive transportation systems, as well as by the negative consequences of ecologically harmful practices, such as climate change/disruption and pesticide exposure (Ringquist 2005). Much of this work has documented the troubling depths and breadth of environmental injustice's impact on the lives of people—including public health and mental health effects—and on how these communities make meaning out of these assaults while organizing for environmental justice. And while EJ Studies may have earlier focused on the United States, scholars are also documenting environmental inequalities and EJ movements' responses to them around the globe (Agyeman et al., 2010; Pellow 2007;

Roberts and Parks, 2006). A small but growing group of researchers—including and especially environmental humanities scholars—have focused on the ways that gender, sexuality, citizenship, indigeneity, and nation shape the terrain of ecological inequalities, but those areas of scholarship remain in need of further development (Adamson 2011; Bell 2013; Buckingham and Kulcur, 2010; Gaard 2004; Smith 2005).

TOWARD A CRITICAL ENVIRONMENTAL JUSTICE STUDIES

Recent scholarship divides EJ Studies into two phases: (1) the "first-generation," which was focused primarily on documenting environmental inequality through the lens of race and class; and (2) "second-generation" studies that extend beyond questions of distribution to incorporate a deeper consideration of theory and the ways that gender, sexuality, and other categories of difference shape EJ struggles (Buckingham and Kulcur, 2010; Walker 2010). In our book *Power, Justice, and the Environment*, Robert Brulle and I used the term "Critical Environmental Justice Studies" (Pellow and Brulle, 2005), which has since been adopted by other scholars working to expand the academic field and politics of environmental justice (Adamson 2011; Holifield et al., 2010). This concept is meant to build on recent scholarship in EJ Studies—"second-generation" writings—that questions assumptions and gaps in earlier work in the field by embracing interdisciplinarity and methodologies and epistemologies including and beyond the social sciences. As this direction in scholarship is still in its formative stages, I take this opportunity to offer some guidance for what a Critical EJ Studies might look like.

Critical EJ (CEJ) Studies is a perspective intended to address a number of limitations and tensions within EJ Studies. These include, for example: (1) questions concerning the degree to which scholars should place emphasis on one or more social categories of difference (e.g., race, class, gender, sexuality, species, etc.) versus a focus on multiple forms of inequality; (2) the extent to which scholars studying EJ issues should focus on single-scale versus multi-scalar analyses of the causes, consequences, and possible resolutions of EJ struggles; (3) the degree to which various forms of social inequality and power—including state power—are viewed as entrenched and embedded in society; and (4) the largely unexamined question of the *expendability* of human and non-human populations facing socioecological threats from states, industries, and other political economic forces.

On the first point above, EJ scholars have a tendency to focus on only one or two forms of social inequality in studies of environmental injustice. For example, some scholars continue to debate the relative importance of race versus class in terms of which category is most important with respect to the distribution of environmental hazards, while only a small group of scholars have explored the role of gender and sexuality in EJ Studies (Buckingham and Kulcur, 2010; Smith 2005). Moreover, the key social category *species* remains, at best, at the margins of the field of EJ Studies, despite the fact that, generally, when and where humans suffer from environmental inequalities, so does the more-than-human world (and vice versa) and often as a result of ideological frameworks that link marginalized humans to "nature." My point here is that since multiple forms of inequality drive and characterize the experience of environmental injustice, the field would do well to expand in that direction. Thus CEJ Studies brings greater attention to how multiple social categories of difference are entangled in the production of environmental injustice, from race, gender, sexuality, ability, and class to species, which would attend to the

ways that both the human and the more-than-human world are impacted by and respond to environmental injustice.

With respect to the second point above concerning *scale*, the EJ Studies literature tends to be characterized by research at one scale or another, rather than a multi-scalar approach. In other words, most researchers focus on the local, regional, national, or sometimes transnational or global scale, but few studies attempt to grasp how EJ struggles function at multiple scales, from the cellular and bodily level to the global level and back (Herod 2011; Sze 2016). Some scholars have addressed this important question by exploring cases in which pollutants produced in one part of the world travel across national borders and impact human and ecological health in another hemisphere (Sze 2006). Scale is of critical importance because it allows us to understand how environmental injustices are facilitated by decision-makers who behave as if sites where hazards are produced "out of sight and out of mind" are somehow irrelevant to the health of people and ecosystems at the original sites of decision-making power and consumption. Attention to scale also assists us in observing how social movement *responses* to environmental injustices draw on spatial frameworks, networks, and knowledge to make the connections between hazards in one place and harm in another. CEJ Studies thus advocates multi-scalar methodological and theoretical approaches to studying EJ issues in order to better comprehend the complex spatial and temporal causes, consequences, and possible resolutions of EJ struggles.

Regarding the third point above—the degree to which various forms of inequality and power are viewed as entrenched in society—this concern stems from my conclusion that the vision of change articulated by EJ Studies scholars and most EJ activists generally looks to the state and capital to accommodate demands via legislation, institutional reforms, and other policy concessions. The concern here is that such an approach leaves intact the very power structures that produced environmental injustice in the first place. Yes, it names those institutions and structures as sources of the problems and seeks to reform them, but by working in collaboration with those entities, such efforts ultimately risk reinforcing their legitimacy. CEJ Studies urges a deeper grasp of the entrenched and embedded character of social inequality—including speciesism and state power—in society and therefore a reckoning with the need for transformative (rather than primarily reformist) approaches to realize environmental justice. In other words, Critical EJ Studies seeks to push our analyses and actions beyond the human, the state, and capital via a broad anti-authoritarian perspective.

Regarding the fourth point above, EJ Studies suggests that various marginalized human populations are treated—if not viewed—as inferior, and less valuable, to society than others. This point is largely undertheorized in the literature (Mills 2001; Pulido 1996). Critical EJ Studies makes this theme explicit by arguing that these populations are marked for erasure and early death, and that ideological and institutional othering is linked to the more-than-human world as well. Moreover, CEJ counters that dominant perspective with a framework that contends that these threatened bodies, populations, and spaces are *indispensable* to building socially and environmentally just and resilient futures for us all.

The above constitute what I call the four pillars of CEJ Studies. CEJ Studies draws from the work of scholars across numerous fields that only periodically intersect, such as Environmental Justice Studies (Adamson 2011; Bell 2013; Bullard 2000; Cole and Foster, 2000), Critical Race Theory (Goldberg 2002), Critical Race Feminism (Hong 2006; Smith 2005), Ethnic Studies (Márquez 2014), Gender and Sexuality Studies and Ecofeminism (Buckingham and Kulcur, 2010; Gaard 2004), Political Ecology (Bennett 2009), and Anti-Authoritarian/Anarchist Theory (Scott 2010; Smith 2011). Furthermore, CEJ Studies is interdisciplinary, multi-methodological, and

is activist-scholar inspired in that it seeks to bridge and blur the boundaries and borders between the academy and community, theory and practice, analysis and action. Critical EJ Studies is only intended to be *one* of many possible approaches to environmental justice scholarship and action. It is neither prescriptive, nor is it a declaration of where the field should be headed.

In the following sections, I apply a CEJ Studies framework to the Black Lives Matter movement to demonstrate the importance of encouraging scholars and activists to think through linkages across theory and social change politics that might not usually emerge from "traditional" EJ Studies or from within many social change movements.

CRITICAL EJ STUDIES AND BLACK LIVES MATTER

In order to examine Black Lives Matter as a CEJ case study, I gathered data from the BLM website, archives, and social media, as well as major essays published in national and international media outlets by BLM advocates and supporters. This selection of data is not intended to be strictly representative, but rather, as a purposive sample it speaks to the core BLM frames and the four pillars of CEJ Studies.

The First Pillar: Intersectionality and the Racial Discourse of Animality

CEJ Studies recognizes that social inequality and oppression in all forms intersect and that members of the more-than-human world are subjects of oppression and agents of social change. Black Lives Matter is a social movement organized primarily around the social category of race, but extends the analysis to multiple categories of difference, reflecting an emphasis on *intersectionality*. Intersectionality is a concept intended to explain the ways that many identities and social categories work together to produce advantages and disadvantages across bodies and space, and that inequalities do not act independently of one another (Collins 2008; Hong 2006).

The founders of BLM present a deeply intersectional approach to the problem of devalued Black life that is inclusive of class, gender, sexuality, immigration status, citizenship, age, ability, and other differences and social categories. All three founders of BLM are women of color. One of them—Alicia Garza—identifies as a queer woman of color, while another—Opal Tometi—is the daughter of Nigerian immigrants and works for an organization focused on the human rights of Black immigrants. The third founder—Patrisse Cullors—who also identifies as queer, organizes support for incarcerated persons and their families, with a focus on mental health. Thus their political and professional work itself is a study in intersectional theory and practice. As BLM co-founder Alicia Garza writes, "Black Lives Matter affirms the lives of Black queer and trans folks, disabled folks, Black-undocumented folks, folks with records, women, and all Black lives along the gender spectrum" (Garza 2014).

Critical EJ Studies speaks to the ways in which various social categories of difference work to place particular bodies at risk of exclusion, marginalization, erasure, discrimination, violence, and othering. These insights are important for building an understanding of the ways that intra-human inequality and oppressions function and how they intersect with human-nonhuman oppression. As David Nibert and Michael Fox put it, "[T]he oppression of various devalued groups in human societies is not independent and unrelated; rather, the arrangements that lead to various forms of oppression are integrated in such a way that the exploitation of one group frequently augments and compounds the mistreatment of others" (Nibert and Fox, 2002, p. 13). "Various devalued groups in human societies" frequently include women, immigrants,

LGBTQ persons, people of color, indigenous peoples, disabled persons, the elderly, low-income people, and nonhuman species. And while the *experiences* of these groups are qualitatively distinct (i.e., not equivalent), the logic of domination and othering as practiced by more powerful groups, the state, and capital provides the common thread of intersectionality through each of their oppressions.

Law enforcement personnel routinely engage in violent acts against humans and nonhumans, even when no threat is evident, thus revealing the ways that state violence produces intersecting oppressions. A 2015 *Baltimore Sun* investigation of the Baltimore, Maryland Police Department (the same town where Freddie Gray was murdered), detailed numerous incidents in which vulnerable people and nonhumans were the subjects of brutal and sometimes lethal force at the hands of police in that city. The report notes that young African American males were the targets of such violence, and so were elderly people, women, children, and nonhuman animals (Friedersdorf 2015). The report discusses, for example, the use of a dead rat to intimidate a police officer working on a police brutality case and the murder of a dog by an officer to intimidate his girlfriend. The *Baltimore Sun* investigation appears to reflect what scholarly studies have long revealed: that there is a well-documented link between the use of violence against nonhuman animals and efforts to exert control over other humans, whether in the destruction of livestock and other food sources during wartime and conquests or through domestic violence directed primarily at women, children, and nonhuman companion animals or pets (Adams 2010; Ascione 1997; Smits 1994).

This brings us to what I call the *racial discourse of animality*, a term meant to capture the language that people use to describe human behavior using nonhuman references and analogies, signaling a set of assumptions surrounding what we view as acceptable "human" versus nonhuman behavior and how different bodies are valued. It reveals the means through which we discuss race, racism, and racial politics in more-than-human terms, as a way of defining the limits and boundaries of the human. This discourse is common in discussions around racial politics and flared up many times around BLM protests against police brutality. What is fascinating is that people on *all* sides of the issues—activists, lawyers, and agents of the state—use this language. In other words, people deploy the racial discourse of animality in the service of White supremacy *and* in the service of racial justice. Consider the following examples:

Lesley McSpadden, the mother of Michael Brown (an African American teenager killed by a police officer in Ferguson, Missouri) spoke to reporters at a public demonstration to call attention to the tragedy of her son's death. She spoke to the bleak outlook of young African Americans facing police brutality: "You took my son away from me! You know how hard it was for me to get him to stay in school and graduate? You know how many Black men graduate? Not many! Because you bring them down to this type of level where they feel they don't got nothing to live for anyway!" While other protesters around McSpadden peacefully raised their hands in symbolic surrender, a police officer's voice was heard and recorded yelling at them, calling them "animals" (Fantz et al., 2014).

In early 2015, Freddie Gray, a twenty-five year old African American man was taken into police custody in Baltimore, Maryland, and, in the process, incurred severe spinal cord and neck injuries and died shortly afterward, sparking nationwide protests. In Baltimore, the protests, led by African Americans and many supporters of the BLM movement, were mainly peaceful but were marred by property destruction, looting, and a number of police officers being injured. Many Whites took to social media—including Baltimore County police officer Jennifer Lynne Silver—and displayed their views on the matter referring to the people involved as "animals" and, in her words, a "disgrace to the human race" (Change.org 2015).

The racial discourse of animality is also used to combat racism. An article in *The Guardian* responded to Jennifer Silver's epithets regarding protesters in Baltimore by arguing that police and society often treat nonhuman animals better than African Americans:

> But 'animals' is a misnomer. People—including police officers—are punished for killing or doing harm to domestic animals. Baltimore has busted dog fighting rings and sent offenders to prison for animal cruelty. In 2014, former Baltimore City police officer Alec Taylor was sentenced to a year behind bars for killing a dog. That might not seem like much, but it is longer than the sentences given to the killers of Michael Brown, Eric Garner, Trayvon Martin, Rekia Boyd, or seven-year old Aiyana Stanley-Jones (Nichols 2015).

In the spring of 2015, a police officer shot Walter Scott, an unarmed African American man in North Charleston, South Carolina, after he fled his car during a traffic stop. Malik Shabazz, president of Black Lawyers for America and former chairman of the New Black Panther Party, appeared on "CNN Newsroom" and stated, "Black men are being killed and hunted down like deer and like dogs" (Griswold 2015). That same month, Democratic Congressman Hank Johnson of Georgia took to the floor of the House of Representatives to urge his colleagues to confront police brutality. Drawing on a phrase usually reserved for hunting nonhuman animals, he stated, "It feels like *open season* on Black men in America" (Griswold 2015, emphasis added).

In these last examples, references to nonhumans are used to communicate the sentiment that African Americans—like all human beings, presumably—should not be treated like nonhuman animals. The assumption here is also problematic because it is speciesist in that it implies that it is acceptable to wantonly hunt and slaughter nonhumans, even if the primary aim is to counter racist violence. My point is that we cannot understand racist violence, and the way we think, talk, and enact it, without paying attention to the relationship between humans and nonhumans, as these examples illustrate.

Finally, the role of *agency* is key to the first pillar of CEJ, since African Americans and other marginalized populations are not just the targets of oppression but also regularly resist their subjugation. While traditional elements of what sociologists call "resource mobilization" (Morris 1984) are on full display with the Black Lives Matter movement—including the mobilization of human bodies, ideas, words, discourses, tactics, and strategies in protest—it is also the case that the urban built environment, information technology, and other forms of more-than-human objects and natures are also integral to that agency and therefore central to making this vision and practice of social change possible (Bennett 2009).

The Second Pillar: Scale, Race, and Difference

CEJ Studies embraces multi-scalar methodological and theoretical approaches in order to better comprehend the complex spatial and temporal causes, consequences, and possible resolutions of EJ struggles.

Scale is deeply racialized, gendered, and classed. The impacts of climate change offer a telling example of how environmental racism reflects this fact. While the conclusions of climate scientists are remarkably clear that anthropogenic climate change is occurring at a dramatic pace and with increasing intensity, this is also happening unevenly, with people of color, the poor, indigenous peoples, peoples of

the global South, and women suffering the most (Harlan et al., 2015). Thus, while climate change matters for all of us, it impacts people and nonhumans with different levels of intensity. If one only pays attention to the global scale, it appears that the worst effects of climate change are not yet upon us. But if one examines what is occurring in neighborhoods, *barrios*, indigenous peoples' lands, and much of the global South, the picture is quite different because the impacts are extensive and ongoing. As Keith Ellison and Van Jones (2015) put it, "[O]ur kids are being poisoned by the air they breathe. Environmental injustices are taking Black lives—that's why our fight for equality has to include climate and environmental justice too."

Social cognition studies find that "implicit bias" among White research subjects results in perceiving threats to their wellbeing when they see Black and Brown people when no such threat exists (Kang 2005). While this research is highly consequential for everyday microsociological interactions across the racial spectrum (especially in the case of gun violence in the name of White "self defense"), it has major macrosociological implications as well. Therefore I find that implicit bias is useful for thinking more deeply about the intersection of race and scale. In other words, if these studies find that people of color are implicitly viewed as threatening, then their presence is perceived to be much *larger* in the social-cognitive terrain of Whites.

Thus race and scale intertwine to reveal also that when Black people respond to racism (whether by police or via environmental racism), their actions may be viewed as a threat that is disproportionate and outsized. We can see this, for example, in the militarized response by police departments when interacting with the Black Lives Matter movement. Many supporters of the Black Lives Matter movement, and even military veterans, decried these practices when disturbing images of police and protesters clashing in Ferguson, Missouri, in response to the police killing of Michael Brown, seemed to be indistinguishable from media images of civilians being repressed by an occupying military force in some far away land. This fact begs for a scalar analysis that links militarized oppression of African Americans to the U.S. military's treatment of people of color elsewhere in the world—in Afghanistan, Iraq, Syria, Pakistan, Yemen, Palestine, and many other nations where the United States uses military force directly or by proxy to protect its interests. This is also an environmental justice issue because the U.S. military is one of the largest sources of pollution on earth (Nazaryan 2014) *and* because militarism and masculinist politics tend to go hand in hand and both tend to result in socially and ecologically harmful practices.

Finally, BLM's work speaks to the myriad ways that scale can be thought of and articulated *temporally*. In fact, the entire point of the BLM movement is, in some ways, an intervention to remind us that blatant acts of anti-Black violence are not a thing of the past and are still quite rampant in what some observers had hoped would be a "postracial" era. BLM co-founder Alicia Garza uses time as an indicator of the intersection of race, sexuality, and scale's intersections, but does so linking history to an imagined future:

> But what I can say to my child, just like my mom says to me, is that there was a time when it wasn't OK for people to be out [about their sexuality]. There was a time when black people were being slaughtered. And I hope that the end to that story is, 'and then we organized, and we built a vibrant international movement, and we really changed conditions for black people in this country, and for everybody.' And I'm hoping that the story that I'm also able to tell is that our demands went beyond 'stop killing us,' to ensure the quality of life for everybody. And that we won that (Brydum 2015).

The Third Pillar: An Anti-Statist/Anarchist Reading of BLM

Social inequalities—from racism to speciesism—are not aberrations, but rather are deeply embedded in society and reinforced by state power and market systems. Therefore, the current social order stands as a fundamental obstacle to social and environmental justice. A logical conclusion of this observation is that social change movements may be better off thinking and acting beyond the state and capital as targets of reform and/or as reliable partners.

Racism, for example, is a foundational component of the political, legal, economic, and cultural systems in the United States. African Americans, for instance, enjoy fewer rights and significantly lower social value than Whites, suffering deep economic, educational, public health, and environmental inequalities; earning far less income and owning far less wealth and property than Whites; and being more likely than Whites to attend low quality, segregated schools and live in residentially segregated communities marked by financial disinvestment, a brutal occupying police force presence, and environmental racism (Bullard 2000; Cacho 2012; Gilmore 2007; Vargas 2010). Public health disparities impact African Americans dramatically, as homicides, infant mortality, life expectancy, asthma, and a range of other illnesses and life events reveal a much lower statistical value of Black life (Williams and Collins, 1995). And millions of African Americans are either confined to prisons via mass incarceration or subjected to routine surveillance and control through the system of mass probation. Thus, racism is, for Black Lives Matter co-founder Alicia Garza, "a disease that this country has in our very DNA" (Garza 2015).

In a statement posted on the Black Lives Matter website, activists contend that the current state of racist violence against African Americans is a core component of American life, a form of oppression that Blacks have consistently challenged: "Rooted in the experiences of Black people in this country who actively resist our de-humanization, #BlackLivesMatter is a call to action and a response to the virulent anti-Black racism that permeates our society" (BlackLivesMatter.com 2016).

Debates often center on whether social movements should seek to reform or transform the legal system. BLM is an important part of that conversation because it is a movement whose participants often embrace the state, but frequently do so in a critical fashion. For example, much of the chanting and protest calls at BLM events include demands to "prosecute the police" and implement stronger laws against hate crimes and police brutality (Furst 2016).[1] The BLM's "National Demands" document reads, in part, "We will help develop a network of organizations and advocates to form a national policy specifically aimed at redressing the systemic pattern of anti-Black law enforcement violence in the U.S." (Moore and Cullors, 2014). In November 2015, after a group of White supremacists shot and wounded several activists who were protesting the police killing of an unarmed African American man named Jamar Clark in Minneapolis, BLM released a statement declaring, "The Black Lives Matter Network urgently calls upon the Department of Justice to investigate this shooting as a hate crime" (BlackLivesMatter.com 2015). Finally, BLM activists have regularly called for greater oversight over police and for increased presence of Black people in government decision-making bodies. For example, in the wake of numerous police killings of African Americans in recent years, the Los Angeles chapter of BLM demanded that the mayor appoint activists from the Black community to key city commissions, and a number of BLM activists are running for political office.

When BLM demands inclusion in governmental bodies and invokes the language of hate crimes and terrorism, such efforts may appear to reflect the power of grassroots movements to move state actors on important progressive issues, but it also indicates the movement's willingness to expand troubling, controlling, authoritative, and

lethal state power. BLM is therefore not asking how we might build safe communities *beyond* the state, but rather how we might do so with *greater* state intervention. BLM co-founder Patrice Cullors' vision of social change includes a plan to "divest from policing and divest from this prison system . . . and reinvest into poor communities, reinvest into allowing us to have access to healthy food, access to jobs, access to shelter" (Cullors 2015).

From a pluralist perspective, states are sites where citizens and other stakeholders converge to elect representatives and make their voices heard and shape public policy (Dahl 2005). Departing from that view, a power elite perspective casts states as sites of power struggles, where certain interest groups tend to dominate others, setting public policy agendas and unevenly shaping life chances for members of society (Domhoff 2013). From Women of Color Feminist, Critical Race Theory, and Anarchist perspectives, states are also institutions that, by definition, practice exclusion, control, and violence (in addition to their other functions) (Goldberg 2002; Hong 2006; Mills 2001; Scott 2010; Smith 2011). Thus, the very purpose of a state is to exert dominance over populations, resources, and territory, among other things.

If Black Lives Matter was founded to challenge state-sanctioned violence then it makes sense to extend the reach of this movement's analysis and action to the problem of environmental racism. Since environmental racism is often a form of state-sanctioned violence via the harm that state agencies and state-regulated companies perpetrate in communities of color, then BLM might do well to pay greater attention to this issue. If we think of environmental racism as a form of violent control over bodies, space, and knowledge systems then we can more effectively theorize it as a form of state violence, a framework that is absent from most EJ scholarship.[2] Moreover, as some BLM activists urge us to think about how to make our communities safe "beyond policing" (Tometi 2015), both BLM and EJ activists and scholars might begin to think about how to make our communities sites of EJ and racial justice *beyond the state*. In fact, the BLM movement, the EJ movement, and EJ scholarship generally look to the state and its legal systems to deliver justice and to regulate industry. Thus far, however, the track record of state-based regulation and enforcement of racial and environmental justice policies in communities of color has been abysmal (Cole and Foster, 2000; Gilmore 2007; Lombardi et al., 2015).

The Fourth Pillar: Indispensability

Critical EJ Studies centers on the concepts of *racial* and *socioecological indispensability*. In *Black and Brown Solidarity* (2014), John Márquez introduces the concept "racial expendability" to argue that Black and Brown bodies are, in the eyes of the state and its constituent legal system, generally viewed as criminal, deficient, threatening, and deserving of violent discipline and even obliteration. Márquez and other ethnic studies scholars contend that, in a White supremacist society, people of color are constructed as and rendered expendable (Cacho 2012; Márquez 2014; Mills 2001; Vargas 2010). Ruth Wilson Gilmore speaks to this point in her book *Golden Gulag* (2007), in which she argues that the massive build up of prisons to warehouse people of color in the state of California and the United States nationally was a public policy decision designed to contain and control populations whose very existence is viewed as troubling. Extending this logic to the problem of environmental racism, philosopher and critical race theorist Charles Mills argues that people of African descent are considered "trash" by policy makers and institutions promoting discriminatory environmental policies because these populations are associated with filth, waste, and uncleanliness in the popular imagination—thus locating pollution in their communities actually makes cultural common sense (Mills 2001).

Critical EJ Studies builds on the work of these scholars by countering the ideology of White supremacy and human dominionism and articulating the perspective that excluded, marginalized, and othered populations, beings, and things—both human and more-than-human—must be viewed not as expendable but rather as *indispensable* to our collective futures. This is what I term *racial indispensability* (when referring to people of color) and *socioecological indispensability* (when referring to broader communities within and across the human/more-than-human divide and their relationships to one another). Racial indispensability is intended to challenge the logic of racial expendability and is the idea that institutions, policies, and practices that support and perpetrate anti-Black racism suffer from the flawed assumption that the future of African Americans is somehow de-linked from the future of White communities. People of color are members of our society, are core participants in our social systems, and are members of our socioecological systems, and are therefore key to ensuring the continued functioning, sustainability, and resilience of our society and planet.

The idea of indispensability is distinct from an assimilationist perspective, which seeks to (often involuntarily and violently) incorporate "others" into one's own vision of a society (Smith 2005). Rather, indispensability honors key EJ and ecological principles by seeing all communities (more-than-human and human) as interconnected, interdependent, but also sovereign and requiring the solidarity of others. Indispensability should also not be confused with a Functionalist view of society and socioecological relations as it recognizes that social roles, positions, and behaviors among various populations can and do conflict and change over time, and that the character of inequality and state and market power in most societies is highly unjust and must be confronted. Functionalism, on the other hand, posits that whatever the character of inequality, social roles, and behaviors may be, it must be positive for society and therefore is in no need of change (Parsons 1954). Indispensability argues against that logic because CEJ Studies is fundamentally focused on securing justice and sustainability in a highly unjust and unsustainable system. Thus indispensability demands dramatic change but does so from the perspective that all members of society and socioecological systems have something to contribute to that process and to our collective futures.

Socially, politically, philosophically, and ecologically, what this means is that we are all linked in webs of social interdependence, so that what happens to one group affects, in some way, all others. As Dr. Martin Luther King, Jr. famously wrote in his landmark "Letter from Birmingham Jail" with regard to racism and the future of the United States: "Injustice anywhere is injustice everywhere. . . . In a real sense all life is inter-related. All men are caught in an inescapable network of mutuality, tied in a single garment of destiny. Whatever affects one directly, affects all indirectly. Never again can we afford to live with the narrow, provincial 'outside agitator' idea . . ." (King 1963).

Thus the importance of CEJ studies here is to underscore that social systems predicated on the annihilation of Black life reveal a self-defeating error. In other words, the idea that Whiteness can only triumph and survive via the annihilation of Black life commits the classic ecological error of *dualism* or *separation*. Dualism is the idea that we see various categories of existence as separate and arranged in oppositional hierarchies, such as culture/nature, man/woman, European/non-European, human/animal, White/Black, heterosexual/homosexual, etc., when in fact these categories are constantly blurred, transgressed, and revealed to be socially constructed and highly fluid and malleable. So CEJ Studies facilitates an understanding that a vision of White supremacy premised on the destruction of people of color is as illogical and self-defeating as a vision of an economy and a nation-state premised on the destruction of ecosystems. In a sense, this observation demonstrates a reality of social systems as ecosystems, and vice versa: that everything in the universe is hitched to everything

else, so that what affects one member or element affects all of them. The destruction of people of color harms White people and it harms the more-than-human world, and vice versa, so CEJ Studies affirms that Black lives, the lives of people of color, are *indispensable*. Going further, the idea of *socioecological indispensability* reflects the CEJ Studies perspective that the wellbeing of all people, species, and ecosystems is *indispensible*. This is both a socioecological reality and an affirmation of a politics of solidarity and coalition building that firmly states "All of us or none!"

Black Lives Matter activists routinely speak to this issue as well. In 2015, BLM issued a "State of the Black Union" in which they wrote, "None of us are free until all of us are free" (DeclarationProject.org 2015). This is a variation on a quote that has been attributed to the likes of the poet Emma Lazarus, the Reverend Dr. Martin Luther King, Jr., and many others. It is also articulated powerfully in the Barry Mann song "None of Us Are Free," which includes the chorus, "None of us are free, none of us are free, if one of us is chained, none of us are free."

Expressing this view more than a century ago, African American historian Anna Julia Cooper told a group of Black clergymen in 1892, "Only the Black woman can say 'when and where I enter, in the quiet, undisputed dignity of my womanhood, without violence and without suing or special patronage, then and there the whole . . . race enters with me'" (Bailey 2004, p. 56). A year later, making this claim even stronger, at the 1893 World's Congress of Representative Women, Cooper stated:

> Let woman's claim be as broad in the concrete as the abstract. We take our stand on the solidarity of humanity, the oneness of life, and the unnaturalness and injustice of all special favoritism, whether of sex, race, country, or condition. If one link of the chain is broken, the chain is broken. A bridge is no stronger than its weakest part, and a cause is not worthier than its weakest element. Least of all can woman's cause afford to decry the weak. We want, then, as toilers for the universal triumph of justice and human rights, to go to our homes from this Congress demanding an entrance not through a gateway for ourselves, our race, our sex, or our sect, but a grand highway for humanity (Cooper 1892).

BLM co-founder Alicia Garza echoes and articulates this idea as follows:

> #BlackLivesMatter doesn't mean your life isn't important—it means that Black lives, which are seen as without value within White supremacy, are important to your liberation. Given the disproportionate impact state violence has on Black lives, we understand that when Black people in this country get free, *the benefits will be wide reaching and transformative for society as a whole.* When we are able to end hyper-criminalization and sexualization of Black people and end the poverty, control, and surveillance of Black people, every single person in this world has a better shot at getting and staying free. *When Black people get free, everybody gets free*. This is why we call on Black people and our allies to take up the call that Black lives matter. . . . Our collective futures depend on it (Garza 2014, emphasis added).

DISCUSSION AND CONCLUSION

Critical Environmental Justice Studies seeks to expand the field of EJ Studies to move beyond its conceptual, theoretical, disciplinary, and methodological limitations. Since that path is still very much in formation, this paper is an effort to chart one course in that direction with greater specificity. Critical EJ Studies draws from numerous fields

of scholarship in order to produce more robust accounts for why environmental injustices occur and persist, for how human and nonhuman forces shape and are shaped by them, and for what environmental justice might look like. That is, the promise of CEJ Studies lies in its capacity to more fully explain the sources and consequences of our socioecological crises and develop more generative analyses of how social change efforts within and across species may meet those challenges.

Finally, CEJ Studies can aid scholars and advocates in thinking through a *redefinition of the concept of environmental justice itself*. Perhaps any discussion regarding the future of EJ Studies and the EJ movement might begin by connecting early EJ scholarship, which centers primarily around the intersection of social inequality and environmental harm, with the concept of *ecological justice*, which centers on the relationship of human beings to the broader nonhuman world. By the term ecological justice, I mean to suggest a more respectful and egalitarian relationship of human beings to one another and to the greater more-than-human world. This model of analysis and politics begins with humans taking responsibility for practicing transformative socioecological political work and extends to understanding inequalities within and across species and space to imagine and struggle for a more democratic multispecies world. Nonhuman species and ecosystems may not engage in politics the way humans tend to, but they can and do exert influence and power over the world (Bennett 2009): for example, consider the impacts of fossil fuels on the daily lives of human beings and on the political systems and economies of every nation on Earth. Ecological justice destabilizes the notion of the human as a biological category at the apex of a human/nature hierarchy and, instead, embraces it as a political category that engages with the broader ecological community. This model of politics also rejects the state as an arbiter of justice and inclusion. The state has managed, included, excluded, homogenized, and controlled humans and nonhuman natures for the benefit of a small elite. That should be reason enough to consider the merits of an anarchist or anti-authoritarian approach to socioecological change. Curiously, this concept of ecological justice closely mirrors and parallels the Principles of Environmental Justice—a sort of founding document of the U.S. EJ movement, suggesting that, in many ways, the EJ movement and EJ Studies have yet to catch up to the vision of the movement's founding principles, which are largely aligned with a CEJ Studies perspective.

In this paper, I applied a Critical Environmental Justice perspective to the phenomenon of the Black Lives Matter movement, demonstrating how attention to multiple categories of difference and inequality (including more-than-human species and the built environment); an emphasis on the role of scale as a way of understanding the violence of racism and the promise of resistance movements; a focus on linking the entrenched character of social inequalities with transformative, anti-authoritarian and anarchist perspectives; and an application of the concepts of racial and socioecological indispensability can produce an enriched account of that movement's core concerns, its limitations, and its possibilities. Black Lives Matter challenges the scourge of state-sanctioned violence against diversely constituted communities of African descent, with a primary emphasis on police brutality and mass incarceration. I argue that if we think of environmental racism as an extension of those state-sanctioned practices—in other words a form of authoritarian control over bodies, space, and knowledge systems—then we can more effectively theorize it as a form of state violence, a framework that is absent from most EJ scholarship.

Geographies of race and ethnicity II: Environmental racism, racial capitalism and state-sanctioned violence

Laura Pulido
University of Southern California, USA

Abstract
In this report I argue that environmental racism is constituent of racial capitalism. While the environmental justice movement has been a success on many levels, there is compelling evidence that it has not succeeded in actually improving the environments of vulnerable communities. One reason for this is because we are not conceptualizing the problem correctly. I build my argument by first emphasizing the centrality of the production of social difference in creating value. Second, I review how the devaluation of nonwhite bodies has been incorporated into economic processes and advocate for extending such frameworks to include pollution. And lastly, I turn to the state. If, in fact, environmental racism is constituent of racial capitalism, then this suggests that activists and researchers should view the state as a site of contestation, rather than as an ally or neutral force.

Keywords
environmental racism, racial capitalism, state violence

I Introduction

We need to rethink environmental racism. The environmental justice (EJ) movement arose in the early 1980s and over the last 35 years activists have succeeded at blocking both new projects and the expansion of existing ones. However, it is questionable if the environments of vulnerable communities have actually improved through EJ. There is compelling evidence that environmental disparities between white and nonwhite communities, what I call the environmental racism gap, have not diminished and that the situation may have worsened (Bullard et al., 2007). EJ scholars have hinted at why the movement has failed to achieve substantive results, including industry capture of the state (Faber, 2008; Lievanos, 2012; Holifield, 2007); state co-optation of EJ activists (Harrison, 2015); and a less oppositional EJ movement (Carter, 2014; Benford, 2005). Yet, I argue a fundamental problem characterizing both EJ activism and research is the failure to theorize environmental racism as a constituent element of racial capitalism. Numerous problems stem from not conceptualizing the problem accurately, including not giving sufficient weight to the ballast of past racial violence, and

Email: lpulid@gmail.com

assuming the state to be a neutral force, when, in fact, it is actively sanctioning and/or producing racial violence in the form of death and degraded bodies and environments.

My goal in this essay is to reposition environmental racism so that it is recognized as fundamental to contemporary racial capitalism. Although the environmental justice movement is global, I focus on the US. Besides originating in that country, it is in the US that EJ has most fully articulated a racial framework and relied heavily on the state. Hopefully other researchers will apply and modify this framework to other parts of the world as appropriate. Developing a more radical analysis of EJ places it in closer conversation with political ecology (Holifield, 2015; Heynen, 2015), the environmentalism of the poor (Nixon, 2011), and other radical streams emanating from the Global South. In addition, I hope to further acquaint geographers with research on racial capitalism coming from critical ethnic studies scholars, such as Jodi Melamed, Lisa Cacho, and John Marquez, as well as geography's own Ruth Wilson Gilmore. Although I focus on environmental racism, I believe other parts of the social formation share structural parallels that might benefit from a similar analysis.

In order to build my argument I first briefly demonstrate the limited gains of the EJ movement. I then consider how racial capitalism produces environmental racism by elaborating on three points. First, I emphasize the centrality of the production of social difference in creating value. Second, I review how the devaluation of nonwhite bodies has been incorporated into economic processes and advocate for extending such frameworks to include pollution. And lastly, I turn to the state. If environmental racism is indeed a function of racial capitalism, then the state immediately becomes problematic in new ways. This is crucial because in the US most activists and researchers are steeped in a liberal politics in which they work *with* the state. Instead, the state must become a site of opposition, as it sanctions racial violence. In order to move forward both as a movement and scholarly field, we must rethink environmental justice.

II The environmental racism gap

While nobody has compared the difference in environmental quality between white and nonwhite communities, numerous researchers have assessed the efficacy of state-based EJ initiatives. Key to understanding EJ efficacy is what I call the 'environmental racism gap'. Recent scholarship has called attention to 'environmental privilege', which seeks to problematize the environmental quality enjoyed by more privileged populations (Park and Pellow, 2011). In contrast, the environmental racism gap highlights the persistent *inequality* between white and nonwhite communities. This gap, which is manifest in practices, regulations, and outcomes, requires discerning between universal and EJ regulations. Universal regulations seek to improve the environment across the board, such as the Clean Air Act. Despite neoliberal deregulation (Faber, 2008), there has been some progress over the last 40 years. For example, researchers have documented significantly increased lung function in youth as air pollution has declined (Gauderman et al., 2015). In contrast, EJ initiatives are intended to protect vulnerable populations and address the problem of differential exposure, especially concentrations (Noonan, 2015). This requires different tools, often called environmental justice.

Below, I present some of the key avenues in which EJ activists have sought relief from the state (see Pulido et al., 2016, for a fuller discussion). Studies typically are narrowly focused in order to produce a rigorous and detailed analysis. Though such an approach is the norm and entirely appropriate, seen individually it obscures larger patterns. Seen collectively, however, it is difficult to escape the conclusion of failure.

The first arena in which activists have appealed to the state is through lawsuits. To date, eight EJ lawsuits have been filed based on the Equal Protection clause of the 14th amendment to the US Constitution. All have failed. The primary problem is the inability to prove discriminatory intent – a requirement of a 2001 Supreme Court decision (*Alexander v Sandoval*), which contracted the definition of discrimination. A second register is Title VI Complaints. Under the Civil Rights Act, public agencies receiving federal funds are prohibited from discriminating. As of January 2014, activists had filed 298 Title VI complaints with the EPA, yet only one has been upheld – a success rate of 0.3% (see also Deloitte Consulting, 2011; Mank, 2008; Gordon and Harley, 2005).[1] A third and distinct sphere of state engagement is Executive Order 12898. This order, issued by President Clinton in 1994, requires all federal agencies to consider the EJ implications of their activities. A 2003 Civil Rights Commission evaluation of the implementation of EO 12898 by the EPA, Housing and Urban Development, and the Departments of Transportation and Interior found that all four agencies had failed to fully incorporate EJ into their activities (see also Gross and Stretesky, 2015; Guana, 2015; Noonan, 2015).

A fourth site for the reproduction of environmental racism is regulatory enforcement. Though definitive assessments cannot yet be made, there is strong evidence to suggest discriminatory enforcement along racial lines, especially in Latina/o communities (Konisky, 2009; Konisky and Reenock, 2013; Lynch et al., 2004; Mennis, 2005).[2] Finally, EJ initiatives have been developed in over 30 states (Targ, 2005). These offer a microcosm into the consistent refusal and/or inability to reduce the environmental racism gap. This was apparent, for example, in California's Global Warming Solutions Act (AB 32), in which it was knowingly decided to continue allowing pollution concentrations' in vulnerable communities as part of a larger effort to reduce global warming (London et al., 2008, 2013; Lievanos, 2012).

III Environmental racism and racial capitalism

Failure on such a scale cannot be resolved by tinkering with policy. While geographers typically attribute such dynamics to neoliberalism (Faber, 2008; Holifield, 2007), this is only part of the story. For instance, what is the connection between court decisions that contract the definition of discrimination and neoliberalism? Pellow (2007) is one of the few to combine political economy and race in his analysis of transnational pollution, although Heynen (2015) has made some important moves in this direction. I build on Pellow's work as well as research from critical ethnic studies to argue that environmental racism is part of racial capitalism.

Ethnic Studies scholars have long grappled with the relationship between racism and capitalism (Barrera, 1979; Marable, 1983; Almaguer, 1994). Cedric Robinson coined the term racial capitalism in *Black Marxism: The Making of the Black Radical Tradition*. First published in 1983, he argued that racism was a structuring logic of capitalism. His work did not initially circulate beyond a small circle of scholars (e.g. Kelley, 1990; Gilmore, 2007), but the rise of critical ethnic studies (Márquez and Rana, 2015) has introduced a new generation to it. While this is new to some (Bonds and Inwood, forthcoming; Driscoll Derickson, 2014; Ruiz, 2015), there is, in fact, older geographic scholarship that sees capitalism as deeply racial (Wilson, 1992; Blaut, 1993; Woods, 1998; Gilmore, 2002). Thus, the ideas are not necessarily new. What *is* new is the term, the intellectual moment, and the political urgency. The time is ripe for a deep engagement with racial capitalism.

A focus on racial capitalism requires greater attention to the essential processes that shaped the modern world, such as colonization, primitive

accumulation, slavery, and imperialism. As McKittrick notes, 'the geographic management of blackness, race, and racial difference (and thus nonblackness) hinges on a longstanding but unacknowledged plantation past' (2011: 953). By insisting that we are still living with the legacy of these processes, racial capitalism requires that we place contemporary forms of racial inequality in a materialist, ideological *and* historical framework.

Dominant historical narratives of racism locate its origins in European colonization. Robinson (2000) challenges this notion by documenting its prior roots in Europe. This is key, because although he and others, such as Melamed (2015: 77), insist that, 'capitalism *is* racial capitalism', this historicization suggests that racism predates capitalism and therefore can be used by diverse economic systems, including colonization and slavery. Indeed, to treat colonization, for example, as solely an economic process is not to fully grasp its human impact, logic, or legacy (Said, 1979; Blaut, 1993; Fanon, 1965; Galeano, 1973; Blackhawk, 2008). We can never overlook the fact that racial ideology (along with guns) enabled colonization. Though conquest and domination were not always the sole motives, the elaborate ideology that constructed indigenous people as less than fully human was entirely necessary for the colonial project. Indeed, Smith (2012) has suggested the genocide is the core logic driving colonization. In the case of the US and other settler societies, colonization led to massive land theft, which was not only a form of primitive accumulation, but also became the basis of those countries' national territories at the cost of native nations (Hixson, 2013).

Earlier debates sought to reconcile racism and capitalism (Wilson, 1992; Barrera, 1979; Almaguer, 1994), but critical ethnic studies and its precursors insist that race cannot always be contained by capitalism (Omi and Winant, 1986; HoSang et al., 2012; Roediger, 2008; Lipsitz, 2006). Though racism has been and is deployed to facilitate maximum accumulation, racism can also exceed the desires of various fractions of capital. Consider the overt racism of the contemporary US Republican Party, which is arguably counter to the desires of much of multicultural corporate America (Melamed, 2011). Given the variability of racism to capitalism, I consider the production of difference and value as the most fundamental point of connection. Accordingly, this should be the starting point for EJ analyses.

I Producing difference and value

The centrality of value to capitalist production is well-known. But there are multiple ways of conceptualizing value, and by extension, differential value. Differential value refers to the production of recognized differences that result in distinct kinds of values. These differences in value become critical in the accumulation of surplus – both profits and power (Cacho, 2011; see also Gilmore, 2002). Just as uneven space is essential to the unfolding of capitalism (Harvey, 2001), human difference is essential to the production of differential value.

Relationality is key to the production of differential value (Cacho, 2012: 13). For example, whiteness derives its meanings and value from various forms of nonwhiteness, which Cacho and Barrett call a kind of negativity. Negativity is important because it 'forms the ground of possibilities for value' (Barrett in Cacho, 2012: 13). While this is familiar terrain for critical human geographers (Anderson, 1987; Kobayashi and Peake, 1994), it is rarely reflected in empirical geographic work. Instead, most of us examine racial outcomes without considering racial production. Analyzing racial production is not merely a theoretical exercise however. Rather, it informs how a problem is conceptualized, and thus shapes political strategy. Indeed, focusing on a particular racial/ethnic group, rather than racial capitalism, per se, may lead to improved conditions for some,

while overlooking capitalism's incessant need to actively produce difference *somewhere*.

> Capital can only be capital when it is accumulating, and it can only accumulate by producing and moving through relations of severe inequality among human groups – capitalists with the means of production/workers without the means of subsistence, creditors/debtors, conquerors of land made property/the dispossessed and removed. These antinomies of accumulation require loss, disposability, and the unequal differentiation of human value, and racism enshrines the inequalities that capitalism requires. (Melamed, 2015: 77)

By theorizing the racialized production of differential value, racial capitalism illuminates not only the inevitability of environmental injustice, but the structural challenges facing activists.

2 Operationalizing nonwhite devaluation

Theories of racial capitalism highlight how racial difference is produced and how that relative valuation gets operationalized. This means not only how ideas and practices of devaluation circulate, but how they become institutionalized, and the implications for the racially subordinate and dominant. There are many ways racism can be harnessed by economic processes. I will mention two that are widely-acknowledged as manifestations of racial capitalism: land and labor.

Land is thoroughly saturated with racism. There are at least two primary land processes to consider: appropriation and access. Appropriation refers to the diverse ways that land was taken from native people, as previously mentioned. Once land was severed from native peoples and commodified, the question of access arose, which is deeply racialized. Numerous laws and practices reserved land ownership for whites. Indeed some groups, such as Asians, actually lost land they once owned (Ruiz, 2015; Curry, 1921).

Differential value is also produced and extracted via racialized labor systems – black chattel slavery being one of the most profound examples. Smith (2012) asserts that slavery is one of the key logics of white supremacy: the ability to commodify human beings. Understanding slavery's history and ballast enables us to appreciate the extent to which devalued black bodies, to paraphrase Ta-Nehisi Coates, have financed both whiteness and the American Dream (2015: 132), and I would add global white supremacy (da Silva, 2007). Recent research reveals the economic contributions of slavery to the US economy and infrastructure, as well as the extreme violence necessary to maintain such a system (Baptist, 2014; Johnson, 2013; Wilder, 2013; for a critique, see Hudson, 2016). Upon slavery's conclusion, numerous legal and de jure forms of labor discrimination and exploitation limited the life chances of nonwhite workers while boosting the opportunities and status of white ones (Roediger, 1991). Dual-wage systems, racially-exclusive labor unions, racialized divisions of labor, share-cropping, and related practices ensured a vulnerable supply of low-wage workers (Barrera, 1979; Saxton, 1995; Almaguer, 1994; Kelley, 1990; Woods, 1998). Racialized economic policy has amplified these effects, as seen in the 1935 National Labor Relations Act's limited protections for occupations dominated by African American, Mexican, and Asian workers. More recently, Gilmore (2007) has shown how the problem of surplus labor, which is disproportionately nonwhite, has been 'solved' by the rise of the prison industrial complex.

Just as labor arrangements and economic and social policy are constituitive of economic formations, so too are ecologies of resource extraction, processing, and disposal. Many EJ policies and scholarship conceptualize both racism and waste practices as externalities, rather than as fundamental to the very fabric of racial capitalism. Yet if racism is continually creating differential value, it is only logical that capital (and

other nondemocratic economic systems) would incorporate this uneven geography of value into its calculus. As Pellow has noted,

> the production of social inequalities by race, class, gender, and nation is not an aberration or the result of market failures. Rather, it is evidence of the normal, routine, functioning of capitalist economies. Modern market economies are supposed to produce social inequalities and environmental inequalities. (2007: 17)

Industry and manufacturing require sinks – places where pollution can be deposited. Sinks typically are land, air, or water, but racially devalued bodies can also function as 'sinks'. Taking this a step further, Moore (2015) has argued that capitalism is a way of organizing nature. Specifically, capitalism functions by restructuring nature. And since humans are nature, we must recognize that capitalism is reproducing itself by restructuring humans on a cellular level. This has nothing to do with malicious intent (Pulido, 2000) and other liberal conceptions of racism. Rather, this is capital acting upon a larger differential valuation (Pellow, 2007), or, in the recent case of lead-contaminated water in Flint, Michigan, the neoliberal state, both of which are part of the 'ecology of capitalism' (Moore, 2015).

3 Environmental racism as state-sanctioned racial violence

This brings us to the state. If environmental racism is part of racial capitalism, then its regulation becomes the province of the state. Kurtz (2009) has observed that the racial state has been overlooked by EJ scholars. Fortunately, researchers have begun analyzing state programs and practices, showing how the state needs to be problematized (Holifield, 2007; Harrison, 2015; Konisky, 2015). Earlier I presented literature indicating that the state has not seriously sought to intervene in the environmental racism gap. Indeed, the state is deeply invested in *not* solving the environmental racism gap because it would be too costly and disruptive to industry, the larger political system, and the state itself. Instead, the state has developed numerous initiatives in which it goes through the motions, or, 'performs' regulatory activity, especially participation (London, Sze, and Lievanos, 2008; Kohl, 2015), without producing meaningful change. The problem is not a lack of knowledge or skill, but a lack of political will that must be attributed to racial capitalism. Environmental racism must be seen in the context of a long line of diverse forms of state-sanctioned violence that facilitates racial capitalism.

The fact that it is disproportionately people of color who are bearing the burden of industrial pollution enables industry to continue despite a mounting death toll. Márquez calls this devaluation of people of color a 'racial state of expendability', which he describes as '[a] fundamental and existential life devaluation, a perpetual susceptibility to obliteration with legal impunity' (2013: 44). This concept illuminates how racism underwrites industrial activity not only through profits, but also through subsidized goods and services for all. Legal impunity is key, as it helps explains why there is no meaningful action to address the environmental racism gap which, in turn, underscores the centrality of environmental racism to racial capitalism. As scholars are beginning to show – the state refuses to implement *meaningful* initiatives in order to maintain racial capitalism. Capital does not have to actually address environmental justice issues because it knows there will be minor, if any, sanctions. Indeed, bureaucrats seek to avoid the anger of conservatives by not enforcing the law (Kates, 2014). The state is not about to dismantle this 'ecological service' that allows firms to remain competitive in the global marketplace. When we put together these two facts – the devaluation of people of color, plus capital acting with legal impunity – environmental racism must

be understood as state-sanctioned racial violence.

So what does this mean for EJ? There are implications for both scholars and activists. In terms of activism we need to change how we view the state and our relationship to it. Far too often the state is seen as an ally, or neutral force. Indeed, even when people lose faith in the state, they often still turn to it because there is no other apparent alternative. Much of the EJ movement has become too implicated in the state itself. What is needed is to begin seeing the state as an adversary that must be confronted in a manner similar to industry. This suggests a two-pronged struggle, against both polluters and the state, which will certainly not be easy.

For researchers, our task is not only to develop a research agenda that recognizes the degree to which environmental racism is a function of racial capitalism, but one that is also linked to the needs of vulnerable communities. Environmental racism will not be solved by a research agenda that reaffirms the boundaries and frameworks established by the Environmental Protection Agency. Indeed, we should help expose the fraudulent nature of the state, how it has sought to co-opt EJ communities, its support of racial capitalism and its willingness to forsake poisoned communities. Together, we can generate new strategies to rebuild a movement that truly works towards environmental justice.

PREFACE

In Search of Treasure

In early August of 1864, a contingent of thirty-six U.S. soldiers, led by an army captain named John Thompson, left Fort Defiance in the northeastern corner of Arizona Territory and trudged north under the hot sun through the sprawling homeland of the Navajos. Diné Bikéyah, as Navajos call their land, spreads over mountain ranges, arid plateaus, and desert lands across what is now the Four Corners region of the United States where New Mexico, Arizona, Utah, and Colorado meet. Captain Thompson and his men were not the only military personnel traipsing through Navajo country—not by a long shot. He and his men were merely a small part of a much larger U.S. military campaign commanded by one General James Carleton, a ramrod straight military man who loved the "frontier" and despised the Navajos, and carried out by the famous scout-turned-army colonel Christopher "Kit" Carson. The larger U.S. campaign had one goal: to rout the Navajos from their homeland and march them some 300 miles southeast to Fort Sumner, which was, for all intents and purposes, a military concentration camp. The Diné, as Navajos call themselves, were known throughout the Southwest for their long and storied history of resistance to colonial invaders, a reputation (and reality) that the U.S. colonizers found none too pleasing.[1] Additionally, settlers in New Mexico and Colorado were keen to discover whether Diné Bikéyah was as rich in mineral resources as it was rumored to be; the age-old colonial apologia for conquest, it seems, was just as alive in 1864 as it had been in 1492, when Columbus wrote back from the New World to Spain that he had discovered a land with a marvelous abundance of minerals, metals, and mines.

Captain Thompson had, by that August of 1864, already proven himself up to the task of forcibly removing the Diné from their homeland. The previous March, he had rounded up 2,400 Diné on behalf of Colonel

Carson, and led them in a forced march to Fort Sumner, a journey dubbed "the Long Walk" by Navajos. In those early weeks of August, however, Thompson's mission was of a different sort. He and his thirty-six men headed straight from Fort Defiance to the deep gorge at the heart of Diné Bikéyah—Tséyi' or Canyon de Chelly,[2] the now-famous canyon lined with swaying cottonwoods and pockmarked with ancient Pueblo ruins.[3] As Thompson and his men marched through the canyon, digging here and there for the pools of fresh water running just below the surface of the sandy canyon floor, they engaged in a fierce, and roundly victorious, battle against an unlikely enemy: the peach orchards that had been cultivated over hundreds of years by Diné families. In the course of his march, Thompson and his soldiers felled a remarkable 4,150 fruit-bearing peach trees and, for good measure, "effectually destroyed" at least eleven acres of corn and beans. Oddly, these binges of violence against Navajo peaches, corn, and beans came *after* the majority of Diné in the area had already surrendered to the army, following an aggressive and violent campaign for their removal from the canyon.[4] In fact, an expedition six months earlier, led by Captain Asa Carey, had declined to destroy the Canyon's peach orchards precisely because most of the Diné in this area had already surrendered—to put it simply, there was no point in ruining the food supplies of people who were no longer there. Yet the army's desire to make war against the peach trees endured even after Thompson's campaign. Not long after Thompson returned to Fort Defiance, leaving a trail of rotting peaches in his wake, a third group of soldiers was sent into Canyon de Chelly under the leadership of Captain John Butler, slashing another 1,000 trees to the apparent satisfaction of his superiors.

We can ask, of course, just what it was about these peach trees, corn stalks, and bean plants that invited such unnecessary violence, such "systematic eradication" of fruits, grains, and legumes.[5] Historian Peter Iverson muses, "perhaps the army simply wanted to remove evidence that contradicted the image of Navajos as full-time nomadic wanderers," which had provided the (quite effective) rationale for their removal in the first place.[6] Perhaps, too, the orchards and fields evidenced a Diné proficiency at agriculture in the high arid climes of the New Mexico territory that surprised Americans who expected Navajo country to be useless for agricultural purposes, a sprawling wasteland described in 1868 by William Tecumseh Sherman, the general of Union Army fame, as "utterly unfit for white civilization."[7] It is not implausible to venture a guess that these binges of violence against peach trees occurred as proxy to settler and soldier frustrations about the newly conquered Southwest and the challenges it presented to American notions of what good agricultural land should look like. Indeed,

ideas about landscape and people, throughout this notorious removal campaign, served as the primary and most powerful impetus for colonial violence against people and peaches alike. Notions that the Colorado Plateau was uninhabited wasteland unfit for farming draw us quite a clear map of how we get from Thompson and his vexed tree felling to more contemporary cases of the interplay between nature, people, colonization, and power.

In this book, I explore the ways in which resources come to enact, enable, and sometimes embody colonial relationships between the U.S. settler colonial state and Native nations, focusing on the ways in which discourses about lands and the peoples who inhabit them shape how colonial violence occurs. In Captain Thompson's expedition, peach trees played a significant role in how the U.S. military sought to subdue the Navajo landscape, which military personnel and white settlers often took to be desert, deserted, and agriculturally barren (but potentially rich in minable resources). The primary focus of this book, uranium mining on Navajo land, takes us a century past Captain Thompson's expedition, but the themes crystallized in his assault on peach trees, corn stalks, and bean plants remain ever present. The power exerted over environmental resources, and the ways in which those in power construct knowledge about landscapes, are a central part of how what we now call social injustices are produced. In this work, I bring together environmental history and environmental justice studies to build what Sylvia Hood Washington calls an *environmental justice history* of uranium mining: a history undertaken with an eye toward building environmentally and socially just futures.[8] This does not mean only giving a more detailed historiography of how uranium mining, and indeed the relationship between the United States and the Diné and their land, developed over time. It also means to situate environmental injustice in larger historical context and to think historically about the role of this story—and how it is told—in shaping how we understand the relationships between coloniality, nature, and, ultimately, decolonization.

Diné Bikéyah is mapped by the Diné as being situated within four sacred mountains: Tsisnaajinii (Blanca Peak) to the east, Tsoodzil (Mount Taylor) to the south, Dook'o'ooslíid (San Francisco Peak) to the west, and Dibe' Ntsaa (Mount Hesperus) to the north.[9] Ranging from the solidified lava flows of Yé'iitsoh Bidił (El Mapaís National Monument) to the forested Ch'óóshgai (Chuska) mountain range, to the stark red rock formations of Tsé bii'nidzisgai (Monument Valley), this landscape contains a remarkable diversity of ecosystems as well as plant and animal life. Currently, the Navajo Nation encompasses more than 25,000 square miles of land, on which more than 170,000 Diné live, while an additional 130,000 Diné live in other parts of the United States.[10] The Diné emerged into this land, the

fifth world, from worlds below, bringing with them the *dzilleezh*, or mountain soil, that would make up the four sacred mountains.[11] In their long tenure within these four mountains, the Diné maintained agricultural and sheepherding practices that sustained their large population, migrating seasonally through Diné Bikéyah in a way that maintained spiritual and environmental *hózhǫ́*, or "balance, beauty, harmony, health."[12] In a very strong sense, the Diné are a land-based nation: their culture, history, geography, religion, and economy are derived from a particular landscape (Diné Bikéyah) and set of natural resources. These connections to landscape are both deeply rooted and evolving.[13] The peach orchards of Canyon de Chelly, laid to waste by Thompson and his contemporaries, exemplified the Navajo proficiency in using pastoralism to maximize the environmental resources of their land: while only roughly 300 denizens of the canyon country lived in the canyon year-round, each fall Navajos would travel from all over Diné Bikéyah to attend the peach harvest,

FIGURE 1. Diné Bikéyah comprises the land within the four sacred mountains, as well as what are sometimes called the four sacred rivers (the Rio Grande River to the east, the Zuni River to the south, the Little Colorado and the Colorado Rivers to the west, and the San Juan River to the north). Marsha Weisiger, *Dreaming of Sheep in Navajo Country* (Seattle: University of Washington Press, 2011), 62.

distributing the fruit—a food source and a commodity—among a wide swath of the Diné population.[14]

The relationship of the United States to Diné Bikéyah has most consistently been organized around resources: the desire for them, the management of them, the perceived dearth of them in this high, arid landscape. Indeed, from the onset of formal U.S. relations with this land, when U.S. troops invaded in 1846 to seize the northern third of Mexico's territory, the Diné were seen primarily as a problem in direct relationship to resources. Navajos were perceived as ruthless and violent raiders, who made their living by stealing livestock and crops from nearby Pueblo and Nuevomexicano settlements. The subtext, frequently, was that Diné land was not of high enough quality to support the Diné people. They had to steal to survive, and they were happy, it would seem from U.S. accounts, to do so. The complex relationship of Diné to their resources and land base, cultivated over centuries of experience, was rarely if ever in evidence in hegemonic historical narratives.[15]

The history of changing constructions of Diné land and resources is embedded in the very etymology of the name "Navajo." Spanish explorers and settlers were the first to call the Diné "Navajos"—although the Diné have adopted the name and often use it interchangeably with "Diné," "Navajo" has no origin in the Diné language. Most scholars attribute the adoption and use of "Navajo" by the Spanish to Franciscan friar Alonzo Benavides's 1630 reference to the Diné as the "Apaches de Navahu" in his *Memorial to the King of Spain*.[16] Benavides and his fellow Spaniards borrowed "Navahu" from the nearby Tewa-speaking Pueblo tribes, for whom the word meant "large area of cultivated fields," a reference to Diné reliance on and talent for agriculture as well as sheepherding. In the twentieth century, however, scholars began to question the veracity of this etymology for "Navajo," some arguing that "a more likely claim" for the name's origin "is made for a Spanish derivation," from the Spanish "nava, meaning flat piece of land, plus the suffix ajo," lending the name a "depreciative" air in which "Navajo would mean a large, more or less worthless field."[17] A handful of years later, Clyde Kluckhohn and Dorothea Leighton concurred, making reference in their influential 1947 monograph *The Navaho*, to "some support for deriving 'Navajo' directly from the Spanish in the sense of . . . a large, more or less worthless, flat piece of land."[18]

The social construction of the high, arid landscapes of the Southwest as "more or less worthless" has been a fundamental component of colonization of the Diné, as well as other southwestern and Great Basin tribes.[19] In fact, the inhabitation of dry, arid landscapes by Native nations was used as evidence of their low status on the Western hierarchy of civilization,

following a kind of environmental determinism that posited that "barren" landscapes supported villainous and savage peoples. In his 1849 reconnaissance survey of Navajo country, for example, Lieutenant James Simpson wondered whether his contemporaries were correct in assigning the blame for "the curse of barrenness" of land to "the wickedness of the people who inhabit it."[20] Classic Western histories resurrect the image of the Navajos as "wicked" people on a "barren" land; as Diné historian Jennifer Nez Denetdale points out, Navajos have consistently been portrayed as a vicious people who relied almost exclusively on raids of nearby Spanish villages for sustenance.[21] Historians and archeologists have roundly debunked this mythology surrounding the Navajo practice of raiding and its presumptions about the poverty of Diné land leading to a need to steal to survive. As ethno-archeologist Klara Kelley notes, Navajo raids on Mexican settlements were almost always undertaken as retribution for the lively trade that existed in northern New Mexico for Navajo slaves, supported by the Spanish and then Mexican colonial governments and continuing into the period of U.S. colonization after 1848.[22] Cebolleta, the oldest settled land grant community in the borderlands of Diné Bikéyah, had particularly well-known Sunday slave markets, specializing in the sale of Diné women.[23] Kit Carson himself had three Navajo children in his household, two of whom had been purchased from slave parties.[24]

The power of thinking about Navajos as violence-prone nomads and of their land as barren desert country was in evidence not four years after Thompson's march into Canyon de Chelly, when the horrendous conditions at Fort Sumner compelled U.S. military leadership to admit that the camp was a failed experiment in Indian policy. Between their removal in 1863 and the closure of Fort Sumner in 1868, the interned Navajo population went from 12,000 to 9,000 people; the 3,000 who died in the camp perished largely from starvation, malnutrition, untreated infections, and interpersonal violence. The surviving Diné were to return to Diné Bikéyah, and General Sherman, who made the final decision to permit the Diné to return to their homeland, did so believing that he was sending them to what he considered, as one historian put it, a "waterless worthless waste"—certainly not the kind of land, we would imagine, that would support fine orchards of thousands of fruit trees and scores of acres of beans and corn.[25] In fact, upon returning to Diné Bikéyah, the Navajos of Canyon de Chelly masterfully regrew their orchards and, by the 1880s, were harvesting peaches once more.

Before allowing the Diné to return to their homeland General Sherman made an ominous prediction. The Navajo claims to their homeland, he believed, would, "sooner or later, be interfered with by people from Colorado

and New Mexico in search of treasure."[26] Sherman was eventually proven partly correct and partly mistaken. Over the course of the next century and a half, prospectors and mining companies made repeated incursions into Diné life, interfering, to be sure, with Navajo connections to their homeland. A rapid succession of energy resources, ranging from oil to hydropower and from coal to uranium, and other in-demand metals, such as vanadium, shaped the twentieth-century relationship between the United States and the Navajo Nation. In the 1920s, the discovery of oil on Diné Bikéyah led to the formation of the first federally recognized Navajo governing body, which was needed to approve oil leases.[27] In the 1930s, Navajo sheepherding was seen as a potential barrier for successful completion of the Hoover Dam, which would go on to provide hydroelectric power to the cities of California and the Southwest. Thus ensued a mass roundup and slaughter of Diné sheep, goats, horses, and cows. Intensive coal mining on and around Navajo country began in the 1960s and continues to be a hotly contested industry with high stakes for Navajo people in terms of both economic development and environmental health. Hundreds of billions of dollars in coal profits have gone to coal companies, rather than to the tribe or families forced off their lands by coal companies. Coal mines and power plants have produced catastrophic environmental problems, and wrangling over coal mining rights has resulted in major struggles over land and environmental quality.[28]

Uranium mining, the subject of this book, has likewise had a massive impact on the Diné and their land. Within the four sacred mountains, the radioactive ore was mined between 1942 and the mid-1980s, first for the secret Manhattan Project and then for the Atomic Energy Program. Currently, renewed interest in nuclear energy has kickstarted what is being called the "new uranium boom." Uranium companies have increased pressure to open new mines and reopen old mines in environmentally sensitive and tribally sacred areas, from the Grand Canyon to Tsoodzil (Mount Taylor), the sacred Diné mountain of the south. In the course of nearly five decades of uranium mining and milling in and near the Navajo Nation, over 2,500 mines employed more than 3,000 Diné. As they provided the labor that in turn provided more than half of the country's domestic uranium reserves, Navajo miners and millers were often relegated to the lowest paid, least protected positions.[29] Increasing evidence, already well known in the early 1940s, of uranium's toxic effects on miners' lungs was actively kept from the miners and their families.[30] The largest spill of radioactive waste in the United States took place on July 16, 1979, when 93 million gallons of radioactive waste was released from a mill site into the Río Puerco. All the while, the primary incentive for the Navajo Tribal Council to

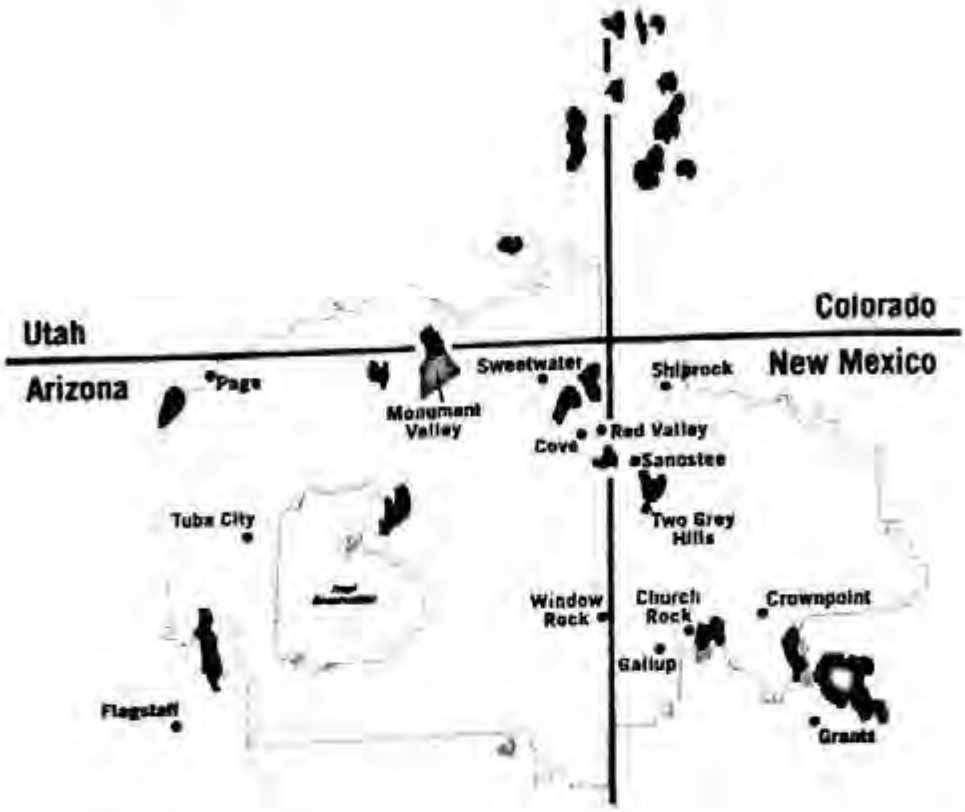

FIGURE 2. Areas of major uranium activity on and near the Navajo Nation from 1942 to 1985 are shown here in black. Doug Brugge, Timothy Benally, and Esther Yazzie-Lewis, *The Navajo People and Uranium Mining* (Albuquerque: University of New Mexico Press, 2007), 28.

permit uranium mining on their land, economic development, was never realized in large part because royalties for uranium ore obtained from tribal lands were kept artificially low.[31] The devastating environmental and human health conditions that ensued from these decades of uranium mining have been at the center of struggles over resource extraction and environmental injustice in Diné Bikéyah.

Despite these repeated incursions into Navajo land and life for the purposes of resource extraction, these incessant interferences "by people in search of treasure," the Diné have consistently contested and resisted colonial imposition and environmental violence. Diné environmentalist and environmental justice organizations have worked on a wide range of issues and had considerable success. In 1979, Navajos together with a coalition with other New Mexico indigenous activists, as well as white and Chicana/o activists, organized a three-day occupation of Tsoodził (Mount Taylor) to protect the mountain from renewed uranium mining. In 1988,

Diné activists successfully blocked the siting of a toxic waste incinerator in Dilkon, Arizona, forming Diné Citizens Against Ruining Our Environment (Diné CARE), an organization that has been internationally recognized for its rigorous work on behalf of grassroots environmental justice.[32] In 1990, with considerable participation from Diné CARE, Navajos hosted a national meeting of indigenous activists that went on to become the Indigenous Environmental Network (IEN), an organization with powerful influence in environmental justice struggles worldwide. Several long-standing groups, such as the Eastern Navajo Diné Against Uranium Mining (ENDAUM), the Dooda (No) Desert Rock Committee, and the Multicultural Alliance for a Safe Environment (MASE), have made considerable progress in preventing new environmental incursions by mining industries on and near Diné land. The work of organizations like these, and the legacy of Diné environmental activism, lends support to a Navajo Nation Council moratorium on uranium mining that was put in place in 2005. By working with and leading local and transnational environmental justice and indigenous sovereignty movements, these organizations chart the ways in which the local and global are intimately intertwined in struggles over the environment, indigenous nations, and natural resources. This work contradicts long-standing notions that the colonial desire for Navajo resources would *ever* go uncontested by a people who draw on centuries of labor to maintain their connections to their land.

INTRODUCTION

Sacrificial Land

> The Colorado Plateau was one of the last areas in the United States to be developed economically. Before the 1880s it was virtually empty except for Indians.
>
> —ROBERT DURRENBERGER, *ANNALS OF THE ASSOCIATION OF AMERICAN GEOGRAPHERS*, 1972

Empty Except for Indians: Wastelanding, Race, and Space

Long before uranium was commonly known for its associations with both nuclear power and nuclear bombs, and long before atomic power took hold of the American public imagination as a fearsome signifier of new human relationships to technology, to the environment, and to each other, uranium was mostly considered waste. Miners came across it when they blasted apart carnotite, a composite rock that can often be recognized by characteristic streaks of red, black, and bright yellow, to get at the real prize: vanadium, which was used to strengthen steel alloys in a range of products, from automobile parts to gun barrels.[1] Vanadium alloys were integral to the design of the Ford Model T, Henry Ford claiming to have discovered vanadium's uses while sifting through the innards of a wrecked French racecar.[2] The peak of vanadium's marketability came during World War II, when the federal government formed the Metals Reserve Company to encourage metal mining for war armaments. Vanadium, it turned out, was a highly sought-after ingredient of President Roosevelt's arsenal of democracy. In the vanadium mines scattered throughout Arizona, New Mexico, Utah, and Colorado, carnotite rock was blasted apart, the vanadium recovered, and the rest of the rock—uranium included—thrown into piles of waste

materials (more commonly called *tailings*). Sometimes the uranium from these mines was salvaged for use in glazes for dishes and glassware, which were manufactured and sold everywhere from Woolworth's to Tiffany's.[3] Uranium oxide glazes were responsible for the orange-red color of the popular Fiestaware dishes. Uranium, like vanadium, could have been used to strengthen steel alloys but was much too costly. Manufacturers were hard pressed to find a use for uranium that was "of a sufficiently distinctive character to make it a commercial product."[4] In 1917, when the global market for radium hit its pre–World War II peak and uranium's radioactivity was discovered, a white trader to the Navajo Nation named John Wetherill hauled some uranium-bearing carnotite ore to Flagstaff, Arizona, to be sent to France for Marie Curie's radiological experiments.[5] By 1920, an Arizonan named John Wade was operating a company called Carriso Uranium Company, which had forty claims in the eastern Carrizo Mountains, mining both vanadium and uranium.[6]

Mostly, though, the uranium was tossed.

That changed forever on October 9, 1941, when President Roosevelt held a secret meeting to deputize the Army Corps of Engineers to take on an atomic program. What came to be known as the Manhattan Project was charged with the development of an atomic bomb, using an element radioactive enough to render it "unsteady as a reeling drunk": uranium.[7] The Manhattan Project sought domestic supplies of uranium from the only source of which it was aware, the vanadium mines in and around the Navajo reservation. With that, uranium went from being a waste by-product of vanadium to the most sought-after ore of the twentieth century.

By 1945, when newspaper headlines blared declarations that unmasked the secret Manhattan Project, like that of the *Santa Fe New Mexican*—"Los Alamos Secret Disclosed by Truman: Atomic Bombs Dropped on Japan"—the government had acquired roughly 10,000 tons of fissionable uranium.[8] Most of that tonnage, however, had been shipped in from foreign sources, a process that was both expensive and fraught with potential security risks.[9] Only 15 percent of the ore had come from the continental United States, much of it secreted from the vanadium mines on and near the Navajo reservation and pulled from vanadium tailings piles.[10] Between 1943 and 1945, an estimated 44,000 pounds of uranium were secretly recovered from Vanadium Corporation of America (VCA) East Reservation Lease area—the site of John Wade's Carriso Uranium Company claims in the Carrizo Mountains.[11] Monument Valley mines, also run by VCA, provided an additional 489 tons of ore.[12] Despite these sources, and despite stepping up its exploratory drilling on the Colorado Plateau to a rate of 200,000 feet per year, the AEC "continue[d] to receive most of its uranium from the

Belgian Congo and Canada."[13] "Our own country," the commission conceded in 1949, "has produced little uranium."[14]

Half a century later, Diné land hosts upward of 2,000 now-abandoned uranium mines, mills, and tailings piles, in which over 3,000 Navajo miners wrenched and blasted raw uranium ore from the ground and then processed it into yellowcake. Abandoned mines sit open, poorly covered, or insufficiently marked.[15] Radioactive tailings piles litter the Navajo landscape, leaching radon gas into the air and water and scattering radioactive debris throughout the ecosystem.[16] In addition to being radioactive, these piles are littered with other toxic contaminants, including arsenic, vanadium, and manganese. The combined environmental contamination of mines, mills, and tailings piles has caused dramatic problems for the water quality of a landscape where water is already in short supply. Expensive water pipelines have yet to be built to serve the estimated 30 percent of Diné people who live near and use unregulated water sources, many of which are contaminated with uranium or arsenic.[17] Homes have been built out of debris from mines, including chunks of rock blasted into neatly squared-off blocks, often at the encouragement of mine operators. These "hot homes" were occupied by multiple generations of families before someone thought to test them for radiation.[18] The U.S. Environmental Protection Agency (EPA) has identified nearly 800 structures and residential areas contaminated with uranium; fewer than forty of the structures had been demolished as of 2014, and only seventeen of those demolished had been rebuilt.[19] Whereas most of the mines were closed by the mid-1980s, when uranium was no longer profitable, a rise in uranium prices has led to a new uranium boom since 2005. The Navajo Nation, still grappling with environmental and human health disasters from its first three decades of experience with the uranium industry, responded by passing the Diné Natural Resources Protection Act (DNRPA) in 2005, which placed a moratorium on new mines in Navajo country. Companies seeking permits to mine in the uranium-rich eastern borderlands of the reservation have denied that the land in question can be considered "Indian Country" despite being overwhelmingly populated by Navajos and being formally represented in the Navajo Nation government.[20]

Although there was ample evidence by the 1950s of the deadly nature of uranium mining, particularly because of the risk of lung cancer, miners were not informed of these health risks, nor were they provided adequate protection from them. High death rates among miners in the uranium-rich Erz Mountains on the border of Germany and the Czech Republic were reported as early as the mid-1500s. As the U.S. Public Health Service itself reported in 1952, "it has been known for centuries that the [Erz] miners

die in the prime of life with symptoms of damaged lungs."[21] From the late nineteenth century on, uranium was identified as the primary culprit in these high death rates, and by the 1930s Erz miners experienced a mortality rate of up to 70 percent, largely due to lung cancer.[22] Further suggesting the deadly nature of radiation exposure, Marie Curie herself died of radium poisoning in 1934.[23] By 1952, radon, a radioactive gas released in the uranium mining process, had been singled out as the primary culprit in these elevated lung cancer rates among miners, although other health problems, including silicosis, tuberculosis, pneumonia, and emphysema, also contributed to high death rates for miners.[24] These discoveries, however, did not lead to changes in mine safety for workers or for the people living near uranium districts.

Rates of lung cancer and respiratory disease have skyrocketed for the Diné, a population described as recently as the 1950s by public health experts as being "immune" to lung cancer.[25] By the mid-1980s, researchers found astronomical rates of cancer deaths among former uranium miners. Miners contracted lung cancer at rates 56 times higher than the national average, and had an average life expectancy of only 46 years.[26] Rates for stomach cancer were 82 times the national average. Miners were more than 200 times more likely to get liver cancer, almost 50 times more likely to get prostate cancer, and over 60 percent more likely to have cancers of the bladder or pancreas.[27] Nor were cancers the only health problems among former miners and their families: researchers also found increased incidents of tuberculosis, fibrosis, silicosis, and birth defects, all linked to exposure to uranium from mines and mills. Radiation-related diseases are now endemic to many parts of the Navajo Nation, claiming the health and lives of former miners to be sure but also those of Navajos who would never see the inside of a mine. Diné children have a rate of testicular and ovarian cancer fifteen times the national average, and a fatal neurological disease called Navajo neuropathy has been closely linked to ingesting uranium-contaminated water during pregnancy.[28] Studies have also found that uranium has genotoxic and mutagenic effects; that is, uranium poisoning can change the genetic material of a chronically exposed population, even further expanding uranium's influence on future populations in ways that are yet unknown.[29] While studies have long suggested a relationship between congenital defects and uranium exposure, a Navajo Birth Cohort Study seeks to measure outcomes for 1,500 Diné newborns in highly contaminated parts of the Navajo Nation.[30]

When uranium remains encased in carnotite rock and in underground ore bodies, it poses little threat to human health or to the environment. Clearly, once released its impacts have been catastrophic. Moreover, one

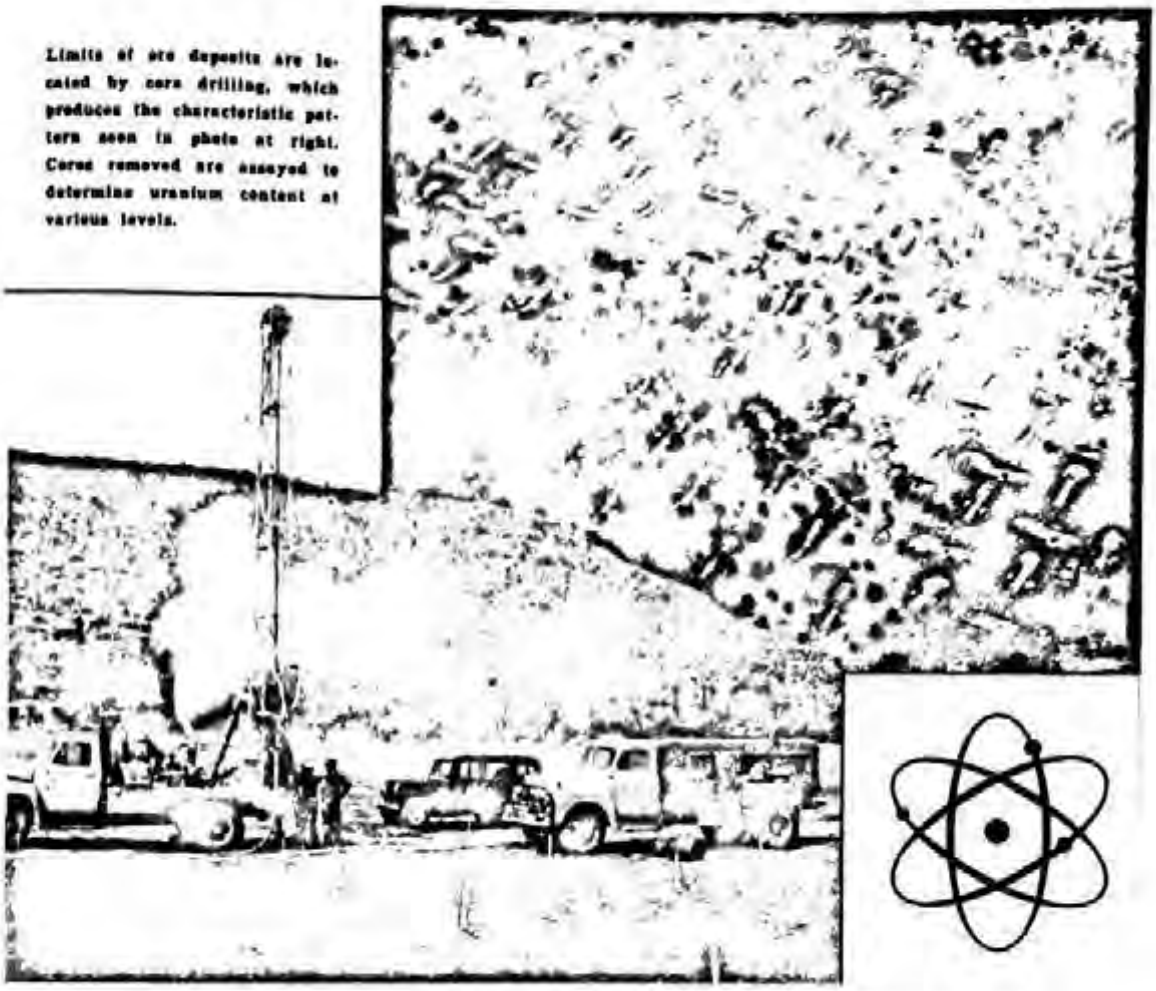

FIGURE 3. The aerial photograph at the top right shows the patterns created on the landscape as core drilling holes pockmark potential mine sites. The ore samples removed from these holes were then tested to determine their uranium content. The image at the bottom left shows a core drilling crew hard at work. of the most problematic components of the struggle for justice over nuclearism has been that, except in extreme circumstances, the ill effects of radiation exposure take ten, fifteen, sometimes twenty years, and sometimes multiple generations, to manifest. This makes uranium mining in Diné Bikéyah a kind of "slow violence" or "delayed destruction" that emerges over time.[31] In uranium country, which, like so many mining industries, is governed by the rule (or lack of rules) of boom and bust, this has meant that by the time many miners got sick, the companies that employed them were long gone. Now, the responsibility for cleaning up mine and mill sites

has been taken on by the Navajo Nation itself. Of the six regions of the Navajo Nation that host the highest concentration of abandoned uranium mines, the Navajo and federal EPAs have prioritized the most heavily contaminated: the eastern borderlands, near the communities of Church Rock and Crownpoint, New Mexico; the area surrounding Cameron, Arizona, in the southwestern corner of the Navajo Nation; Monument Valley in the north; and the area surrounding Cove, Arizona, where mines are scattered across the Chuska Mountains and Red Valley. Now, three decades after the uranium market hit a precipitous decline in the Southwest and the last mines operating on the Navajo Nation were shuttered, life-saving cleanup of abandoned mine sites is only recently underway.[32] Before cleanup was even considered by federal agencies, Navajo families and the Navajo Nation spent decades seeking recognition of the very real connections between uranium mining and the environmental health impacts with which they lived.[33]

The state of environmental and human health problems in the Navajo Nation as a result of the uranium industry, and the fact that uranium was so disproportionately mined on and near Native land, makes this a clear-cut case of environmental racism, which occurs whenever communities of color are disproportionately exposed to or deliberately targeted for environmental harm.[34] Examples of environmental racism are diverse and varied: to name just a few, there are the petrochemical processing facilities that share fence lines with historically African American communities in Louisiana; the overwhelming tendency of toxic waste facilities to be located in and near African American, Latino, Asian American, and Native communities; and the "food deserts" in inner cities, where fresh produce cannot be found for miles.[35] The basic premise behind environmental justice as a social movement and as a field of academic inquiry is that our growing environmental problems—polluted air, water, soil, changing climate, accelerating industrialism, and so on—are disproportionately born by racially and economically marginalized communities both in the United States and globally and moreover that these marginalized communities are often targeted for environmental degradation.[36]

Feminist scholars hasten to add that even within these marginalized communities, environmental problems tend to be borne differently by women than men.[37] Women occupy the socially constructed role of caretakers; women are most likely to live in poverty, to experience hunger, and to bear the financial and care responsibilities for children and elderly or sick family members. Women are also often most likely to be in close contact with environmental resources: they haul water, grow and cook food, and wash clothes. By virtue of this close contact, women can be seen as "the first environment," not as essentialized Mother Earth but rather as occupants of

socially constructed roles in the home and family that often place them in a unique relationship to environmental ills.[38] Women's exposure to toxins in the domestic sphere, moreover, illustrates the unbounded ways in which toxins move between industry and home. In the case of uranium mining, women were exposed to radioactive and chemical toxins from the mines and mills when workers came home wearing contaminated clothes. Women also worked in the mines, lived in hot homes built with radioactive tailings, and bore severe economic hardship when their husbands were hospitalized and later died of radiation-related diseases. The widows of uranium workers became the first and often most effective activists against mining when the adverse health effects of the industry began to take shape, reflecting a larger pattern in environmental justice organizing in which women often make up the majority of participants in environmental justice struggle.[39]

Although scholars of environmental justice studies most often focus on contemporary (post-1982) examples of environmental injustice,[40] Native Americans are quick to note that the tendency of those in power to exert their power by manipulating resources and degrading the natural environment is something with which colonized people are all too familiar; in fact, "the most workable date for the founding of the Native [environmental justice] movement . . . is 1492."[41] This close relationship between environmental justice and Native Americans derives from the similarly close relationship between environmental racism and settler colonialism. Settler colonialism is a distinct form of colonial power, with a very particular relationship to resources and land. Whereas we might think of colonialism as tending to be mainly invested in the extraction of resources—labor, goods, or raw materials—for the benefit of a metropole, or colonizing home country, settler colonialism adds a layer of complexity: it is a form of colonial power that involves the settler making a home in a land that is already home to indigenous peoples. To quote Deborah Bird Rose, indigenous peoples "got in the way" of settler colonialism "just by staying at home," because *home* is precisely what the settler colonial state seeks to occupy and remake.[42] Remaking Native land as settler home involves the exploitation of environmental resources, to be sure, but it also involves a deeply complex construction of that land as either always already belonging to the settler—his manifest destiny—or as undesirable, unproductive, or unappealing: in short, as wasteland.

No one driving down the curvy switchbacks of Narbona Pass would be particularly inclined to think of Navajo country as wasteland—or even desert. Carving through the verdant Chuska Mountains just on the New Mexico side of the New Mexico–Arizona state line, Narbona Pass links the towns of Crystal, on the east side of the Chuskas, with Sheep Springs, on

the west. The Chuskas here are a rich palette of mauve and burgundy, sage and peridot green. The air is thick with the piney smell of evergreens, and the air is sharp and cool even in the summer months. The Chuskas are the heart of Diné forest resources, and Narbona Pass puts these resources on full display.[43] The rich woodlands of the pass speak neither to the long-standing image of Diné Bikéyah as austere desert country nor to the underlying conditions of drought, water shortage, and tree death (from foresting, global climate change, and invasive species) with which the Diné have been contending.[44] The realities of environmental conditions, and the complex relationships of the Diné to their environment, are made invisible in settler discourses that construct this land as unqualified desert country or claim that it is "empty except for Indians."

In this book, I argue that the history of the uranium industry on and near Diné Bikéyah demonstrates how landscapes of extraction are, to borrow from geographer Gillian Rose, forms of representation as well as empirical objects.[45] Notions of Navajo country as "uninhabited" wasteland create a representational criterion by which ideas about the land have been formed. When prospectors, mining companies, and the Atomic Energy Commission (AEC) identified the Four Corners area as what one newspaper called "the scenic topsoil of America's vast energy storehouse,"[46] extractive industrialism was naturalized as indigenous to the landscape itself, and indigenous inhabitants of the land were placed under erasure to be "always disappearing" in the face of settler colonialism's advance.[47] The land, occupied and claimed by tribes, with its own unique sets of ecological conditions and realities, ceased to be an empirical object—the material conditions of Narbona Pass, with its shimmering greens and crisp air, is forgotten in favor of an interpellation of Navajo country writ large as wasteland. This book is a history of contested representations of landscapes, representations that produce starkly urgent material conditions with high stakes for humans, animals, air, water, and earth. Following Valerie Kuletz, who argues that deserts are targeted for environmentally destructive industries because they are understood as worthless in a Euro-American worldview, I explore the mapping of Navajo land and, by extension, other kinds of lands rendered pollutable through discourses of race, gender, class, and/or sexual difference as "wasteland." The wasteland discourse, as Kuletz framed it, is a current in the American environmental imagination that sees deserts as threatening, marginal, and—revealing the distinctly gendered framework of this marginalization—"barren" places predisposed to what she calls deterritorialization.[48]

Environmental sociologists have outlined the ways in which environmental problems in the context of contemporary industrialism (the post–World

War II period of "late modernity") are imbricated in a treadmill of production, in which extraction of raw materials and dumping of material waste are expanding with markets, often exponentially.[49] The treadmill requires "wastelands" from which resources are increasingly extracted and where (often toxic) waste is increasingly dumped. Patterns of environmental racism tell us that race has become a primary way by which those landscapes of extraction and pollution are marked as racialized spaces excluded from or ignored by the regulatory protection of the state.[50] Because environmental inequality is an inherent feature of the way in which industrialism operates contemporarily—raw materials for products, after all, must come from somewhere, and toxic waste must go somewhere—the wasteland is the "other" through which the treadmill of production is constituted. In this way, just as civilization has been constituted on and through savagery, environmental privilege is made out of the discursive process of rendering a space marginal, worthless, and pollutable.[51] This produces a strong relationality between environmental injustice and environmental privilege as mutually constituted phenomena. For the energy industry in the United States, which has been disproportionately reliant on indigenous resources,[52] the extraction of energy's raw materials (uranium, coal, oil, natural gas, water, and, increasingly, wind and sunshine) has devastated Native lands while Native people often benefit the least in terms of economic development and cheap energy—a phenomenon that can be shorthanded as energy injustice.[53] Here, the treadmill of production can quite clearly be seen as being built on and through the degradation of Native land and life; as one Diné resident of Black Mesa noted, "Somewhere far away from us, people have no understanding that their demand for cheap electricity, air conditioning and lights twenty-four hours a day have contributed to the imbalance of this very delicate place."[54] To put it another way: if, as historian Ned Blackhawk has argued, the indigenous body in pain is the ultimate symbol of colonial progress and modernity, indigenous land laid waste is its territorial corollary.[55]

I call this process *wastelanding*.

Wastelanding, I argue, has been a key and underexplored component of environmental racism. The "wasteland" is a racial and a spatial signifier that renders an environment and the bodies that inhabit it pollutable.[56] The problem of land laid waste is complicated by the fact that environmental degradation is not only relegated to lands that Americans find aesthetically distasteful; quite to the contrary, while we find radioactive tailings piles in the desert, we also find leaking barrels of Agent Orange on Bahamian beaches, dioxin-releasing copper mines near the shores of the Great Lakes, and strip mines in the rainforests of South America.[57] Thus, it is not only a

matter of a Euro-American distaste for dusty arid locales that renders deserts "wastelands" but rather a condition in which even the most marvelously abundant of jungle-scapes can come to be seen as just so much waste of space. This book, therefore, argues that colonial epistemologies do not just look on deserts as wastelands but that wastelands of many kinds are constituted through racial and spatial politics that render certain bodies and landscapes pollutable. Wastelanding builds on Kuletz's "wasteland discourse" to explore how this convergence of discourse and space has been deployed in multiple contexts, including nondesert landscapes, and how environmental racism can be theorized at multiple scales.

Wastelanding takes two primary forms: the assumption that nonwhite lands are valueless, or valuable only for what can be mined from beneath them, and the subsequent devastation of those very environs by polluting industries. Hydroelectric dams in James Bay, Canada, for instance, would, according to the National Audubon Society, "'make James Bay and some of Hudson's [*sic*] Bay uninhabitable for much of the wildlife dependent on it.'"[58] This very pollution results in the common designation of wastelanded spaces, including those of the uranium industry on Diné land, as "sacrifice" zones. As sacrificial lands, these landscapes of extraction allow industrial modernity to continue to grow and make profits. In scholarly parlance, these two forms of wastelanding can be termed *social construction* and *reification*: first, a culturally agreed-upon logic that derives from taken-for-granted categories of difference, which we then understand as natural and common sense, and second, the process of materializing, of making real, or of acting on those constructions.[59] Wastelanding reifies—it makes real, material, lived—what might otherwise be only discursive. Like race, which is a social construction made material by the embodied consequences of racism (threats and acts of violence, foreshortened life expectancy, incarceration, under and uncompensated labor, inequalities in wealth accruement, and so on), ideas about the value of environments are manifested by the material consequences of environmental destruction (or, in the inverse, by environmental protection[60]). Patterns of environmental racism make clear the connections between race and wastelanding. Race and space are connected through a social construction of difference that becomes spatialized through segregation and unequal distribution of resources. As Allan Pred puts it, through racism, "The socially barred become locationally removed from opportunity-yielding social, economic, and political networks." By a "feat of ontological magic," the "idea-logics of cultural racism are—abracadabra, hocus-pocus, simsalabim—concretized."[61] Wastelanding is a primary one of these "feat[s] of ontological magic," wherein racialized lands are made to seem uninhabited or unimportantly inhabited, represented as

worthless, and then—"abracadabra, hocus-pocus"—systematically stripped of their material and ideological worth.

Nuclearism makes a fitting site to study wastelanding because it is so clearly a multiscalar problem. Radiation is spatially multiscalar, with impacts that can be measured at the bodily, the ecosystemic, or the planetary level; it holds potential to change our very cells or affect the ways in which organs change over time. Its effects can be traced from the subatomic to the ecosystemic and everything in between (from cells and organs to sheep and corn). It can be as unimaginably small as the split nucleus or as nightmarishly large as the mushroom cloud. Likewise, nuclearism is temporally multiscalar: its impacts range from the moment an explosion initiates a nuclear chain reaction, to the tedious process of a miner chipping away at an ore body, to the limits of the human temporal imagination (uranium 238, for example, uranium's most common isotope and the one that is used to produce plutonium, has a half-life of 4.46 billion years). Nuclearism's deadliness can manifest in the immediacy and violence of acute radiation exposure or, more commonly, in the slow growth of tumors in lungs and genetic mutations passed down through generations. And because its effects are not always felt immediately, because the causal relationship of radiation to health outcome is a moving and precarious target, and because is it impossible to see, feel, or taste your exposure to radiation, nuclearism triggers human anxiety to an almost incomparable extent. Nuclearism's affective multiscalarity has produced gut-wrenching fear in communities downwind of nuclear test shots, defiant rage in environmental activists, and apocalyptic bravado in the culprits behind the Cold War's mad doctrine of mutually assured destruction. These multiscalar natures of nuclearism—environmental, spatial, temporal, and affective—make it a particularly apt site for exploring wastelanding as a racial and spatial process of signification that makes extreme environmental degradation possible.

Wastelanding, too, is multiscalar: in uranium country, destroying the environment through uranium mining does not just mean destroying the nonhuman world and ecosystems. It means to wasteland, to render pollutable, the lungs, the cells, and the respiratory tracts of everyone involved in the nuclear cycle. It also means to wasteland Navajo worldviews, epistemology, history, and cultural and religious practices. In order for uranium mining to occur on the level it did (and still does), indigenous ways of knowing landscapes and their worth must be themselves rendered pollutable, marginal, unimportant.[62] To borrow from poet Adrienne Rich, in wastelanding—rendering an environment pollutable in ways that are both ideational and material—"The words are purposes. / The words are maps."[63]

The Words Are Purposes: The Wasteland as Floating Signifier

On July 4, 2008, I pulled into the town of Kayenta, Arizona, in the northwestern corner of the Navajo Nation, on an empty gas tank. I was less than thirty miles away from where I had stopped on the side of the road to gape open-mouthed at the 200-yard section of the Black Mesa coal conveyor belt visible from Highway 160—a highway, not incidentally, built to usher uranium ore out of Tsé bii'nidzisgai (Monument Valley) and usher tourists in. The coal conveyor stretched forbiddingly across the highway, angling up to a leering tower on the east side of 160. To the west, it cut into the face of Black Mesa, stretching to the mesa's horizon in the oddly linear negative space of cleared trees. Four miles to the west, at the intersections of Indian Route 41, Peabody Coal Company Access Road, and Haulage Road (more inscriptions of resource extraction on the built environment of Navajo country), were the headquarters of the coal mining operation, which I could not see but knew was there from the crinkled topographic map spread out on my passenger seat. Making a sudden turn up a dirt road that sent my dog lurching onto the floorboards in the back of my Jeep, I wasted most of the quarter tank of gas I had left seeking a better angle from which to view this coal mining monolith.

Thirty miles later, I coasted into Kayenta on fumes to fill up my tank at the dusty gas station that presides over the town's single major intersection. Filling a tank with gas, during this particular summer, was an even more politically charged activity than usual, especially in the Navajo Nation, where people regularly drive large pickups long distances over hard roads to fill water tanks, get groceries, visit family, or attend to livestock located in remote parts of the country. During the summer months of 2008, the price for a tank of gas shot up to almost $5 a gallon; oil companies raked in record profits, and a barrel of oil cost an unprecedented $145 dollars. Global political–economic forces of resource extraction and transnational corporate capitalism occupied an elephantine presence in every gas station in the continental United States, and this particular 7-Eleven was no exception. That summer the *Navajo Times* was full of articles and editorials that had a central, driving focus: the incapacitating effects of gas prices on the Diné.

This part of Diné Bikéyah is not just home to coal mines but is also a major access point to the western reservation's uranium mine sites, which were abandoned after the climax of the uranium boom and left unreclaimed, with the radioactive guts of the mines exposed nakedly to the surrounding air, earth, water, animals, and human population. The mines in nearby Monument Valley were among the first to be exploited in the early years of the

Manhattan Project, and they left behind some of the most dangerous environmental legacies in the form of uncovered mine shafts, polluted water, and hot homes. During the early uranium booms, Diné workers arrived at these mine sites from across Diné Bikéyah, taking advantage of any opportunity for wage work during decades (the 1940s and the 1950s) when poverty gripped the reservation more than it had since the years after their removal to Bosque Redondo. Navajos tended to prefer jobs in the mines to other options—railroad work or venturing to California as farm laborers—because the mining jobs were close to home. Over the course of the 1940s, 1950s, and 1960s, uranium mining and milling in the western reaches of the reservation dramatically changed the geography of Monument Valley and the area surrounding Kayenta: new roadways were mapped and paved and new bridges built to sustain the traffic of heavy uranium haulers. Entire mesas in Monument Valley were blasted out of existence, and mills operated twenty-four hours a day to transform ore rock into yellowcake.

Not three hours north of Monument Valley, where I gazed at the familiar mesas and buttes with a sense that I had been there before—a symptom of my "imagined intimacy" with this postcard-ready landscape[64]—I arrived in a very different kind of southwestern desert town: Moab, Utah. Here, the gas was just as expensive, but the sheen of a thriving, well-developed tourist destination in the height of the summer season posed a stark contrast to Kayenta, despite the fact that both towns sit in equally striking landscapes, and each has intimate history with the uranium industry. In Moab during the uranium boom years, some of the largest and most famous uranium strikes made this town among the most famous of the Colorado Plateau's "yellowcake towns."[65] In total, three-quarters of all uranium miners during the booms of the 1950s to 1960s were non-Native and worked in mines in yellowcake towns like Moab: Grand Junction and Uravan, Colorado; Marysvale and Monticello, Utah; and so on.[66] Now, the legacy of uranium is remembered quite differently in these non-Native yellowcake towns than in Kayenta, a difference illustrated perhaps nowhere so clearly as in downtown Moab, where the Uranium Bike Shop hosts racks of high-end mountain bikes and a three-foot-tall graffiti-style mural of its name. Farther along Moab's Main Street, an antique-looking sign on an office building reads matter-of-factly "Uranium Offices, 11 N. Main," named thus during the height of the uranium frenzy and left unchanged, presumably, out of nostalgia for those boomtown days.

These two experiences of two very different towns, so closely juxtaposed, would eventually come to frame my own personal take on mine country, how uranium was inscribed on landscapes differently, and how the

FIGURE 4. The Uranium Bike Shop sits near downtown Moab, Utah, illustrating one of the many ways in which the legacy of uranium mining is inscribed on the built environments and political economies of former uranium boomtowns. In this image, the shop's name is painted in a three-foot-tall faux graffiti tag over the display windows. Photo by the author.

radioactive ore came, over time, to acquire very curious meanings. In Kayenta, and in the Navajo Nation in general, uranium is one of a litany of metals and minerals that have been extracted from the land to a devastating extent, leaving behind scarred earth and ongoing environmental health disasters. In Moab and former uranium boomtowns like it, such as Grand Junction, Colorado, mining has assumed an oddly nostalgic affect, a history that lends local flavor to ski areas, camping hot spots, and mountain biking destinations. In and around the Navajo Nation, mining is a very contemporary site of struggle over land, jobs, and sovereignty; in other parts of mine country, it is a colorful narrative of national history, its museums offering tourists an alternative activity on rainy days.

The contrast between Kayenta and Moab suggests that deserts have shifting meanings. These towns, less than 200 miles apart, have radically different histories with energy-extractive industrialism. This difference is, to a large extent, the very unnatural evolution of starkly different political–economic

histories of mining in different places. These different evolutions of pollution and geography in turn suggest that that wastelanding—a racial and spatial signifier that renders landscapes pollutable—is only *incidentally* about deserts. The wasteland, I argue, is a floating signifier in the Western environmental imagination: it does not always have a specific somatic or material referent, but rather it flexibly (floatingly) marks different objects, landscapes, and bodies. Deserts, thus, are not the reason for wastelanding. They are, rather, its frequent but not exclusive target. Just as race is a discursive technology with often deadly material effects, so too is wastelanding the process by which pollutability is materialized.

My explorations of the wasteland are thus very much about race, not only because environmental racism and wastelanding are conceptual intimates, but also because race is a discourse that is only incidentally a referent to different human body types. Just so, wastelanding is a discourse that is only incidentally a referent to different kinds of landscapes (including deserts). Race is quite deeply involved in wastelanding the environments that are deemed resource-rich for settler industrialism, just as certain human bodies are deemed productive reserves of labor (itself a resource) for settler industrialism and rendered exploitable via race. One might go so far as to say that racialized bodies are in many ways themselves wastelanded. Race intersects with the environmental imagination, even as it intersects with gender and sexuality, to produce wastelands: places that are marked, physically and ideologically, for exploitation, resource extraction, and national sacrifice. Just as race is embodied, often violently, despite being in essence strictly a discourse (as I tell my students, race is a *discourse* powerful enough to make *genocide* possible), "wastelanding" is a discourse-made-material through the degradations of targeted environments and their human and nonhuman denizens. It is through this process that even verdant landscapes—or nonlush places that are nonetheless aesthetically pleasing or otherwise fitting for American environmentalist affect—can be rendered pollutable, and desertscapes embraced as protectable. The referent of wastelanding is inconsistent; the outcome is not.

As scholars of ethnic and women's studies have long pointed out, we can recognize categories of human difference as being socially constructed by the ways in which their meanings change over time, space, and culture. Race, for example, can be recognized as a social construct rather than an expression of essential, or inherent, human difference by the ways in which racial categories are constantly in flux: what it means to be white has changed dramatically over the course of just the twentieth century, often in response to negotiations between legal and cultural constructions of whiteness;[67] for

Mexicans in the Southwest in the aftermath of the Treaty of Guadalupe Hidalgo, legal race status was tied to citizenship and differed from cultural or "common sense" race status;[68] for African Americans in the Jim Crow South, race status could change by the simple act of crossing state borders; and so on. As these examples attest, race is not a reflection of essential or innate difference but a malleable structure of feeling and exclusion that organizes populations' life experiences and outcomes and access to resources. Feminist scholars have likewise demonstrated how gender and sex are social constructions, on the basis of their malleability over time, space, and culture.[69] The argument here is that social constructions are not always, or even *initially*, about bodies themselves. Race, gender, and sexuality are structures of exploitation that are only most spectacularly about organizing social resources according to types of human bodies. They are an intersecting web that renders exploitable, negligible, and marginal a range of symbolic, psychical, and physical entities—in other words, a multiscalar range of materialities and symbols.[70] This is how scholars of race come to talk about the myriad things, bodies, ideas, and feelings that can become, as we say, *racialized*: they take on or seem to inhere raciality precisely because race is a discourse made material rather than a materiality made discursive. Bodies can be racialized; so too can voices, ideas, clothes, places, costs of labor, gestures, words, foods, jobs, sexualities, and so on.

If we extend this analysis of the relationship between social construction and materiality to spaces, we can see how wastelanding is not so much about the inherent value of wastelanded places as it is about the *meaning*—social, cultural, ecological, or juridical—that we make out of them. Consider the inner-city "ghetto" that becomes gentrified by upper-middle-class white settlement: the meaning of the space shifts through discursive and material meaning-making practices, as well as racialized and classed repertoires of dispossession and displacement. In that shift in meaning, the "ghetto" moves from being *pollutable* to being *protectable*—from urban wasteland to "Back Yard" (as in, Not in My Back Yard). There is nothing essential or inherent to the urban space itself that invites disdain; the material conditions of the place derive from the hegemonic meaning that is ascribed to it.

Just so, there is nothing about the desert itself that invites disdain, even white Western disdain with its clear cultural preferences for lush and verdant landscapes.[71] This is precisely because that preference is culturally and historically constituted and contingent on the particularities (and peculiarities) of how the white Western environmental imagination has evolved in the "New World." Environmental historians have pointed out how wilderness

areas, lush forests included, have in the past been understood as distinctly evil locales precisely because they were seemingly uncultivated—"wild"—the same quality that now marks out "wilderness" areas for environmental protection.[72] Those lush, verdant landscapes have likewise been themselves seen as "Desarts [*sic*]," in the sense of being uncultivated and vacant to the eye of a European settler.[73]

Deserts as we now understand them have been differentially interpellated as sacred or profane, as *constitutive* of the white masculine settler subject or as his demise. Particularly in the saga of nineteenth-century Western exploration, deserts constituted the geographic barrier to the mythical land of California; no matter what route overland travelers chose to get to California's storied gold mines, beautiful coasts, and rich agricultural lands, they had to first pass through deserts that threatened, and often took, their lives. Thus, deserts came to be imagined as an environmental specter threatening the white masculine settler and the larger project of settlement itself. When John C. Frémont, the Great Pathfinder, looked upon the deserts of the West, he saw them as "'forbidding,' 'inhospitable,' 'desolate,' 'bleak,' 'sterile,' 'dreary,' 'savage,' 'barren,' 'dismal,' 'repulsive,' and 'revolting.'"[74] Environmental determinism coupled with biological theories of race meant that the desert tribes were particularly reviled by settlers, their desert lands seemingly evidence of a distinctly savage nature. Deserts as "environments of scarcity" led explorers and settlers to develop a view of desert tribes, in Frémont's words, as "the nearest approach to the mere animal creation."[75] Ironically, the fact that desert tribes survived—in fact flourished—in "environments of scarcity" in which white settlers so struggled could have been evidence, by the same racialist (il)logic, of the tribes' superiority rather than inferiority, an excellent example of the ways in which, when it comes to social constructions, "logic is in the eyes of the logician."[76]

As the desert came to be incorporated in the American environmental imagination, however, it came to acquire a range of cultural meanings, not all of them negative. When John Muir visited Arizona in 1905 and beheld what is now, thanks in large part to his advocacy, the Petrified Forest National Park, he included this desert-scape as part of the sacred "wilderness" that helped to constitute the Progressive-era American preservationist (what we now call environmentalist) movement. This category of protected wilderness had, until that point, largely revolved around mountainous, or at least *green*, landscapes that more closely fit American aesthetics of the wild places of the Western continent. With that, the American environmental imagination began to see deserts as protectable wilderness, too, a trend that grew as arid canyon country, particularly the Grand Canyon, became a centerpiece of environmental tourism and wilderness conservation legislation.

The Canyon, in particular, went in a very short space of time from "an 'unprofitable locale' to the 'sublimest thing on earth.'"[77]

The image of deserts changed most dramatically, perhaps, during the mid-twentieth century, as cultural representations of the "frontier" and "winning the west" centered on narratives that, quite often, took place in desert locales, thanks in large part to the rise of the Hollywood western.[78] Picture a pair of Old West gunslingers headed into a saloon, and your imagination will more than likely call up a dusty town scene in the middle of desert country, a place surrounded by sagebrush, piñon pines, and craggy mountain passes—a place, in short, "no more specific than 'the Southwest.'"[79] If these narratives are part of what "America" now means, then we can rightly say that the settler state has grounded itself in the desert Southwest, making the desert central to how we understand our history and ourselves. During the uranium booms, in which uranium was closely conflated with nothing less than the very survival of the nation-state, the nation was, materially and ideologically, remaking itself through the resources of desert country.

In Monument Valley, just outside of Kayenta, the valorization and degradation of the desert occurred simultaneously in the 1940s and 1950s; even as film crews shot the westerns that would underscore white Americans' collective "imagined intimacy" with this part of Navajo country as the symbolic setting for their imagined community, uranium companies were busily blasting its famous red mesas into nonexistence for the uranium encased inside. This simultaneity of valorization and degradation is perhaps symbolized nowhere so well as in the story of Monument Valley's Cly family, told in the 2000 documentary film *The Return of Navajo Boy*. The Cly family was first captured on film in the 1950s by director Robert J. Kennedy, who depicted them herding sheep, weaving Navajo rugs, and cooking meals outside of their hogan. Kennedy's work, however, made no reference to the enormous changes under way for Monument Valley Diné in the 1950s, Clys included, coming from both the film and the uranium industries. Over the course of subsequent decades, the Cly family came to embody those changes: the family's matriarch, Happy Cly, once described as "the most-photographed woman in America" for the widely circulated postcards bearing her image,[80] died of lung disease in 1960, which her family attributed to nearby uranium mines.[81] Upon her death, her youngest grandchild was adopted away from his family in what the Clys thought would be temporary missionary foster care. The child was never returned, and his connection to his family serves as the primary emotional draw of the film. (His eventual return to them as an adult, moreover, gives the film its name.)

That youngest son bears an uncanny name: John Wayne Cly, a name given him by John Wayne himself while the actor was in the valley on one

of his several film shoots. John Wayne Cly grew up on and near the reservation, working, among other wage work, in uranium mines, before finally finding his family again in Monument Valley—a family much changed by the environmental health problems attendant with unregulated uranium mining.[82] The Clys were thus multiply marked by settler colonialism: they witnessed the death of family members from radiation-related diseases, were archived in photography and film as archetypal western "Indians," and lost a child—named after an American icon in an iconic American landscape—to the assimilative practice of adopting out Native children to white families. *The Return of Navajo Boy,* therefore, tells a story of the multiscalar implications of the uranium industry within a larger context of settler colonialism, reflecting the powerfully complex interweavings of the colonial, familial, bodily, and ecosystemic causes and consequences of resource extraction for nuclearism in desert country.

Deserts, clearly, are more complex than mere wastelands: they are home to both John Wayne *and* John Wayne Cly, home to Kayenta's unregulated mine sites and Moab's Uranium Bike Shop. Wastelands, in turn, are floating signifiers deeply joined to race, class, gender, sexuality, and coloniality in their demarcation of spaces as pollutable.

The Words Are Maps: Colonial Cartographies, Borderlands, and the Production of Justice

In 1955, in the midst of a booming uranium rush in the northeastern part of the state, the New Mexico State Mapping Agency released its annual report. The cover bore an image of a plane hauling away a mountain and leaving behind a smooth, flat topographic map—in effect doing away with nature in favor of charts. The image serves as a powerful representation of the false universalism of modern colonial episteme, what Donna Haraway calls the "god trick of seeing everything from nowhere," and a reminder that maps are a powerful means by which states exert control over peripheral spaces, particularly those that are rich in resources.[83] In the mid-1950s, when the image was produced, mapping the uncharted domain of the state was a project of critical importance to the state as a whole; mapping projects, after all, were kindled by the desire to locate potentially minable ore deposits, and uranium occupied no small part of that imperative. By 1955, uranium was widely considered the state's golden ticket into the modern industrial age.

Cartographic practice in the mid-twentieth century was, of course, not a "view from nowhere"; it was a view from deeply embodied—and very specific—perspectives on space. In exploring the evolution of these wasteland discourses in the twentieth century, and how they connect to the

environmental degradations of the uranium industry, my central questions revolve around the subjectivity of dominant cartographic discourses and the construction of Diné Bikéyah as peripheral, distant, marginal, desert, or deserted: "empty except for Indians." Geography and notions about space have, of course, long been matters "of considerable imperial significance."[84] Colonized terrain has been representationally contained and restrained in maps, just as the practice of surveying and cartography, the productive labor of mapping, represents a *repertoire* of colonial action—a practice of power relations.[85] Central to the work of understanding settler colonialism, then, is the project of explicating the ways in which the production of knowledge about space is historical, social, and deeply leaden with power.[86] Suffice to say: as Ann Laura Stoler calls historians to turn from "archive-as-source to archive-as-subject," so must those of us who are geographically inclined begin to read cartographic discourses as revelations of colonial ontology and technology, as *subjects* of our research and theory, rather than as objective representations of the natural, social, or political world.[87]

In the Southwest, cartographic discourses and articulations of territoriality are deeply complex. This region is in multiple senses spatially and ideologically liminal—in other words, it is a borderland. The history of uranium mining aptly illustrates this liminality: uranium country is simultaneously Navajo country, which, more often than not, is also claimed by Pueblo nations, by Nuevomexicano land grant communities, and by multiple state and federal agencies. Uranium mining, moreover, has existed at multiple kinds of ideological or affective borders. As such, each chapter of the book addresses spatiality and borderlands in a different way. In chapter 1, I explore how the pre-uranium mining history of federal relations to the Diné constituted a kind of economic borderland: during the period of livestock reduction in the 1930s, in which Diné herds were "reduced" (a euphemism, often, for slaughter) by tens of thousands, Navajo poverty was treated as a result of what was deemed irrational land use. The Navajos came to be seen as occupying the space between rational conservation practice and abject poverty during a time when both conservation and poverty were crucial concerns for Americans in general. During this period, the Navajo herd owner as a "social problem" constituted a grim counterpoint to the trope of the "ecological Indian," and Diné poverty was seen as the direct result of the tribe's failure to understand its land base and resources.

Chapter 2 explores the early years of the uranium boom, looking to the ways in which uranium in the Southwest seemed to constitute a *temporal* borderland between the anachronistic past and the technological (nuclear) future. As *Time* magazine so artfully put it in 1952, "For years, the parched, mountainous wastelands of the Colorado Plateau were known for their scattering of dinosaur bones and the ruined homes of prehistoric cliff-dwelling

Indians. But now the area is known for something far more important: uranium."[88] Crediting uranium with creating what the magazine called "the wasteland's glorious new reputation," this kind of rhetoric created a tension between the anachronistic space of "dinosaur bones" and "prehistoric cliff-dwelling Indians" and the "far more important" technological futurity promised by uranium.[89] Similarly, chapter 3 explores how the Diné and other southwestern tribes were placed, often through little or no action of their own, in a position of manning this temporal borderland between past and future—ushering in the uranium booms of the future and then quietly disappearing into the past. This chapter also traces the transmogrification of Diné country from "waterless, worthless waste" to spectacular tourist attraction and star of the Hollywood western, making it a kind of *affective* borderland between cowboy and Indian (self and other) in the U.S. popular imagination.

In chapter 4, I examine the ways in which the spatiality of risk in Diné Bikéyah shattered the imagined division between public and private in the uranium wage economy. Despite the fact that uranium companies and other industrialists touted the importance of wage work in assimilating Navajo workers (in large part because wage work was predicated on normative gender roles and binary gender spheres—men laborers in the uranium mines bringing wages home to wives and children), the impacts of uranium in the 1960s and 1970s increasingly obviated such a division between public and private spaces. The risks of radiation crossed the borders between industrial and domestic spheres, violating that public/private "fiction of gender."[90] By the late 1960s, when more than 200 Diné miners and millers had died of radiation-related diseases, women and children were also beginning to experience the adverse health effects of the industry; their appeals to industry and government for compensation, moreover, were largely denied or ignored because radiation risk was officially understood to end at the borders of the work site.[91] Thus women's activism for environmental justice has revolved in large part around counter-mapping, or using maps "to delineate and formalize claims to . . . territories and resources," in two senses: counter-mapping their claims to land taken over by the uranium industry, and counter-mapping the transboundary nature of radiation's risk.[92]

In chapters 5 and 6, I follow the general geographic trend that the uranium industry took beginning in the late 1960s: off of the reservation proper to the eastern reaches of Diné Bikéyah near Tsoodzil (Mount Taylor). Uranium activity in other parts of Diné Bikéyah slowly ground to a halt in the latter half of this decade; all mines in Monument Valley were closed by 1968. The East Reservation Lease mines in the Carrizo Mountains were closed by 1967. The Kerr McGee Shiprock mill shut down in 1968,

leaving behind a fearsome amount of radioactive tailings directly adjacent to the reservation's largest population center. The land of northwestern New Mexico, just to the east of the Navajo Nation border, was easily the largest producer of uranium in the United States. Despite being outside of the official boundaries of Navajo Nation, it is quite clearly Navajo country, home to multiple Navajo communities and central to Diné worldviews and history. Adding to its analytic and material complexity, this area is also claimed by multiple Pueblos, Nuevomexicano land grant communities, ranchers, and federal and state land management agencies.

In moving from west to east, the uranium industry, and by extension the narrative trajectory of this book, goes against the way that Navajos most often articulate geographical knowledge. Although each of the four cardinal directions are crucial to Diné geography (as represented by the four sacred mountains), "east is the direction Navajos emphasize."[93] Hogans, six- or eight-sided Navajo homes, have one eastern-facing door; and more often than not, Diné creation stories often begin in the east.[94] When Navajos list the four sacred mountains, they generally begin in the east with Tsisnaajinii (Blanca Peak) and then move south, west, and end in the north. The uranium industry, perhaps fittingly given its deeply destructive relationship to the Diné, goes against this geographical grain, moving from the early mines in Monument Valley, to the Carrizo Mountains near the Arizona–New Mexico state line, to Shiprock, to the eastern reaches of Diné Bikéyah in the area surrounding Tsoodzil. Just as east to west is important, so too is below to above. While Diné geographies are generally oriented east, then south, then west and north, they also emphasize emerging into this world from worlds below. Here, too, the uranium industry has inverted Diné geographies: uranium deposits were, more often than not, discovered via aerial surveys of the land, and cartographic practice in the twentieth century in general relied heavily on views of the land from above, as did the New Mexico State Mapping Agency in its 1955 cover. This book is thus, in large part, a project of mapping out these conflicting perspectives on landscapes as they emerge in the history of uranium mining, all the while keeping a close eye on what is at stake when toxins meet tissues.

Mines that remain to be sufficiently cleaned up are called, poetically enough, "legacy mines." On the Navajo Nation, this designation gestures to the larger colonial imaginary in which the history of uranium mining is entrenched. The "legacy" of these mines comes to be tangled up with pollution, environmental decline, and the material and ideological depredations of race as it is constructed and practiced under conditions of ongoing settler colonialism. The "legacy" of mining in Navajo country and elsewhere might indeed stand in for what race scholars have called the

"sedimentation" of racism over time, which occurs when inequalities and privileges alike accrue over time in ways that compound, rather than alleviate, the effects of racism in social structures.[95] It is an appropriately material metaphor. As legacies and sedimentations do, mining has come to shape the *affect* of power relations between colonizer and colonized; it has shaped the experiences, bodily health, and life expectancy of the Diné long after the problem should have been rectified; and it has altered the very landscape, real and ideological, of Diné Bikéyah. The wasteland, desert or otherwise, becomes a place where pollution and environmental degradation collect, settle, and form sediment that makes a lasting impact on human and nonhuman bodies. Likewise, wasteland discourses collect and sediment to give shape to power relations between peoples and geographies, creating a highly spatialized set of power relations that invoke place as well as race.[96]

This book contends that settler colonialism is so deeply about resources that environmental injustices, whether on Native lands or lands of other others, must always be viewed through the lens of settler colonialism. While the connections between the two forms of power are various, the body is a good place to start—just as race and racial power are organized at the level of the body, so too are the functions of environmental violence.[97] Theorizing environmental justice at the level of settler colonialism, slavery, for example, can be seen as the degradation of the racialized environment of the body, the radical devaluation of the resource of black labor for colonial economies, and directly tied to contemporary manifestations of the ways in which blackness is racialized (for example, the structural and cultural ghettoization of urban communities, subjection of the black body to environmental violence and sanctioned state violence, as well as the more commonly cited cases of environmental racism, such as the disproportionate siting of toxic waste dumps or petrochemical plants in black communities). All of these manifestations derive from the bodily or material effects of racialization and speak to the ways in which "race" can be seen as an arbiter of resources, if resources are defined as ranging from access to clean air, water, and food to clean jobs, state services, community self-determination, or even what sociologist Avery Gordon calls complex personhood.[98] In the context of extreme and ongoing environmental violence, decolonization cannot be imagined outside of environmental justice, and vice versa. They are twinned projects. I argue in this book that, although uranium mining provides a powerful, and pulsing, explication of the twinned interests of environmental justice and decolonization, it is but one piece of a much larger system of power relations.

This is not such a radical leap. The study of environmental injustice is the study of race, resources, and power and their intersections with gender

and sexuality. Although the context for many studies of environmental justice cases is temporally and geographically local out of necessity, as these struggles are born of life-and-death urgency in local communities, most derive from a larger context of colonial power relations. While the degradation of the natural world has been a constitutive component of modern capitalist economies, race has been a central technology by which that degradation has occurred.[99] By the same token, race is and has often been performed through environmental degradation. The raciality of Natives in the "New World," for example, was marked precisely through the desire for resources and through the mythic degradation of the imagined Native body ("animallike," hyper- or asexualized, unclean, monstrous, "red").[100] What followed was actual degradation of real Native bodies: rape, mutilation (often sexualized), mass slaughter, military aggression, and so on. Native encounters with settler colonialism are so deeply entangled with environment and resources that even the phrase "environmental racism" can seem to lose all meaning in a tribal context, quite simply because "racism" has *always* meant environmental violence for Native peoples. The desire for indigenous resources is the primary way in which colonialism marks the indigeneity, whether the desired resources are the land of the North American continent, or uranium, oil, and natural gas, or more intangible resources like Native spiritual and cultural practices (here, think of "resources" as dream catchers, Blessing Way ceremonies, hippie beads, hipster headdresses, and the myriad other ways in which non-Natives have sought to constitute whiteness through "playing Indian"[101]). In Patrick Wolfe's estimation, "Whatever settlers may say—and they generally have a lot to say—the primary motive for [genocide] is not race (or religion, ethnicity, grade of civilization, etc.) but access to territory." "Territoriality," he concludes, "is settler colonialism's specific, irreducible element."[102] As settler colonialism has progressed in the twentieth and twenty-first centuries, Wolfe's use of "territory" might helpfully be substituted with "resources," of which territory is one of many.

Wastelanding is thus a fully colonial project of rendering resources extractable and lands and bodies pollutable, rather than merely a problem of distribution of environmental "bads." Thanks in no small part to mainstream narratives that posit environmental justice cases as problems of unjust distribution that are best solved through the legal system, environmental justice activists and scholars have had to grapple with a purely juridical model of justice: the notion that, like lawyers in a grand class action lawsuit, scholars and activists offering overwhelming *evidence* of damage and disproportion will lead to the redress of environmental injustice.[103] This juridical model derives from the deeply liberal notion that justice is the

natural condition of modern political systems and that offering evidence of *injustice* will produce the requisite distributional changes. Andrea Smith calls this kind of reasoning "the liberal myth that the United States was founded on democratic principles . . . rather than a state built on the pillars of capitalism, colonialism, and white supremacy."[104] This liberal myth denies the reality that, as David Pellow puts it,

> The production of social inequalities by race, class, gender, and nation is not an aberration or the result of market failures. Rather, it is evidence of the normal, routine functioning of capitalist economies. Modern market economies are *supposed* to produce social inequalities and environmental inequalities.[105]

Environmental justice activists, moreover, are presumed to be concerned merely with the presence of toxins rather than with the larger structures of power that produced these toxins and funneled them into wastelanded communities in the first place. Quite to the contrary, these activists are most often "*not simply* challenging the distribution of toxins within communities of color" but "also challenging the justice of oppressive . . . institutions *themselves.*"[106] In the context of uranium mining, the disproportionate distribution of the uranium industry on Native land can be seen as a deadly component of the larger structures that organize Native relationships to the settler colonial state: heteronormativity, patriarchy, sexual violence, racism, land dispossession, and resource exploitation. Doing environmental justice work in this way calls into question not only the unjust distribution of environmental harm but also the capacity of the settler colonial state—"a state built on the pillars of capitalism, colonialism, and white supremacy"—to create and distribute more acceptable kinds of rights.[107]

The distributive model of justice operates from the kind of "theory of change" that imagines an impossible future: one *with* the environmental contamination built into the modern risk society distributed along "just" lines (to each according to their consumption).[108] This world is impossible because modern forms of capitalism, industrialism, and environmental contamination cannot exist without technologies of racial and colonial domination. Put simply, the treadmill of production relies on artificially cheapened resources and labor—artificially cheapened through the discourses of race, class, gender, and coloniality.[109] Thus, the distribution of toxins is merely the *signifier* of the foundational, enabling modalities of modernity: "capitalism, colonialism, and white supremacy."[110] To ask for "just" distribution of industrial pollution, waste sites, mines, unsustainable and toxic labor, and so on, is not to ask for redistribution but rather to ask for modernity to throw up its hands and dismantle itself.[111] This kind of

rearticulation of the distributive model has been shorthanded by environmental justice activists as a move from the politics of NIMBY (Not In My Back Yard) to the politics of NOPE (Not On Planet Earth);[112] Winona LaDuke perhaps said it best: "we don't want a bigger piece of the pie. We want a different pie."

Approaching environmental justice at the level of settler colonialism rather than distribution changes the nature of what we mean by *justice* and *injustice*. If the injustice in question is primarily articulated as being about problems of distribution, "justice" is limited to the fictive notion that redistribution of environmental harm solves the problem of environmental racism. Quite to the contrary, a state that has structurally excluded populations of color, the queer, immigrants, and others is not compatible with meting out justice for those communities, precisely because it is constituted on and through their exclusion.[113] These others, as Charles Mills puts it, "mark the limits of the sovereign's full responsibilities"; in other words, they come to inhabit the sovereign's borderlands.[114] By extension, industrialized capitalism cannot function without designating landscapes pollutable. The exclusion of wastelanded geographies from state protection and the structural reliance on the treadmill of production combine to make the settler state a likewise unfavorable source of justice for nonhuman nature.

Environmental justice holds potential for helping us rethink and remap these questions of justice and injustice outside of the frame of rights discourse because of the transformative ways in which it theorizes *environment* as wherever humans "live, work, play, and pray" and *environmentalism* as a political practice deeply invested in class, race, and gender justice. This kind of analysis moves environmental justice studies, particularly studies of environmental injustice on Native land, to a more complex understanding of nature and justice in the past, present, and future of settler colonialism. It is precisely this more complex understanding of nature and justice that this book seeks to engage. In looking closely at the representations of the territory on which settler colonialism is grounded, we find, more often than not, wastelanding at work. Through wastelanding, the logic of settler colonialism denies that its "wastelands" could be sacred, could be claimed, could have a history, or could be thought of as home. Instead, to wasteland a space is to defend the notion that the land is, always has been, and always will be "empty except for Indians": to mark it and make it, ultimately, sacrificial land.

Resources, Infrastructure, and Settler Colonialism

SOVEREIGNTY FOR SURVIVAL

AMERICAN ENERGY DEVELOPMENT AND INDIAN SELF-DETERMINATION

Introduction

IN THE SPRING of 1973, in the heart of the same Powder River Country of Montana where George Armstrong Custer met his death a century earlier, a modern-day Indian revolution erupted. Much like the nineteenth-century conflict sparked by white prospectors seeking gold in the sacred Black Hills of Dakota, the twentieth-century version featured an impassioned revolt against the incessant intrusions of non-Indians hoping to extract precious minerals. Also as in the earlier conflict, Indian resistance was fueled by fear that losing control over an indigenous land base would produce the end of the People, erasing the unique social customs and cultural values that distinguished their group from others. Survival once again hung in the balance. And as in the earlier conflict, this revolt would fundamentally alter the relationship between the federal government and Native American tribes.

There were, of course, important differences. For one, rather than seeking yellow gold in the Black Hills, white prospectors during the 1970s desired the "black gold" of the Yellowstone Country known as low-sulfur, subbituminous coal. Changing patterns in world energy production and domestic consumption following World War II had combined with new environmental legislation during the early 1970s to transform this once overlooked energy source into a highly valuable commodity. And vast quantities of this desirable resource happened

to lie tantalizingly close to the surface of the Northern Cheyenne and Crow Reservations in southeastern Montana. To access this coal, non-Indians once again worked through and with the federal government. But rather than employing military force, as was done during the nineteenth century, multinational companies exploited a broken and outdated legal regime that sought to promote the development of western resources at the expense of tribal sovereignty, ecological health, and simple equity.

Although the tactics differed, the initial results of this late twentieth-century grab for Indian resources were comparable to nineteenth-century efforts. By 1973, energy firms had gained control of hundreds of thousands of acres of Indian land and millions more were threatened. On the Northern Cheyenne and Crow Reservations alone, the combined acreage opened for mining exceeded 600,000 acres, allowing energy companies to prospect over half the Northern Cheyenne's total land mass. It is no surprise, then, that Indian leaders such as the Northern Cheyenne's John Woodenlegs drew parallels to their tribes' nineteenth-century battles. As Woodenlegs explained, "Our Cheyenne people fought hard to be allowed to live in Montana. Our whole history has been a struggle for survival. The impact of uncontrolled coal development could finish us off."[1]

But unlike the tragic, if also heroic, nineteenth-century battles that relegated Northern Plains tribes to small parcels of their once vast homelands, circumscribing their control over daily activities and all but eliminating the tribes' political sovereignty, the postwar contest ultimately expanded tribal powers. It left Indians better positioned to capitalize on their abundant natural resources, if they chose to do so. This story, then, is not another romantic account celebrating valiant but largely unsuccessful fights for freedom on the Northern Plains. It is, instead, a powerful tale of tribes becoming skilled negotiators, sophisticated energy developers, expert land managers, and more effective governing bodies. In this story, Indians worked meticulously to increase their understanding of the complicated legal, political, and economic mechanisms governing their lands and created a sovereign space where tribes decide the fate of their resources. These tribal governments asserted control over reservation resources to ensure their communities' survival. And the story begins in the same remote corner of south-

eastern Montana where a century earlier the Northern Cheyenne and Sioux dealt the United States military its most crushing Indian defeat.

At its most essential, what happened on the Northern Plains in the 1970s was that energy tribes—those American Indian groups possessing substantial energy resources—expanded their governments' *capacity* to manage reservation land, and as a result, there came a belated recognition of the tribes' legal *authority* to govern communal resources. Indian people seized the skills necessary to protect their sovereignty because sovereignty was crucial to protecting tribal lifeways and land. To accomplish this, energy tribes had to first dismantle a century-old legal regime built on the premise of inherent tribal sovereignty but corrupted with an ideology of Indian inferiority. As far back as the 1830s, the Supreme Court had articulated a seemingly expansive view of tribal sovereignty that should have afforded Indian groups control over their own affairs. In *Worcester v. Georgia* (1832), for instance, Chief Justice John Marshall explained, "The Indian nations had always been considered as distinct, independent, political communities, retaining their original natural rights, as the undisputed possessors of the soil, from time immemorial." President Andrew Jackson's infamous retort, however, that "the decision of the Supreme Court has fell still born" set the tone for how local, state, and federal authorities would respect this and other early holdings favorable to Indian rights. With few exceptions, nineteenth-century government officials and non-state actors ignored federal case law, enacted statutes overriding judicial decisions, or reinterpreted Marshall's opinions to eviscerate their holdings. Whites desired Indian land and resources, and they'd be damned if an impotent federal judiciary would stop them.[2]

To justify this taking of indigenous lands, nineteenth-century Americans constructed complicated and evolving ideas about Indians' inferior capacity to manage their own affairs. Early, ambivalent views of Native Americans as either noble savages or ignoble beasts rendered eastern tribes beyond the pale of Euro-American civilization, supporting an Indian removal policy thinly veiled as a humanitarian mission to protect unprepared Indians from encroaching American settlers. These efforts to separate a supposedly inferior people gradually gave way by midcentury to more benevolent, if misguided, assimilation policies designed to indoctrinate Indians with the civilizing values of settled

agriculture and Protestantism. By the end of the century, however, the dominant conception had changed once again, as pseudo-scientific racial theories emerged to challenge the efficacy of this cultural uplift program, claiming race permanently relegated Indians to the periphery of American society. Discouraged by the persistence of Indian culture, eastern policy makers gladly handed over responsibility for "the Indian problem" to western politicians, who employed more "realistic" views of Indians' inability to evolve in order to justify an imperial land policy. Recast as people doomed by their race, Indians now became "assimilated" through industrial education, federal wardship, partial citizenship, and the loss of more land and resources.[3]

The "Indian New Deal" of the 1930s supposedly changed all this. Orchestrated by the social crusader John Collier, whom Franklin Roosevelt appointed commissioner of Indian Affairs in 1933, the federal government set about reversing its Indian policy of the past 150 years. Collier ended the disastrous program of allotting tribal lands to individual Indians—which had also opened "surplus" areas to white settlers—and sought to empower tribal governments to protect communal holdings. As we will see, however, Collier himself was not immune to paternalistic assumptions of Indian inferiority. The scion of a prominent southern family, Collier turned from his capitalist roots to fight for the preservation of Indian culture because he believed it offered vital lessons in communal living to a spiritually bankrupt, individualistic America. Still, Collier's Progressive faith often overrode his benevolent intentions. Under his tenure, the Office of Indian Affairs constructed a legal regime that gave tribal governments some tools to protect their land base yet also ensured that decisions over how to manage reservation assets remained largely in the hands of federal experts.[4]

Nowhere was this Progressive, paternalistic impulse more evident than in the laws governing Indian minerals. Prior to the 1930s, a hodgepodge of narrow and often conflicting statutes left the development of these resources in disarray. Collier and his colleagues within the Department of the Interior sought to provide a uniform system for Indian mineral development, but they differed in approaches. In particular, a young assistant solicitor named Felix Cohen resurrected John Marshall's early nineteenth-century opinions on inherent tribal sovereignty to advocate for tribal governments making their own development decisions, free of federal influence. For Collier, however, the risk

of allowing unprepared tribal leaders to develop reservation resources by engaging in the cutthroat world of industrial capitalism proved too much. Instead, the Office of Indian Affairs adopted an approach used for public minerals: federal officials would survey reservation lands, judiciously select tracts for development, and then require competitive bidding to determine which mining companies could prospect and lease Indian minerals. Tribes had to consent to the extraction of their minerals, but federal law gave them no specific authority to develop these resources themselves. The regime fit Collier's twin goals perfectly. Federal officials would help tribes develop reservation economies to support their communities, and in doing so they would insulate indigenous lifeways from capitalism's divisive influence.[5]

It was within this legal context that most tribes first encountered multinational energy companies seeking to extract reservation minerals to feed America's post–World War II energy demands. Driven by stubborn ideologies that cast doubt upon Indian capacity for managing tribal resources, statutory law failed to provide explicit authority for tribes to develop their own resources. Instead, Native Americans were forced to rely on their federal trustees, who had been tasked with surveying reservation land and selecting appropriate tracts for development. These officials, however, were completely unequipped to do so. The results were predictable. Energy firms, not federal agents, surveyed Indian reservations, proposed which areas to open for development, and then secured permits to prospect and mine. They also accomplished this under a veil of secrecy, careful not to attract competition from other developers that would drive up the price of Indian minerals. By 1973, energy companies had opened millions of acres of Indian land to prospecting and mining, yet tribal governments had collected miniscule payments for this privilege.

That is, until the Northern Cheyenne took action to ensure the survival of the tribe. Located at the epicenter of a booming new trade in western, low-sulfur coal, Cheyenne tribal members saw the grandiose scale of mining proposed for their reservation and envisioned hordes of non-Indian coal miners descending on their lands, disrupting the social customs and cultural norms that sustained their unique indigenous community. Many Cheyenne lamented the potential environmental impacts of massive strip mines, but far more feared becoming minorities on their own reservation. Tribal members of all stripes thus mobilized

to fight for what they believed to be their tribe's survival, organizing a grassroots campaign to protest potential mining that prompted tribal leaders to take legal actions to protect the reservation. Here, the tide of energy companies exploiting Indian minerals turned.

What follows is a "movement history" that explains how this small group of American Indians organized to halt a specific mining project they viewed as a threat to their indigenous community and then mobilized similarly situated energy tribes into a national coalition to educate tribal leaders and demand changes to federal law. The tale begins in Lame Deer, Montana, but travels quickly to the adjacent Crow Reservation, then to reservations and courtrooms across the West, corporate boardrooms in the East, federal agency headquarters in Washington, D.C., and ultimately, the United States Congress. The Northern Cheyenne and the Crow tribes are featured prominently, but this is not a tribal history. These two groups were the first to successfully challenge reservation energy projects, thus a tribal-level investigation is warranted into the reasons why these communities, and not others, were able to halt mining until their governments controlled reservation resources. Such an analysis is provided, as is an explanation of how heated intratribal fights over mining wrought important changes within the Northern Cheyenne and Crow communities. But what happened after these tribes asserted control over reservation mining had a far greater impact on tribal sovereignty nationwide. The explanation for that sea change in federal Indian law is the true burden of this book. By organizing disparate energy tribes into a national coalition focused on increasing tribal capacity to govern reservation land, the efforts begun in southeast Montana ultimately delivered a new legal regime—anchored by the 1982 Indian Mineral Development Act—that recognized tribal, not federal, control over reservation development.

Scholars of Native America should have little trouble fitting this remarkable tale into the broader trajectory of federal Indian policy at the close of the twentieth century. After all, the 1970s began with President Richard Nixon publicly rebuking the existing Indian policy of "Termination," which sought to end the government's special trust relationship with Indian tribes, and proclaiming "a new era in which the Indian future is determined by Indian acts and Indian decisions" rather than federal agencies. Labeling this new policy "Indian Self-Determination," the president affirmed his goal was not to assimilate Indian people into

the larger American mass, but to empower tribal governments so that they may "strengthen the Indian's sense of autonomy without threatening his sense of community." The move fit clearly within Nixon's burgeoning New Federalism philosophy to transfer responsibility and power for social welfare from federal to local governments. With respect to Native Americans, Nixon also sought to end what many viewed as an unhealthy dependence on the federal government. For American Indians who had been clamoring for more control over their lives and land since the reservation system began in the mid-nineteenth century, the message could hardly have been more welcomed. These people had never stopped working to determine their own fate, but now the president provided rhetorical cover for their actions. A policy window to effectuate real change had opened.[6]

Yet despite the lavish attention paid to Nixon's message by both contemporary observers and historians, the self-determination policy was not self-executing. There was no sudden transfer to tribal governments of authority and responsibility over reservation land, people, and programs. Simply put, no white man could grant Indian sovereignty; tribal governments themselves would have to fill in the contours of the self-determination policy. Even Nixon's legislative proposals to hand over federally funded programs required tribal governments to first request such authority and demonstrate their capacity to run these programs effectively. Many tribes seized this opportunity to take over programs related to reservation housing and education, as authorized by the 1975 Indian Self-Determination and Education Act, but Indians also pursued self-determination through other measures not anticipated by federal policy makers, most famously Indian gaming.[7]

In pursuing these paths to power, then, tribal actors worked within the political and legal structure crafted by non-Indians, but they also took extralegal actions to shape that structure to address the issues most important to them. And no issue was more important than control over reservation land and resources. Yet there are no histories explaining how tribes reclaimed authority over these items. This book tackles this crucial, and as yet unexplained, transition, demonstrating how energy tribes worked beyond the existing legal structure to transform the promise of sovereignty contained in the self-determination policy into actual control over reservation development. In doing so, tribes greatly enlarged a third area of sovereignty within the federal system where

tribal, not federal or state, governments now hold primary authority over reservation land and resources.[8]

There are also important lessons here that transcend interests in American Indian history and policy, and none is more important than demonstrating how control over *energy* confers *power*. To state as much sounds axiomatic, but this book reveals the complicated, underlying material and social forces that make such a statement appear self-evident. On the material side, we know that energy underlies power. Physicists have long told us that energy is the life force of all activity, that it exists in all matter, and every organism uses energy, mostly derived from the sun, to accomplish tasks. Energy is the capacity to do work. In converting energy into useful motion, scientists describe organisms as exhibiting power. Power is thus energy put to work, and all beings exercise some form of it. Of course, one of the greatest conversions of energy into power has come with the ability to burn fossil fuels to produce electrical and mechanical power.[9]

But energy also produces power in the social realm. Older sociological conceptions of power, dating back to Max Weber, defined the term as a function of social position or status. More recently, sociologists of science and technology, environmental historians, and historians of technology have come to recognize that "social power" has a material, energetic basis as well. The ability of humans to effectuate their desires, often by shaping the actions of others, derives not from their position in society but is produced through their increasing ability to control material inputs, mostly by exhibiting mastery over social structures governing those inputs. As Bruno Latour explains, "This shift *from principle to practice* allows us to treat the vague notion of power not as a cause of people's behavior but as the consequence of an intense activity of enrolling, convincing, and enlisting." Power, in other words, is not the result of status and does not explain how people achieve their ends. Instead, it is created though the process of acquiring capacity to control matter—and thus energy—and must itself be explained.[10]

Throughout the 1970s, American Indians increased their capacity to control energy and thus grew more powerful. They secured energy experts to review potential mining projects, educated tribal leaders so they could negotiate better mineral contracts, and passed tribal ordinances to shape how energy resources would be extracted. They improved their mastery over those social structures governing access to

energy. Ultimately, as we will see, this increased capacity produced changes in federal law that recognized tribes' legal authority over reservation resources. Again, increasing capacity to control energy expanded tribal power within the federal structure. Lawyers call such power "sovereignty."

Precisely because control over energy produces power, this book also demonstrates the far-reaching impacts of local conflicts over natural resources. Environmental historians, in particular, have spent years explaining how the pursuit of valuable resources structures relations between developed cores and distant peripheries. The incorporation of outlying commodities into global markets, we are told, renders faraway places dependent on urban regions, while producing untold environmental destruction and social dislocation at the point of extraction. Influenced by anthropologists, the best of these studies complicate the story by recognizing how local actors shape the implementation of seemingly "universal" forces like global capitalism or the high modernist ideology of nation building. Instead of an easy, top-down application of these forces to extract resources, peripheral elites, peasants, wage workers, indigenous communities and their laws, customs, and norms all influence development. In the creative space where universals and local influence meet—what Anna Tsing calls "friction"—resources often get extracted, but on compromised terms.[11]

These nuanced investigations into global resource development, however, still tend not to follow the trajectory of impacts outward, from local to regional, national, or global implications. Environmental and social effects are felt in the periphery, and perhaps local actors influence the method of extraction, but their actions rarely alter the larger structures shaping development. This book demonstrates the opposite, that local efforts to control how development unfolds in particular places produces power at the periphery, which can radiate beyond those locales. Certainly, changes in the global energy industry and antiquated federal laws created pressures to develop energy minerals on Native American reservations, where energy firms were forced to negotiate with increasingly knowledgeable tribal leaders to get deals done. But local concerns over tribal survival not only informed the types of development Indians would allow, they also shaped the overriding economic and legal structures that first brought energy firms to their reservations. To ensure survival, energy tribes increased their

control over tribal resources and authorized only mining projects in which their governments could control the pace and scale. This then affected regional development schemes from the American Southwest to the Northern Plains. But when federal law seemed to prohibit even this type of tribal control over reservation mining, energy tribes set out to change the national legal structure governing their resources. Ultimately, the tribes succeeded in securing new legislation granting tribal authority over reservation minerals, and in doing so they encoded local concerns over tribal survival into federal laws governing energy development nationwide. The local emanated outward to shape regional mining projects, national laws, and global energy flows.[12]

The final lesson drawn from this book involves the intimate connections between a group's physical and social landscape, its approach to governance, and how the community defines itself. Arthur McEvoy stresses the mutability of a society's legal and political structures, explaining how they "evolv[e] in response to their social and natural environments even as they mediate the interaction between the two." For McEvoy, the manner in which a group decides how to govern itself reflects cultural choices made over the best method for mediating social relations and managing the surrounding nonhuman environment. Groups value certain behavior between their members and toward their land and thus establish political institutions and pass laws to achieve those desired results. But these social structures are not all-controlling. Physical and social environments change due to external or internal forces, and when they do, the people often change their governments to better align with the altered conditions. Laws and political institutions are simply culture manifested, with roots in both the physical and social environment.[13]

To McEvoy's apt description of the basis of governance, I would add that once group members establish their governing principles and procedures, they then partly define their community based on these decisions. They might say, for example, "We are Crow, thus we manage the environment this way"; or, "As Northern Cheyenne, we believe this is the best manner to police ourselves." Changing governing structures, such as ratifying new constitutions or placing power over natural resources in new government bodies, is thus an incredibly disruptive event for the community because it fundamentally alters how the group has previously defined itself. Some members may support the move as

a reasonable extension of the community's belief system, but for others the change is a threat to the group identity they subscribe to. These members ask the fair question: "Are we still Crow if we no longer govern ourselves and our resources the way the Crow used to?"

For many American Indian communities wrestling with the prospect of reservation energy development, these contentious internal struggles over natural resource governance and identity left the most lasting legacies. Groups like the Crow and Navajo altered their governments to take advantage of development opportunities and better control mining's impacts, but these changes deeply divided their communities. These divisions, in turn, often made it difficult to form the consensus necessary to capitalize on their abundant resources. Tribal factionalism is, of course, nothing new, and scholars have sometimes explained these conflicts in terms of internal groups vying for control over valuable resources. But few studies explain the ferocity of these debates in terms of changes to the legal structures governing natural resources. Under the auspices of "modernizing" or improving the "efficiency" of their tribal governments, energy tribes altered their governments and increased their capacity to manage reservation land. For some, however, these changes signified much more than improvements to governance. They represented a revaluing of an essential component of tribal culture (how the group manages its environment) and thus a redefining of tribal identity. Governance, the environment, and culture were inextricably entwined. As the cultural geographer Don Mitchell explains, "Moments of intense political and economic restructuring . . . are also moments of intense cultural restructuring."[14]

The remarkable tale of Indian agency that follows, then, not only explains how energy tribes reconfigured the legal relationship between tribal and federal governments, it also demonstrates how this process wrought fundamental changes within tribal communities. Considering the intimate relationships between the environment, law, and culture, how could it be any other way?

THE NATIONAL CAMPAIGN

6 Taking the Fight National

BY THE SUMMER of 1974, the view from southeastern Montana was improving. Responding to perceived attacks on the homeland, both the Northern Cheyenne and Crow had taken control of reservation mining and were exploring options to develop their resources in ways that ensured their communities' survival. The Northern Cheyenne's successful petition to the Department of the Interior had halted reservation mining and put the tribe in a position to extract the coal itself. The community was unified and prepared to reverse American Indians' historical role as passive observers to the development of their own resources. Next door, the Crow would soon fracture over the issue of reservation mining, but in summer 1974, the tribe's newly elected chairman, Patrick Stands Over Bull, had established a reservation mining moratorium and was focused on developing only the Ceded Strip. All Crow agreed that tribal control over energy projects was necessary to mitigate harmful social, cultural, and environmental impacts. Benefiting from difficult lessons learned elsewhere, both tribes stood ready to reap economic benefits from development pursued only on tribal terms.

Yet as important as these actions were for the Crow and Northern Cheyenne communities, those involved in these battles recognized that the war over Indian energy could not be won solely in southeastern Montana. Events beyond regional and national boundaries ensured

continual pressures to develop reservation resources across the West, pressures that could be met only with a similarly broad campaign to equip tribal leaders with the tools and knowledge needed to control development. Thus, in the months following President Nixon's November 1973 announcement of Project Independence—an ambitious response to OPEC's October oil embargo that called for expanding domestic production to make the country "energy independent" by the end of the decade—tribal leaders made several attempts to mobilize a consortium of similarly situated tribes to share experiences, consultants, and funding to prepare for the coming onslaught in energy demand. If the country wanted Indian resources, energy tribes could facilitate the process, but they had their own set of demands. These groups organized to ensure their communities received the bulk of benefits from reservation development.

STANDING GROUND: "A DECLARATION OF INDIAN RIGHTS"

Ironically, the federal government planted the seeds for the first pan-tribal association to defend Indian energy rights. On October 3, 1972, Interior Secretary Rogers Morton announced a joint, interagency, federal-state task force "to assess the potential social, economic and environmental impacts which would result from future development of the vast coal deposits and other resources in the five Northern Great Plains States." Involving a dozen federal agencies and a handful of states, the Northern Great Plains Resource Program (NGPRP) followed two previous attempts in the decade to coordinate energy development in the region. Like its predecessors, which included the ill-fated *North Central Power Study,* the NGPRP explored the possibility of a massive, interjurisdictional, region-wide development scheme to transform the thinly populated Northern Plains into an "energy belt" to meet the nation's growing needs. But unlike the previous studies, which focused solely on maximizing the rate of production for valuable resources, the Department of the Interior intended the NGPRP to take a more holistic approach. Multiple scenarios for regional development would be studied, and potential impacts assessed across a wide range of economic, social, and environmental values. In fact, in explaining the NGPRP as "an outgrowth of public concern in the region [over] prior

studies of the region's resources by Federal and State governments as well as private organizations," Secretary Morton left little doubt that his agency had heard the complaints of Northern Plains' ranchers and environmentalists who feared energy development would disrupt their livelihoods and landscapes. Responding to these concerns, the secretary promised a more thoughtful approach to regional development.[1]

The same attention, however, was not paid to the region's first occupants, as once again, no one had bothered to solicit Native American input for the proposed plans. Anxious tribes could only watch as the Interior secretary promised other constituencies a more calculated approach to Northern Plains' development while declaring confidently that "these major coal deposits will be developed, that is inevitable, but how they are developed is of national interest." Excluded from the process, Indians felt their apprehension over the potential use of tribal resources increase as President Nixon delivered a series of unprecedented addresses in 1973 that stressed the need to expand domestic energy production, particularly from the nation's vast coal reserves. Never before had a president featured energy policy in a message to Congress or the American people. Now, even before the October 1973 Arab oil embargo, Nixon was highlighting the disparity between the amount of coal the country possessed—according to him, over half the world's reserves—and the amount being used to meet domestic energy needs—again by the president's estimate, less than 20 percent. To remedy this disparity, in his April 1973 address the president urged "that highest national priority be given to expanded development and utilization of our coal resources," including those along the Northern Plains. When Nixon again emphasized these vast untapped coal reserves in his November 7 announcement of Project Independence, the message from the top was clear. Energy development was coming to the Northern Plains and the federal government was paving the way.[2]

The nation's newfound commitment to Northern Plains coal development was on a collision course with indigenous peoples' commitment to community survival. Sensing tribal resources would again be sacrificed for the good of the country, Indian leaders reacted to Nixon's call for energy independence by organizing a historic gathering of Northern Plains tribes for December 18, 1973, on North Dakota's Fort Berthold Reservation. The one hundred plus delegates who arrived at the reservation shared by the Mandan, Hidatsa, and Arikara tribes

planned initially to discuss the NGPRP's impact to tribal water rights. The conversation broadened quickly, however, to include a general denunciation of the regional development program and a plan for a coordinated defense. Unable to ignore a gathering of this many disgruntled stakeholders, especially those with precious water and mineral rights, NGPRP Director John Vanderwalker scrambled to attend the meeting and placate Indian concerns. He did not receive the reception he had hoped for. Instead, the gathered tribal leaders made clear their strong resolve to oppose regional development without Native input, leaving the director with little choice but to bring the tribes into the NGPRP process. Yet Vanderwalker's view of the tribes' appropriate role was telling of the government's notion of tribal sovereignty, even under the new self-determination policy. Labeling these groups as special "consultants," the NGPRP director invited the tribes merely to submit formal comments on the final report. Apparently, the insensitivity of belatedly asking American Indians to "consult" on a plan that would deeply impact their resources and communities was lost on Vanderwalker.[3]

The insult was not missed by tribal delegates. Those in attendance seized the opportunity to submit comments on the NGPRP as a chance to organize collectively and articulate broader concerns regarding the expropriation of Indian resources. Before disbanding at Fort Berthold, delegates established a temporary committee to draft their comments and enlisted the assistance of Native American Rights Fund (NARF) attorney Thomas Fredericks, himself a Mandan tribal member. At the time, NARF attorneys were already busy on the nearby Northern Cheyenne and Crow Reservations restructuring or canceling existing mining projects. This experience, combined with NARF's earlier work on behalf of Hopi and Navajo tribal members, positioned Fredericks's relatively small public-interest law firm as the nation's foremost expert on protecting Indian mineral rights. It also allowed NARF attorneys to develop a common legal strategy that entailed first asserting tribal control over natural resources—and defending this claim in legal or administrative actions, if necessary—before entertaining proposals to develop them. Fredericks shared this message with his new clients, several of whom, like committee member and Northern Cheyenne President Allen Rowland, were already fighting their own tribal battles to control reservation mining. Under Fredericks's guidance and with Rowland's support, the temporary committee's task to provide specific comments

on the NGPRP morphed into a general defense of indigenous rights over all Northern Plains resources guaranteed by past treaties.[4]

As the broader scope of this undertaking became clear, those involved understood that a simple declaration of rights was not sufficient to defend legal claims to highly valuable resources. A formal organization was required to carry the fight. Thus when the Northern Plains tribes gathered again in Billings, Montana, on January 17, 1974, to review their draft statement on Indian resources, delegates formed another ad hoc committee to not only finalize the statement but also draft a constitution and bylaws for a new federation to protect tribal rights. None other than Northern Cheyenne Tribal President Allen Rowland chaired this new committee. Working throughout the winter, Rowland and his fellow delegates returned to Billings in March to approve what was now titled the "Declaration of Indian Rights to the Natural Resources in the Northern Great Plains" and finalize founding documents for the Native American Natural Resources Development Federation (NANRDF). By May, the new organization had elected former and future Rosebud Sioux Tribal President Robert Burnette as its chairman. In addition to his tribal duties, Burnette also was the former executive director of the National Congress of American Indians and the visionary behind the Trail of Broken Treaties. Clearly, he possessed the leadership qualities and experience necessary to make NANRDF a force to be reckoned with on the Northern Plains. Within a few short months, the indigenous outrage at being excluded from the NGPRP process had blossomed into a full, pan-tribal alliance to protect tribal resources and communities.[5]

Much like the Northern Cheyenne and Crow revolts, organizers of this pan-tribal alliance understood their mission as a desperate defense of tribal homelands, and the Native American Rights Fund made sure to make this point in terms all Americans could understand. Dedicating its spring 1975 newsletter to the formation of NANRDF, NARF staff drew explicit comparisons between the saga unfolding on the Northern Plains and the American Revolution. The Northern Cheyenne and Crow, NARF explained, were the Sons of Liberty that ignited the insurrection. The Billings meetings played as a modern-day Second Continental Congress, producing a Native Declaration of Independence and a confederation to manage the anticolonial war. And just as the complaints of the Boston patriots had found their fullest expression in the

exalted prose of the Founding Fathers, the arguments first articulated by the Northern Cheyenne and Crow were now being expounded upon by the twenty-six founding members of NANRDF. Their Declaration of Indian Rights explained how the international energy crisis "makes the vast coal resources of [the Northern Plains] very appealing for immediate development," and that such pressure to develop "threatens the viability of our environment and the continued existence of the 26 tribes which occupy the Northern Great Plains." Defiant in its defense of these communities, NANRDF put the world on notice that its members intended to "maintain their ownership to the priceless natural resources which are geographically and legally related to their reservations" and warned federal agencies that any attempt to divert or use tribal resources "shall be at their own risk." The line in the sand had been drawn.[6]

To defend its position, NANRDF set out not only to represent its members' interests in federal and state planning efforts but also to construct an indigenous network of knowledge to help tribal leaders make sound resource development decisions. In fact, of NANRDF's four founding purposes—(1) to coordinate efforts to describe and quantify Northern Plains Indians' cultural and natural resources, (2) to develop scientific data and expertise to make informed management decisions for these resources, (3) to represent affected Indians in federal and state planning programs, and (4) to provide assistance to individual tribes in managing their resources—three were dedicated to generating and sharing information on appropriate resource management techniques. This focus on gathering knowledge about minerals and markets and educating tribal leaders on the nuances of energy development mirrored the approach taken by the Crow and Northern Cheyenne. The affinity was no accident. The very same leaders and advisors involved in those struggles were applying similar tactics in this concomitant effort to build a pan-tribal alliance.[7]

ON THE OFFENSIVE: CREATING THE COUNCIL OF ENERGY RESOURCE TRIBES

By the summer of 1974, the revolution launched in Lame Deer had gained solid footing in tribal communities across the Northern Plains. The government's latest coordinated efforts to tap regional energy re-

serves triggered indigenous resistance among numerous potentially affected communities. Conditioned by the Cheyenne, Crow, and southwestern experiences, the Northern Plains groups issued a declaration of rights drawing attention to the government's latest exploits and formed a pan-tribal organization to combat them. NANRDF was the first entity of its kind, uniting dozens of tribes behind the single purpose of protecting valuable tribal minerals.

But for all of its importance, the Northern Plains' coalition was still regional in scope and defensive in nature. It was an appropriate response, for it reflected the particular threat posed. The Department of the Interior's actions to exploit Northern Plains' resources represented an older, Progressive-era approach to western development, one where the government directed resource management and reflexively ignored tribal input. In the 1970s, however, new federal agencies were exploring innovative partnerships with groups outside the federal bureaucracy that could increase domestic energy production nationwide. If Interior's actions on the Northern Plains called for a defensive response, this novel approach provided common ground for energy tribes and federal officials to work together. It also provided a platform to expand the Northern Plains alliance into a national consortium to represent the interests of all energy tribes. Tribal leaders formed NANRDF to fight Department of the Interior actions in the North, but they would establish the Council of Energy Resource Tribes (CERT) in partnership with new federal efforts to cooperatively expand domestic energy production.

A familiar warrior triggered the search for common ground between energy tribes and the federal government. On February 13, 1974, George Crossland, the Osage attorney who had first counseled the Northern Cheyenne to tear up their coal leases, wrote to Stuart Jamieson of the National Congress of American Indians (NCAI) advocating for a "tribal energy coalition" to help tribes maximize the long-range benefits of their energy resources. Crossland was not involved in NANRDF's creation, but he understood what Project Independence meant for Native resources. He warned Jamieson that the country's excessive growth would continue to place extreme pressures on these resources and argued that tribes needed a common strategy to protect their minerals or else "we shall see the experiences of the Osages and Navajos-Hopis repeated: the depletion and consumption of the

resources base." Following up a month later, Crossland submitted a more extensive memo to NCAI Executive Director Chuck Trimble that included data on the nation's increasing energy use and quotes from its top energy policy makers. According to the longtime tribal rights advocate, these indicators "lead inevitably to the conclusion that the Bureau [of Indian Affairs] and [the Department of the] Interior are quite willing to sacrifice Indian people, in the first instance, for the gain of the energy industry." "Therefore, if the 'past is prologue,'" Crossland continued, "the tribes must be more informed than ever before if they determine to utilize their natural resources. In the headlong rush to meet the nation's energy demands, it is entirely conceivable that the loss of tribal viability will be considered just one of the nation's 'social costs.'" One of the nation's foremost experts in defending tribal resource rights was raising the alarm to the country's largest Indian rights group and asking the NCAI to organize its members for a mutual defense.[8]

As it turns out, Crossland's plea fit perfectly with an important policy shift occurring within the NCAI to empower tribes to develop their own, Indian-led reservation economies rather than relying on outside capital to build non-Indian enterprises on the reservations. Founded in 1944 to fight federal efforts to terminate the special trustee relationship between tribes and the federal government, the NCAI had consistently worked "within the system" to protect tribal treaty rights and enhance indigenous communities. During the 1960s, this approach meant largely eschewing the combative tactics of more militant groups, such as the National Indian Youth Council or the American Indian Movement, to focus on extending President Lyndon Johnson's Great Society programs to impoverished American Indians. To stimulate reservation economies, the NCAI thus obtained status as a national Community Action Agency and administered an Indian Economic Development Program designed to bring industrial activity to rural reservations. As the NCAI explained in a proposal to the Economic Development Administration, this approach involved "a series of 'industrial show-type' seminars wherein Indian Tribes would set up booths extolling the benefits of locating industry on their respective reservations . . . and booths were [also] provided for industries to display their products for consideration by the Tribes." To develop reservation economies, the NCAI acted essentially as a national Chamber of Commerce seeking to site private industries on Indian reservations.[9]

By the early 1970s, however, the organization was reexamining this model. Member tribes were rejecting the "industrial show" approach due largely, as the NCAI noted, to the "growing nationalistic emphasis of the Tribes on the development of Tribal government and development of their natural resources." Proposing a shift in tactics to the Economic Development Administration in 1974, the NCAI explained that in this "year of national introspect[ion]" caused by the Arab oil embargo, tribes "are engaged in widespread governmental and economic development, and are beginning to look increasingly to the development of their [own] human and natural resources." To lead this transition to Indian-centered reservation economies, the NCAI proposed a series of intensive, multiday seminars that would educate tribal leaders on the specific industries most appropriate for their reservations. These included commercial fishing seminars for Pacific Northwest tribes and agribusiness primers for those in the Great Plains, but the NCAI argued that "potentially the most important seminar on the proposed schedule" was a panel on energy resources intended for the "Indian 'Energy Belt' extending from western North Dakota diagonally southwestward through Arizona." In this time of soaring energy demands and limited international oil supplies, the NCAI looked to Indian energy development as the potential flagship for its new approach to reservation economies.[10]

And, of course, who knew more about the intricacies of the Indian energy industry than the tribes and consultants currently fighting to control their minerals? NCAI staffers thus reached out to the Northern Cheyenne, Crow, and other Northern Plains tribes to help organize the first ever "Indian energy conference" for late summer 1974. Dan Israel and Thomas Fredericks—NARF attorneys who represented the Crow and NANRDF, respectively—responded with a series of memos to conference organizer Stuart Jamieson, sharing their extensive experience with Indian energy development and outlining everything from general topics to be addressed to specific panel structures and suggested participants. Unsurprisingly, the issues topping NARF's discussion points reflected their experience on the Northern Plains, including developing tribal capacity to control reservation resources, educating tribal leaders on how to negotiate contracts that retained tribal ownership over mining ventures, and discussing the role of the recently formed NANRDF. When the NCAI announced details of the August 1974

energy conference in its national newsletter, the proposed agenda mirrored the format and topics suggested by the NARF attorneys. And if the influence of the Northern Plains energy tribes was not clear enough, the conference was scheduled to take place in Billings and would be cohosted by Northern Cheyenne President Allen Rowland and Crow Chairman Patrick Stands Over Bull.[11]

*

The NCAI-sponsored Indian Energy Conference marked an important transition in the movement for tribal control over reservation resources. Coming together for several days of debate and discussion, tribal leaders began to reconceive their mission as not only defending reservation resources against perceived threats to tribal survival but also proactively using these assets to expand tribal sovereignty and reservation economies. Of course, both the defensive and proactive strategies were needed to replace non-Indian mining with tribal-led ventures, and both views were represented at this conference. Allen Rowland, for instance, opened the meeting by deriding the federal government's failure to uphold its trustee duty and explaining that NANRDF had been formed specifically to fight federally led development. "Where's our trustees?" Rowland asked the audience rhetorically, "Well by God, that's a damned good question. I've been looking around for them for a hell of a long time now, about 15 years. And every place I go, I find them working against us. . . . [S]o what's got to happen, the way I look at it, is the Indian people got to band together to save what we have left." Rowland was not alone in his continued calls for a mutual defense. Suggesting specific tactics to strengthen tribal resistance, Crow activist Dale Kindness warned that coal development would spell the end of many indigenous communities unless tribes established reservation zoning ordinances and environmental codes to shape planned mining. Kindness pleaded, "If we are to continue as Indian people with our own values, society and culture, we have to stand up straight and get our stuff together." Clearly, the experience of the Crow and Northern Cheyenne as the test subjects for Northern Plains' energy development had produced powerful sentiments against non-Indian mining.[12]

But the other message offered at this unprecedented gathering moved beyond defensive posturing and suggested an innovative approach to capitalize on the tribes' vast resources. Interestingly, this view was artic-

ulated most clearly by an outsider, Arjun Makhijani, who was a project specialist at the Ford Foundation's Energy Policy Project. Since 1971, the Ford Foundation had been committing its substantial resources to resolving what it saw as an unsustainable rate of American energy consumption. As part of this effort, Makhijani worked with a group of distinguished economists, scientists, engineers, and policy experts to explore the range of available energy choices and to suggest new policies for responsible energy use. Completing its final report, entitled *A Time to Choose,* earlier in 1974, this team recommended a "conservation oriented energy policy" to reduce America's energy demand, which would address the associated problems of energy shortages, environmental and social concerns arising out of increased domestic production, and the growing power of Middle Eastern oil exporters. At the end of their three-year study, the Ford Foundation group represented perhaps the country's foremost gathering of energy experts. They had the knowledge energy tribes lacked.[13]

Recognizing the need for expert assistance, the NCAI had approached the Ford Foundation for help on its Indian Energy Conference. Directed to Makhijani, NCAI Director Chuck Trimble met with the energy expert and explained the tribes' predicament. "We're ground zero on this," Trimble acknowledged. "We don't know what we have, and therefore we don't know where we're going, and that's what this conference is about." Makhijani responded by admitting he knew very little about American Indians, but he nevertheless accepted Trimble's invitation to apply his vast knowledge of the global energy industry to reservation development. The indigenous network of knowledge was expanding.[14]

Arriving in Billings as the featured speaker on the opening panel, Makhijani captivated the conference by offering the stunning suggestion that energy tribes model their approach after the Organization of Petroleum Exporting Countries (OPEC). The Ford Foundation's energy expert first explained the central role energy held in the global economy and then walked the attending tribal leaders through OPEC's history from exploited colonial states to "one of the most dominant economic forces in the world." This remarkable transition, Makhijani explained, was due to its collective management of oil, and energy tribes could do the same with coal.[15]

Of course, evoking the specter of an "a Native American OPEC" less than a year removed from the October 1973 Arab oil embargo and the infuriating fuel shortages it produced was a dangerous proposition.

Makhijani thus was careful not to emphasize OPEC's cartel power in withholding oil and setting prices. Instead, similar to the benefits NANRDF organizers touted, he argued OPEC's biggest attribute was its ability to collect and share information on global energy projects to ensure its members pursued similar strategies with their oil company partners. The same type of an organization, Makhijani argued, could serve the tribes well by "permit[ting] you to get a lot of knowledge about what your resources are [and] what the relation of those resources [are] to the U.S. and world energy picture." Once these data were obtained, Makhijani continued, "it should be relatively easy for Indians to go into business for themselves, rather than lease to coal companies from which they're usually not deriving adequate benefit." Clearly encapsulated, this was the message of Indian-led economic development the NCAI had gathered the tribes to hear.[16]

With Makhijani articulating the path forward, subsequent speakers focused on the specific steps to carry out this project. Northern Cheyenne and Crow attorneys reviewed the actions they had taken to halt existing mining, but then focused their comments on how to develop reservation codes to shape future mining. George Crossland bashed existing federal regulations that restrained Indian entrepreneurship before he and others proposed changes to federal law that could give tribes flexibility to enter into promising commercial ventures beyond the standard lease form. Each of these suggestions reflected a new, forward-looking perspective that envisioned Indians controlling their own resources, and each called for a collective effort to make this goal a reality. Barney Old Coyote, a Crow tribal member and president of the American Indian National Bank, created to finance tribal ventures, used a football analogy to support the strategy. "You can have the best defensive unit in football," Old Coyote told the audience, "but if you don't have the ball, and you're on the defensive all the time, you're never going to win the ball game." The energy tribes were ready to go on the offensive.[17]

*

At the end of the two-day Indian Energy Conference, Barney Old Coyote continued his football analogy by announcing that one of the offensive "plays" he and others had been exploring was a partnership

with the Federal Energy Office. Created in the wake of the Arab oil embargo to allocate reduced oil supplies and control prices, this temporary crisis-management office had become the hub of energy policy and planning under the Nixon administration. When the president and Congress created the permanent Federal Energy Administration (FEA) in summer 1974, the new agency largely absorbed the responsibilities and expertise of the Energy Office, including the search for ways to make the country energy independent. To carry out this goal, the FEA started exploring partnerships with groups outside the federal government, offering grants to fund private, domestic energy projects.[18]

And here is where Old Coyote and his fellow tribal leaders saw an opening. Rather than have this new agency support mining projects designed by energy firms that rarely owned mineral resources yet profited greatly from their development, Old Coyote questioned the gathered tribes, "Why not have the Energy Office . . . start dealing [directly] with the Indian owners of resources and of energy in this country?" It was a question worth considering, even for a group conditioned to be wary of federal involvement in the development of their resources. Those in attendance began to recognize that they, as individual tribes or a consortium, could contract directly with the federal government to obtain funding to support mineral studies and development plans to produce energy for the nation and revenue for themselves.[19]

The idea of forming a national coalition of energy tribes that would interface with the federal government to gather and share energy information quickly gained momentum. Six weeks after the energy conference in Billings, many of the same participants gathered at the NCAI's national convention in Denver to share their insights with a broader audience. Arjun Makhijani, who, as NCAI Director Chuck Trimble explained, had "become famous overnight" within the Indian community, once again offered OPEC as a template for shifting "your tactics in a very fundamental way from defensive battles to assertion and recognition of your rights before anything happens [to your resources]." Makhijani cautioned, however, that in order to assert these rights, the energy tribes first needed to know exactly what resources they possessed. "You first of all have to know what you have got," he warned. "If you don't have this knowledge, then you will be at the mercy of the government and the companies, from the very start, as you have been in the past." George Crossland echoed these comments, arguing

the tribes' first step was to coordinate a national inventory of Indian resources, particularly those water rights so precious to any western development scheme.[20]

Makhijani's and Crossland's warnings took on added importance in the winter of 1974–75 as it seemed that some federal agencies still planned to appropriate Northern Plains' resources for Project Independence. On February 24, 1975, the Department of the Interior and the Army Corps of Engineers entered into a memorandum of understanding to market Upper Missouri River Basin water—much of which was committed to Indian reservations—for industrial purposes. Sensing their fears were coming to pass and that Indian resources would be auctioned away without their input, the energy tribes launched into action. Northern Plains' tribal leaders traveled to Washington, D.C., to lodge their objections with federal officials and then submitted a formal letter of protest to President Gerald Ford, threatening a lawsuit that could tie up valuable water rights in litigation for years. It was the standard defensive tactic, but it was complemented by NANRDF's and NCAI's outreach to the new FEA Administrator Frank Zarb. Hoping to head off the federal appropriation of tribal water rights, these organizations requested that Zarb provide "heavy federal funding of engineering, economic, and socio-cultural studies to determine the presence and quantity of natural resources and the social and economic impact of development of those resources on Indian resources."[21]

Tasked with exploring all options to increase domestic production, FEA officials were eager to engage tribes possessing significant energy resources. On April 22, 1975, at an FEA "consumer workshop" in Denver, Deputy Administrator John Hill met with tribal groups from both the Northern Plains and the Southwest who had formed a unified "Indian caucus" to press their concerns. After meeting with Hill, this group issued a formal statement demanding that the president reaffirm the federal trustee duty to protect Indian assets and develop these resources "only with the informed consent, concurrence, and the active participation of each tribe." Days later, many of these same caucus members then flew to Washington, D.C., to attend a meeting arranged by the NCAI between FEA Administrator Zarb and NANRDF representatives. While the Northern Plains group had scheduled the meeting to discuss FEA assistance to tribes in their region, when NANRDF members made their play for federal funds, the southwestern tribes

demanded their fair share as well. The hoped-for unity among energy tribes was being tested over the allocation of federal support, and the FEA began to understand how difficult it could be to formulate national policy for a diverse Native America.[22]

Despite the lack of unity displayed by the energy tribes—or because of it—this April 25 meeting set in motion the process that would produce the Council of Energy Resource Tribes. Once the diverse interests of the energy tribes became clear, Zarb commissioned an FEA task force to develop a comprehensive Indian energy position paper that evaluated the role of all Indian resources in meeting national energy goals and considered the environmental and socioeconomic impacts of reservation resource development. In typical bureaucratic fashion, the resulting position paper suggested an additional "interagency/Indian tribes task force" to obtain more tribal input for FEA's national Indian energy policy. After a meager attempt to organize this new task force in San Francisco in June 1975 attracted only a handful of tribes, the FEA pushed for a much larger gathering in Washington, D.C., the following fall. This time, with both FEA Administrator Zarb and Bureau of Indian Affairs Commissioner Morris Thompson scheduled to attend, and travel expenses provided, representatives of more than twenty energy tribes from across the country arrived to discuss how the FEA could facilitate tribal energy development.[23]

In the halls of the Federal Energy Administration, the Council of Energy Resource Tribes was born. On September 16, 1975, attendees at this latest round of meetings spent a long opening day hearing from federal officials about how the FEA intended to increase domestic energy production and where Indian resources could fit into this goal. Tribal representatives understood the need for collective action, but as individual groups with diverse interests and concerns, the tribes debated how to respond. After spending two more days trying to organize themselves and develop a unified position, LaDonna Harris of the Americans for Indian Opportunity decided to aim for something lower. Seeing the tribes struggle to agree on substance, she gathered a small group of volunteers to focus on process. This group, which included NARF attorney Charles Lohah and Jicarilla Apache attorney Robert Nordhaus, then drafted an organizational charter to provide energy tribes with an institutional mechanism for communicating tribal desires to federal officials. The organization would be a mouthpiece but little

more. By the end of the day on September 18, fourteen of the twenty-three tribes present had signed the two-page charter drafted by Harris and company. They then proceeded to elect the charismatic chairman of the Navajo tribe, Peter MacDonald, as their leader. Common ground had been found over procedure, but not all were sure of the impact of their actions. Leaving the FEA's Washington headquarters at one o'clock the following morning, LaDonna Harris recalls Charles Lohah turning to her and asking point blank, "What have we done?"[24]

GROPING TOWARD AN IDENTITY: CERT'S FORMATIVE DAYS

CERT had been birthed by the federal desire to develop domestic energy sources but driven by energy tribes' determination to take charge of reservation development. Its founding documents reflected the confused nature of its origins. Along the lines of the OPEC-style organization Arjun Makhijani proposed, CERT's organizational charter envisioned a coalition of similarly situated tribes that would share energy information and cooperate to "promote the general welfare of the Energy Resource Tribes." But issued concurrently with this charter was a longer list of recommendations to the FEA that emphasized the need for partnership between CERT and the federal government to respond to "the present 'Energy Crisis' and potential 'Energy Disaster.'" This second document called for the creation of yet another task force under the newly created, cabinet-level Energy Resources Council—which Frank Zarb also directed—that would include the leaders of all energy tribes. This task force would work with the federal government to review the needs and practices of Indian resource development, make available federal assistance to support such projects, and monitor reservation mining. It seemed a worthy proposal, but together the two documents suggested conflicting organizations. On one hand, CERT's charter called for an independent coalition of mutual interest to share information and strengthen each member's negotiating position with energy companies and federal agencies; on the other, the position paper proposed an intimate, institutional connection between energy tribes and the federal government that blurred the lines between the two. Certainly, the tribes took momentous actions in Washington

that September, but it was hard to ascertain exactly what these actions meant.[25]

The creation of CERT confused even those tribes and tribal leaders that spearheaded the movement for a national coalition of energy tribes. Writing to NCAI Executive Director Charles Trimble a week after the FEA meetings, Northern Cheyenne President Allen Rowland noted that his and a few other important energy tribes had not signed the organization's founding documents and suggested an Indian-only meeting, free of federal interference, to clarify CERT's purpose. Like NARF attorney Charles Lohah, Rowland was not sure what CERT was. Responding dutifully, the NCAI brought the energy tribes back to the same Billings facility where Rowland and Crow Chairman Patrick Stands Over Bull had hosted the inaugural Indian energy conference a year earlier to better define the new organization.[26]

At this latest gathering of the energy tribes, confusion reigned. Was CERT an independent organization of energy tribes or simply a task force of the FEA? If an independent organization, what was its relationship to the Northern Plains federation known as NANRDF? Did their purposes align or would the organizations compete for federal funding and tribal membership? Would CERT subsume NANRDF? After hours of debate, NARF attorney Thomas Fredericks, who was now NANRDF's executive director, attempted to clear the air. Believing CERT and NANRDF had similar goals but different functions, Fredericks recounted the series of meetings that led to CERT's creation and then argued that "both groups can co-exist" because CERT's only purpose was to act as "the organization or the vehicle to supply the administration with the consensus . . . of the Indian community as to what they feel about energy development on reservation lands and Indian country." According to Fredericks, CERT was not an independent cartel but rather served as an important advisory body to federal policy makers, especially those agencies with money to invest in domestic energy production. "I think the whole concept of CERT," Fredericks explained, "was that by having a voice in the administrative arm of government, that the monies that were available to really develop this energy could be . . . channeled to the Indian tribes because of the potential that exists on most reservations." Fredericks and others used organizational charts depicting the federal bureaucracy to point out where

CERT would give Indians "a voice in the upper echelons of the energy policy makers to [force them to] come up with programs that would be relevant to the Indians' needs." The explanation seemed to quiet the controversy. After making his case, Fredericks then focused the meeting back on CERT's demands to the FEA, walking the audience through a line-by-line analysis of its earlier list of recommendations. If CERT truly was a mouthpiece to provide Indian input into federal energy policy, crystallizing these demands was its most important task.[27]

This interpretation that CERT's primary role was to work within the federal government to advise policy makers and lobby for aid in Indian energy development set the organization's early agenda. Cultivating federal connections, CERT requested $1 million in federal seed money to conduct a resource inventory study and then opened offices in Denver and Washington, D.C., to give the organization one foot in Indian Country and another in the Beltway. The organization also used federal funds to hire its first executive director, Ed Gabriel, an FEA staff member who was instrumental in forging the federal-tribal partnership. Apparently, raiding the federal bureaucracy to lead a pan-tribal organization charged with developing indigenous resources barely raised an eye. As Marjane Ambler explains, Gabriel "was a logical choice" due to the closeness of the CERT-FEA relationship. Be that as it may, tribal leaders that had been inspired a year earlier by calls for a "Native American OPEC" to wrest back control over reservation development must have wondered how their cause became so intimately entwined with the federal government.[28]

*

Fortunately for those desiring a more independent federation, the honeymoon between federal policy makers and CERT was short-lived. In March 1977, with a new Democratic administration prioritizing energy policy and promising a comprehensive energy program within its first ninety days, CERT Chairman Peter MacDonald challenged Jimmy Carter to address Indian energy concerns or else risk losing access to these valuable minerals. During the previous year and a half, MacDonald and his fellow tribal leaders had worked their federal connections to advance CERT's mission, but they were becoming frustrated with the lack of results. The organization's $1 million initial request,

for instance, had not been met, and the BIA was blocking the FEA's encroachment onto their traditional bureaucratic turf. MacDonald complained publicly, "We have gone to [multiple federal agencies] and pleaded for resources to inventory our minerals—pleaded for the kind of technical assistance necessary to achieve self-sufficiency," but to no avail. Now, with the change in administration, MacDonald determined the time was right to deploy alternative tactics to secure the support tribes needed. Delivering a public speech in Phoenix, the Navajo and CERT chairman issued a not-so-veiled threat to federal officials:

> Now, as some of you know, a dozen Indian nations have formed a domestic OPEC. We call it CERT. . . . We ask [for assistance] now quietly and constructively. We will not ask much longer. We will withhold future growth at any sacrifice if that is necessary to [tribal] survival.

In a few short lines, MacDonald made public an option energy tribes had been discussing for years. If the federal government would not willingly provide the tools energy tribes needed to intelligently and responsibly manage their resources, the Indians would convert CERT into an OPEC-style cartel to withhold desperately needed energy sources.[29]

Reflecting this bold, new approach, CERT members moved quickly to reframe their relationship with the federal government. Meeting days before President Carter's April 18, 1977, "unpleasant talk" with the nation wherein he described the present energy crisis as the "moral equivalent of war," CERT members issued a revised statement of demands that omitted any reference to the energy tribes acting as a task force within the executive bureaucracy. Instead, the statement repositioned CERT as an independent coalition of resource owners controlling "55 percent [of the nation's] uranium, 30 percent of coal and 3 percent of petroleum and natural gas." Considering this substantial tribal stockpile, CERT demanded "direct and constant" access to the secretary of energy. Never willing to give up on the federal-tribal partnership, though, CERT also dangled the possibility of cooperation if the federal government took four specific actions: (1) fund a comprehensive energy resource inventory, (2) help energy tribes construct alternative development agreements to the standard lease contracts, (3) provide capital for energy tribes to develop their own resources, and (4) educate tribal leaders in proper energy resource planning. Although not new requests, energy tribes' crystallized their most crucial demands

for tribal control. And if the demands were not new, the negotiating strategy certainly was. If the feds wanted access to Indian resources, they now would have to engage with an independent cartel threatening to withhold energy resources crucial to the country's growth.[30]

Apparently, federal officials were unmoved by the new tactic, and so in the summer of 1977 MacDonald dramatically upped the ante by transforming the OPEC analogy into a potential partnership with the oil-exporting countries. In July, the CERT chairman met with several OPEC members in Washington, D.C., of all places, to discuss how these former colonial nations had gained control over their valuable resources. Noting that "federal red tape and foot dragging" had left him no other options, MacDonald assured national reporters covering these meetings that he was "not looking for advice on how to impose an embargo" but instead "our purpose is more long range," seeking technical assistance on how to structure mineral development deals, plan for sustainable development, and market Indian minerals. Still, news of Arab and tribal leaders meeting in the nation's capital to discuss potentially withholding valuable energy resources garnered much attention, which was exactly what MacDonald intended. On his own reservation, the Navajo tribal chairman had made a political living framing energy projects as a colonial appropriation of Indian resources to feed American growth. For years, he had even compared the Navajo nation to the exploited OPEC states and advocated that his tribe follow a similar anticolonial approach to resource management. "From now on," MacDonald had announced in the *Navajo Times* in March 1974, "the Navajos intend to use the same kind of tactics that oil-rich Arabs have employed. Our goal is the same: a bigger take from our desert Kingdom." Now, in 1977, the CERT chairman hoped that by cementing a formal relation with these Middle Eastern states—or at least appearing to—he could goad the federal government into following through on promises of support for all energy tribes.[31]

Seeking a partnership with OPEC and, more important, cultivating CERT's public image as the "Native American OPEC" was a bold move with, at best, mixed results. The strategy got the federal government's attention and perhaps produced initially a few more federal dollars. But as Marjane Ambler reports, it also ignited a public backlash against "unpatriotic Indians" who appeared to be withholding American energy. This anti-CERT sentiment hit a fever pitch in January 1979, when

an exiled zealot named Ruhollah Khomeini led an Islamic Revolution that toppled the Iranian monarchy. The loss of oil from the world's second largest exporter disrupted global markets, and although other Middle Eastern states worked to offset the deficit, panic quickly set in. Oil companies and consumers alike rushed to obtain the petroleum they feared would not be available the next day. In a repeat of the 1973 energy crisis that had heightened demand for Northern Plains' coal, the nation endured its second bout of frustrating fuel shortages. America's disdain for foreign oil producers had never been higher.[32]

The same was true of the country's feelings toward energy tribes. CERT continued to request more and more federal dollars throughout late 1970s, including $2 million in 1978 and an astonishing $60 to $70 million in 1979. But in the wake of the second energy crisis, these requests now appeared to most Americans as blackmail during the country's time of need. As the *Denver Post* editorialized in 1979: "Supposedly we are to pony up cheerfully so the noose of escalating energy prices can be tightened around our necks? The energy crisis is too important for confrontational politics, which, if pursued likely will boomerang and hurt the Indian cause rather than help it." This is exactly what happened. CERT kept requesting money, but federal officials could not justify supporting an organization touting its ties to the Middle East.[33]

Peter MacDonald was not deaf to the events capturing the nation's attention and understood the need for another shift in strategy. Writing to President Carter days after his famed July 15, 1979, "crisis of confidence" speech, wherein the president challenged the nation to fight "on the battlefield of energy [so] we can win for our nation a new confidence," MacDonald maintained his defiant tone but recommitted Indian energy to the fight. Telling the president he was disheartened Native Americans had not been included in Carter's new energy program, the CERT chairman nevertheless affirmed, "Today I offer my support, and that of the 24 other CERT energy-producing tribes, to the president and his Administration, and will await his direction." Of course, that support would come with a price, but MacDonald was reaching out to change the trajectory of federal-tribal relations.[34]

Carter soon took the CERT chairman up on his offer to provide Indian energy to the nation. Within the month, Charles Duncan, the newly confirmed secretary of energy, met with Peter MacDonald

and then dispatched his assistant director, Richard Stone, to CERT's December 1979 annual meeting. At that gathering, CERT members unveiled proposals for several new reservation energy projects, including two large coal-fired generating plants, an oil refinery, and a coal gasification facility. Impressed by the Indians' efforts, Stone responded with the federal commitment CERT had been seeking. His $24 million pledge included $10 million for specific tribal projects, $7 million for an Indian resource inventory, and another $2 million to cover CERT's day-to-day operations. In the heat of a yet another "energy crisis," MacDonald and his fellow tribal leaders learned that playing the role of an independent broker for Indian energy resources worked far more effectively than the alternative of an antagonistic cartel threatening to withhold valuable minerals.[35]

*

With this lesson learned, the 1979 CERT annual meeting should have presented a scene of congratulatory celebration for the young organization. Instead, reaching its goal of obtaining federal support caused yet another round of deep introspection by CERT's members. Those Indians, like many within the chairman's own Navajo tribe, who had adopted a nationalistic stance toward controlling their minerals now questioned CERT's authority to speak for their tribal governments and commit reservation resources to the American market. According to Marjane Ambler, other tribal members who desired to halt all reservation mining protested what they saw as CERT's new position as "an elitist broker of Indian resources . . . prostituting its members' land and people in exchange for energy agency dollars." Winona LaDuke even describes one group of "traditional people" from the Navajo Reservation crashing the 1979 Phoenix meeting, demanding "that the indigenous members of CERT realize their traditional and spiritual ways of survival and their responsibility to the earth and their people." Ironically, at the height of its influence with federal officials, CERT appeared to be crumbling from the inside. As CERT's executive director, Ed Gabriel, later admitted, "We got what we asked for [at the 1979 Phoenix meeting], but it took us more than a year to recover."[36]

To restore legitimacy in the eyes of all its constituents, CERT shifted focus from selling the benefits of Indian energy development to federal

officials and toward proving the organization's value to tribal leaders and members. The first step was to clarify that the bulk of federal dollars CERT secured would go directly to benefit tribal energy programs, not into the organization's coffer. Thus, just days after the Phoenix meeting, CERT explained in its newsletter that the government's $24 million pledge would fund specific reservation inventories and feasibility studies "and not be channeled through CERT." The organization then focused its activities on providing consulting services to individual tribes desiring development—which, of course, could be paid for with these new funds—rather than assume the role as spokesperson for all energy tribes. To do so, CERT grew its technical assistance center in Denver, where by 1981 two-thirds of its sixty employees were located, leaving only a small lobbying team in Washington. The geologists, energy consultants, and former federal employees in the Denver office understood the type of information tribes needed to pursue development, and most important, they knew how to obtain funds to gather that information. Through assisting tribes in putting together federal grant applications and private lending documents, CERT officials claimed that, by 1981, they had secured $17 million for tribal energy projects that would not have been available otherwise. Federal bureaucrats also recognized CERT's value in this endeavor. Energy Department official Richard Stone explained that in this period of unprecedented federal investment in energy development, federal money "goes to those who produce good paper, [and] the paper CERT has produced on behalf of the tribes has been of consistently good quality."[37]

By producing "good paper" to secure funding for potential energy projects, CERT was positioning energy tribes to finally capitalize on their vast and valuable resources if they chose to do so. A voluntary coalition of independent sovereigns, CERT itself had no authority to commit Indian resources. Instead, the grants and loans it helped secure would fund reservation inventories and feasibility studies to allow tribal leaders to make their own informed decisions. Of course, CERT often benefited by conducting these studies itself, getting paid with the same federal dollars it secured for tribal governments. The individual projects CERT helped evaluate included a natural gas refinery on the Jicarilla Apache Reservation; a hydroelectric facility for the Nez Perce; oil, gas, and geothermal projects with the Cheyenne River Sioux; and the nation's first synthetic fuel facility on the Crow

Reservation. Clearly, CERT worked to develop tribal energy, but by the start of the new decade, the OPEC template was dead. In its place was something more closely resembling a professional consulting firm. CERT had become a pan-tribal organization with the business experience and technical expertise to empower tribal governments to manage their own resources.[38]

Not all American Indians, however, were happy with this outcome. CERT's close ties with—and some would say, dependence on—the federal government continued to draw criticism that the organization was a pro-development entity ignoring the concerns of ordinary Indians. Winona LaDuke, the Ojibwe environmental activist and future Green Party vice presidential candidate, complained that of the approximately one hundred studies CERT was conducting or had completed by 1980, only five focused on mineral development's harmful impacts. The rest, she concluded, supported "non-renewable, extractive, and technologically-advanced development scenarios." When CERT officials defended its focus on development by reminding LaDuke that "CERT does only what the tribal chairmen request," the activist responded by reminding them that "the choices and options presented to each tribe originate in reports from the CERT staff." Those studies, of course, overwhelmingly supported large-scale energy projects oriented toward exporting Indian resources off-reservation.[39]

The criticism was fair, but it failed to resonate widely. For a majority of American Indians who knew only suffocating poverty, the chance to develop reservation minerals under the control of their tribal governments was too great an opportunity to forego. In the end, disgruntled Indians like LaDuke were not CERT's clients; the tribal governments were. The organization thus focused on expanding tribal capacity by securing funds to study energy projects and educate elected officials on the institutional controls necessary to shape mining operations. Ed Gabriel admitted freely that his goal was to transfer his organization's expertise over to the tribes so that CERT could close its technical assistance center by the mid-1980s and focus purely on lobbying. Its members shared this goal, as Hugh Baker, director of energy for the Three Affiliated Tribes of the Fort Berthold Reservation, explained:

> People who have problems with CERT should think of the concept behind forming it. I continually remind the CERT staff, "You're here to put yourselves out of business by teaching me. When we, [the tribes] get

rich on [energy resources], maybe you can come work for us. Until then, help us get rich." [40]

CERT worked in many ways to transfer knowledge to its tribal clients, but perhaps the greatest lesson it offered was that tribal governments must control the pace and scale of mining to ensure profits without sacrificing community. Gathering mineral and market data was an important first step, but mainly because this information better positioned tribes to negotiate the mineral agreements that controlled mining operations and profits. As for these agreements, CERT consultants constantly hammered home the need for tribal leaders to reject mineral "leases," which afforded tribes little control, and instead pursue "alternative contracts" that retained tribal ownership over mining ventures. Ownership, they lectured, guaranteed control.

And at least initially, the federal government seemed to agree. BIA officials tentatively supported the use of alternative contracts as a way to open reservations to development under tribal terms. As we will see, however, these officials eventually questioned whether federal law provided tribal governments with the authority to develop their own resources under these alternative contracts. The old concerns about Indian capacity to responsibly manage their assets, which were embedded in the 1938 Indian Mineral Leasing Act, came back to the fore. Energy tribes, facing the possibility that they would be denied the right to exercise their newly developed capacity, once again would have to mobilize to protect this most basic principle of sovereignty. This time their fight would take them all the way to the halls of Congress.

7 Recognizing Tribal Sovereignty

AS THE ENERGY tribes gathered for the September 1980 annual meeting of the Council of Energy Resource Tribes, they had good reason to be optimistic. Earlier that year, the federal government had made good on its $24 million pledge to support Indian energy development. The tribes had put these funds to work developing an extensive Indian resource inventory, conducting feasibility studies for new energy technologies, breaking ground on tribal mining projects, and continuing to educate tribal leaders on resource management techniques. In addition to the flow of federal dollars, the Department of the Interior had also just proposed new regulations for mining on Indian lands that promised to minimize "any adverse environmental or cultural impact on Indians, resulting from such development" as well as guaranteeing the tribes "at least, fair market value for their ownership rights." The key to delivering these results was a new provision authorizing Indian mineral owners to enter into flexible mineral agreements that "reserve to them the responsibility for overseeing the development of their reserves." These "alternative contracts" to the standard lease form would finally provide tribes with the control necessary to ensure mining did not threaten their indigenous communities.[1]

Reflecting the improved relationship with the federal government, CERT held its 1980 annual gathering in Washington, D.C. There, Chairman Peter MacDonald explained that the meeting's purpose was

to further explore "how to go about building a truly meaningful energy partnership between the tribes and the federal government." Federal officials played their part enthusiastically: Energy Secretary Charles Duncan delivered the keynote address, and numerous governors, senators, and members of Congress attended the event to endorse the strengthening tribal-federal relationship. The three presidential candidates—Jimmy Carter, Ronald Reagan, and the independent congressman John Anderson—either personally attended or sent congressional delegates to voice their support for tribal autonomy and lobby for CERT's endorsement. Speaking at the concluding press conference, Senator John Melcher of Montana captured the shared sentiment: "No longer can the federal government dictate the terms of energy development on Indian lands [and] no longer can the government decide what is good for the Indian people." All the years of work seemed to be paying off. Again, optimism abounded.[2]

But to those paying close attention, there were rumblings of trouble in the recesses of the conference's meeting hall. In fact, despite the recent contribution of funds, promising new regulations, and supportive messages, Wilfred Scott, CERT's vice chairman, noted "mixed signals" coming from federal officials over whether tribes had the legal authority to manage their own minerals. The specific source of these concerns was a recent oil and gas deal struck between the Northern Cheyenne and the Atlantic Richfield Company (ARCO) that deviated from standard lease form and procedure. This agreement, like a lease, conveyed exploration and production rights to the oil company, but it retained for the Northern Cheyenne certain ownership interests in the project. Moreover, the Northern Cheyenne procured this alternative oil and gas contract through private negotiations rather than via the standard public notice and bidding process. Government officials wondered aloud whether federal law allowed a deal that failed to comply with the 1938 Indian Mineral Leasing Act, even if it represented a clear exercise of tribal sovereignty. After delaying approval until a tribal referendum established that a majority of Northern Cheyenne supported the project, the Department of the Interior grudgingly authorized the arrangement only after ARCO agreed to assume the risk should a court later invalidate the contract.[3]

More troubling than the reluctant approval, however, was Interior's announcement made shortly after CERT's annual meeting. The Northern Cheyenne contract had forced the agency to review the law

governing reservation mineral rights, and the department's new lead attorney, Clyde O. Martz, did not like what he saw. A former University of Colorado law professor and oft-described "father of natural resource law," Martz reasoned that "the Indian Nonintercourse Act prohibits contracts that convey interest in land unless they meet the requirements of the 1938 Mineral Leasing Act." Finding no other statutory authorization for alternative contracts like the one just entered into by the Northern Cheyenne, the solicitor told CERT staff that any contract conveying Indian minerals "other than the traditional lease, may currently be illegal." Once again, the federal government threatened to constrain tribal sovereignty.[4]

Martz's statement regarding the legality of alternative contracts sent shockwaves through the energy tribes' community. Peter MacDonald called it the "final betrayal," rendering "everything CERT tribes have been doing or want to do . . . illegal." This strong reaction stemmed from the fact that tribes had come to view alternative agreements as the linchpin for exerting control over reservation development. They were the mechanism that allowed tribal leaders to apply their increasing expertise to secure desirable terms and oversee mining operations. Without non-lease contracts, the progress of the previous decade could be lost, turning back the clock to the days of federally run bidding procedures, standard lease terms, and minimal tribal control. Martz's opinion even threw the legality of his own agency's recently proposed rulemaking into question. How could an executive agency promise to allow tribes "to enter into contracts which reserve to them the responsibility for overseeing the development of their [mineral] reserves" if federal statutes limited energy contracts to the standard lease form? Federal officials had promised Indian self-determination but now seemed poised to invalidate clear exercises of tribal sovereignty. Certainly, energy tribes had come a long way in developing the *capacity* to manage their own resources. Now, it appeared, there was work left to be done to ensure that federal law recognized their *authority* to do so.[5]

"THE MOST IMPORTANT TRIBE IN AMERICA," REPRISE

The Northern Cheyenne's measured pursuit of energy development forced federal officials to address the disconnect between federal laws governing Indian resources and tribes' increasing capacity to manage

these assets. Since the Northern Cheyenne's successful 1974 challenge to its inequitable coal leases, the tribe had been working to develop its vast energy reserves in a manner that balanced the need for revenue with the desire to preserve its indigenous community and environment. The first step in this process was ensuring that the tribe, not individual allottees, actually owned the minerals underlying the reservation. Like the Crow's allotment law, the Northern Cheyenne Allotment Act had reserved subsurface mineral rights to the tribe, but only for a period of fifty years. The intent was to provide the initial means for an economic base but ultimately to have these rights flow to individual landowners. Prior to the 1960s, however, there was no viable market for Cheyenne oil, gas, or coal. Sensing the tribe had missed its opportunity to capitalize on communal resources, both federal and tribal officials lobbied to have the mineral rights transferred to the tribe in perpetuity. In 1968, Congress obliged, passing a law effectuating this permanent transfer.

But federal support for tribal ownership of mineral rights came with conditions. Not wanting to create liability from an unconstitutional taking of private property rights, the 1968 law conditioned the permanent transfer on a determination by a federal court that the 1926 Northern Cheyenne Allotment Act had not created vested mineral rights in allottees. In other words, Congress practically demanded litigation, placing the Northern Cheyenne in the unenviable position of having to sue its own members to settle property rights. Seeing little alternative, the tribe commenced legal action in summer 1970 against several allottees who stood to gain mineral rights at the end of the fifty-year period. By 1976, the case had made its way to the United States Supreme Court, where, in *Northern Cheyenne Tribe v. Hollowbreast,* the court upheld the permanent transfer of minerals to the tribe. Specifically, the unanimous opinion found that the conveyance conformed to the 1926 act's original intent that the tribe benefit from their minerals, which clearly had not yet happened.[6]

In the same year the Northern Cheyenne confirmed tribal rights over reservation minerals, the tribe also forged new legal ground to shape regional energy projects threatening its reservation. Recall that in 1972, the planned construction of the Colstrip Power Plant at the reservation's border had helped unite the tribe with area ranchers and environmentalists against regional coal development. This partnership spread concerns about impending energy projects and produced the Northern

Cheyenne's historic petition to cancel all reservation leases. It did not, however, stop construction at Colstrip. By 1976, two coal-fired boilers were in operation with plans announced for two additional units that were twice the size of the originals. All told, this facility had the potential to produce 2,100 megawatts of electricity, making it larger than the country's dirtiest power plant, the Four Corners facility, located on the edge of the Navajo Reservation.[7]

With a massive power plant planned at the reservation's border, and just beyond the reach of the tribal government, the Northern Cheyenne got creative. The tribe turned to new relief offered by the 1970 Clean Air Act and announced in July of 1976 that it would reclassify the air above its reservation as a Class I air shed. Under the pioneering 1970 environmental law, the Environmental Protection Agency had established a nationwide area classification system to prevent the deterioration of air quality in regions with relatively clean air. Initially the EPA designated all air sheds as Class II areas, which would allow for some air quality degradation due to light industry. The implementing regulations, however, gave state and tribal governments the option to protect specific areas from virtually any change in air quality by requesting an upgrade. In June 1976, the state of Montana approved the Colstrip plant's expansion based on modeling that showed its air emissions would not violate the region's Class II standards. Two weeks later, Northern Cheyenne President Allen Rowland announced plans to reclassify his downwind reservation to the higher, cleaner standard.[8]

As the first land manager in the nation, whether state or tribal government, to request an upgrade in air quality protection, the Northern Cheyenne garnered many accolades from the environmental community. One publication even named the tribe "Environmentalist of the Year" for 1976. But more than a defense of the natural environment was at play. The tribe took action primarily to ensure the integrity of its social and cultural community. This was the same concern that rallied tribal members to halt on-reservation mining. Massive energy development on *or* near the reservation would despoil the Cheyenne's land, air, and water, but even more so, it would bring outsiders to disrupt social customs and cultural norms that defined the tribe. Numerous tribal members and groups, including the Northern Cheyenne Landowners Association, made this exact point to the state of Montana during Col-

strip's permitting process. The tribal government's official comments warned that development on the reservation's border "portend[s] nothing but adverse environmental, social and cultural consequences for the People of the Northern Cheyenne Tribe, their way of life, and the natural resources of their Reservation Lands." These comments further explained the tribe's opposition within the context of its long and difficult history to secure the reservation:

> Not only is the Reservation the Northern Cheyenne Tribe's Home Land; as a Tribe, as a People, it is their *only* place in this world. The Tribe's life as a People, as the Tribe knows and desires to maintain it, is unqualifiedly dependent upon maintaining its Reservation free from outside environmental insult and destructive social and cultural impact.

But these pleas went unheeded and the state of Montana issued Colstrip's permit. The tribe was now forced to take its argument to the federal level. Writing to the EPA to request the redesignation of the reservation's air shed, Allen Rowland was clear about Cheyenne intentions:

> We are not requesting this redesignation because we are against progress, either here or anywhere else. Our Tribe has been struggling for progress and self-determination for years. . . . For us, progress means developing *our* environmental resources in renewable and compatible manners. . . . Not only are such activities our livelihood, they are the cores of our value systems as a people.

The Northern Cheyenne did not oppose energy development per se, just projects beyond tribal control because they threatened the community. The tribe thus exercised its sovereign rights under the Clean Air Act to prevent a project that would change the fabric of its region and reservation.[9]

As powerful as this argument was, the Northern Cheyenne could only shape, not preclude, regional energy development. The EPA granted the tribe's request to upgrade their air designation and stepped in to halt Colstrip's expansion based on expected impacts to the new Class I air shed. Colstrip's owners responded, however, by adding new pollution control technologies that they claimed would drastically reduce emissions. The move satisfied EPA officials, whose focus remained on protecting environmental quality. In fall 1979, the agency approved the issuance of Colstrip's long-awaited expansion permit.[10]

But again, the Northern Cheyenne had broader concerns than just the environment. The tribe filed a legal challenge to the EPA's approval, and the longtime head of the Natural Resources Committee, Edwin Dahle, began exploring a negotiated settlement that would allow for Colstrip's construction *and* alleviate tribal fears over the unhealthy influx of non-Indians and pollutants. Ultimately, Colstrip's owners and the Northern Cheyenne settled on what CERT Executive Director Ed Gabriel described as "a precedent-setting, multi-faceted agreement" whereby the facility would install more stringent pollution controls, fund reservation air quality monitoring, provide $350,000 to the tribe for continued socioeconomic impact analyses, and guarantee employment and job training at Colstrip for tribal members. Certainly the outcome did not please all Cheyenne, but these concessions addressed the tribe's major fears. As Dahle explained, the agreement reduced the threat of unwanted people and pollutants and meant "wealth will be coming into the reservation, not just flowing out, as it has in the past." Dahle also believed the agreement would help the tribe "develop a trained workforce for the day when the Cheyenne might develop our own coal."[11]

*

The Northern Cheyenne's willingness to negotiate and tailor the Colstrip facility to address specific tribal concerns signaled a shift in the tribe's approach to energy development. Throughout much of the 1970s, the tribal government had found itself on the defensive, fighting to prevent projects it did not control rather than pursuing energy ventures that could bring wealth. This approach began to change, however, with the fall 1978 election of new council members eager to explore development options. This rush of new blood coincided with mounting debt accrued through the tribe's various legal battles and the real possibility of reduced federal support for tribal programs. Now that the tribe had secured its authority over reservation resources—not to mention demonstrated its ability to shape off-reservation development—the time had come to exercise this power to produce revenue. As Allen Rowland explained, "We've made millionaires out of several lawyers"; now it was the tribe's turn.[12]

This shift toward a more assertive pursuit of tribal-controlled development was evident on the very first day the new council members took office. Sworn in on September 13, 1978, by none another than Marie Sanchez, who by now was a tribal judge, the newly elected leaders endured a crash course in reservation energy development. CERT consultants were brought in to lead a three-day orientation program featuring CERT Executive Director Ed Gabriel, National Congress of American Indians President Chuck Trimble, Native American Rights Fund attorneys John Echo Hawk and Scott McLaroy, and the tribe's own attorney, Steven Chestnutt, who had spearheaded the petition to halt uncontrolled reservation mining. The new officers also heard from Dick Monteau, director of the Northern Cheyenne Research Project (NCRP) that had been established after the first round of harmful coal leases in 1973 to investigate coal mining's impacts. Supported by federal funds, the NCRP was a quasi-independent arm of the tribal government that gathered economists, geologists, anthropologists, and energy consultants to inventory Cheyenne resources and evaluate mining proposals. It provided the internal, institutional expertise the Northern Cheyenne had lacked when the tribe eagerly auctioned away reservation coal rights in the early 1970s. In evaluating potential energy projects, the NCRP also was guided by the founding principles of "maintaining survival [of the Northern Cheyenne] as an ethnic group" and "aiding in the maintenance of Tribal identity and sovereignty."[13]

With the Northern Cheyenne's renewed interest in energy development, it did not take long for the NCRP to prove its worth. In summer 1979, several energy companies approached the tribe with new coal mining ventures, and the tribe referred these proposals to the NCRP for analysis. The staff there quickly concluded that although cloaked in the language of joint partnerships, these latest deals shared similar deficiencies with the previous leases. Namely, they provided no tribal control over the pace and scale of development. Without such control, the NCRP warned the tribe would be unable to protect its community and environment. Hearing these critiques, the Northern Cheyenne rejected the offers out of hand.[14]

But more than tribal control was now required for on-reservation energy projects. Among the general membership, concerns about coal development's impacts had grown so strong that even when a proposal

provided control, tribal members were wary to authorize strip-mining. In response to the deficient 1979 deals, for instance, tribal consultant George Crossland—the Osage attorney who initially found fault with the Northern Cheyenne's earlier coal leases—introduced a coal mining proposal from the Fluor Corporation that would have allowed the tribe to retain complete ownership over the venture. Fluor, the world's largest construction firm, offered to operate the proposed mine under a service contract. But even this was too much. The wounds of the recent coal mining wars were fresh, and tribal members rejected this promising deal structure. Council member Joe Little Coyote explained the reaction: "Because of the impact on our socio-economic and cultural development, coal mining is not an option at all at this point." Tribal members simply could not overcome the idea that massive strip mines would disrupt community relations and despoil their landscapes.[15]

With reservation coal mining a dead issue, pro-development tribal leaders quickly turned to the seemingly less invasive option of oil and gas drilling as the vehicle for economic growth. Ironically, the initial push for this form of development came from the NCRP, which, according to employee James Boggs, typically operated under "a policy of caution and skepticism towards large-scale leasing." Considering this viewpoint, the organization's director, Richard Monteau, had for some time been exploring the possibility of a small, tribally owned and operated oil and gas project as an alternative to massive strip-mining. When tribal members rejected all coal mining offers in the fall of 1979, pro-development council members appropriated the idea for oil and gas production and expanded the scope of Monteau's small proposal to fit their larger objectives. In December 1979, these leaders then consolidated authority over energy development decisions by passing a resolution bringing the NCRP under the direct supervision of the tribe's Planning Committee, which was controlled by the pro-development wing. In protest, much of the NCRP's staff, including Director Monteau, resigned. With the cautious NCRP eviscerated, the path was cleared to pursue large-scale oil and gas projects.[16]

To land such a deal, the Northern Cheyenne turned the typical, federally controlled process for soliciting and evaluating energy proposals on its head. Rejecting the standard public notice and bidding process, the tribe advertised directly for mining partners in national oil and gas trade journals. By February 1980, Tribal President Allen Rowland

could report that the response was "very good . . . proposals are coming in daily." But to evaluate these offers, the Northern Cheyenne turned not to federal officials; instead, it relied largely on its own expertise, augmenting this knowledge where necessary with some Bureau of Indian Affairs technical assistance. Several tribal members argued that the loss of the NCRP had left the tribe unprepared to effectively evaluate drilling proposals, but Harvard-educated tribal member Joe Little Coyote skillfully led negotiations with potential energy partners. In May, the tribal government settled on an agreement with the independent oil firm Atlantic Richfield Company that gave the tribe a $6 million upfront bonus and a 25 percent production share. Beyond these unprecedented financial benefits, the contract also stipulated that the Northern Cheyenne would retain joint ownership over all geological data and would hold approval authority over all operating plans, and that ARCO would fund a Tribal Oil and Gas Office to monitor drilling activities. This was not your typical lease. Instead, it resembled more a service agreement in which the drilling company would prospect and produce reservation oil and gas in exchange for a share of the profits. Importantly, the Northern Cheyenne retained control.[17]

Most, though certainly not all, tribal members viewed the ARCO deal as a sensible compromise between all-out development and none at all. Opponents pointed to the relatively hasty manner in which the deal was constructed and the absence of the NCRP to evaluate its impacts. But when these concerns were put to the entire tribe in the form of two referenda on the ARCO agreement, an overwhelming majority sided with their tribal government (82 percent in the first, 88 in the second). Yes, the tribe would open its reservation to an outside developer, but most were comfortable with the tribal government retaining oversight over drilling operations and ownership of geological data. Furthermore, many defended the deal on environmental grounds. Allen Rowland noted simply that drilling pads leave smaller holes in the ground than do coal mines, and Joe Little Coyote concurred that oil wells "are a lot more environmentally acceptable than coal mining." The Department of the Interior also agreed, describing the ARCO project in its environmental assessment as "the first major energy development on the reservation, but it is small-scale when compared to other energy development alternatives such as strip-mining." In a world of trade-offs, the impoverished Northern Cheyenne determined that some

energy development, operating under the supervision of its Tribal Oil and Gas Office, was better than none at all.[18]

*

The Northern Cheyenne's increasing sophistication in managing its valuable energy resources was emblematic of advances occurring throughout Indian Country. Since 1975, numerous tribes had positioned themselves to negotiate alternative contracts that included better financial terms than the BIA's standard leases. Although not all deals resulted in tribal-led mining ventures, each evidenced the tribes' increasing capacity to tailor contracts to reflect specific reservation conditions. For example, on the Navajo Reservation, where the tribal government had the most experience with mineral development and possessed ample geological and market data, the tribe brokered a 1977 uranium deal with the Exxon Corporation that netted a $6 million bonus and included the option for a joint venture operation. On the Blackfeet Reservation, however, where less geological information existed, tribal leaders willingly gave up bonus payments in favor of an oil and gas agreement with the Damson Oil Corporation that included percentage royalties plus half of all production revenue once the company recouped its start-up costs (potentially 58 percent of all profits). In this case, Blackfeet leaders may not have secured ownership over the energy project, but they understood that a back-loaded service contract was necessary to encourage the small, independent oil company to prospect in a relatively unproven area. And like other tribes, the Blackfeet knew federally orchestrated leases did not meet tribal demands. As one BIA area director explained, "The difference [now] is that the tribes are fully informed about the market value of their holdings and the [problems with the] leasing strategy." Kenneth Black, the director of the National Tribal Chairman's Association, summed up the demands of these newly enlightened leaders: "No more leases—we want a percentage of the deals."[19]

Tribal efforts to secure more beneficial agreements certainly indicated a rising level of sophistication, but their alternative contracts also put the Department of the Interior in the difficult position of trying to support Indian self-determination while also enforcing the letter of the law. Federal agents did their best to juggle these competing duties,

employing a host of innovative legal theories to approve negotiated contracts that deviated from the 1938 Indian Mineral Leasing Act. One such theory applied a broad reading of the term "lease" contained in the statute, rationalizing that the 1938 Congress surely intended to authorize whatever form of mineral contract was favored by industry standards, and thus joint ventures must be allowed. Another approach justified non-lease mining agreements based on an obscure federal statute authorizing tribes to enter into "service contracts," though this law had been previously applied only to approve contracts for tribal attorneys. By 1980, then, the Interior Department had approved a handful of alternative contracts based on these legal theories, but the piecemeal approach left the law unsettled. Serious concerns remained as to the authority of tribes to negotiate their own contracts and participate directly in the development of reservation resources.[20]

With the Northern Cheyenne–ARCO agreement, Interior Solicitor Clyde Martz had seen enough. After first delaying his review of the contract until the September 1980 tribal referendum confirmed that a strong majority supported the deal—again, more than 80 percent were in favor—Martz then suspended federal approval until two issues could be resolved. One, the solicitor questioned whether the contract conveyed a property interest in Northern Cheyenne minerals, making it a "lease" that then failed to comply with the 1938 Indian Mineral Leasing Act. Two, Martz wondered whether any other laws beyond the 1938 act authorized such a mineral agreement. Hoping to slap a pragmatic solution onto a sticky legal question, the Northern Cheyenne and ARCO quickly executed a "Statement of Intent" noting the parties themselves did not consider the agreement a lease but instead a service contract authorized by existing law. For good measure, ARCO also agreed not to sue the federal government if a court later invalidated the agreement.[21]

This stop-gap solution eased some of Martz's immediate concerns, but the former law school professor was most interested in a long-term fix that could clarify tribal authority once and for all. Martz was sympathetic to tribal aims, but his hands were tied without further congressional action. Pulling in Montana Senator John Melcher, all parties thus agreed to support legislation that would, according to Northern Cheyenne Vice President George Hiwalker, Jr., "remove any uncertainty that may exist regarding the Secretary's . . . authority to approve such

agreements, and to provide Indian tribes with a clear alternative to the 1938 Minerals [*sic*] Leasing Act." With a legislative solution proposed, and ARCO's promise not to sue, Interior Secretary Cecil Andrus had enough assurances to approve the Northern Cheyenne–ARCO agreement on September 23, 1980. A few days later, Martz made the startling announcement that, without clarifying legislation, other alternative agreements may be illegal. As he did so, however, both Senator Melcher and the Solicitor's Office had already begun work on legislation to recognize tribal authority to enter into these vital contracts.[22]

"DOING BUSINESS WITH INDIAN TRIBES": THE 1982 INDIAN MINERAL DEVELOPMENT ACT

Just as it had done in stopping inequitable leasing practices earlier in the decade, the Northern Cheyenne provided the specific impetus for changing federal law to recognize tribes' sovereign control over reservation development. But the tribe, of course, did not operate in a vacuum. Broader changes in federal Indian affairs created a sense of urgency that helped push the new legislation through Congress. These changes were set in motion barely a month after the Department of the Interior approved the Northern Cheyenne–ARCO agreement when the country elected Ronald Reagan as its fortieth president. A California conservative who sought to extend many of the policies of his fellow Californian Richard Nixon, Reagan proclaimed his support for Nixon's Indian self-determination policy and its goal of strengthening tribal governments so as to lessen federal dependency. But like Nixon, Reagan inherited a sputtering national economy and a burgeoning federal bureaucracy, two problems he aimed to remedy with deep cuts in government spending. Perhaps unsurprisingly, Indian programs topped the list of expendable items. The president's first budget proposed more than $1 billion in cuts to the 1982 federal Indian budget, representing a 34 percent reduction. These cuts included a 77 percent reduction in economic development programs and a 46 percent reduction to programs assisting Indian energy resource management.[23]

But the real blow to Indian energy development was actually much worse. The only Indian energy programs Reagan proposed to leave intact were those run by the BIA to inventory Indian minerals and oversee mineral leasing; the Department of Energy's entire tribal energy

program, which provided the backbone of support for CERT and specific Indian energy projects, was on the chopping block. Adding insult to injury, the president also appointed western attorney James Watt as the new Interior secretary. As president of the Mountain States Legal Foundation, Watt had just filed an amicus brief to the Supreme Court challenging tribal rights to tax energy companies operating on their reservation. The multifront attack on tribal-controlled energy development so alarmed energy tribes that CERT Chairman Peter MacDonald immediately wrote to Congress complaining that the new administration seemed determined to "return to an era of . . . giveaways of tribal oil, gas and coal resources."[24]

Energy tribes fought hard against Reagan's budget cuts in Congress, but the unmistakable trend of diminishing federal support forced tribal leaders to reassess their strategies for pursuing energy development. With 74 percent of CERT's 1981 budget pegged to federal funds, energy tribes could not simply wait and hope that Congress would reverse the trend. These groups needed immediate cash to continue consulting services and capital for mining projects already in development. To fill the financial gap left by a retreating federal government, CERT reached out to private industry. Styling its 1981 annual meeting as "Doing Business with Indian Tribes," CERT's Executive Director Ed Gabriel pressed hard for industry attendance, touting the tribes' vast natural resources and assuring potential investors that "the Indian people are amenable to bold, innovative business proposals of all types." The only stipulation, Gabriel noted in his letter to industry invitees, was that the deals must "recognize and respect [the tribes'] own cultural, environmental, and economic values and priorities."[25]

The 1981 meeting featured speakers who continued the message that tribal leaders stood ready to consider serious business proposals. In his opening remarks, Peter MacDonald implored the assembled tribal leaders and corporate officers to demonstrate the power of private investment by turning economically depressed reservations "into new growth zones that would transform the economy, the nation, and the future for us all." "I encourage you to gamble," the CERT chairman continued, as "the odds are much better here than at Las Vegas. There is risk—but the risk is far less than the danger we face if we fail to seize the opportunity of the moment." MacDonald's call for investment was followed by energy consultants explaining the procedures for doing business in

Indian Country and by testimony from corporate executives already working with tribes extolling the potential for profits. And as if on cue, the keynote speaker at the conference, Houston oilman Michael Halbouty, a close energy advisor to President Reagan and a member of Secretary Watt's Commission on Fiscal Accountability of the Nation's Energy Resources, concluded the meeting by telling the audience, "It is about time that the entire business community of the United States realize that it can do business with the Indian tribes."[26]

This shift by energy tribes toward actively courting private investment was certainly not the first time these groups looked outside the federal government to support their quest for economic self-sufficiency. The tribes had made similarly eager overtures in the 1960s, when energy companies first descended on western reservations looking for low-sulfur coal. This time, however, tribal leaders understood what was needed to make the tribal-private partnership work for both parties. Years of work by CERT and others to educate tribal leaders and provide market and geological data created negotiators well equipped to demand fair royalties. But as Peter MacDonald explained at the 1981 CERT meeting, "Simply bargaining for higher royalty rates is not enough and [the energy tribes] must explore issues involving ownership, management, up-front payments, and differentiation of agreements to authorize development." The tribes were hungry to strike deals, but this time they understood that the agreements must give Indians an active role in the ensuing ventures.[27]

To ensure the outcome they desired, CERT members concluded their annual meeting with a series of resolutions supporting measures that would give energy tribes the authority to control reservation resource development. In emphatic terms, MacDonald declared these initiatives would inaugurate "the dawning of a new era for [the federal-tribal] relationship: an era of recognition of our right to freedom from the shackles of federal restrictions on our ability to do business, to look after the needs of our people and to shape our own future." After first demanding that tribes receive the same regulatory status as states in every "federal program that delegates authority," tribal delegates turned their attention to the ongoing efforts to amend the 1938 Indian Mineral Leasing Act. Clearly, energy tribes supported any action enlarging—or more accurately, recognizing—their sovereign authority over reservation

resources. But CERT had not been consulted on this important piece of new legislation and the energy tribes wanted a voice in the process. The organization's lawyers at the Native American Rights Fund opined that tribes "probably" already possessed the legal authority to negotiate alternative agreements, but like Senator Melcher and the Department of the Interior, CERT began drafting its own piece of clarifying legislation. Until its version was considered and its officers consulted, the organization resolved to oppose the other bills. The energy tribes would go it alone, if necessary, working their congressional connections to promote their own legislative proposal.[28]

*

By fall 1981, then, no less than three different versions of legislation to amend the 1938 Indian Mineral Leasing Act were in circulation. While they differed in the details, all shared the goal of clarifying tribal authority to negotiate alternative mineral contracts. The proposals drafted by Senator Melcher and by CERT were similar in that they offered a clear, straightforward authorization for tribes to enter into whatever type of agreement they desired, subject only to the federal government's subsequent approval. This shared approach provided ground for dialogue between the energy tribes and the senator, dissolving CERT's opposition to his bill. When the Department of Justice endorsed Melcher's proposal, finding "no reason to differentiate between lease and non-lease arrangements" in the law, the senator introduced his bill to Congress on November 30, 1981. Rather than supplant the old 1938 Indian Mineral Leasing Act, however, the proposal left that statute intact to give tribes the option of using competitive bidding procedures and standard lease forms if they so desired. The bill also included a provision retroactively ratifying all previous alternative agreements.[29]

Energy tribes and their corporate partners quickly rallied to support the proposed legislation. At special on-site hearings held in Billings in February 1982, nine western tribes—including the Northern Cheyenne, Crow, and Navajo—voiced their support for the legislation's general concepts. They argued again that increased tribal sophistication meant their governments deserved the flexibility to craft deals meeting their specific needs. As Navajo spokesman Gilbert Harrison explained,

> In the last decade, the Navajo Nation has upgraded its internal capacity to plan, evaluate and develop various energy projects. No longer is the Navajo Tribe satisfied with the old standard federal leases, which only emphasized and relied on royalty return. New concepts which could be formalized will address alternative forms of agreements keyed to assumption of control and efficient development of its energy resources and these agreements will pay a higher return to the tribe.

Knowledgeable mining companies agreed, noting, as ARCO representative Curtis Burton did, that the days of Indian ignorance in energy negotiations were gone:

> Our recent experience in conducting business with representatives of Indian tribes is that the tribes, represented by their elected authorities and by retained experts, bring to the negotiating table a level of sophistication and trading skill that rebuts any alleged need for a status resembling guardianship for the protection of tribal assets.

Witnesses expressed similar sentiments a month later when these hearings continued in Washington, D.C. There, Peabody Coal Company, Amoco, and oil and gas prospector Mission Resources added their names to the list of corporate supporters.[30] Existing law may have treated American Indians as incapable wards, but business people engaged with tribal enterprises understood how inaccurate that perception was.

Not all interested parties, however, supported a bill designed to ease the tribes' ability to develop reservation resources. Indian allottees formed the most forceful opposition to Melcher's proposal, arguing the new law would subject them to the same pressures and unbalanced negotiations that had produced inequitable coal leases with tribal governments a decade earlier. Norman Hollow, chairman of the Assiniboine and Sioux tribes on the Fort Peck Reservation, where 90 percent of minerals were owned by individual allottees, distilled their complaints:

> The fundamental thing wrong with [the bill] is that it provides the tribes and individual Indians with no protection or advice during the most important time; that is, when the company or its agent is soliciting a lease or contract from the individual Indian. Perhaps most tribes will have the means and will to hire independent consultants. But [Melcher's bill] leaves the uneducated and uninformed Indian on his own.

Tribal governments may have come a long way in developing the expertise to manage reservation resources, but many believed the same could not be said for individual Indians who happened to own valuable mineral rights.[31]

This allottee opposition reflected the diversity of Indian experience with mineral development and the differing ownership structures on reservations. But energy tribes had come too far in developing their institutional capacities to allow individual Indians to now derail the expansion of tribal authority. The fix, they proposed, was not to discard the new law but to tie the fate of allottee mineral owners to their presumably better-equipped tribal governments. Melcher's Senate select committee thus amended the bill to remove allottees' authority to negotiate their own alternative agreements and give these individuals only the right to join a tribal agreement. As the committee report explained, everyone agreed allottees should receive the same flexibility to develop their minerals as the tribes themselves, but there was no way to ensure they would be adequately prepared and protected. Therefore, since "it is, of course, expected that tribes are in the best position to protect their own members from exploitation," the committee amended the bill to "retain the Secretary's authority to approve the inclusion of allottees in a tribe's negotiated agreement." For allottees on the Northern Cheyenne, Navajo, Fort Peck, and other reservations whose plans for mineral development differed from their tribal governments, the response to their fears of being exploited must have provided cold comfort.[32]

With allottee concerns addressed, though perhaps not alleviated, supporters refocused the debate on the proposed legislation's primary benefit: recognizing tribal *authority* over reservation resources to match the tribes' expanded *capacity* to craft smart energy deals. At the bill's final hearings, CERT Executive Director Ed Gabriel reiterated that his members were prepared to govern their own minerals and that energy tribes "were no longer content to sit on the sidelines while their resources were being taken from them under unfair terms." This law, Gabriel argued, was thus "a critical element" for Indian self-determination, not to mention for "all Americans, as our country strives to become more independent of foreign energy resources." The Department of the Interior concurred, sending letters of support to both the Senate and House

committees explaining that the flexible mineral agreements authorized by the legislation would "provide the vehicle by which tribes can become directly involved in management decisions," thereby "enabling them to gain management experience and contributing significantly to the goal of self-determination." Tribal capacity and authority thus formed a mutually constitutive relationship. Increased tribal skills and knowledge justified tribes' having the authority to strike their own deals and participate in mineral development, and this participation would further increase tribal capacity to effectively manage reservation resources. Capacity without authority, however, thwarted the goals of Indian self-determination.[33]

With the support of federal agencies, mining companies, and energy tribes, Melcher's bill gathered bipartisan support as it worked its way through Congress. Reported unanimously out of the Senate Select Committee on Indian Affairs, the full Senate passed the measure on June 30, 1982. On the House floor, Arizona Democrat Morris Udall and Nebraska Republican Douglas Bereuter coordinated the easy passage of a slightly amended bill, which they explained updated antiquated federal laws passed early in the twentieth century when tribes did not have the capacity to effectively manage their minerals. Melcher and Udall avoided a time-consuming conference between the Senate and House by negotiating mutually agreeable amendments that both chambers passed unanimously on December 8 and 10, respectively. As Melcher explained on the Senate floor, the new law would provide the flexibility Indians needed to develop their resources, which "should help tribes to become economically self-sufficient and the rest of the Nation to become less dependent upon foreign energy sources." On the House side, Congressman Bereuter agreed, noting the law "is strongly supported by Indian tribes, the administration, and by companies interested in working with tribes to develop reservation mineral resources. It represents a large and positive step toward the future economic well-being of a large segment of the Nation's Indian population."[34]

With all parties in support, on December 22, 1982, President Reagan signed the bill into law as the Indian Mineral Development Act. The bill's sponsor, Senator Melcher, hailed the act as an opportunity for tribes "to play an active role as opposed to the passive role permitted under the 1938 Act." He further explained that "in the last de-

cade, many Indian tribes, under self-determination, have begun to build solid governmental infrastructures, as well as trained management and planning personnel." The president followed up one month later with his administration's first, and only, formal statement on Indian policy. In it, Reagan reaffirmed Nixon's self-determination approach and pledged "to assist tribes in strengthening their governments by removing the federal impediments to tribal self-government and tribal resource development." The statement announced the transfer of the White House's Indian affairs personnel from the Office of Public Liaison to the Office of Intergovernmental Affairs, thereby recognizing the tribe's "rightful place among the governments of this nation." Then, in a clear nod to the recently passed Indian Mineral Development Act, the president noted:

> Tribal governments have the responsibility to determine the extent and the methods of developing the tribe's natural resources. The federal government's responsibility should not be used to hinder tribes from taking advantage of economic development opportunities. . . . The federal role is to encourage the production of energy in ways consistent with Indian values and priorities. To that end, we have strongly supported the use of creative agreements such as joint ventures and other non-lease agreements for the development of Indian mineral resources.

Almost a half century after the 1938 Leasing Act coded into law paternalistic assumptions of Indians' inability to manage their affairs, tribes finally secured explicit federal authority to develop reservation resources however they deemed fit.[35]

The ground for this remarkable expansion of tribal sovereignty was prepared over the previous decade by energy tribes' coordinated efforts to increase their capacity to responsibly and effectively manage reservation assets. Once adequately prepared, tribal leaders pursued innovative deal structures meant to realize their desire for tribal-controlled development. The Northern Cheyenne were both leaders in and emblematic of this movement. After first confirming ownership over reservation minerals and asserting legal rights to shape regional development, the tribe negotiated a sophisticated oil and gas agreement that promised both revenue from and control over drilling operations. But the deal also forced federal officials to reckon with an outdated and ineffective law that seemed to foreclose the Cheyenne's and other energy tribes'

chosen path to self-determination. Undeterred, these groups redirected their energies toward changing that law. Working under the pressures of massive federal budget cuts and with a consortium of federal officials and energy executives, energy tribes orchestrated the passage of the 1982 Indian Mineral Development Act to provide the legal authority to match the tribes' recently expanded governing capacity.

Epilogue
New Era, Similar Results

IRONICALLY, AS FEDERAL policy makers, energy executives, and tribal leaders collectively hailed the 1982 Indian Mineral Development Act as a momentous victory for tribal sovereignty, several of those most responsible for its passage were not present to share in the celebration. One month before President Reagan signed the act into law, at the Council of Energy Resource Tribes' annual meeting in Denver, the organization announced plans to replace its longtime director, Ed Gabriel. A former Federal Energy Administration official, Gabriel had led CERT from the beginning, using his contacts to secure federal support and push through legislative changes that empowered tribal governments. Gabriel had tactfully guided the organization's evolution from an Indian advisory body for federal policy makers to the polemical "Native American OPEC" and ultimately into a professional association dedicated to improving tribal governance. He was an integral player in CERT's rapid rise to becoming a formidable national institution capable of empowering tribal leaders and enlarging tribal sovereignty.[1]

But Ed Gabriel's departure signaled a shift within an organization that had come of age. His replacement, David Lester, was the current commissioner of the Department of Health and Human Services' Administration for Native Americans and could match Gabriel's understanding of the federal bureaucracy. He also possessed attributes

his predecessor did not. As an enrolled member of the Creek Tribe of Oklahoma, Lester would be CERT's first Native American director. The move held great symbolic meaning, representing the passage of responsibility and expertise for reservation energy development from federal to Indian hands. Yet David Lester's hiring was more than just a symbolic act. His unique skill set would shape CERT's new direction. As commissioner of the Administration for Native Americans, Lester had administered a multimillion-dollar federal grant program to aid social and economic development on reservations. He also was a former economic development specialist for the National Congress of American Indians and former director of the United Indian Development Association. His experience in growing reservation economies replaced Gabriel's aptitude for lobbying for federal support, and over the next several years, Lester would oversee the closing of CERT's Washington, D.C., office to focus on providing technical assistance to tribes seeking to develop their resources. With tribal governments now possessing clear legal authority over tribal minerals, energy tribes shifted their attention from the nation's capital back to the reservations. More than at any time in their history, the tribes were well positioned to capitalize on their vast resources.[2]

Sadly for these groups, forces beyond their control would thwart the successful execution of their recently clarified authority over reservation development. Not only did Ronald Reagan's budget cuts inflict financial woes on CERT and its members, but the same president who signed into law the Indian Mineral Development Act also pursued energy and economic policies that made the development of Indian energy, particularly low-sulfur coal, economically nonviable. Reagan accelerated President Carter's deregulation of oil prices, which produced a temporary surge in domestic oil supplies as producers moved reserves into the unregulated market to take advantage of higher prices. The expected increase in domestic output, however, was matched by an unexpected rise in global exploration and production by non-OPEC countries seeking to capitalize on higher international oil prices following the "energy crisis" of 1979. In the face of higher international prices, OPEC's discipline broke down, and its members raced to capture the economic windfall. By 1983, OPEC was frantically trying to regain control of global supplies and prices by lowering its production quotas, but the damage was done. The world was flooded with oil, and

the demand required to consume this across-the-board increase failed to materialize. Reagan's austere fiscal and monetary policies exacerbated a global recession, and conservation measures instituted during the Ford and Carter administrations contributed to an overall decline in energy consumption. With demand waning and production soaring, the "energy crises" of the 1970s turned into the "oil glut" of the mid-1980s.[3]

Cheap oil collapsed the market for Indian energy just as tribes had secured the authority to develop their minerals. Low-sulfur Indian coal development was particularly hard hit—why buy coal when oil was so cheap? Tribes struggled to find development partners to invest in reservation coal mines, and those that had negotiated potentially lucrative deals now saw the projects shelved. In 1980, for instance, the Crow had secured the nation's first alternative coal agreement with the Shell Oil Company, but by 1985 Shell had determined that the project was economically infeasible. In a curt letter to the tribal government, the multinational energy firm explained that due "to the current status of the coal market," it must surrender all rights to Crow coal. The Westmoreland Coal Company had reached a similar conclusion a few years earlier, releasing rights to portions of its Crow coal lease.[4]

Tribes possessing oil and gas deposits faced similar struggles. Many rushed to exercise their newfound flexibility to negotiate energy deals only to find their bargaining position undercut by the oil glut. In these altered economic conditions, the new negotiated contracts began to resemble the old leases. Better-informed tribal leaders were able to secure important concessions like tribal hiring preferences, environmental protection clauses, and fluctuating royalties tied to market prices, but energy companies now refused to give up control over mining operations. With an abundance of oil, developers had little reason to begin new projects in which they could not dictate the pace and scale of development. Without control, tribes remained subject to corporate decisions over whether or not to develop and at what scale. The glutted market meant reduced oil and gas production, and the drilling that did occur produced diminished revenue because royalties were now tied to declining market prices. Tribal revenue from oil and gas development reached its peak of $198 million in 1982, then plummeted by 60 percent over the next four years. The same energy tribes that had successfully increased their governing capacity and altered federal law

to authorize tribal control of reservation development found mastery over a shifting global energy market to be more elusive.[5]

Ongoing intratribal disputes over whether to pursue development, and on what terms, also continued to challenge energy tribes. The Crow example is again instructive, for after the contentious July 1977 impeachment of Tribal Chairman Patrick Stands Over Bull, the Crow community shuffled through a series of leaders as it debated energy development. In fact, of the five tribal chairmen elected in the twenty years following the first serious coal proposal in 1966, only Edison Real Bird (1966–1972) escaped calls for impeachment. Two leaders, Stands Over Bull (1972–1977) and Donald Stewart (1982–1986), were either forcibly removed from office or had all executive powers stripped by tribal resolution. And in every impeachment episode—each of which mirrored in intensity the debates surrounding Stands Over Bull—the driving argument for removal was the alleged mismanagement of tribal energy resources.[6]

These passionate internal debates both did violence to communal relations and drove away potential energy partners. Firms desiring Crow minerals found the tribe's constantly changing political landscape confusing and too risky for business. After Stands Over Bull's impeachment, energy companies pleaded with the Department of the Interior to provide clarity as to which Crow faction held the authority to strike coal deals. Mindful of the new policy of Indian self-determination, however, federal officials responded by refusing to "substitut[e] [their] judgment for that of the tribe's in an internal dispute of this sort." Without clarity, several energy firms abandoned development plans, and those that continued to pursue Crow minerals pushed the tribe to restructure its government to provide a more stable negotiating body.[7]

Ultimately, the Crow tribe responded to pressures to develop by, once again, altering its governing structure. In 1980, a new majority disbanded the cautious Coal Authority and authorized the tribal chairman to aggressively pursue development projects. But as indicated by Shell's and Westmoreland's surrender of Crow coal rights, market conditions hampered these efforts. Ongoing battles within the tribal council, which still included all adult members of the tribe, also continued to drive away potential investors. By 2001, a frustrated majority had seen enough and took dramatic action to overhaul the entire tribal government structure. The Crow ratified a new constitution that replaced

its hyper-democratic tribal council with a system based on the United States' model of representative government, including separation of powers and a strong executive branch.[8]

Finally, with this new governing structure in place and oil prices again skyrocketing due to disruptions in global supply, the Crow negotiated a 2004 agreement with the Westmoreland Coal Company to allow the first commercial coal mining on the reservation. The deal, in fact, merely extended the company's ongoing operations in the Ceded Strip southward onto the reservation proper. Most years, revenue from this enlarged Absaloka Mine provides two-thirds of the tribal government's nonfederal budget—more than $20 million in 2010. The mine also employs a 70 percent tribal workforce. The relationship between the Crow and Westmoreland has become so strong that Tribal Chairman Darrin Old Coyote recently affirmed to a congressional subcommittee that "without question, [the Absaloka Mine] is a critical source of jobs, financial support, and domestically produced energy. [Westmoreland] has been the Crow Nation's most significant private partner over the past 39 years."[9]

But on a reservation with 47 percent unemployment and a per capita income less than half the U.S. average ($11,987 to $27,334), coal mining's benefits still do not reach all tribal members. The tribal government thus continues to explore more development opportunities, largely with the blessing of the tribal majority. Since Westmoreland's extension, the Crow have granted the mining firm more coal rights in the Ceded Strip and also announced three new energy ventures with other companies on the reservation itself. One of these projects could be the nation's first mine-mouth, coal-to-liquids gasification plant; the others look to export Crow coal to Asia. Billions of tons of coal and millions of dollars of tribal revenue are once again on the table. Of course, not all are thrilled about the prospect of impending development and some tribal members continue to fear the potential impacts. The tribe will continue to wrestle with these decisions. But while it is too early to judge the effects of these potential projects on the Crow community and landscape, it is clear that a restructured tribal government, informed by decades of energy development experience, possesses the clear legal authority to make the deals.[10]

With global oil prices remaining relatively high in recent years, the Crow tribe is not alone in using its sovereign authority to once again

explore tribal-led energy projects. On the Navajo Reservation, where the postwar exploitation of tribal minerals began and rampant poverty remains, the tribe has taken a two-step approach to exerting control. First, the community has acted largely in unison to shut down dirty and unwanted projects. Second, some portions of tribe have pushed for tribal-controlled ventures to replace them. In 2005, for instance, the tribal government passed a moratorium on uranium development and, in partnership with the Hopi Tribal Council, withdrew tribal water rights necessary to operate Peabody Coal Company's Black Mesa Mine. That same year, Indian and non-Indian environmental groups forced the closure of the Mohave Generating Station after the facility failed to install costly pollution control technology. These actions delivered death blows to some of the reservation's more notorious energy projects, but Navajo energy development was far from dead. Starting in 2003, the Diné Power Authority, a tribal enterprise, pursued plans to build its own coal-fired power plant on the reservation, the Desert Rock Energy Project. This facility was proposed to provide electricity to another ambitious tribal endeavor, the Navajo Transmission Project, which would have provided the infrastructure needed to carry reservation-produced electricity to distant markets. Neither project, however, was realized. Local environmental opposition emerged from the outset and the requisite permits were never obtained.[11]

Undeterred, the Navajo tribal government now has gone back to the infamous mine that began the tribe's tumultuous experience with commercial coal development. On December 31, 2013, the Navajo Transitional Energy Company, another tribal enterprise, bought the Navajo Mine from the world's largest mining firm, BHP Billiton. This massive facility—once the planet's biggest strip mine—had fed coal for over fifty years to the Four Corners Generating Station—once the country's dirtiest power plant. Now the Navajo own it. But the community cannot agree on whether this is a good thing. Proponents point to the protection of Navajo jobs and the secure revenue stream gained by continuing to sell coal to the Four Corners plant, which would have likely shut down had Billiton not found an interested buyer to keep the mine open. These supporters also hail the deal as a victory for tribal sovereignty, positioning the tribe to control the future of these coal reserves, whether that be exploring cleaner coal gasification technology or exporting coal to Asian markets. Opponents, of course, question the

sanity of now participating in an industrial process that has brought so much harm to the community. Detractors also fear the environmental liabilities the tribe has inherited and argue that buying a worn-out coal mine to supply an outdated power plant makes little business sense. The arguments on both sides are fair. But these are the dilemmas faced by a sovereign government representing diverse constituencies and attempting to wield its power to participate in a risky global energy industry.[12]

In the thirty-four years since the Northern Cheyenne negotiated the oil and gas deal with the Atlantic Richfield Company that triggered fundamental changes to federal Indian law, the tribe's reservation has seen little development. In the early 1980s, ARCO drilled dozens of prospecting wells, but most came up dry. By 1984, the company was forced to walk away, leaving behind unreclaimed drill sites and a community becoming more, not less, impoverished. Two years after ARCO shuttered its operations, reservation unemployment reached 60 percent—up from 34 percent in 1979. It has remained there ever since. According to the 2000 census, the per capita income was only $7,247, and more than 50 percent of the population was mired below the poverty line. No doubt, the Northern Cheyenne's 1970s actions allowed the tribe to maintain control of its resources and protect the reservation. That place is still the Cheyenne homeland, free of the non-Indian interlopers tribal members worried so much about. But it is also free of desperately needed economic development.[13]

Further, the Northern Cheyenne's success in keeping its land a distinctly tribal space has not protected the community from the pernicious influences of the outside world. Today, the reservation is completely encircled by coal development. A dozen miles to the north, the Colstrip Power Plant continues to burn coal extracted from a massive adjacent strip mine. On the eastern border, Arch Coal, Inc., the nation's second largest coal company, is developing the vast Otter Creek Tracts, which span more than 8,000 acres and are estimated to hold over 1,200 million tons of coal. Twenty-five miles to the south, several strip mines operate in the vicinity of Decker, Montana, and the reservation's the western boundary is flanked by the Crow Reservation and its impending development. Testifying to Congress in 2014, Tribal President Llevando Fisher complained that the surrounding activity puts constant pressure on the Northern Cheyenne's inadequate public services and

facilities and "produces major influxes of newcomers to the area [that] leads to undesirable socio-economic effects on the Tribe, including on-reservation crime, traffic, and accidents." But the tribe reaps none of the financial rewards that would help combat coal mining's ill effects. As Fisher explained, "We suffer the impacts of development but receive no revenues that would allow us to minimize the ills inflicted by this development."[14]

For this reason, the Northern Cheyenne—the tribe that halted the exploitation of tribal energy resources and was labeled as the anti-development tribe—will soon vote on whether to pursue reservation coal mining once again. Already once, in 2006, a tribal referendum directed the tribal government to do just that. Intervening elections, however, have placed a succession of alternating pro- and antidevelopment leaders in the tribe's highest office. The community is clearly divided on the issue. On February 13, 2014, President Fisher, once a coal mining opponent, asked for clarity. Explaining that "the bleak financial future facing our nation" had persuaded him to now personally prefer development, Fisher announced that he would nevertheless "let the people decide." "We may not all agree," he warned, "but we'll let the majority decide . . . [and] if the Northern Cheyenne vote yes by a majority for coal development on our reservation, we will go strongly in that direction." Considering the mountains of coal underlying the Cheyenne Reservation and the tribe's historical importance to Indian energy development nationally, federal officials, energy executives, and other tribal leaders look on anxiously as the tribe deliberates its decision.[15]

In each of these cases of potential reservation development, the debates over tribal survival continue. The infighting is particularly intense when changes to tribal governing practices are proposed to facilitate energy development, as they often are. Some Indians hail the creation of tribal enterprises or new governing committees endowed with the authority to dispense tribal property as necessary improvements to tribal governance. Employing modern and efficient management techniques, they argue, will help the tribes conduct business and alleviate poverty. Others deride the new governing methods as an affront to traditional tribal practices and a threat to the continued existence of the tribe. Of course, the labels of "modern" and "traditional" forms of governance are deeply problematic. Both assume the authenticity of a particular governing structure and then argue that exterior forces either demand

change or require its preservation. The labels are, in essence, ahistorical. But the point here is that the battles over resource development, tribal governance, and indigenous identities continued unabated after energy tribes secured authority to control development. Changing the law to recognize tribal sovereignty was an incredible victory; taking back control over reservation development saved the tribe. But this victory was not the end of the struggle to capitalize on reservation resources. Tribal communities remain subject to the same national and global pressures that first brought energy companies to their doorstep. For that matter, so do indigenous peoples worldwide. Here in the United States, these communities sometimes have been able align the desires of the tribal majority with market forces and reap mining revenues. More often, they have not. Their responses to these forces, however, continue to shape their communities, their landscapes, and the tribal governments that patrol both.[16]

*

In yet another example of the inner turmoil that often accompanies tribal energy development, CERT's 1982 annual conference not only witnessed the departure of Executive Director Ed Gabriel, but it also marked the last meeting for CERT and Navajo Tribal Chairman Peter MacDonald. Just two weeks before the Denver gathering, the Navajo Nation voted MacDonald out of office in favor of Peterson Zah, the head of the DNA People's Legal Services, which represented individual Navajos fighting energy projects often supported by MacDonald's administration. Zah's position with DNA had given him a political base to attack MacDonald's pro-development policies, and MacDonald's defeat meant the longstanding chairman could no longer serve as CERT's leader. At exactly the moment energy tribes secured authority to develop their own minerals, CERT was faced with replacing its entire leadership team.[17]

Like its new director, David Lester, CERT's new chairman, Wilfred Scott, brought a different perspective to Indian energy development. Scott's Nez Perce tribe did not possess substantial hydrocarbons and showed little appetite for pursuing large-scale energy projects. In fact, the Nez Perce had recently rejected a hydroelectric facility due to potential harm to its tribal fishery. In addition to this different perspective,

Scott also brought a different leadership style, replacing MacDonald's combative bluster with a conciliatory approach that cultivated cooperative relationships between member tribes, CERT officials, and federal agencies. The new leadership tandem of Scott and Lester continued to advocate for tribal control of mining projects and made available CERT's consulting services to tribes desiring development. But in contrast to their predecessors, they did not push mineral development as a panacea for tribal problems. More wary of the potential social and environmental impacts of development, CERT's leaders counseled tribal governments to take calculated approaches to reservation development that considered their preparedness to manage potential projects and their community's support for them.[18]

The difficult market conditions of the 1980s also meant there was little upside to pushing hard for development until tribes were ready to manage and support it. In the interim, energy tribes focused on improving their capacity to regulate mining and consolidated legal authority over tribal resources. CERT continued to provide technical assistance to help tribes determine their resource inventories, improve accounting systems to better track royalties, and, with the increasing support of the Environmental Protection Agency, monitor environmental impacts of existing development.[19]

To match this continued growth in capacity, the tribes pushed through a series of new federal laws designed to further extend tribal control over reservation development. The 1992 Indian Energy Resources Act directed the Department of the Interior to help tribes develop a "vertically integrated energy industry on Indian reservations," and the 2003 Energy Policy Act provided grants and technical assistance to achieve this end. Tribal control over energy development reached its legal apogee in 2005 with the passage of the Indian Tribal Energy Development and Self-Determination Act, which authorized tribes to completely forego federal approval of development projects once they had established a "tribal energy resource agreement" (TERA). Serving as "master agreements" between individual tribes and the federal government, TERAs must include adequate procedures for constructing tribal energy deals, provisions related to the tribe's economic return, lists of all tribal laws governing reservation mining, and assurances of the tribe's capacity to monitor and manage environmental and social impacts. Once a TERA is approved, a tribe has complete regulatory author-

ity over reservation energy development, from contract negotiations to enforcement of the deal's terms. Critics argue that TERAs remove important federal protections for tribal lands—such as the requirements of the National Environmental Policy Act and the National Historic Preservation Act—but these agreements represent the fullest manifestation yet of Indian self-determination. Such autonomy has always come with risks, as well as benefits.[20]

The significant change in CERT's leadership that accompanied the passage of the 1982 Indian Mineral Development Act thus ushered in a new era in the tribes' approach to energy development. New leaders counseled a more measured, though still active, pursuit of development, and energy tribes continued to expand their knowledge of and sovereignty over reservation resources. Distant market forces and intratribal turmoil, however, stifled potential projects, leaving the end results, for now, largely unchanged. Energy tribes continue to wait for the day when they can capitalize on their valuable minerals, which they now possess the capacity and authority to do.

Beyond ushering in a new era in Indian energy development, the 1982 changeover in CERT's leadership also provided an opportunity to reflect on how far the tribes had come. Seizing the moment, outgoing chairman Peter MacDonald delivered a farewell address at CERT's annual meeting that recounted the entire history of the organization he helped create. The flamboyant leader did not disappoint. Applying a Star Trek metaphor to characterize CERT's voyage as a long-imperiled mission with little hope of success, MacDonald began by listing the many challenges facing "Starship CERT" at its outset. These included the energy tribes' immense diversity, their lack of geological and market data, and the resistance of federal agencies to relinquish control over Indian resources. He also noted the universal hostility created "just by dubbing ourselves the 'Native American OPEC'" and the criticism CERT received from some American Indians when it obtained "the thing that we feared most . . . a federal grant, and not just one federal grant, but numerous federal grants." The early days of CERT, the chairman recalled, were characterized by confusion over its mission, the ignorance of its members, and the reluctance of federal officials to faithfully carry out their trustee duty.[21]

But the message MacDonald hoped most to convey was that despite these long odds, CERT survived in the same way American Indians had

survived since European contact, by adapting to constantly changing circumstances. In his words, the organization "evolved from a MEANS to increase bargaining leverage to an END in itself—a forum for giving tribes power in national politics." Now that CERT and its allies had exercised their power to change federal law and clarify the tribes' expansive sovereignty, MacDonald predicted:

> CERT will become a SYMBOL for the next voyage of the human species—a voyage to a post-industrial world. It is a voyage which Native Americans are uniquely equipped to make. . . . We retain our traditions, our sense of community, and the medicine bundles of sacred soil, brought from previous worlds and preserved to enable us to achieve harmony in a new world, yet unknown. . . . Spaceship CERT is ready for its next five-year voyage—ready to create the think tanks, the social experiments, the new institutions, and the new linkages for our peoples, the First Americans. We are equipped by long tradition and practice to adapt, adjust, and yet survive with our identity miraculously preserved.[22]

MacDonald's last point was the most important to American Indians. The onslaught of demand for tribal resources had brought the world's largest energy firms to reservation borders, where a flawed legal regime invited them in. Proposed mining not only imperiled reservation landscapes, but it threatened to erase established customs and norms that defined the communities living there. Yet, as alluded to by MacDonald, the energy tribes survived with their identities intact. Belying perceptions encoded in federal law that American Indians were incapable wards, these tribes mobilized a defense of their homeland and developed the institutional capacity to regulate industrial activities within that land. Based on this increased capacity, the 1982 Indian Mineral Development Act recognized tribal authority to direct reservation development, which subsequent laws strengthened. Now equipped with the legal authority to pursue development in line with their communities' desires, only the successful execution of that power is left unfinished. The fact that external, often global, structures continue to limit the exercise of this sovereignty—while internal debates rage over how to respond to these pressures—does not diminish the energy tribes' accomplishments. Rather, it makes them historical actors like any other, operating among forces they can shape but not fully control.

Notes

INTRODUCTION

1. "Proceedings of the Native American, Environmentalist, and Agriculturalist Workshop" (Northern Rockies Action Group, December 10, 1975), 15, in author's possession.

2. 31 U.S. 515 (1832), 559. A staunch federalist, Marshall limited his defense of tribal sovereignty to internal tribal matters within tribal lands, maintaining that the federal government held superior authority over the tribes' external relations. In fact, he followed the quote about Indian nations being distinct and independent with the words "with the single exception of that imposed by irresistible power" of a conquering nation. This recognition of federal supremacy, however, does not affect Marshall's legal opinion that tribes retained the right to manage resources within their lands. As to Jackson's quotes, see Felix S. Cohen, *Cohen's Handbook of Federal Indian Law* (Newark: LexisNexis, 2005), 50, n. 304; Ronald N. Satz, *American Indian Policy in the Jacksonian Era* (Lincoln: University of Nebraska Press, 1974), 49, n. 31; Francis Paul Prucha, *The Great Father: The United States Government and the American Indians* (Lincoln: University of Nebraska Press, 1984), 212, n. 61. Most historians agree on the accuracy of Jackson's quote, though the more popular version holds that the president replied, "John Marshall has made his decision, now let him enforce it." Regardless of his actual words, subsequent federal actions made clear Jackson's policy to ignore the Supreme Court's holding. Finally, the literature on non-Indians divesting Indians of their land and resources in the nineteenth century is voluminous. Francis Paul Prucha provides the classic introduction to the many ways in which this was accomplished (Prucha, *Great Father)*. For the more specific point of how non-Indians used the legal system

to erode tribal sovereignty, see Charles F. Wilkinson, *American Indians, Time, and the Law: Native Societies in a Modern Constitutional Democracy* (New Haven: Yale University Press, 1987), esp. 56–57; Sidney L. Harring, *Crow Dog's Case: American Indian Sovereignty, Tribal Law, and United States Law in the Nineteenth Century* (Cambridge: Cambridge University Press, 1994); David E. Wilkins, *American Indian Sovereignty and the U.S. Supreme Court: The Masking of Justice* (Austin: University of Texas Press, 1997), esp. chapter 3; and Lindsay Gordon Robertson, *Conquest by Law: How the Discovery of America Dispossessed Indigenous Peoples of Their Lands* (New York: Oxford University Press, 2005).

3. For early views and policies of European colonials and Americans toward American Indians, see Prucha, *Great Father,* esp. 5–9 and parts 1–2; Robert F. Berkhofer, *The White Man's Indian: Images of the American Indian from Columbus to the Present* (New York: Alfred A. Knopf, 1978); Brian W. Dippie, *The Vanishing American: White Attitudes and U.S. Indian Policy* (Middletown, CT: Wesleyan University Press, 1982), esp. parts 1–2; Bernard W. Sheehan, *Savagism and Civility: Indians and Englishmen in Colonial Virginia* (Cambridge: Cambridge University Press, 1980). For the mid-nineteenth-century emphasis on assimilation, and the later turn toward race as a marker of inferiority, see Frederick E. Hoxie, *A Final Promise: The Campaign to Assimilate the Indians, 1880–1920* (Lincoln: University of Nebraska Press, 1984). David Rich Lewis explains the prominent role of settled agriculture in the project to "civilize" Indian cultures. *Neither Wolf nor Dog: American Indians, Environment, and Agrarian Change* (New York: Oxford University Press, 1994), esp. 3–21.

4. The literature on Collier is extensive. A particularly helpful work explaining Collier's motivation to protect Indians' communal ethic is E. A. Schwartz, "Red Atlantis Revisited: Community and Culture in the Writings of John Collier," *American Indian Quarterly* 18, no. 4 (Autumn 1994): 507–31; see also Lawrence C. Kelly, *The Assault on Assimilation: John Collier and the Origins of Indian Policy Reform* (Albuquerque: University of New Mexico Press, 1983); Kenneth R. Philp, *John Collier's Crusade for Indian Reform, 1920–1954* (Tucson: University of Arizona Press, 1977); Elmer Rusco, *A Fateful Time: The Background and Legislative History of the Indian Reorganization Act* (Reno: University of Nevada Press, 2000); Graham D. Taylor, *The New Deal and American Indian Tribalism: The Administration of the Indian Reorganization Act, 1934–45* (Lincoln: University of Nebraska Press, 1980); and Stephen Kunitz, "The Social Philosophy of John Collier," *Ethnohistory* 18, no. 3 (Summer 1971): 213–29. For an explanation of how Collier's Office of Indian Affairs effectively retained control over Indian assets through its use of "technical assistance" to the tribes, see Thomas Biolsi, *Organizing the Lakota: The Political Economy of the New Deal on the Pine Ridge and Rosebud Reservations* (Tucson: University of Arizona Press, 1992), esp. chapter 6.

5. As I discuss in chapter 1, Felix Cohen's position stemmed from his normative vision of America as a legally pluralistic society with power decentralized to local authorities. For Cohen's concept of legal pluralism and his efforts to apply it to American Indian law, see Dalia Tsuk Mitchell, *Architect of Justice: Felix S. Cohen and the Founding of American Legal Pluralism* (Ithaca: Cornell University Press, 2007). For additional explanations of Cohen's approach to Indian law, particularly

how legal realism influenced his work, see Christian McMillen, *Making Indian Law: The Hualapai Land Case and the Birth of Ethnohistory* (New Haven: Yale University Press, 2007), 128–33; Jill Martin, "The Miner's Canary: Felix S. Cohen's Philosophy of Indian Rights," *American Indian Law Review* 23 (Summer 1999): 165–79; Martin P. Goldberg, "Realism and Functionalism in the Legal Thought of Felix S. Cohen," *Cornell Law Review* 66, no. 5 (1981): 1032–57; and Stephen M. Feldman, "Felix S. Cohen and His Jurisprudence: Reflections on Federal Indian Law," *Buffalo Law Review* 35, no. 2 (1986): 479–515. Chapter 1 also covers how the 1938 Indian Mineral Leasing Act provided a uniform mineral leasing system whereby tribes, through the Bureau of Indian Affairs, could solicit offers to extract reservation minerals, but they could not develop these resources themselves. Instead, the federal government would oversee the work of outside developers who "leased" Indian minerals for production. Indian Mineral Leasing Act, Public Law 75-506, 52 Stat. 347 (1938), codified as amended at 25 U.S.C. § 396a–f [2006]; Cohen, *Cohen's Handbook of Federal Indian Law,* 2005 ed., 1091.

6. Richard Nixon, "Special Message to Congress on Indian Affairs," July 8, 1970, The American Presidency Project, ed. Gerhard Peters and John T. Woolley, http://www.presidency.ucsb.edu/ws/index.php?pid=2573. For Nixon's Indian policy conforming to his New Federalism approach, see George Pierre Castile, *To Show Heart: Native American Self-Determination and Federal Indian Policy, 1960–1975* (Tucson: University of Arizona Press, 1998), 80–86. Nixon's self-determination policy actually continued a trend begun with President Lyndon Johnson's Office of Economic Opportunity to provide tribal governments direct control over reservation funds and resources. See Castile, *To Show Heart,* and Thomas Clarkin, *Federal Indian Policy in the Kennedy and Johnson Administrations, 1961–1969* (Albuquerque: University of New Mexico Press, 2001). As George Castile argues, "The rhetoric, the language of self-determination, had long been around; what was new [under the Johnson administration] was a practical mechanism to transfer authority to the tribes—the [Office of Economic Opportunity] system of compacting with local Indian community action agencies to carry out federal programs." George Pierre Castile, *Taking Charge: Native American Self-Determination and Federal Indian Policy, 1975–1993* (Tucson: University of Arizona Press, 2006), 14. According to Castile, Nixon simply carried forth this model and proposed new federal legislation that authorized the Bureau of Indian Affairs to transfer some of its responsibilities to tribal governments, again following the template already established by the Office of Economic Opportunity.

7. For a discussion of Nixon's original legislative proposals to effectuate his policy, how the Watergate scandal hampered the passage of these bills, and the Democratic Congress's embrace of the Indian Self-Determination and Education Act after Nixon's resignation, see Castile, *To Show Heart,* chapters 4 and 6–7. There is a robust and growing literature on Indian gaming. See, e.g., W. Dale Mason, *Indian Gaming: Tribal Sovereignty and American Politics* (Norman: University of Oklahoma Press, 2000); Angela Mullis and David Kamper, eds., *Indian Gaming: Who Wins?* (Los Angeles: UCLA American Indian Studies Center, 2000); Duane Champagne and Carol Goldberg, "Ramona Redeemed?: The Rise of Tribal Political Power in California," *Wicazo Sa Review* 17, no. 1 (2002): 43–63; Eve

Darian-Smith, *New Capitalists: Law, Politics, and Identity Surrounding Casino Gaming on Native American Land* (Belmont, CA: Thomson/Wadsworth, 2004); Steven Andrew Light and Kathryn Rand, *Indian Gaming and Tribal Sovereignty: The Casino Compromise* (Lawrence: University Press of Kansas, 2005); and Jessica R. Cattelino, *High Stakes: Florida Seminole Gaming and Sovereignty* (Durham: Duke University Press, 2008).

8. My notion of a "third area of sovereignty" is related to, but different from, Kevin Bruyneel's concept of a "third space of sovereignty." In *The Third Space of Sovereignty,* Bruyneel demonstrates how Euro-American legal institutions and cultural constructions continuously limited American Indians both to a place outside the American polity (spatial boundary) and to a time before the emergence of a modern American state (temporal boundary). However, while careful to note these limitations, Bruyneel also finds ambiguity in the application of these principles, stemming largely from the multifaceted nature of the American people and its state. The lack of uniformity in views and policies toward American Indians produces what Bruyneel calls "colonial ambivalence," creating a space within which American Indians could operate historically to exercise some sovereignty and extract benefits from the federal government. It is here, in this "third space of sovereignty," where American Indians are neither wholly within nor outside the American state, that Bruyneel finds Indian agency and the explanation for the continued resiliency of American Indian groups today. Kevin Bruyneel, *The Third Space of Sovereignty: The Postcolonial Politics of U.S.–Indigenous Relations* (Minneapolis: University of Minnesota Press, 2007), 1–25. While greatly influenced by Bruyneel's work, my use of the "third area of sovereignty" is less amorphous and stands simply for that area within federal jurisprudence where tribal governments, rather than federal or state governments, maintain primary authority.

9. Joseph F. Mulligan, *Introductory College Physics* (New York: McGraw-Hill, 1985), 138 and 157.

10. For Weber's understanding of social power, see H. H. Gerth and C. Wright Mills, eds., *From Max Weber: Essays in Sociology* (New York: Oxford University Press, 1962), 180. The literature on power from historians of technology and the environment has been reviewed recently by a group of scholars at the University of Virginia that includes myself, Edmund Russell, Thomas Finger, John K. Brown, Brian Balogh, and W. Bernard Carlson. The claims made here regarding the energetic basis of social power derive from that collective effort. See Edmund Russell et al., "The Nature of Power: Synthesizing the History of Technology and Environmental History," *Technology and Culture* 52, no. 2 (April 2011): 246–59. Latour's quote is in Bruno Latour, "The Powers of Association," in *Power, Action, and Belief: A New Sociology of Knowledge,* ed. John Law (Boston: Routledge and Keegan Paul, 1986), 273.

11. Immanuel Wallerstein's "world systems theory" provides the most influential analysis of these core-periphery relations. For a cogent summary of this theory, see Immanuel Maurice Wallerstein, *World-Systems Analysis: An Introduction* (Durham: Duke University Press, 2004). Representative examples of environmental histories that apply the theory to international development in the modern era include Richard P. Tucker, *Insatiable Appetite: The United States and the Ecologi-*

cal Degradation of the Tropical World (Berkeley: University of California Press, 2000), and John F. Richards, *The Unending Frontier: An Environmental History of the Early Modern World* (Berkeley: University of California Press, 2003). For studies of American development in this mold, see, e.g., Richard White, *The Roots of Dependency: Subsistence, Environment, and Social Change Among the Choctaws, Pawnees, and Navajos* (Lincoln: University of Nebraska Press, 1983); William Cronon, *Nature's Metropolis: Chicago and the Great West* (New York: W. W. Norton, 1991); and William G. Robbins, *Colony and Empire: The Capitalist Transformation of the American West* (Lawrence: University Press of Kansas, 1994). Influential anthropologies demonstrating the difficulties in applying universal ideologies in foreign, local contexts include James C. Scott, *Seeing Like a State: How Certain Schemes to Improve the Human Condition Have Failed* (New Haven: Yale University Press, 1998), and Anna Lowenhaupt Tsing, *Friction: An Ethnography of Global Connection* (Princeton: Princeton University Press, 2005).

12. A major exception to the statement that environmental histories have tended not to follow the trajectory of impacts outward from the periphery is Richard Grove's work, *Green Imperialism.* In it, Grove demonstrates how the incorporation of local knowledge of the natural world, generated in colonial peripheries, influenced scientific knowledge in the metropoles, leading ultimately to powerful scientific critiques of colonialism. Richard Grove, *Green Imperialism: Colonial Expansion, Tropical Island Edens, and the Origins of Environmentalism, 1600–1860* (New York: Cambridge University Press, 1995).

13. Arthur F. McEvoy, *The Fisherman's Problem: Ecology and Law in the California Fisheries, 1850–1980* (New York: Cambridge University Press, 1986), 13.

14. Studies that explain tribal factionalism in terms of resource conflicts include White, *Roots of Dependency,* esp. 109–17; Lewis, *Neither Wolf nor Dog,* esp. 41 and 154–55; Larry Nesper, *The Walleye War: The Struggle for Ojibwe Spearfishing and Treaty Rights* (Lincoln: University of Nebraska Press, 2002), chapter 8; and Paul C. Rosier, *Rebirth of the Blackfeet Nation* (Lincoln: University of Nebraska Press, 2001). Mitchell's quote is at Don Mitchell, *Cultural Geography: A Critical Introduction* (Malden, MA: Blackwell, 2000), 77.

PROLOGUE

1. According to the coal industry's leading trade journal, in 1972, Consolidation trailed only the Peabody Group in American coal production. "Top 15 Coal-Producing Groups in 1972," *Coal Age,* April 1973, 39. For details on Consolidation's proposal, see K. Ross Toole, *The Rape of the Great Plains: Northwest America, Cattle and Coal* (Boston: Little, Brown, 1976), 63–64; Marjane Ambler, *Breaking the Iron Bonds: Indian Control of Energy Development* (Lawrence: University Press of Kansas, 1990), 64–65; Michael Wenninger, "$1 Billion Coal Plant Discussed," *Billings Gazette,* November 29, 1972; and Michael Wenninger, "Battle Brews over Reservation's Coal," *Billings Gazette,* April 2, 1973.

2. Dell Adams to Northern Cheyenne Tribe, July 7, 1972 (quoted in Ziontz, Pirtle, Moresset, and Ernstoff, "Petition of the Northern Cheyenne Indian Tribe to Rogers C. B. Morton, Volume II: Appendix," January 7, 1974, A-142 to A-144,

K. Ross Toole Papers, series V, box 28, folder 2, Mansfield Library, University of Montana). For the Northern Cheyenne's average per capita income, see "Northern Cheyenne Highlights, Calendar Year 1969," 1970, 1, 8NN-75-92-206, box 14, folder "Evaluation of Ten Year Goals," National Archives, Denver, CO.

3. The few existing studies of Indian energy development generally portray tribal leaders as passive observers to a BIA-controlled system of exploitation. See Toole, *Rape of the Great Plains;* Ambler, *Breaking the Iron Bonds;* Donald Fixico, *The Invasion of Indian Country in the Twentieth Century American Capitalism and Tribal Natural Resources* (Niwot: University Press of Colorado, 1998); and Charles F Wilkinson, *Fire on the Plateau: Conflict and Endurance in the American Southwest* (Washington, DC: Island Press, 1999). A recent collection of essays, however, demonstrates how "from the beginning of energy development on Indian lands, Indian people have been actively engaged: as owners and lessees of resources, workers in the industries, consumers of electricity and gasoline, and developers of tribal energy companies, as well as environmentalists who sometimes challenge these enterprises." Sherry L. Smith and Brian Frehner, eds., *Indians and Energy: Exploitation and Opportunity in the American Southwest* (Santa Fe: SAR Press, 2010), 5. This work follows in the latter mold, explaining how through active engagement in energy development projects, tribal governments gained the knowledge and legal tools necessary to manage their own resources.

CHAPTER 1. THE TRIBAL LEASING REGIME

1. John Artichoker to James Canan, December 28, 1965 (quoted in Ziontz, Pirtle, Moresset, and Ernstoff, "Petition of the Northern Cheyenne Indian Tribe to Rogers C. B. Morton, Volume II: Appendix," January 7, 1974, A-1, K. Ross Toole Papers, series V, box 28, folder 2, Mansfield Library, University of Montana [hereafter Ziontz et al., "Northern Cheyenne Petition"]).

2. Ibid. To be clear, a small coal mine already existed on the reservation by the time Krueger submitted his proposal. This mine, however, supplied heating coal to reservation residents and did not export coal off reservation for industrial uses. Krueger's offer was the first proposal to develop Cheyenne coal in commercial quantities to be used for the industrial production of electricity. For the response from Billings BIA officials, see Ned O. Thompson, memo, January 7, 1966 (found in Ziontz et al., "Northern Cheyenne Petition," A-1 to A-2).

3. The quote describing the trustee duty as a cornerstone of Indian law comes from *Dept. of Interior v. Klamath Water Users Prot. Ass'n,* 532 U.S. 1, 11 (2001). In that opinion, the court merely affirmed the description of this duty as it appeared in Felix S. Cohen, *Cohen's Handbook of Federal Indian Law,* 2005 ed. (Newark: LexisNexis, 2005), 221. For further description of this trustee duty being akin to the common law duty of any fiduciary to responsibly manage a trust corpus for beneficiaries, see *United States v. Mitchell,* 463 U.S. 206, 225 (1983). John Marshall first acknowledged the United States' superior title to Indian lands in *Johnson v. M'Intosh,* reasoning the country's "discovery and conquest" of a new but inhabited land provided this right. Although he characterized the federal claim as an "absolute ultimate title," Marshall also admitted that Indians still possessed

the "legal as well as just" right of occupancy, which granted them certain sovereign rights within that territory. 21 U.S. 543, 592, 574 (1823). Later, in *Cherokee Nation v. Georgia,* Marshall elaborated that this unique indigenous land right did not create full sovereign Indian nations within the territory of the United States but instead made the tribes "domestic dependent nations . . . in a state of pupilage," likening their relationship to the United States as "that of a ward to his guardian." 30 U.S. 1, 17 (1831). This special status of Indian nations as "domestic dependent nations" forms the basis the United States' trustee duty to responsibly manage Indian land and resources. The last quote holding the federal government to the most exacting fiduciary standards comes from *Seminole Nation v. United States,* 187 U.S. 286, 297 (1942); see also Cohen, *Handbook of Federal Indian Law,* 2005 ed., 419–20, and Christian McMillen, *Making Indian Law: The Hualapai Land Case and the Birth of Ethnohistory* (New Haven: Yale University Press, 2007), 89–90.

4. Lyn Fisher, "Transcript of Notes of Conversation with J. Canan of the BIA Regarding the Northern Cheyenne Petition," June 15, 1979, 8, K. Ross Toole Papers, series V, box 28, folder 3, Mansfield Library, University of Montana.

5. Act of July 22, 1790, Public Law 1–33, § 4, 1 Stat. 137 (1790). The 1790 Non-Intercourse Act specifically prohibited the transfer of Indian land unless "duly executed at some public treaty, under the authority of the United States." As to major shifts in federal Indian policy, their justifications, and the impact on Indian land holdings, see notes 3–5 to introduction, above, and accompanying text.

6. As to John Collier's Indian New Deal, see generally notes 4–5 to introduction, above, and accompanying text.

7. E. A. Schwartz, "Red Atlantis Revisited: Community and Culture in the Writings of John Collier," *American Indian Quarterly* 18, no. 4 (Autumn 1994): 507–31. Schwartz argues that Collier's concept of a "Red Atlantis," which he developed after his first visit with the Taos Pueblo Indians in 1920, initially captured both the idea that Indians could offer lessons to white America on the values of group cohesion and also the recognition that this reservoir of knowledge required federal protection from capitalist attacks. Schwartz goes on to note, however, that Collier gradually subjugated the former concept to the latter, as he increasingly viewed his mission to slowly integrate—but not assimilate—Indians into American society and became less concerned with the direct transfer of Indian knowledge to whites. Other helpful works on Collier's life and his perception of American Indians include Lawrence C. Kelly, *The Assault on Assimilation: John Collier and the Origins of Indian Policy Reform* (Albuquerque: University of New Mexico Press, 1983); Kenneth R. Philp, *John Collier's Crusade for Indian Reform, 1920–1954* (Tucson: University of Arizona Press, 1977); Elmer Rusco, *A Fateful Time: The Background and Legislative History of the Indian Reorganization Act* (Reno: University of Nevada Press, 2000); Graham D. Taylor, *The New Deal and American Indian Tribalism: The Administration of the Indian Reorganization Act, 1934–45* (Lincoln: University of Nebraska Press, 1980); and Stephen Kunitz, "The Social Philosophy of John Collier," *Ethnohistory* 18, no. 3 (Summer 1971): 213–29.

8. For Collier's views on indirect administration, see Rusco, *Fateful Time,* 160–63 and 176. For a discussion of how, in practice, BIA's "technical assistance" could often preempt tribal decision making, see Thomas Biolsi, *Organizing the*

Lakota: The Political Economy of the New Deal on the Pine Ridge and Rosebud Reservations (Tucson: University of Arizona Press, 1998), 128–32.

9. Initially, two young attorneys, Cohen and Melvin Siegel, worked on the draft legislation. Little is known of Siegel, but Elmer Rusco reports that Lucy Cohen, Felix's wife, remembers Siegel remaining at the Department of the Interior for only a few months, and thus he could not have been a major contributor to Indian policy debates. Rusco, *Fateful Time,* 193. For the quotes describing Cohen's views on legal pluralism, see Dalia Tsuk Mitchell, *Architect of Justice: Felix S. Cohen and the Founding of American Legal Pluralism* (Ithaca: Cornell University Press, 2007), 57.

10. Mitchell, *Architect of Justice,* 82–90. The original bill's quotes are taken from ibid., at 83. It should be noted that Felix Cohen strongly opposed the BIA's position that the Indian Reorganization Act authorized only the federal government to issue corporate charters to Indian tribes. Cohen's stance, consistent with the argument he would make throughout his tenure, was that the right to incorporate was a fundamental right of any sovereign power. Because Congress had not explicitly extinguished this right for Indian tribes, they thus retained the authority to define their own powers through corporate charters. Felix Cohen to Frederic Kirgis, April 14, 1937, National Archives II, College Park, MD (hereafter NAII), RG 48, entry 809, box 12.

11. For the deliberations over Interior's bill, see Vine Deloria, Jr., and Clifford M. Lytle, *The Nations Within: The Past and Future of American Indian Sovereignty* (Austin: University of Texas Press, 1984), 66–79; Mitchell, *Architect of Justice,* 90–101; and Rusco, *Fateful Time,* 192–209. The final statute is at Indian Reorganization Act (IRA), Public Law 73-383, ch. 576, § 16 48 Stat. 984, 987 (1934), codified at 25 U.S.C. § 476 (2006). The quote from the Solicitor's Opinion is at Nathan Margold, U.S. Department of the Interior, "Powers of Indian Tribes," in *Opinions of the Solicitor: Indian Affairs* (Washington: Government Printing Office, 1946), 446. As to the novelty of Cohen's argument that tribal powers originated with the tribal sovereign, Charles Wilkinson demonstrates how this articulation of inherent sovereignty simply echoed sentiments expressed by Chief Justice John Marshall in *Worcester v. Georgia.* In that famous opinion, which Cohen cited liberally in his Solicitor's Opinion, Marshall stated that the "Indian nations had always been considered as distinct, independent, political communities, and the settled doctrine of the law of nations is that a weaker power does not surrender its independence—its right to self-government—by associating with a stronger, and taking its protection." 31 U.S. 515, 559 (1832). See also Charles F. Wilkinson, *American Indians, Time, and the Law* (New Haven: Yale University Press, 1987), 54–59. Marshall thus was first to advance the theory that tribes possessed all the powers of a sovereign, surrendering only their external sovereignty by virtue of Euro-American conquest, but Cohen resurrected this foundational principle after decades of its subjugation to the federal government's plenary power. See also David E. Wilkins, "The Era of Congressional Ascendancy over Tribes," in *American Indian Sovereignty and the U.S. Supreme Court* (Austin: University of Texas Press, 1997). Deloria's and Lytle's point about tribal powers is found at *Nations Within,* 159. These two authors also argue that when Congress slashed the Department of the Interior's original list

of tribal powers down to three it unwittingly expanded tribal sovereignty. They reason that although Interior's proposal included a long list of *potential* powers, these powers had to first be granted by the federal government in the form of a corporate charter tailor-made to the specific situation of each tribe. The final IRA, however, granted these three enumerated powers to any tribe organized under the statute, not to mention recognizing "all powers vested . . . by existing law." Thus, in the final law, although the BIA retained the right to approve tribes' organizing constitutions, once accepted it could not deny these powers. Deloria and Lytle, *Nations Within,* 142.

12. This premise of Indian powers mirrors the first principle Cohen would later articulate in his seminal work, *Handbook of Federal Indian Law.* Cohen, *Handbook of Federal Indian Law,* 2005 ed., 2. ("Nonetheless, there are some fundamental principles that underlie the entire field of federal Indian law. First, an Indian nation possesses in the first instance all of the powers of a sovereign state." Emphasis removed.) As to the debates within Interior, the Solicitor's Office itself was also divided over the proper interpretation of tribal powers. Within that office, the most prominent members of the divided camps were Assistant Solicitor Frederick Wiener and William Flannery, who invariably offered legal interpretations limiting tribal powers and affirming BIA's oversight role, versus Cohen, Solicitor Nathan Margold, and Charlotte Westwood, who offered consistently expansive interpretations of tribal sovereignty. On resolving inconsistencies between the Northern Cheyenne constitution and Interior's regulations relating to grazing leases, see William Flannery, memorandum to file, February 27, 1936, NAII, RG 48, entry 809, box 9; and Felix Cohen, memorandum to file, March 6, 1936, NAII, RG 48, entry 809, box 9. On disagreements over whether tribal governments can issue timber contracts, mineral leases, or agricultural leases to Indian cooperatives at a nominal sum, see William Flanery, memorandum to file, October 22, 1936, NAII, RG 48, entry 809, box 11; and William Flannery to Frederick Wiener, November 14, 1936, NAII, RG 48, entry 809, box 11. On whether a conflict of interest justifies the BIA's denial of a timber contract entered into by the Flathead Indians, see William Flanery to Frederick Wiener, December 1, 1936, NAII, RG 48, entry 809, box 11; and Charlotte Westwood to Frederick Wiener, December 1, 1936, NAII, RG 48, entry 809, box 9. On a dispute over whether the Paiute Indians of the Pyramid Lake Reservation can veto a mineral lease issued prior to the tribe's organization under the IRA, see Frederick Wiener to Nathan Margold, March 6, 1937, NAII, RG 48, entry 809, box 12; and unsigned memo to Assistant Secretary of the Interior, March 9, 1937, NAII, RG 48, entry 809, box 12.

13. The National Archives does not contain a copy of the BIA's initial proposal to streamline the process for developing Indian minerals, but it is referenced at Charles Fahy to the Geological Survey, August 8, 1933, NAII, RG 48, entry 809, box 2. No further action appears to have been taken on this proposal until 1935, when Felix Cohen drafted a memo on behalf of Solicitor Nathan Margold detailing the impacts of the proposed legislation. Nathan Margold to John Collier, February 6, 1935, NAII, RG 48, entry 809, box 6.

14. Cohen's "fiery retort" that was later amended to soften its tone can be found at Nathan Margold to John Collier, January 24, 1935, NAII, RG 48, entry 809,

box 6 (draft memorandum authored by Felix Cohen). Assistant Solicitor Rufus Poole's memo questioning the Solicitor's Office's role is at Assistant Solicitor Poole to Nathan Margold, January 28, 1935, NAII, RG 48, entry 809, box 6. Finally, as to Cohen's amendments, compare Nathan Margold to John Collier (draft memorandum authored by Felix Cohen), January 24, 1935, NAII, RG 48, entry 809, box 6 with Nathan Margold to John Collier, February 6, 1935, NAII, RG 48, entry 809, box 6. Cohen wrote in the margins of both the original draft and the memo from Poole, "revised as to form."

15. The final bill, along with Senate and House reports, can be found at S. 2638, H.R. 7681, 74th Cong. (1935). It is interesting to note the statutory language governing the secretary's veto authority is different for oil and gas leases than for other minerals. With respect to oil and gas, the final statute specified the secretary could reject bids for development "whenever in his judgment the interest of the Indians will be served by so doing." With other minerals, the statue authorized tribes to lease their interests only "with the approval of the Secretary of Interior." Compare 25 U.S.C. § 396(b) with § 396(a) (2006). For Interior's position that the 1938 IMLA controlled all transfers of Indian minerals, see Senate Select Committee on Indian Affairs, *Permitting Indian Tribes to Enter into Certain Agreements for the Disposition of Tribal Mineral Resources and for Other Purposes,* 97th Cong., 2d sess., June 10, 1982, 8–12; House Committee on Interior and Insular Affairs, *Permitting Indian Tribes to Enter into Certain Agreements for the Disposition of Tribal Mineral Resources and for Other Purposes,* 97th Cong., 2d sess., August 13, 1982, 9–13; and Senate Select Committee on Indian Affairs, *Hearings Before the Select Committee on Indian Affairs on S. 1894*, 97th Cong., 2d sess., 1982, 70–77.

16. Elmer Thomas's quote is found at S. 2638, 74th Cong., 1st sess., *Congressional Record* 79 (May 28, 1935): S8307. As for passage on the House's consent calendar, see H.R. 7626, S. 2689, 75th Cong., 3rd sess., *Congressional Record* 83 (May 2, 1938): H6057. Wiener's quotes are found at Frederick Wiener to Nathan Margold, March 5, 1936, NAII, RG 48, entry 809, box 9. Finally, the 1938 Indian Mineral Leasing Act is found at 25 U.S.C. § 396a–396g (2012). The act's implementing regulations in effect during the events detailed here are at 25 C.F.R. § 171.2 (1966).

17. Mining Act of 1866, 14 Stat. 251 (1866); Charles F. Wilkinson, *Crossing the Next Meridian: Land, Water, and the Future of the West* (Washington, DC: Island Press, 1992), 40–50; Samuel P. Hays, *Conservation and the Gospel of Efficiency: The Progressive Conservation Movement, 1890–1920* (New York: Atheneum, 1972), 67. For a discussion of the specific problems related to coal, see ibid., 82–83.

18. Hays, *Conservation and the Gospel of Efficiency,* 82–90; see also Wilkinson, *Crossing the Next Meridian,* 50–54. The 1920 Mineral Leasing Act is found at Mineral Leasing Act of 1920, Public Law 93–153, 41 Stat. 438 (1920), codified at 30 U.S.C. § 181 et seq. (2006).

19. Charles Fahy to the Geological Survey, August 8, 1933, NAII, RG 48, entry 809, box 2. The 1938 Indian Mineral Leasing Act is codified at 25 U.S.C. § 396a–g (2006), and the controlling regulations at the time of the Northern Cheyenne coal sales are at 25 C.F.R. § 171 (1966).

20. Richard White, *"It's Your Misfortune and None of My Own": A New History of the American West* (Norman: University of Oklahoma Press, 1991), 399.

21. James S. Cannon and Mary Jean Haley, *Leased and Lost: A Study of Public and Indian Coal Leasing in the West* (New York: Council on Economic Priorities, 1974), 21–23. Chapter 2, below, provides much greater detail of public officials' failure to carry out the mandates of the 1920 Mineral Leasing Act. See chapter 2, notes 7–12 and accompanying text.

22. The 1938 act's public bidding requirement for oil and gas is at 25 U.S.C. § 396b (2006). Nowhere in the act does it require bidding for minerals other than oil and gas, yet the controlling regulations requiring that all Indian minerals be "advertised for bids" are at 25 C.F.R. § 171.2 (1966).

23. The tribal resolution is at Northern Cheyenne Tribal Resolution No. 9 (66), February 10, 1966 (found in Ziontz et al., "Northern Cheyenne Petition, A-1 to A-2). Thompson's communication to BIA headquarters is located at Ned O. Thompson to Commissioner of Indian Affairs, April 2, 1966, Central Classified Files, 1958–75, Northern Cheyenne, decimal #332, box 21, RG 75, National Archives, Washington, DC. It is also described at Ziontz et al., "Northern Cheyenne Petition," A-3; and Toole, *Rape of the Great Plains,* 62.

24. The fixed royalty rate was provided in Charles Corke to James Canan, March 15, 1966 (found in Ziontz et al., "Northern Cheyenne Petition," A-4).

25. Interior put in place an acreage limit for Indian coal leases to prevent mining firms from securing a mineral development monopoly on any given reservation. The limitation, however, could be waived if a "larger acreage is in the interest of the [tribe] and is necessary to permit the establishment or construction of a thermal electric power plant or other industrial facilities on or near the reservation." 25 C.F.R. 171.9(b). For the rationale behind the acreage limitation, see Myron E. Saltmarsh, "Acting Area Realty Officer to Area Director," March 12, 1974, K. Ross Toole Papers, series V, box 28, folder 3, Mansfield Library, University of Montana. Washington officials actually authorized such a waiver for Northern Cheyenne development on numerous occasions. Fryer to James F. Canan, May 11, 1966, Central Classified Files, 1958–75, Northern Cheyenne, decimal #332, box 21, RG 75, National Archives, Washington, DC; and Ziontz et al., "Northern Cheyenne Petition," A-4. For further description of the acreage limit waiver and the reduction in royalties for coal burned on reservation, see Ziontz et al., "Northern Cheyenne Petition," A-4 to A-9.

26. The life of John Woodenlegs's famed grandfather is detailed in Wooden Leg and Thomas Bailey Marquis, *Wooden Leg: A Warrior Who Fought Custer* (Lincoln: University of Nebraska Press, 1962). Both the *Lincoln Star*'s editorial and Woodenlegs's reply ("From the President") were reprinted in the March 18, 1966, edition of the Northern Cheyenne newsletter, the *Morning Star News* (in author's possession). For Metcalf's introduction of Woodenlegs's letter on the Senate floor, see *Progress on the Northern Cheyenne Reservation,* 89th Cong., 2d sess., *Congressional Record* (February 21, 1966): S3391–92. Jim Canan describes his meeting with John Woodenlegs and reservation superintendent John Artichoker at the Billings, Montana, Northern Hotel to hear their strong support for coal development. Fisher, "Transcript of Notes of Conversation with J. Canan of the BIA Regarding

the Northern Cheyenne Petition," 2. Thompson's additional request for immediate action on the Cheyenne coal auction is found at Ned O. Thompson to Commissioner of Indian Affairs, May 6, 1966, Central Classified Files, 1958–75, Northern Cheyenne, decimal #332, box 21, RG 75, National Archives, Washington, DC. For a general description of Cheyenne actions to move along the process, from the Cheyenne's own attorneys, see Ziontz et al., "Northern Cheyenne Petition," A-5.

27. Steven H. Chestnut, "Coal Development on the Northern Cheyenne Reservation," in Commission on Civil Rights, *Energy Resource Development: Implications for Women and Minorities in the Intermountain West* (Washington, DC: Commission on Civil Rights, 1979), 162–63.

CHAPTER 2. POSTWAR ENERGY DEMANDS AND THE SOUTHWESTERN EXPERIENCE

1. For the tripling of American oil consumption from 1948 to 1972, see Daniel Yergin, *The Prize: The Epic Quest for Oil, Money, and Power* (New York: Simon and Schuster, 1991), 541.

2. As to the post–World War II deals that brought Middle Eastern oil to the world, see ibid., chapter 21. For the broad societal impacts of cheap oil, see ibid., 541–60; and Rudi Volti, *Cars and Culture: The Life Story of a Technology* (Westport, CT: Greenwood Press, 2004), 105–13.

3. Ivan Given, "Toward Energy Entity," *Coal Age,* November 1966; "The Coal Industry Makes a Dramatic Comeback," *Business Week,* November 4, 1972, 52–53; James S. Cannon and Mary Jean Haley, *Leased and Lost: A Study of Public and Indian Coal Leasing in the West* (New York: Council on Economic Priorities, 1974), 3 and 9–11; Bureau of Competition and Bureau of Economics, *Staff Report to the Federal Trade Commission on the Structure of the Nation's Coal Industry, 1964–1974* (Washington, DC: Federal Trade Commission, 1978), 159–61; and Peter Galuszka, "1911–1986: Coal's Rise and Fall and Rise," *Coal Age,* June 1986, 52–53.

4. "The Coal Industry's Controversial Move West," *Business Week,* May 11, 1974; Cannon and Haley, *Leased and Lost,* 3–6; and Bureau of Competition and Bureau of Economics, *Staff Report to the Federal Trade Commission,* 37–39, 156.

5. Alfred E. Flowers, "Energy and Security," *Coal Age,* August 1968, 59. The Clean Air Acts of 1963 and 1967 were the first statutes to focus on controlling air emissions, though they established a research regime to determine the best pollution control techniques, rather than setting specific air emission limits. Clean Air Act of 1963, Public Law 88–206, 77 Stat. 392 (1963); Air Quality Act of 1967, Public Law 90–148, 81 Stat. 48 (1967). The 1970 Clean Air Act, however, greatly expanded the federal government's role in regulating air pollution by establishing emission limits for both stationary and mobile sources. Clean Air Act of 1970, Public Law 91–604, 84 Stat. 1676 (1970); see also Office of Air and Radiation, Environmental Protection Agency, "History of the Clean Air Act," http://epa.gov/air/caa/caa_history.html (accessed April 2, 2013). For the federal government's increasing concern over sulfur emissions and industry's response, see "HEW Slaps Low Sulfur Limits on Fuel," *Coal Age,* January 1967; Alfred E. Flowers, "Cleaning the Air," *Coal Age,* November 1967; "Keys to Big Markets for Coal: Research and

Pollution Control," *Coal Age,* November 1967; and Alfred E. Flowers, "The Sulfur Question," *Coal Age,* April 1968. For the impacts of the 1967 oil embargo and 1970 Clean Air Act on promoting western coal, see "Western Coal Is Booming, but Serious Problems Lie Ahead," *Coal Age,* September 1971; "The Challenges and Opportunities in Mining Western Coal," *Coal Age,* April 1973; "Western Coal . . . Important Element in National Energy Outlook," *Coal Age,* April 1973; and "The Coal Industry's Controversial Move West," *Business Week,* May 11, 1974.

6. The figure noting that 80 percent of western coal underlies federal or tribal land comes from Cannon and Haley, *Leased and Lost,* 2. For more detailed description of the existing legal regime, and the wasteful practices it replaced, see, above, chapter 1, notes 17–18 and accompanying text.

7. Bennethum's quote is found in Cannon and Haley, *Leased and Lost,* 22. The historical data on the mineral leasing program are ibid., 4, and the figures on coal's average market value are ibid., 27. In 1975, the Federal Trade Commission issued a report on Indian mineral leasing that confirmed the general pattern of industry-led development, though it noted the Navajo tribe had nominated its own tracts of land for energy development. Federal Trade Commission, *Staff Report on Mineral Leasing on Indian Lands* (Washington, DC: Federal Trade Commission, October 1975), 20–23.

8. Cannon and Haley, *Leased and Lost,* 2–3.

9. Ibid., 4–6. As to coal lease concentration among large oil companies, see ibid., 9–11.

10. The quotes from both the General Accounting Office and the Council for Economic Priorities are found at Canon and Haley, *Leased and Lost,* 22.

11. Details of the moratoriums are found ibid., 24; and Sally Jacobsen, "The Great Montana Coal Rush," *Bulletin of the Atomic Scientists* 29, no. 4 (April 1973): 41. As to Interior's decision to lift the moratorium and impose new policies and procedures, see Thomas Kleppe, "Press Release: New Federal Coal Leasing Policy to Be Implemented under Controlled Conditions" (Department of the Interior, January 26, 1976), series 6: NCAI Committees and Special Issues, box 234, "Coal Regs. [II]," National Congress of American Indians Collection, National Museum of American Indians Archive Center, Suitland, MD (hereafter NCAI Collection).

12. Thomas Clarkin, *Federal Indian Policy in the Kennedy and Johnson Administrations, 1961–1969* (Albuquerque: University of New Mexico Press, 2001), 2–3; and Harvard Project on American Indian Economic Development, *The State of the Native Nations: Conditions under U.S. Policies of Self-Determination* (New York: Oxford University Press, 2008), 114–15. American Indian income levels are taken from Alan Sorkin, "Trends in Employment and Earnings of American Indians," in *Toward Economic Development for Native American Communities: A Compendium of Papers Submitted to the Subcommittee on Economy in Government of the Joint Economic Committee, Congress of the United States* (Washington, DC: Government Printing Office, 1969), 107, 109, 111, and 114–15. Educational statistics can be found at Margaret Connell Szasz, *Education and the American Indian: The Road to Self-Determination* (Albuquerque: University of New Mexico, 1999), 134. Mortality rates are located in Helen Johnson, "American Indians in Rural

Poverty," in *Toward Economic Development for Native American Communities,* 21–22. Some experts placed the life expectancy rate for reservation Indians even lower, at an astonishing forty-two years. House Committee on Interior and Insular Affairs, Subcommittee on Indian Affairs, *A Review of the Indian Health Program: Hearing Before the House Committee on Interior and Insular Affairs, Subcommittee on Indian Affairs,* 88th Cong., 1st sess., 1945, 21.

13. The BIA's assessment of tribal coal possessions is found at Federal Trade Commission, *Staff Report on Mineral Leasing on Indian Lands,* 6. The Geological Survey's estimate is found at Comptroller General of the United States, *Indian Natural Resources: Part 2, Coal, Oil, and Gas: Better Management Can Improve Development and Increase Indian Income and Employment: Report to the Senate Committee on Interior and Insular Affairs* (Washington DC: Government Printing Office, March 31, 1976), 2. Tribal assessments can be found in Joseph Jorgensen, ed., *Native Americans and Energy Development II* (Boston: Anthropology Resource Center and Seventh Generation Fund, 1984), 6; and Joseph Jorgensen, ed., *Native Americans and Energy Development* (Cambridge, MA: Anthropology Resource Center, 1978), 6.

14. Oil, gas, and uranium figures can be found in Comptroller General of the United States, *Indian Natural Resources: Part 2, Coal, Oil, and Gas,* 1–2; Federal Trade Commission, *Staff Report on Mineral Leasing on Indian Lands,* 8; and Marjane Ambler, *Breaking the Iron Bonds: Indian Control of Energy Development* (Lawrence: University Press of Kansas, 1990), 94, n. 8. The Harris quote is found in Ambler, *Breaking the Iron Bonds,* 94.

15. American Indian Policy Review Commission, *American Indian Policy Review Commission Final Report Submitted to Congress May 17, 1977,* vol. 1 (Washington, DC: Government Printing Office, 1977), 7.

16. For the Navajo's and Hopi's long knowledge of their energy minerals and how such knowledge influenced the formation of their tribal governments, see Peter Iverson, *Diné: A History of the Navajos* (Albuquerque: University of New Mexico Press, 2002), 133–36; Lawrence C Kelly, *The Navajo Indians and Federal Indian Policy, 1900–1935* (Tucson: University of Arizona Press, 1968); Kathleen P. Chamberlain, *Under Sacred Ground: A History of Navajo Oil, 1922–1982* (Albuquerque: University of New Mexico, 2009); and Charles F Wilkinson, *Blood Struggle: The Rise of Modern Indian Nations* (New York: Island Press, 2005), 284–87. As to the rapid growth of the American West after World War II, see Lisa McGirr, *Suburban Warriors: The Origins of the New American Right* (Princeton: Princeton University Press, 2001), esp. 25–29. For World War II and the effect of the Cold War on the American West generally, see Gerald D. Nash, *The American West Transformed: The Impact of the Second World War* (Bloomington: Indiana University Press, 1985); and Gerald D. Nash, *World War II and the West: Reshaping the Economy* (Lincoln: University of Nebraska Press, 1990).

17. The numbers on postwar energy demand in the American Southwest come from Brian Morton, "Coal Leasing in the Fourth World: Hopi and Navajo Coal Leasing, 1954–1977" (PhD diss., University of California, Berkeley, 1985), 49. Alexander's quote is found in Alvin M. Josephy, Jr., "The Murder of the Southwest," *Audubon,* July 1971, 54.

18. Peter Iverson covers Navajo oil and uranium mining in *The Navajo Nation* (Westport, CT: Greenwood Press, 1981), 77–80; and Iverson, *Diné,* 220. Benally's quote is found at Iverson, *Diné,* 219. For uranium mining impacts to the Navajo, see also Judy Pasternak, *Yellow Dirt: An American Story of a Poisoned Land and a People Betrayed* (New York: Free Press, 2010); Doug Brugge, Timothy Benally, and Esther Yazzie-Lewis, *The Navajo People and Uranium Mining* (Albuquerque: University of New Mexico Press, 2007); Peter Eichstaedt, *If You Poison Us: Uranium and Native Americans* (Santa Fe: Red Crane Books, 1994); and Ward Churchill and Winona LaDuke, "Native America: The Economics of Radioactive Colonization," in *Review of Radical Political Economics* 15 (Fall 1983): 9–19.

19. Jones's 1956 quote is found in Morton, "Coal Leasing in the Fourth World," 189. The 1959 quote is at Peter Iverson and Monty Roessel, eds., *For Our Navajo People: Diné Letters, Speeches and Petitions, 1900–1960* (Albuquerque: University of New Mexico Press, 2002), 253.

20. Todd Andrew Needham, "Power Lines: Urban Space, Energy Development and the Making of the Modern Southwest" (PhD diss., University of Michigan, 2006), 145–46.

21. Andrew Needham and Allen Dieterich-Ward, "Beyond the Metropolis: Metropolitan Growth and Regional Transformation in Postwar America," *Journal of Urban History* 35, no. 7 (2009): 950–51. For background on the Four Corners Plant and the Navajo Mine, see Iverson, *Navajo Nation,* 79–80; Morton, "Coal Leasing in the Fourth World," 7–8; and Josephy, "Murder of the Southwest," 55. To be clear, Utah International obtained its coal mining lease prior to entering an agreement to supply coal to the Four Corners Plant. As Andrew Needham demonstrates, however, from at least 1957 onwards, the power plant intended to use Navajo coal as its fuel source. Needham, "Power Lines," 219–20.

22. Information on WEST's Grand Plan is provided in Josephy, "Murder of the Southwest," 62–64; and Charles F. Wilkinson, *Fire on the Plateau: Conflict and Endurance in the American Southwest* (Washington, DC: Island Press, 1999), 220–22. The WEST official's quote is found in Wilkinson, *Fire on the Plateau,* 212. While Wilkinson does not provide a source for this quote, the same statistics on the size of this regional project appear in other contemporary accounts, e.g., Josephy, "Murder of the Southwest," 61; and "Power: WESTward Ho!," *Time* (October 2, 1964).

23. The decision to combine private and federal systems is covered in Needham, "Power Lines," 245–56. Needham also explains in great detail the environmental opposition to more federal dams in the Southwest and thus Udall's move to interconnect federal hydroelectric and irrigation systems with the WEST network. Ibid., chapter 7. Udall's first quote comes from John Redhouse, *Geopolitics of the Navajo Hopi Land Dispute* (Albuquerque: Redhouse/Wright Prod., 1985), 16 (quoting Suzanne Gordon, *Black Mesa: The Angel of Death* (New York: John Day, 1973)). His second quote is at "Udall Pledges Cooperation with Utilities: Prophecies Great Future," *Arizona Republic,* June 24, 1965.

24. Morton, "Coal Leasing in the Fourth World," 7–12.

25. Ibid., chapter 5. Morton blames the suboptimal leases on an overriding federal policy to develop the nation's coal at all cost. I question whether he confuses

policy goals with executive agency actions, as a close reading of his analysis reveals that federal agents simply failed to uphold the intent of mineral leasing legislation, which was to thoughtfully and systematically develop the nation's resources so as to avoid waste, prevent monopolies, and regulate mining in the public interest. For Morton, this failure to perform indicates that the 1920 Mineral Leasing Act and the 1938 Indian Mineral Leasing Act did not substantially alter nineteenth-century policies that encouraged, and failed to regulate, private exploitation of public and Indian resources. My view is different, as these Progressive reforms were intended to curtail many of the excesses of Gilded Age mining, but the federal agencies tasked with carrying out these directives simply were not provided the tools and resources for doing so. Still, we both arrive at the same conclusion: that the federal regime failed to efficiently develop western resources for the good of public and Indian owners. See Morton, "Coal Leasing in the Fourth World," chapter 7.

26. Lynn A. Robbins, "Energy Development and the Navajo Nation," in Jorgensen, *Native Americans and Energy Development,* 43. Smith's quote is found in Josephy, "Murder of the Southwest," 64.

27. Josephy, "Murder of the Southwest," 67.

28. Lynn A. Robbins, "Energy Development and the Navajo Nation," in Jorgensen, *Native Americans and Energy Development,* 43.

29. Josephy, "Murder of the Southwest," 64; Federal Trade Commission, *Staff Report on Mineral Leasing on Indian Lands,* 22–23.

30. For detailed accounts of Hopi villagers' struggle to prevent Black Mesa mining, see Wilkinson, *Fire on the Plateau;* Josephy, "Murder of the Southwest," 64–67; and Richard O. Clemmer, "Black Mesa and the Hopi," in Jorgensen, *Native Americans and Energy Development.* At the time the Black Mesa lease was issued, only six of the eighteen Hopi Tribal Council slots were filled validly. Josephy, "Murder of the Southwest," 66; Jorgensen, *Native Americans and Energy Development,* 26–27. Alvin Josephy's quote is found at Josephy, "Murder of the Southwest," 66. Charles Wilkinson uncovered John Boyden's clear conflict of interest. See Wilkinson, *Fire on the Plateau,* 169–71. The quote from the Hopi leader is found in Clemmer, "Black Mesa and the Hopi," in Jorgensen, *Native Americans and Energy Development,* 30.

31. Comptroller General of the United States, *Indian Natural Resources,* 11. Federal Trade Commission, *Staff Report on Mineral Leasing on Indian Lands,* 21 and 95.

32. Redhouse, *Geopolitics of the Navajo Hopi Land Dispute,* 16. The Peabody permit revoked by the tribal council was designed to provide coal to the proposed Mohave Generating Station, owned by the WEST-affiliated Southern California Edison Company.

33. Redhouse, *Geopolitics of the Navajo Hopi Land Dispute,* 16–17. Udall's quote is found in "News about Navajo Country," *Navajo Times,* July 29, 1965 (quoted in Redhouse, *Geopolitics of the Navajo Hopi Land Dispute,* 16). Littell's first quote comes from "Norman M. Littell Makes Statement," *Navajo Times,* November 18, 1965. The second quote is found in "Norman M. Littell, General Counsel for the Navajo Tribe, Makes Statement on Conflicting Claims of Navajo and Hopi Tribes," *Navajo Times,* January 6, 1966 (both are quoted in Redhouse, *Geopolitics of the Navajo Hopi Land Dispute,* 17).

34. Iverson, *Navajo Nation,* 105.

35. For environmental opposition to Grand Canyon dams and thus need to construct the Navajo Generating Station, see Needham, "Power Lines," chapter 7.

36. Wilkinson, *Blood Struggle,* 303–4; Josephy, "Murder of the Southwest," 62–64; and Redhouse, *Geopolitics of the Navajo Hopi Land Dispute,* 18–22. In 1948, the states of Wyoming, Colorado, Utah, New Mexico, and Arizona signed the Colorado River Compact to allocate water rights to this valuable western water source. Arizona received 50,000 acre-feet, but no provision was made for Navajo rights even though the majority of state land adjoining the river was on the reservation. Although these specific Navajo water rights had not been determined, the 1908 Supreme Court *Winters v. United States* decision held that the creation of Indian reservations implied a reserved right to the water flowing through or adjacent to them in order to fulfill the purpose of the reservation system, which was to provide a self-sufficient homeland to transform Indians from "wild" hunters and gatherers to "civilized" agricultural and pastoral people. 207 U.S. 564 (1908); and Cohen, *Federal Indian Law,* § 19.02 (2005). Under the *Winters* doctrine, the Navajo thus had a strong legal claim to a majority of Arizona's allocated Colorado River water. The deal orchestrated by the Department of the Interior and WEST, however, required the Navajo to give up this legal claim to 34,100 acre-feet of water, plus an additional 3,000 acre-feet for the town of Page, Arizona, where the Navajo Generating Station would be built.

37. Josephy's quote is found at Josephy, "Murder of the Southwest," 64. For more on the unfairness of the deal to supply water and coal to the Navajo Generating Station, see Philip Reno, "High, Dry, and Penniless," *The Nation* (March 29, 1975), and Wilkinson, *Fire on the Plateau,* 212–23. Josephy's presidential report, commissioned by President Nixon's chief of staff Bob Haldeman, is found at "The American Indian and the Bureau of Indian Affairs: A Study with Recommendations, February 11,1969," in *Red Power: The American Indians Fight for Freedom,* ed. Alvin Josephy, Jr. (New York: McGraw-Hill, 1971). As George Pierre Castile shows, Haldeman's memo requesting this report conveyed Nixon's desire to "show more heart, and that we care about people, and [Nixon] thinks the Indian problem is a good area for us to work in." Castile, *To Show Heart; Thomas Clarkin, Federal Indian Policy in the Kennedy and Johnson Administrations, 1961–1969* (Albuquerque: University of New Mexico Press, 2001), 76.

38. For the Navajo's Committee to Save Black Mesa, see Josephy, "Murder of the Southwest," 64. The quote from Hopi elders is found at Clemmer, "Black Mesa and the Hopi," in Jorgensen, *Native Americans and Energy Development,* 29. Clemmer's assessment of the Senate hearings is at Clemmer, "Black Mesa and the Hopi," in Jorgensen, *Native Americans and Energy Development,* 30.

39. For discussions on the rampant news coverage of Navajo and Hopi coal development, see Needham, "Power Lines," 312; and Clemmer, "Black Mesa and the Hopi," in Jorgensen, *Native Americans and Energy Development,* 28. The *New York Times* quote is found at Stan Steiner, "The Navajo vs. the Bulldozer," *New York Times,* March 20, 1971.

40. For Peter MacDonald's efforts to tap into rising nationalist sentiment among younger Navajo and his actions to control, not suspend, energy development, see Needham, "Power Lines," 309–39; and Andrew Needham, "'A Piece of the

Action': Navajo Nationalism, Energy Development, and Metropolitan Inequality," in Sheri L. Smith and Brian Frehner, *Indians and Energy: Exploitation and Opportunity in the American Southwest* (Santa Fe: School for Advanced Research Press, 2010), 210–14. The anticolonial quote comes from "Candidates for Chairman," *Navajo Times,* October 19, 1970, and the quote about reclaiming Navajo control of their resources is mentioned in Josephy, "Murder of the Southwest," 64.

41. Andrew Needham is especially helpful in understanding MacDonald's new approach to reservation development. As he explains, "By the time the tribe began questioning the electrical development on their land, most of the projects needed to generate electricity—strip mines, railroads, slurry pipes, power plants, and transmission lines—were already in place. As fixed capital, this geography resisted change imposed from the outside, leading Navajos to pursue regulatory instead of transformative change." Needham, "Power Lines," 261.

CHAPTER 3. "THE BEST SITUATION IN THEIR HISTORY"

1. Federal Trade Commission, *Staff Report on Mineral Leasing on Indian Lands* (Washington, DC: Federal Trade Commission, 1975), 41–43.

2. Ibid., 5; and James S. Cannon and Mary Jean Haley, *Leased and Lost: A Study of Public and Indian Coal Leasing in the West* (New York: Council on Economic Priorities, 1974), 31. To reiterate, these lease acreages represented only a tiny fraction of Indian lands actually opened to energy companies because the prospecting permits that led to leases gave mining firms access to much larger areas of the reservation to drill and explore. Once locating particularly desirable deposits, the coal companies then held exclusive rights to convert the large prospecting permit into a smaller lease, which authorized the actual removal of coal. As we will see in chapters 4 and 5, for American Indians, the presence of outside energy developers scouring their reservations for precious minerals was often as disturbing as the actual mining activities.

3. The lease royalty figures come from Cannon and Haley, *Leased and Lost,* 4; and Federal Trade Commission, *Staff Report on Mineral Leasing on Indian Lands,* 83–84. The Montana coal excise tax is discussed at K. Ross Toole, *The Rape of the Great Plains: Northwest America, Cattle and Coal* (Boston: Little, Brown 1976), 62–64. Ultimately, the Ninth Circuit Court of Appeals found Montana's taxation of tribal mineral revenues to be an unlawful infringement on tribal sovereignty. *Crow Tribe v. Montana,* 819 F.2d 895, 903 (9th Cir. 1987). The Supreme Court later clarified, however, that Montana's excise tax was unlawful not because states lacked the authority to tax non-Indian development of reservation resources but because Montana's tax was "extraordinarily high" and unfairly discriminated against the tribe's ability to market their coal. *Cotton Petroleum Corp. v. New Mexico,* 490 U.S. 163, 186–87, n. 17 (1989); for further clarification see also *Montana v. Crow Tribe,* 523 U.S. 696, 715 (1998) ("Montana, *Cotton Petroleum* thus indicates, had the power to tax Crow coal, but not at an exorbitant rate."). The Supreme Court thus left open the possibility of states imposing reasonable taxes on non-Indian operators extracting minerals from Indian reservations.

4. Charles P. Corke to William G. Lavell, November 3, 1966, Central Classified Files, 1958–75, Northern Cheyenne, decimal #332, box 21, RG 75, National Archives, Washington, DC; F. F. DuBray, Realty Officer to Realty Files, July 14, 1966 (found in Ziontz, Pirtle, Moresset, and Ernstoff, "Petition of the Northern Cheyenne Indian Tribe to Rogers C. B. Morton, Volume II: Appendix," January 7, 1974, A-9, K. Ross Toole Papers, series V, box 28, folder 2, Mansfield Library, University of Montana [hereafter Ziontz et al., "Northern Cheyenne Petition"]).

5. John R. White to Area Office Realty Files, May 9, 1973, 3, K. Ross Toole Papers, series V, box 28, folder 3, Mansfield Library, University of Montana; John Woodenlegs, "Statement Presented by John Woodenlegs, President, Northern Cheyenne to Conference called by Robert L. Bennett," October 5, 1966, Lee Metcalf Papers, General Correspondence, Collection No. 172, box 237, folder 237–1, Montana Historical Society, Digital Library and Archives.

6. Ziontz et al., "Northern Cheyenne Petition," A-11 to A-14. The first document that directly discusses Peabody's takeover of Sentry's interests is a May 18, 1967, letter from the coal company's attorneys to the BIA's Northern Cheyenne office. But several other documents make it clear that discussions for this takeover were ongoing between Peabody and the Northern Cheyenne since the end of 1966. For instance, on December 17, 1966, Tribal President John Woodenlegs told President Lyndon Johnson's National Advisory Committee on Rural Poverty that his tribe had recently "advertise[d] for coal prospecting, resulting in a very hopeful negotiation with the largest coal mining company in America." Similarly, early in 1967, Peabody Vice President Richard Miller wrote Senator Lee Metcalf of Montana to thank him and fellow Montana Senator Mike Mansfield, for their "offer to assist us with federal departments and agencies that may be helpful in the development of [Northern Cheyenne coal]." Metcalf's subsequent correspondence makes clear that the parties involved understood that Peabody's goals included the construction of a power plant on or near the reservation. John Woodenlegs, "Statement Presented to President's Johnson's National Advisory Committee on Rural Poverty," December 17, 1966, Lee Metcalf Papers, General Correspondence, Collection No. 172, box 237, folder 237–1, Montana Historical Society, Digital Library and Archives; Richard Miller to Lee Metcalf, February 15, 1967, Lee Metcalf Papers, General Correspondence, Collection No. 172, box 237, folder 237–1, Montana Historical Society, Digital Library and Archives; Lee Metcalf to Oakley Coffee, February 25, 1967, Lee Metcalf Papers, General Correspondence, Collection No. 172, box 237, folder 237–1, Montana Historical Society, Digital Library and Archives. The Northern Cheyenne's approval of the permit expansion is found at John Woodenlegs, "Resolution No. 70 (67)," October 16, 1967, Central Classified Files, 1958–75, Northern Cheyenne, decimal #332, box 21, RG 75, National Archives, Washington, DC. John White's quote is found in Ziontz et al., "Northern Cheyenne Petition," A-20.

7. James Canan to Commissioner of Indian Affairs, November 9, 1967, Central Classified Files, 1958–75, Northern Cheyenne, decimal #332, box 21, RG 75, National Archives, Washington, DC; Charles Corke to James Canan, November 16, 1967, Central Classified Files, 1958–75, Northern Cheyenne, decimal #332,

box 21, RG 75, National Archives, Washington, DC; A. F. Czarnowsky, memo, November 16, 1967 (found in Ziontz et al., "Northern Cheyenne Petition," A-21).

8. John R. White to Area Office Realty Files, 3. For a thorough description of the Peabody extension negotiations, see Ziontz et al., "Northern Cheyenne Petition," A-14 to A-23.

9. For the tribal council taking the initiative to offer more land for mining and Rowland's leadership in opening the entire reservation, see John R. White to Area Office Realty Files, 4. ("It is my belief that no one in the Bureau up to that point [of the Northern Cheyenne resolution] had suggested that another coal sale be held.") The actual tribal resolution authorizing the reservation-wide lease sale is found at John Woodenlegs, "Resolution No. 37 (68)," April 22, 1968, Central Classified Files, 1958–75, Northern Cheyenne, decimal #332, box 21, RG 75, National Archives, Washington, DC.

10. Reinholt Brust, memo, May 6, 1968 (found in Ziontz et al., "Northern Cheyenne Petition," A-55, n. 165); A. F. Czarnowsky, handwritten note, April 30, 1968 (found ibid., A-57).

11. Ziontz et al., "Northern Cheyenne Petition," A-63 to A-64. Rowland's quote is found in Toole, *Rape of the Great Plains,* 52.

12. A. F. Czarnowsky to Superintendent, Northern Cheyenne Agency, August 1, 1969 (found in Ziontz et al., "Northern Cheyenne Petition," A-80).

13. As to Peabody pressure, see "Northern Cheyenne Highlights, Calendar Year 1969," 1–2; and Ziontz et al., "Northern Cheyenne Petition," A-30 to A-31, A-82. At the same meeting where the tribal council considered Peabody's second bid, company executive J. H. Hobbs announced that his firm planned to exercise the lease option on its first permit and extract coal, but only if the tribe allowed Peabody to construct a railroad line to the coal fields. No doubt the implied assertion was that Peabody's willingness to continue the entire project also hung on the council approving Peabody's second bid. Tribal council actions to accept Peabody's second bid, issue a lease on the first coal permit, and negotiate for transportation infrastructure across the reservation can be found at Northern Cheyenne Tribal Resolution No. 20 (70), August 18, 1969 (found in Ziontz et al., "Northern Cheyenne Petition," A-81); Northern Cheyenne Tribal Council Resolution No. 10 (71), July 20, 1970 (found in Ziontz et al., "Northern Cheyenne Petition," A-35); and Northern Cheyenne Tribal Council Resolution No. 24 (70), August 31, 1970 (found in Ziontz et al., "Northern Cheyenne Petition," A-43).

14. W. H. Oestreicher to Allen Rowland, June 1, 1970, Central Classified Files, 1958–75, Northern Cheyenne, decimal #332, box 21, RG 75, National Archives, Washington, DC. For tribal council efforts to renegotiate royalty terms, see Ziontz et al., "Northern Cheyenne Petition," A-38 to A-44. The original August 1970 deal terms included minimum royalty payments that would commence in the third year of the contract to insure Peabody actively pursued production rather than simply sitting on the coal deposits until the market improved. The tribal council successfully negotiated an increase in these minimum royalty terms and secured a promise from Peabody to start paying them in the contract's first, not third, year. The BIA official assisting the tribe in these negotiations was Donald Maynard, and his quote regarding immediate tribal needs is found at Donald Maynard to Acting

Director, Economic Development, September 28, 1970, Central Classified Files, 1958–75, Northern Cheyenne, decimal #332, box 21, RG 75, National Archives, Washington, DC. There were also numerous other incidents where the Northern Cheyenne pushed back against Peabody and demanded amendments to their existing contracts, with the BIA's blessing. For instance, when Peabody's second permit came up for renewal in fall 1971 and it became clear the coal company needed Cheyenne water to fully develop the coal resources, the two sides hammered out an agreement where the tribe promised certain water rights in exchange for more advanced royalties. Ziontz et al., "Northern Cheyenne Petition," A-50 to A-55, A-84 to A-87. The new BIA superintendent Alonzo Spang—himself, an enrolled member of the tribe—encouraged the tribe's hard negotiating tactics, writing to President Rowland, "The Tribal Council has every right and power to request that leases be re-negotiated. Our [BIA] action would be required once negotiations are complete. We are in full agreement with the Council's request to have Peabody Coal Company become involved in a re-negotiation of the cited leases." Alonzo T. Spang to Allen Rowland, November 26, 1971 (found in Ziontz et al., "Northern Cheyenne Petition," A-85).

15. Maurice W. Babby to A. F. Czarnowsky, February 3, 1971 (found in Ziontz et al., "Northern Cheyenne Petition," A-89 to A-90). As to interest generated for Northern Cheyenne coal, see Allen Rowland to John R. White, October 1, 1970 (found in Ziontz et al., "Northern Cheyenne Petition," A-103).

16. Allen Rowland to John R. White, October 1, 1970 (found in Ziontz et al., "Northern Cheyenne Petition," A-103); Allen Rowland to John R. White, December 4, 1970 (found in Ziontz et al., "Northern Cheyenne Petition," A-105).

17. Ziontz et al., "Northern Cheyenne Petition," A-111 to A-113, A-121 to A-123.

18. Compare Regional Mining Supervisor to Superintendent, Northern Cheyenne Agency, April 28, 1971 (found in Ziontz et al., "Northern Cheyenne Petition," A-123) with John J. V. Pereau to Allen Rowland, April 30, 1971; and Office of Area Director to Superintendent, Northern Cheyenne Agency, May 18, 1971 (both found in Ziontz et al., "Northern Cheyenne Petition," A-123 to A-124). Final contract figures come from Rogers Morton, "Decision on Northern Cheyenne Petition," June 4, 1974, 2, Eloise Whitebear Pease Collection, 10:31, Little Bighorn College Archives, Crow Agency, MT; Ziontz et al., "Northern Cheyenne Petition," A-124 to A-127, A-136; and Alvin M. Josephy, Jr., "Agony of the Northern Plains," *Audubon* 75, no. 4 (July 1973): 92. These numbers include the previous Peabody permits.

19. Ziontz et al., "Northern Cheyenne Petition," A-126.

20. Ibid., A-137 to A-139. For further details of Consolidation's proposal, see chapter 1, above, notes 1–2 and accompanying text. Toole's quote is found at Toole, *Rape of the Great Plains,* 49.

CHAPTER 4. "THE MOST IMPORTANT TRIBE IN AMERICA"

1. U.S. Department of the Interior, *North Central Power Study* (Billings, MT: Bureau of Reclamation, 1971), 5; see also K. Ross Toole, *The Rape of the Great*

Plains: Northwest America, Cattle and Coal (Boston: Little, Brown, 1976), 19–20; and Marjane Ambler, *Breaking the Iron Bonds: Indian Control of Energy Development* (Lawrence: University Press of Kansas, 1990), 67–68. As for analyses of the projects' potential impacts, see Alvin M. Josephy, Jr., "Agony of the Northern Plains," *Audubon* 75, no. 4 (July 1973); Alvin M. Josephy, Jr., "Plundered West: Coal Is the Prize," *Washington Post,* August 26, 1973; and Lynton R. Hayes, *Energy, Economic Growth, and Regionalism in the West* (Albuquerque: University of New Mexico Press, 1980), 24. The National Academy of Sciences first articulated the concept of a "national sacrifice area" to meet the nation's energy needs in their 1974 report, *Rehabilitation Potential of Western Coal Lands*. Examining the coal industry's recent trend to locate mines on public and tribal lands in the western United States, this report noted vast difficulties in reclaiming strip mines in arid regions. Concluding that restoration of such lands to their previous ecological state "is not possible anywhere," the report suggested bluntly that the United States declare certain regions "National Sacrifice Areas," where reclamation would not even be attempted. James S. Cannon and Mary Jean Haley, *Leased and Lost: A Study of Public and Indian Coal Leasing in the West* (New York: Council on Economic Priorities, 1974), 7–8. Two years later, K. Ross Toole first applied the label of "national sacrifice area" to the Northern Plains. Toole, *Rape of the Great Plains,* 4.

2. Toole, *Rape of the Great Plains,* 52.

3. The letter is quoted in both Ambler, *Breaking the Iron Bonds,* 65; and Josephy, "Agony of the Northern Plains," 96.

4. This portion of the letter is quoted at Ziontz, Pirtle, Moresset, and Ernstoff, "Petition of the Northern Cheyenne Indian Tribe to Rogers C. B. Morton, Volume II: Appendix," January 7, 1974, A-144 to A-146, K. Ross Toole Papers, series V, box 28, folder 2, Mansfield Library, University of Montana (hereafter Ziontz et al., "Northern Cheyenne Petition").

5. Bert W. Kronmiller to Don Maynard, July 26, 1972 (found in Ziontz et al., "Northern Cheyenne Petition," A-126).

6. Interview with William L. Bryan, Jr., June 13, 2011, Bozeman, MT, in author's possession; and William L. Bryan, Jr., "Report on the July 1972 Activities of William L. Bryan, Jr., Northern Rocky Mountain Environmental Advocate," July 1972, in author's possession. Bryan's dissertation is found at William LaFrentz Bryan, Jr., "An Identification and Analysis of Power-Coercive Change Strategies and Techniques Utilized by Selected Environmental Change Agents" (PhD diss., University of Michigan, 1971).

7. Toole, *Rape of the Great Plains,* 52.
